the laws of linear perspective is essential. He will use also what is called aerial perspective, which, being concerned with the relative tones, colours, and clarity of objects seen at different distances, through the atmospheric veil, is much more a matter for sensitive observation and feeling than for science. See Drawing.

Perspiration. Excretion of water from the skin through the sweat glands. In the human being, the sweat glands consist of small coiled tubes situated in the deepest part of the true skin, from which a duct passes up to the surface. The secreting tube is lined by columnar cells, outside of which is a layer of muscular fibres. Sweat glands are abundant all over the skin, but are most numerous on the parts which are free from hair, particularly the palms and soles.

There is always a certain amount of activity in the sweat glands, but the secretion, as soon as it reaches the surface, is evaporated, and thus normally the skin feels dry. This is accordingly known as insensible perspiration. Under the influence of exercise, heat, or certain emotions, the activity of the sweat glands is greatly increased, and the secretion then collects on the surface, forming beads or drops of sweat. This is sensible perspiration. The physiological function of sweating is to assist in regulating the body temperature by the dilatation in heat and the shrinkage in cold of surface blood vessels. Anidrosis is abnormal diminution in the quantity of sweat excreted. It is seen in diabetes, myxoedema, and some affections of the nervous system. See Hyperidrosis.

Persulphuric Acid. An acid formed when sulphur heptoxide (S_2O_7) is dissolved in water. It is made by the action of sulphuric acid on ammonium or barium persulphate. It is formed during the working of accumulators, by electrolysis of the sulphuric acid. On dilution with strong sulphuric acid mono-persulphuric acid is formed. The salts of persulphuric acid known as persulphates are used as oxidising agents.

Perth. Royal and municipal burgh and county town of Perthshire, Scotland. On the Tay, it is 48 m. by rly. N. of Edinburgh. The wooded hills of Kinnoull, rising to 729 ft., and of Moncrieffe, 725 ft., the magnificent river, and the impressive back-

Perth arms

Perth, Scotland. View from Bridgend showing the bridge over the Tay
British Railway Executive

ground of the Grampians combine to form an environment fully justifying its being called the Fair City. An ancient city, it was noted for its noble ecclesiastical edifices, but of these there remains only the 13th century cruciform church of S. John, from which it derived its former name of St. Johnstown, and in which in 1559 John Knox preached his celebrated sermon against idolatry. Other prominent buildings are S. Ninian's episcopal cathedral (1850-90), the new city hall, the general convict prison for Scotland, and the municipal buildings, the latter on the site of the palace in which the Gowrie conspirators met. The city has a large infirmary, public library, art gallery and museum, and barracks. There are several schools, but the castle and the market cross have been pulled down.

An imposing nine-arch bridge, 840 ft. long, across the Tay communicates with the suburb of Bridgend, and along the W. bank of the river extend two public parks—the N. and S. Inch. Dyeing is the staple industry, and brewing, ironfounding, and the manufacture

of ink, linen, gauge glasses, floor-cloth, and chemicals are carried on. From here steamers go to Dundee and other ports on the E. coast. It has valuable salmon fisheries and large cattle markets are held.

Perth, Western Australia. View of the centre of the capital city, with Mount's Bay road bordering the Swan river and the Darling ranges in the distance
Bu courtesy of the Australian News and Information Bureau

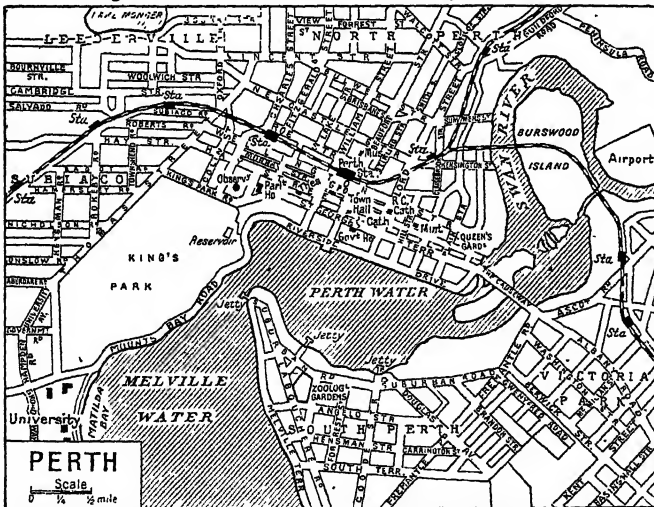

Said to have been founded by Agricola in A.D. 70, Perth has a wealth of historical memories. A burgh in 1106, it was constituted a royal burgh in 1210, and was the Scottish capital till 1482. Many times besieged, it was taken by

Bruce in 1311, and Edward III in 1335. The scene in 1396 of the combat between the Quhele and Chattan clans, described by Scott in *The Fair Maid of Perth*, and of the murder of James I in 1437, it was captured by Montrose in 1644, and again by Cromwell in 1651. Market day, Fri. Pop. est. 39,700.

Perth. Capital city of Western Australia. It stands on the Swan river, 12 m. N.E. of the port of Fremantle at its mouth. The chief public buildings are Government House, Parliament House, town hall, mint, public library, and the university of W. Australia. The city has a museum and art gallery, zoological gardens, and extensive public parks, King's Park covering

1,000 acres. There are cathedrals for both Anglicans and Roman Catholics, Perth being the seat of the primate of W. Australia. There are electric tramways and trolley buses. South Perth, Nedlands, Mount Lawley, and Dalkeith are suburbs. Perth was founded in 1829 and made a municipality in 1856. Its growth, however, was due to the discovery of gold at Kalgoorlie in 1893. Exports are wheat, wool, fruit, dairy produce, gold, and timber. Pop. 260,000.

Perth, EARL OF. Scottish title borne by the family of Drummond since 1605, when James, Lord Drummond, was made an earl. The 4th earl, James (1648-1716), was made a duke by James II when in exile. He had been lord chancellor of Scotland, but after 1688 he left the country. The three succeeding dukes, for so they were called although the title had no validity, were prominent Jacobites. The title became extinct when the 6th duke died in 1760. Claimed without success until 1853, the title was conceded to George Drummond (1807-1902), brother of the 1st duke of Perth. The story of the earls of Melfort is similar; they were

Perth, Western Australia. Plan of the city, showing the jetties on Perth Water and the suburb of South Perth

Jacobites, received a dukedom from James II, and lost practically all in the Stuart cause. George Drummond counts as 14th earl of Perth. The 16th earl is noticed separately. An eldest son bears the courtesy title of Viscount Strathallan.

Perth, JAMES ERIC DRUMMOND, 16TH EARL OF (b. 1876). British diplomatist. Born Aug. 17, 1876, and educated at Eton, he entered the Foreign office in 1900. He was one of the prime minister's private secretaries, 1912-15, then private secretary to the

foreign minister until 1919. For 14 years Sir Eric Drummond was secretary-general to the League of Nations. He was British ambassador in Rome, 1933-39, returning to become chief adviser on foreign publicity at the ministry of Information, 1939-40. He was knighted 1916; succeeded to the earldom, 1937; and became a representative peer for Scotland in 1941.

Perthite. Variety of red feldspar found at Perth, Ontario, Canada. Consisting of laminations of orthoclase and albite, it is used as a gem stone. See Orthoclase.

Perthshire. County of Scotland. Its area is 2,493½ sq. m., making it the fourth largest in the country. It belongs partly to the Highlands and partly to the Lowlands, and is pierced by the Firth of Tay. The surface is mountainous. In the N. and W. are the Grampians; a large number of its heights exceed 3,000 ft., among them Ben Lawers, Ben More, Ben Lui, and Schiehallion. In the S. and E. are the Sidlaw and Ochil Hills. The chief river is the Tay; among its tributaries are the Almond, Earn, Tummel, and Lyon. The Teith and Allan flow to the Forth. The largest of many lochs are Tay, Erich, Vennachar, Rannoch, Katrine, and Achray. Across the S.E. stretches the valley of Strathmore, and in the E. is the Carse of Gowrie. Beautiful glens, e.g. Garry, abound, and herein are the Trossachs, the pass of Killiecrankie, and other famous spots.

Perth is the county town and largest place. Other towns are Crieff, Blairgowrie, Dunblane, and Auchterarder. Holiday resorts include Pitlochry, Aberfeldy, Comrie, and Callander. In the county, too, are Abernethy and Blair

Atholl. Agriculture is the chief industry, but a large proportion of the land is given up to deer forests and grouse moors. Oats, barley, and wheat are grown; horses and cattle are reared. A large number of sheep are fed on the hills. An earthquake belt occurs near Comrie. With Kinross-shire two members are returned to parliament. Perthshire was the headquarters of the kingdom of the Picts. Their capital was in turn Abernethy, Forteviot, and Scone; and Scone long remained the coronation place of the Scottish kings. There are relics of a Roman camp at Ardoch. Pop. 120,772.

LITERARY ASSOCIATIONS. These are especially notable in connexion with Scottish song. Caroline, Baroness Nairne, author of *The Land o' the Leal*, *Callers Herrin'*, and other familiar songs, was born in the Auld House of Gask. Henry Adamson (d. 1639), the friend of Drummond of Hawthornden and author of *The Muses' Threnodie*, was born at Perth. David Mallet, or Malloch (c. 1705-65), was born at Crieff; Dugald Buchanan (1716-68) was born at Ardoch; and Duncan MacIntyre (1724-1812), although of Argyllshire birth, is said to have found much of his inspiration for his poems in Perthshire. Robert Nicoll (1814-37), poet and prose writer, was born at Little Tulliebeltane, Auchtergaven; George Gilfillan at Comrie; and Charles Mackay (1814-

89), Scots song-writer and author of *Cheer, Boys, Cheer*, at Perth. Notable books on the county include *History of Perthshire*, T. H. Marshall, 1849.

Perthus or **PORTUS**, COL DU. Pass over the E. Pyrenees, on one of the roads leading from Perpignan in France to Figueras in Spain. It is defended on the French side by Fort Bellegarde.

At the end of the Spanish Civil War the district became a centre from which Catalan refugees escaped into France. On Feb. 6, 1939, the frontier was thrown open by the French to admit troops as well as civilians. Gen. Franco's artillery and air force bombarded and bombed the assembled refugees, of whom over 250,000 crossed the frontier in a few days.

Pertinax, **PUBLIUS HELVIUS**, Roman emperor from Jan. 1 to Mar. 28, A.D. 193. A man of humble birth, born at Alba Pompeia in Liguria, he entered the army. He distinguished himself in the wars with the Parthians and in Britain, and after the murder of Commodus he was invited to become emperor. But the discipline which he attempted to re-establish proved so irksome to the spoilt soldiery that he was murdered in less than three months. On his death the empire was sold by auction to Didius.

Pertinax. Pen-name of Charles Joseph André Géraud, French publicist. Born Oct. 18, 1882, he

Perthshire. Map of the Scottish county celebrated for its picturesque glens, passes, and lakes

was educated at the university of Bordeaux. From 1908 to 1914 he was London correspondent of the *Echo de Paris*, in which from 1917 to 1938 he contributed a daily article. In 1919 he opposed the creation of the League of Nations as inconsistent with existing alliances. He was editor of *L'Europe Nouvelle* during 1938-40, and on the defeat of France went to the U.S.A. where he became diplomatic correspondent of the North American Newspaper Alliance, also contributing to the *Daily Telegraph*, London, and *France-Soir*, Paris. His book

Les Fossoyeurs, a study of Gamelin, Daladier, Reynaud, Pétain, and Laval, published in New York in 1943, was translated into English as *The Gravediggers*.

Perturbation. Term used in astronomy for the disturbance in the orbits and positions of the planets and comets caused by the attractions which they exert on one another. It was from unexplained perturbations in the movements of Uranus that Adams and Leverrier predicted the existence of the planet Neptune.

Pertussis. Scientific name for whooping cough (*q.v.*).

of sugar, cotton, and coffee. Between these cultivated strips the coastal plain is almost desert.

The montaña, a region undeveloped, mostly difficult of access, and in parts still unexplored, presents a striking contrast to the other parts of the republic. The montaña slopes down from the E. spurs of the Andes to the interior of the continent. Here flourishes the vast virgin forest of the damp Amazonian basin. The waters teem with fish; serpents and alligators abound; gorgeous birds of every size, from the gigantic heron to the tiny hummingbird, haunt the woods and waters. Innumerable streams wind through the forest, feeding the upper waters of the Amazon. Three great navigable rivers cut their way by gorges through the E. Cordillera, namely, the Marañon, which is the main stream of the Amazon, the Huallaga, and the Ucayali, which rises in the S. of the country and receives many affluents in its long course N. The long navigable stream of the Javary forms the Brazilian boundary through most of its course.

The pop. in 1940 was 7,023,111, of whom 46 p.c. were pure Indian, 53 p.c. white or mixed. The ruling class, of almost pure Spanish descent, numbers c. 500,000; Chinese and Japanese, c. 42,000; British residents, c. 2,300; U.S. citizens c. 1,100; pure Negroes, c. 30,000.

The peasantry, villagers, and labourers of the sierra, the Cholos, are pure Indian, a gentle, somewhat apathetic and melancholy race. They still speak Quichua, the language of the Incas. The Aymara language also survives; but on the sierra most of the Indians know something of Spanish. Small and scattered tribes of uncivilized Indians inhabit the recesses of the montaña.

The capital and largest town is Lima (*q.v.*), with a population of 522,828. Callao, the port, linked with Lima by rail and tramway, has about 75,000 inhabitants. Arequipa, situated on the S. uplands but connected with the coastal region, has about 46,000. Other towns of note are the seaports Mollendo and Paita, Trujillo (30,000) in the N. near the coast, Cuzco (40,000) and Ayacucho (20,000) in the sierra, and Iquitos (40,000) on the Amazon.

GOVERNMENT. Under a constitution promulgated on April 9, 1933, Peru has a chamber of deputies of 153 members, and a senate of 49 members elected for

PERU: A REPUBLIC OF THE ANDES

Peru (*El Perú*), a S. American republic bordering the Pacific and lying wholly within the southern

Peru arms

Tropics, forms an irregular oblong stretching about 1,200 m. from N.W. to S.E. The area, estimated at c. 482,000 sq. m., is uncertain owing to frontier disputes with Ecuador and Colombia on the N., Brazil on the E., and Bolivia on the S.E. The dispute with Chile on the S. was settled, through U.S. mediation, in 1929, when Tacna went to Peru, Arica to Chile.

Peru is not in itself a distinct geographical region, but forms part of the Andean system of S. America, being traversed throughout its whole length by the stupendous mountain system of the Cordilleras. The Peruvian part of this gigantic mountain system has a peculiar magnificence of its own, owing to the fact that the Western Cordillera here rears itself precipitously, like a huge irregular wall, broken by many ravines, almost from sea level to a height of 16,000 ft., even the passes between the peaks mostly exceeding 14,000 ft. This W. range forms a continuous barrier running parallel to the Pacific coast. A broad plateau, from 11,000 to 13,500 ft. above sea level, stretches between this range and the still loftier chain of the Eastern Cordillera, whose snow-peaks rise to more than 20,000 ft. The plateau is broken by many subsidiary mountain masses, and in its N. part is traversed by the central Cordillera. Near Cuzco the ranges converge, and are heaped together into the rugged

transverse ridge or "knot" of Vilcanota. S. of this the plateau widens out between two ranges, enclosing L. Titicaca and stretching into the yet broader Bolivian plateau. L. Titicaca forms the main part of a hydrographical system of inland drainage.

This vast mountain system cuts Peru into three distinct longitudinal zones: the rainless coastal plain, from 30 to 60 m. wide; the sierra or mountain system itself, about 250 m. wide; and the montaña, the remote inland region of forest which clothes the eastern slopes of the Andes, and stretches far into the Amazonian basin. The mountains determine the rainfall and the extraordinary contrast between the E. and W. regions of the republic. The moist trade-winds, sweeping across the continent from the Atlantic, upon striking the barrier of the E.

Peru flag; red, white, and red

Cordillera are forced upwards and chilled, and shed copious rains.

On the other hand, because the cold Humboldt (or Peru) current cools winds blowing in from the Pacific, before they reach the shore and the mts., the coastal plain between the Andes and the Pacific is rainless, although in the winter—from about May till October—the daily *garra*, a mist often breaking into a slight drizzle, moistens the soil and revives vegetation. The many short and rapid rivers descending from the Andes to the Pacific permit strips of irrigation, which yield abundant crops

Peru. Map of this Andean republic, at one time the most important Spanish colony in South America

six years. The president is elected for five years, and is not eligible to succeed himself. Males of 21 and over able to read and write are eligible to vote, which is compulsory from 21 to 60. The president appoints the eleven ministers of his cabinet. The 24 departments are divided into 134 provs. plus the constitutional prov. of Callao.

The R.C. religion enjoys state protection, but all religions are tolerated. Military service is compulsory. The army on a peace footing numbers some 30,000. The navy includes two out of date cruisers and an old destroyer, four submarines, a river flotilla, and some auxiliary vessels. Both army and navy have aviation corps.

The monetary unit is the sole (worth 15.38 U.S. cents) divided into 100 centavos. The metric system of weights and measures is general but not compulsory.

Elementary education is free and compulsory from 7 to 14; secondary education was made free in 1946. Travelling teaching units tour the Indian villages. In Lima is the central university of San Marcos, founded in 1551, as well as

the R.C. university. There are other state universities at Arequipa, Cuzco, and Trujillo.

First in value of exports comes sugar. Other important exports are cotton, petroleum products, copper, lead, and wool. Peru gave quinine and also the potato to the world. The principal imports are machinery, vehicles, and electrical goods, food, textiles, chemicals and dyes, pharmaceutical goods, and metallic products. There are large deposits of iron at Marcona, and excellent coal lies near by. Peruvian industry includes oil refineries, copper smelters, and the first rubber tire factory on the S. American W. coast. Local factories produce cheap cotton textiles as well as substantial quantities of woollen cloth, leather goods, cement, chemicals, drugs, tobacco, and processed foods.

In the coastal zone the natural and most convenient transport is by sea; about 25 ports, most of them mere villages with open roadsteads, serve this coastal traffic. Callao, the chief port of external trade, is situated on a spacious sheltered bay and possesses fine

docks and wharves. Mollendo is the second port. Paita, in the N., possesses a fine natural harbour. Short rlys. link seaports with centres of production.

The Andean plateau has access to the sea by two mountain railways. One of these, the Callao-Oroya line, traverses a pass in the W. Cordillera higher than the summit of Mont Blanc, and descends thence about 3,000 ft. to Oroya, which is linked by a N. extension to the great copper mines of Cerro de Pasco. Another extension passes S. to Huanavelica, and will eventually join the Southern rly., which mounts from Mollendo to Arequipa, and thence over the W. Cordillera to the shore of L. Titicaca at Puno, whence steamers connect it with the Bolivian rly. system. A N. extension joins Puno with Cuzco and Sta. Ana. Total length of Peru's rlys. is 2,758 m. There are more than 20,000 m. of road suitable for motor traffic. The central highway from Lima to Oroya, completed 1935, was extended 1943 to Huanuco and Pucallpa on the Ucayali, making possible a journey by road and river from the Pacific to the Atlantic. The Peruvian section of the Pan-American highway is complete. Commercial air-lines have helped to make the interior more accessible, and link the principal towns of the coastal plain. But much of the transport on the sierra is still carried by troops of llamas driven by Indians.

The montaña depends almost entirely on river transport. The river port of Iquitos, 2,300 m. from the Atlantic, is visited by ocean steamers. Large river steamers navigate great stretches of the Amazonian affluents; and it is impossible to estimate the immense extent of streams navigable by smaller craft and motor-boats.

ARCHAEOLOGY. The material remains of pre-Columbian Peru pertain to a wide geographical region dominated by the Aymará and Quichua people. It embraced N.W. Argentina and Bolivia, besides impinging in N. Chile on the Araucanian and in Ecuador on the Chibcha region.

Before the Christian era the Yunca, or rainless and stoneless coastal valleys, were occupied by fishing tribes, whose vast shell-mounds have yielded their bone implements and some basketware. There came among them, traditionally from the sea—whether from middle America, the W., or both, is undetermined—an agricultural people who erected truncated

1. Decoration from ancient terra-cotta vessel. 2. Earthenware musical instrument. 3. Figure in pottery of man playing a flute. 4. Pottery figure of an official, probably a portrait. 5. Pottery head, full face. 6. Pottery head, profile. These four figures illustrate the skill with

which the ancient Peruvian craftsmen portrayed features. 7. Stone seat from Manabi, Ecuador. 8. Earthenware trumpet. 9. Inca water carrier from Cuzco. 10. Natives of the Yucay Valley. 11. Present-day Indians in dress similar to that worn in the Inca period

PERU: RELICS OF THE PAST, AND PERUVIANS OF THE PRESENT DAY

pyramidal mounds of adobe for burial and for the platforms of residential structures. The N. section, round Trujillo, called early Chimu, is marked by pottery moulded into human, animal, and vegetable forms. The S. section, called early Nasca, is marked by pottery with painted decoration.

In the well-watered Andean uplands, amply supplied with stone, arose another agricultural people, who domesticated the llama for transport and the alpaca for wool. Using stone tools, they set up remarkable megalithic structures, notably at Tiahuanaco near L. Titicaca, in the Cuzco valley, and at Ollantaytambo, which guarded the Amazon pass. To this archaic period succeeded a new artistic outburst which, down to the 8th century, intermingled with the coast cultures. It was marked by stone carving, weaving, and goldwork, and a southward migration produced the Diaguite or Calchaqui culture of N.W. Argentina.

The remnants of one of the megalithic dynasties, apparently under pressure from the coast, took refuge in a fastness called Tampu-Tocco, identified by Bingham in 1911 with Machu-Picchu in the Urubamba valley. Besides cyclopean remains this site yielded pictographic stones, showing that an undeveloped system of record preceded that of the later quipus or knotted cords. By about 1100 the Inca tribe, perhaps emerging from Tampu-Tocco, began to dominate the highlands, while the later Chimu and Nasca cultures on the coast independently reached a new zenith of their own, before being absorbed into the Inca empire.

Megalithic Remains

The most imposing megalithic remains are at Tiahuanaco. At Sillustani on L. Umayo are numerous burial-towers or chullpas, and stone circles. From Chavin de Huantar, in the Marañon valley, came a diorite stela 25 ft. high, sculptured to represent a deity. The Inca builders used smaller blocks for their edifices, which were sometimes many-storeyed, as on the islands in L. Titicaca and at Pachacamac. At Marca Huamachuco are extensive llama-corral; at Huanuco Viejo a series of stone baths. The Inca constructed stone aqueducts and bridges, terraced hillsides for cultivation (which are still in use), and paved highways throughout the empire. *Consult Ancient Civilizations of the Andes, P. A. Means, 1931.*

HISTORY. The Incas, during four centuries of domination, by

a process of elaborate and steady conquests had brought under their sway an empire measuring more than 1,500 m. from N. to S., and comprising approx. the present territories of Bolivia, Peru, and Ecuador. The Inca conquest of Quito in the 16th century, and the death of the conqueror, were followed by a destructive civil war between the rightful heir, Huascar, and his half-brother, the usurper Atahualpa. Thus the distracted state of the country partly accounts for the fact that a policy so extensive and apparently so well organized fell before a handful of Spanish adventurers. After seven years of preliminary effort and exploration, and after suffering indescribable hardships, Pizarro (*q.v.*) landed at Tumbez in 1531; he advanced into the interior, treacherously put to death Atahualpa, and in 1533 entered the capital Cuzco. In 1535 he founded the present capital, Lima. Notwithstanding some later native attempts at resistance, favoured by quarrels among the Spanish conquerors, the Inca empire had fallen, and about the middle of the 16th century the authority of the Spanish viceroy was established.

Under Spanish Dominion

For two centuries the history of Peru was virtually the history of Spanish S. America. For the viceroy, installed at Lima, not only ruled his own vicerealty, comprising the present territories of Bolivia and Peru, but also held authority over almost all the Spanish governors upon the continent.

The seat of the viceroy, Peru itself had a less agitated and eventful history than the other "kingdoms" of S. America. The interest of its history is mainly concerned with administration and finance; for it was the viceroy's duty to transmit to Spain the royal share of the precious metals mined in Peru, particularly in the silver mines of Potosí (now in Bolivia). In the course of the 18th century many reforms were made, and two new vicerealties, in New Granada and in Buenos Aires, were set up, independent of Peru. In the year 1780 a serious native revolt shook the vicerealty. The revolt was suppressed by loyal Indians under Spanish officers, and was followed by barbarous executions.

During the revolutionary movements in other parts of the continent during 1810-22, Peru was the stronghold of Spanish authority. Indeed, royalist expeditions sent thence drove the Argentine invaders from Upper Peru (now

Bolivia), and reconquered Chile. However, in 1820 an army and fleet, under San Martín and Cochrane, invaded Peru from Chile, and in 1821 San Martín entered Lima, and proclaimed himself protector of Peru. But the war continued for three years longer. Lima for a time was re-occupied by the royalists, and it was not until 1824 that the battle of Ayacucho ended Spanish dominion in S. America.

Independence and Wars

For three years Peru recognized the authority of Bolívar, "the Liberator"; upon his departure, in 1826, the republic entered upon the stormy career characteristic of tropical republics of mixed blood, presidents and dictators succeeding one another with bewildering rapidity. In 1836 the attempt of the Bolivian, Santa Cruz, to unite Bolivia and Peru under his dominion led to war with Chile. From 1845 to 1862 domination by Ramón Castilla brought comparative tranquillity, better administration, and economic progress. But after him the old disorders re-occurred, and trouble with Chile over frontiers was deferred by war with Spain (1864-66).

The frontiers of Peru, Bolivia, and Chile in the coastal desert were not a burning question until it was discovered that the desert might yield great wealth, first in the form of guano, and then in that of nitrates, and this led to the war between Chile and the allied republics of Peru and Bolivia (*see Chile-Peruvian War*). The victorious Chileans occupied Lima for nearly three years. The war was a severe blow to Peruvian prosperity, and political disorders rendered recovery more difficult. Yet Peru has shared the general South American movement of consolidation and settlement.

In the First Great War the republic was driven by German attacks on shipping to break off diplomatic relations with Germany, seize the German ships at Callao, and open the Peruvian ports to the Allies. In the Second Great War Peru declared war on Germany and Japan, Feb. 12, 1945. She took no active part in the war, but was an important source of raw materials for the Allies. She was a foundation member of the United Nations organization.

Pern, BALSAM OF. Liquid exuded from the trunk of *Myrciaylon pereirae* of Central America, after beating and scorching the bark. It is used in medicine as a stimulating dressing for wounds and as an expectorant in bronchitis.

Perugia. A province of central Italy, covering most of the region of Umbria. It is mainly mountainous, being traversed by the Apennines, is watered by the Tiber and affluents, and contains the Trasimene Lake. The mountains yield iron, coal, and marble, while the valleys produce wheat, olives, and grapes. Much wine and olive oil are produced. Perugia is sparsely inhabited. See Umbria.

Perugia (anc. *Perusia*). Italian city, capital of the prov. of the same name. It is picturesquely placed on hills at an alt. of 1,705 ft. overlooking the Tiber, 10 m. E. of the Trasimene Lake or Lago di Perugia, and 126 m. by rly. N. of Rome. Irregular in plan, its medieval walls enclose separate hill tops. There are remains of the Etruscan terraced walls, gates, and tombs.

The 15th century Gothic cathedral of San Lorenzo, adorned with fine paintings and carvings, is still unfinished. Among many interesting churches is that of San Pietro, a curious edifice founded about 1000, rich in masterpieces by Perugino and others. The university, founded 1307, houses a collection of Etruscan and Roman antiquities, and a library. The great Gothic municipal palace (1281-1333) has a valuable collection of pictures by Umbrian masters. In the cathedral square are a large fountain, a statue of Pope Julius III, and the money changers' hall (1453), with beautiful frescoes by Perugino. There are also an academy, a school of art, a public library, a botanical garden, and an observatory. The manufactures include liqueurs, silk and woollen goods, and there is a considerable trade in corn, fruit, wine, and oil. Perugia was one of the twelve cities of Etruria. It was captured

by the Romans in 309 B.C., was destroyed by Octavian in 41 B.C., in the so-called Perusine war against Lucius Antonius, and again destroyed by Totila, 549. For 13 centuries it was more or less subject to the popes, and was annexed to the dominions of Victor Emmanuel in 1860. Pop. 82,407.

During the Second Great War Perugia was captured from the Germans by troops of the 8th army after heavy fighting in the outskirts. The city escaped damage except for the blowing up of the 13th century bridge of S. Giovanni by the Germans.

Perugino or **PIETRO VANNUCCI** (1446-1524), Italian painter. Born at Città della Pieve, he studied

Perugino,
Italian painter
Self-portrait

at Perugia and in the school of Verrocchio at Florence. He worked in Florence and Perugia till 1480, when he was employed by Pope Sixtus IV on the decoration of the Sistine chapel and other portions of the Vatican; when he returned to Florence Raphael became his pupil. He was among the first of the Italians to use the oil medium successfully, though he painted also in tempera, and his graceful figures, with their poetic landscape background, procured him a wide reputation. He died at Fontignano, near Perugia. There are five works by him in the National Gallery.

Peruke. Artificial head of hair, a variant of periwig. See Wig.

Peruvian Bark. Former name for the bark of various species of *Cinchona* imported from Peru and Bolivia for the sake of the quinine contained in it. The story of its discovery, and of the subsequent introduction of the trees into India, is told in the article on bark (*q.v.*). The species yielding the highest percentage of quinine

are *C. calisaya* and *C. ledgeriana*, known as yellow barks. Red bark (*C. succirubra*) is the species that has been grown most extensively in the Himalayas and Nilgiris. In Java, which supplies about nine-tenths of the world's requirements of bark, the species chiefly grown is *C. ledgeriana*. See Cinchona; Markham, Sir C. R.

Peruvian Mastic Tree. Californian pepper-tree (*Schinus molle*), a small fragrant tree of the family Anacardiaceae. It is indigenous in Brazil and Peru. The alternate leaves are divided into many pairs of lance-shaped leaflets with toothed edges. The small, yellow-white flowers are clustered and succeeded by pea-like, rosy fruits of an oily nature. The resinous sap that gives its fragrance to the tree is used by the Peruvians as an astringent for the gums, and the root is used medicinally.

Peruzzi, BALDASSARE (1481-1536). An Italian architect and painter. Born near Siena, he studied probably under Pacchiarotto. He painted at Siena without obtaining eminence, and then went to Rome, where he built the Villa Farnesina for Agostino Chigi. This success induced him to devote himself to architecture, and in 1520 he was appointed architect to S. Peter's. After the sack of the city in 1527, when he was robbed of his possessions, he fled to Siena, where he became city architect. He died in Rome, Jan. 6, 1536. *Prom. Perootsy.*

Perversion (Lat. *pervertere*, to turn about). Term for an anomaly of psychological development in which the patient shrinks from normal sexual behaviour, but can find gratification in some substitute activity. The principal perversions are homosexuality; exhibitionism; fetishism; sadism, and its derivative masochism. In very mild forms they are widely distributed among normal people. See entries under all these heads; also Oedipus Complex.

Pesaro. City of Italy, the capital of the prov. of Pesaro e Urbino. It stands on the river Foglia, near its mouth in the Adriatic Sea, 37 m. by rly. N.W. of Ancona. The old cathedral, now closed, has a 12th century mosaic pavement, and the new one has a famous picture by Bellini. The prefecture was built in the 15th century for the Sforzas, whose fortress (1474) remains. The museum contains a rich collection of art pottery, furniture, etc. The conservatoire was founded by Rossini, a native of the city. An

Perugia, Italy. General view of the capital city of the province

old Roman bridge spanned the Foglia. Manufactures include silks, woollens, majolica, glass, iron, and sealing-wax, and Pesaro is noted for its figs, which are exported in large quantities. Founded as Pisaurum by the Romans in 184 B.C., it was destroyed by the Goths and restored by Belisarius. Pesaro was a papal possession in the 8th century, and was later ruled by the houses of Malatesta, Sforza, and Rovere, falling again to the popes from 1631 to 1860.

During the Second Great War Pesaro was captured by Polish forces of the Allied 8th army, supported by gunfire from British destroyers, in a fierce battle Aug. 31–Sept. 2, 1944, against the German 1st parachute div., the defenders of Cassino. The town, damaged by Allied bombing and shelling, was also mined and otherwise damaged by the Germans. The cathedral roof was shaken by blast, the church of S. Antonio was gutted. Most works of art had, however, been removed to safety. Pop. 51,560. *Pron.* Pezz-aro.

Pesaro e Urbino. Prov. of N.E. Italy, in the Marches. It extends from the Apennines to the Adriatic Sea, and its area is 1,118 sq. m. A mountainous prov., its fertile valleys produce grain, fruit, wine, and oil. Iron is mined and silk manufactured.

Pescadores OR FISHERS' ISLANDS. Group of islands formerly belonging to Japan. Situated in Formosa Strait, between the island of Formosa and the mainland of China, it consists of some 24 inhabited islands and 25 uninhabited rocks, all of basaltic formation, and low-lying. It covers an area of nearly 50 sq. m., and has a pop. of more than 75,000. The soil is fertile, and produces rice, millet, and other cereals. Navigation is extremely dangerous. A possession of China down to 1895, when it was ceded to Japan, the group was officially called Bokoto by the Japanese, and is known to the Chinese as Pang-hu or Peng-hu. In 1945 the group was returned to Chinese sovereignty.

Pescara. River, prov., and tn. of S. Italy, in the region of Abruzzi e Molise. The river rises in the Apennines as the Gizio and Aterno, which unite above Popoli. Below this town the river flows across the prov. N.E. to the Adriatic coast. At its mouth is an hydraulic electric power station for the supply of Rome. The town is at the mouth of the river on the coast, 8 m. N.W. of Chieti. It has a fortified harbour and is a sea-

bathing resort. Here d'Annunzio was born. Pop., with Castellammare Adriatico, with which Pescara has merged, 19,870.

During the Second Great War Pescara was occupied by Indian troops of the Allied 8th army, June 10, 1944. It suffered no damage.

Pescara, FERNANDO FRANCESCO D'AVALOS, MARQUIS OF (c. 1490–1525). Neapolitan soldier. He en-

Peshawar, Pakistan. Street scene in this city of the N.W. Frontier Province

tered the service of the emperor Charles V, and fought in the wars with the French. He took part in the battle of Ravenna, 1512, at which he was taken prisoner, and in the battle of Pavia, 1525, after which he was made commander-in-chief in Italy. He died Nov. 4, 1525. His wife was Vittoria Colonna (q.v.).

Peschiera. Town of Italy, in the prov. of Verona. It stands on the river Mincio, where it issues from the Lago di Garda, 20 m. N.N.W. of Mantua. One of the famous fortresses of the Quadrilateral (q.v.), it was captured from the Austrians by the Sardinians, May 30, 1848. *Pron.* Pesky-aira.

Pescia. City of Italy, in the prov. of Lucca. It is 23 m. by rly. W.N.W. of Florence. The cathedral, restored in 1693, has a 13th century façade and pulpit, and a fine monument to Baldassare Turini. Paper-making and silk manufacture are the leading industries, and there is trade in oil, wine, and fruit. Overrun by the Allied 5th army in the early days of Sept., 1944, it suffered only slight damage during the Second Great War. *Pron.* Pesk-ya.

Peseta. Spanish silver coin. The monetary unit of Spain, its nominal value is about 9½d. It is divided into 100 centimos and has been coined in ½, 1, 2, and 5 peseta silver pieces, and 5, 10, 20, and 25 peseta gold pieces.

Peshawar. District and capital city of the N.W. Frontier Province,

Pakistan. The dist. is a hill-girt basin, W. of the Indus, drained by the Kabul river and its tributaries, the Swat and Bara. Wheat is the chief crop. Half of the people are Pathans. The rly. follows the Kabul valley from Attock on the Indus to Peshawar, and thence to Jamrud, and a branch goes N. to Dargai at the foot of the Malakand Pass. The Lower Swat, Bara river, and Kabul river canals provide water for irrigation. Area, 1,547 sq. m. Pop. 851,833.

The town lies near the Bara, 190 m. from Kabul and 276 m. from Lahore. It occupies a strategic position in relation to the Khyber Pass, 10½ m. to the W., into Afghanistan, and is a great trade centre for raw silk and thread, silk and cotton goods, sugar, tea, etc. A broad-gauge rly. joins the town with Jamrud to the W. with Campbellpur Junction, E. of the Indus. Pop. 130,967.

Peshawar was a Buddhist capital in the 2nd century, and a great resort of Chinese pilgrims in the 5th, 6th, and 7th centuries. From the 8th century, when the Afghans first reached the district, it has been a debatable ground. Mahmud in the 11th century made it a base of operations against N.W. India. Under Jahangir and his successors Peshawar was subject to Delhi. It came into British hands at the annexation of the Punjab in 1848. It formed part of the dominion of Pakistan created Aug., 1947. *Pron.* Pesh-ah'wer.

Peshwa (Persian, leader). Title of a Marhatta chieftain. Originally applied to the chief adviser or prime minister, after the usurpation of supreme power by one of these ministers, it was given to the raja of Poona. The last Peshwa was Baji Rao, deposed by the British in 1818. *See* Mahratta.

Peso (Lat. *pensum*, weight). Monetary unit of Argentina, Chile, Mexico, Uruguay, and Colombia, originally a gold coin. The first peso was a Spanish coin, coined in both gold and silver, circulating in Spain and her colonies.

Pessimism (Lat. *peessimus*, worst). A word of modern coinage denoting, in general, the tendency to look on the worst side of things; in

philosophy, the doctrine that life and existence are fundamentally evil. From a religious point of view it reaches its extreme in Buddhism. Its chief modern representatives are Schopenhauer and von Hartmann. All satisfaction of our needs is illusory, and only leads to new needs and consequent grief; the best thing is to take no interest in life. According to Hartmann, the unconscious leads us in a direction contrary to our own interests. Progress only makes us more sensible of pain, which is part of our existence. Pleasure is only negative, pain positive. See *Pleasure; consult Le Pessimisme au 19e Siècle*, E. M. Caro, 1878; *Pessimism: a History and Criticism*, J. Sully, 1891; *Studies in Pessimism*, A. Schopenhauer, Eng. trans. T. B. Saunders, 4th ed. 1893.

Pestalozzi, JOHANN HEINRICH (1746-1827). Swiss educationist. Born at Zürich, Jan. 12, 1746, and

J. H. Pestalozzi,
Swiss educationist

educated at the university there, he became interested in social and educational reform. He wrote *The Evening Hours of a Hermit*, 1780, and the immensely successful moral tale, *Leonard and Gertrude*, the following year. During 1798-99 he conducted at Stanz, on the Lake of Lucerne, a school for orphaned children. From 1799 to 1825 he kept a school first at Berthoud and then at Yverdon, where he put into practice his educational theories, which are based on the idea that understanding is only possible by that spontaneous perception which is a result of observation. These views he expounded in *How Gertrude Teaches Her Children*, 1801. He died Feb. 17, 1827.

Pestilence (Lat. *pestilentia*, an infectious disease). Term used for any infectious deadly disease. See *Black Death*; *Plague*.

Pétain, HENRI PHILIPPE BENOÎME OMER JOSEPH (b. 1856). French soldier and statesman. Born at Cauchy-la-Tour, Pas-de-Calais, April 24, 1856, he was commissioned from St. Cyr in 1878. He passed through the École de Guerre, where he was assistant instructor under Foch in 1906, and was promoted col. in 1911, proceeding to the command of the 33rd infantry regt. When the First Great War broke out he commanded the 4th infantry bde., but before

the end of the year was placed in command of the 33rd corps, taking part in the operations in Artois, 1915. As commander of the 2nd army in 1915, he took part in the Champagne offensive, and in Feb., 1916, was placed in command of the defences of Verdun, where he displayed brilliant generalship. Placed over all the armies of the centre in Dec., 1916, he later became chief of staff, and in 1917 succeeded Nivelle in command of the armies of the north and north east. In Mar., 1918, when Foch was made Generalissimo, Pétain became c.-in-c. of the French armies, and on Nov. 19, 1918, he received the baton of a marshal of France. He was named a member of the academy of moral and political sciences in 1919, and made a member of the Académie Française in 1929.

Marshal Pétain,
French soldier

In 1920 Pétain became vice-president of the higher war council, and in that capacity directed operations against Abdel Krim in Morocco in 1925-26. Appointed inspector-general of air defences in 1931, he was in the same year made a member of the higher council of national defence. In 1934 Doumergue chose him as war minister.

A fervent R.C., right wing in politics, he was sent as ambassador to Madrid in 1939. Reynaud, the premier, recalled him May 18, 1940, to assume the office of vice-premier in the hope that the hero of Verdun would save France. But Pétain no longer believed that fighting would save her, and when Reynaud resigned, June 16, and President Lebrun called on Pétain to form a govt., he immediately made contact with Hitler through the Spanish ambassador in France, and authorised the acceptance by the plenipotentiaries he sent to Compiègne of the German armistice terms, June 22. He transferred his govt. from Bordeaux to Vichy, July 1, and there he abolished the constitution of the Third Republic, assuming the functions of head of the state. Certain of German victory, he accepted and encouraged collaboration with the Germans, although he publicly insisted that "honour" forbade France to fight against her former allies. In Sept. he designated Laval his successor, and in Oct. made him foreign

minister; but, soon mistrusting Laval, dismissed him and revoked his nomination to the succession in Dec., putting Darlan in his place. Under German pressure, however, he accepted Laval as prime minister in April, 1942.

After many hesitations, he gave the order for resistance to the Allies when they landed in N. Africa in Nov. The subsequent occupation of the whole of France by the Germans destroyed his position, and Laval's increasing power reduced him to impotence; but he refused to abdicate, and made some effort to re-establish constitutional order. This failing, by the end of 1943 he had shut himself up in his quarters in the Hôtel du Parc at Vichy, refusing to deal with Laval. When the Allies landed in Normandy, June 6, 1944, he broadcast an appeal to all Frenchmen to remain quietly at their posts. As the Allies approached Paris from the W. and Vichy from the S., the Germans tried to persuade him to leave Vichy. After persistent refusals—he wanted to surrender to the F.F.I.—he at last, Aug. 20, consented to go when the Germans threatened to shoot a hundred hostages and shell Vichy. He was taken to Belfort, and then to Sigmaringen, where he was detained until, at his own request, he was allowed, April 24, 1945, to enter Swiss territory. He crossed to the French frontier at Vallorbe, where he was arrested April 26 and interned in Fort Montrouge. Brought to trial in Paris, July 23, charged with treason, he was sentenced to death Aug. 15, the sentence being commuted two days later to life imprisonment. He was transferred to the island of Yeu, Vendée, to serve this sentence.

Petal (Gr. *petalon*, thin sheet of metal). In a flower, the inner whorl of floral leaves, the outer whorl being the green protective sepals. Petals are usually delicate, white or coloured, but may be scale-like: or sepals and petals may be alike. Collectively the petals are referred to as the corolla of the flower. They may be quite separate one from another (polypetalous corolla), or variously united to form a tube, a funnel, a bell, etc. (gamopetalous corolla). The petals are usually the most conspicuous parts of the plant, their purpose being the attraction of nectar-seeking insects to assist in the work of pollination. With this object in view the petals are frequently streaked with some stronger tint, the "honey guides." See *Flower*.

Petard (Fr. *péter*, to make an explosion). Military engine, now obsolete. It consisted of a small

Petard. Example of use of the ancient military engine, from a print of c. 1579

metal or wooden case, shaped like a half-cone, and filled with gunpowder. It was used to make a breach in a wall, or to blow in a gate when attacking a fortress. The usual procedure was to fasten it against a door or wall or any other obstacle, and then to fire it with a fuse. The man in charge of a petard was called a petardier. Its modern equivalent is the mortar (*q.v.*), but in the Second Great War a close-support tank was called the petard. It was fitted with an 8-in. mortar and carried fascines which could be laid to form a causeway across ditches screening pillboxes or other strong points. Petards were manned by the Royal Engineers. Shakespeare, in *Hamlet*, coined the phrase, "Hoist with his own petar."

Petchenegs or **PATZINAKS**. Nomadic Turkish people. Advancing from the Ural about 840, they drove the Magyars before them into Hungary, 895. In the 10th century they ruled from the Volga to the Danube, became Mahomedans, broke the power of the Chazars, and harassed the Russians. Driven from S. Russia by the Kumanians about 1047, they maintained their power in what is now Rumania until about 1100.

Peter. Masculine Christian name, from the Greek *petra*, stone or rock. It became popular throughout Christendom as that of one of the leading apostles of Jesus Christ. The French form is Pierre, and the Italian Pietro. The Spanish form is Pedro, and under that form the Spanish and Brazilian sovereigns bearing the name appear in this work.

Peter. One of the twelve apostles. A son of Jonas, apparently a native of Capernaum, he was in partnership with his brother Andrew as a fisher on the lake of Galilee when called to be an apostle. Previously, perhaps, a disciple of John the Baptist, and originally called Simon, he re-

ceived the name of Cephas or Peter from Christ, who, in reference to the meaning of the name, declared that on this rock He would build His Church. With James and John, Peter became one of the inner circle of the apostles. The story of his denial of Christ on the eve of the Crucifixion is common to all four Gospels.

Of impetuous character, eager and generous in disposition, he was a born leader of men. After the Resurrection, Christ appeared to him and gave to him the charge, Feed My sheep. He preached the first sermon after the great Pentecost, and was the first to admit a Gentile to the Christian Church. He left Antioch, where he had been working, after his dissension with S. Paul, and is believed to have preached throughout Asia Minor, to have gone to Rome, and to have met death by crucifixion, perhaps under Nero, A.D. 68. See Christian-ity; Jerusalem; Papacy.

Peter, EPISTLES OF. Two books in the New Testament written by S. Peter. Several works have survived which were ascribed to the apostle but were not in reality his. Examples are the apocryphal Gospel of Peter, the Preaching of Peter, and the Apocalypse of Peter. The question naturally arises, therefore, whether the Epistles of Peter have been rightly ascribed to him. They claim in the first verse to be written by the apostle. This claim for the First Epistle is supported by adequate external evidence. The Epistle is quoted by Polycarp and seems to have been known to Barnabas, Clement of Rome, and Papias. Its authenticity is accepted by Irenaeus, Tertullian, Origen, and Eusebius.

As for internal evidence, it has been objected that many of the ideas are Paul's rather than Peter's; that one would expect from Peter more personal reminiscences of the life of Jesus; and that the persecution referred to in chap. 4, vv. 14-16 indicates a date later than Peter's death. The first and second objections are not vital. Regarding the third, there were no doubt persecutions before the official imperial persecution of A.D. 64.

The Petrine authorship, therefore, may well be accepted, and we may conclude that the Epistle was written from Rome before 64. External evidence for the Second Epistle is weak. It is not included in the Muratorian Canon, or even in the old Latin and Syriac versions. It does not seem to have

been used by the earliest Christian Fathers; its authorship is doubted by Origen, and it is placed by Eusebius among the disputed books. See Bible; New Testament.

Peter I, THE GREAT (1672-1725). Tsar of Russia. Son of the Tsar Alexis, he was born May 30,

Peter the Great, Tsar of Russia After J. M. Nattier

1672, and succeeded to the tsardom jointly with his elder brother, Ivan, in 1682. Young Peter was trained by the Swiss, Lefort, and the Scot, Patrick Gordon. His passion for ships and for sham warfare was early indulged. In 1689 he effected a *coup d'état*, overturning the regency of his sister Sophia, though without officially deposing his brother. The same year he married Eudoxia Lopukhina. Ivan died in 1696.

A barbarian but at the same time a genius, Peter was imbued with the three conceptions of organizing his vast dominion after W. models, impregnating it with W. culture, and extending its borders to the Baltic on the N. and the Black Sea on the S. His first task was a military reconstruction directed by Gordon. A war with Turkey gave him the port of Azov, 1696, and the opportunity for creating a navy. His next step was to dispatch scions of noble families to observe and study the manners and methods of W. Europe. Peter followed this up in 1697 by himself making the great tour, visiting European courts and working with his own hands in the shipyards of Holland and at Deptford, London. He also studied anatomy and engraving. He returned to Russia to complete the suppression of a revolt raised by the party hostile to western innovations, and brought with him engineers, artisans, and scientists.

In 1699, after the accession in Sweden of Charles XII (*q.v.*), Peter formed a coalition with Poland and Denmark for a partition of the Baltic provinces of Sweden, which should establish Russia on that sea. Charles, however, crushed Denmark, shattered Peter's huge army at Narva (*q.v.*), and then turned on Poland. Peter was left at leisure to found his new capital of Petersburg, and to apply the lessons of Narva to the organization of his army. When Charles again turned upon Russia, he was drawn deep into the country, and

his army was annihilated at Poltava in 1709, though he himself escaped over the Turkish border and presently induced Turkey to declare war upon Peter. The tsar, with his army, was enticed into a trap near the Prut, and would have been annihilated but for the diplomatic skill of his mistress Catherine—afterwards his wife and successor—who procured a treaty by which Peter gave up Azov.

He now made himself master of Finland, and after the death of Charles imposed upon Sweden in 1721 the peace of Nystadt, which transferred to Russia the Baltic provinces Peter desired. Expansion S.E. at the expense of Persia was his next project, which carried the Russian borders to the Caspian and the Caucasus; but further ambitions were stayed by his death, Jan. 28, 1725. He was succeeded on the throne by Catherine I, whom he had married in 1712.

Peter's energy, which was volcanic, transformed Russia from a medieval Oriental state to a power on level terms with its Western neighbours. He altered everything, commerce, taxation, education, costume. Frequent opposition was savagely put down; even the crown prince Alexis was judicially murdered by the tsar after a quarrel. Peter never civilized himself, remaining a prey to hysterical rage, a debauchee, and in some respects a monster. But his ability was supreme, and there is no doubt that his aim transcended a mere lust for power.

Bibliography. History of the Russian Empire under Peter the Great, Voltaire, 1763; Lives, K. Waliszewski, Eng. trans. 1898; S. Graham, 1929; G. Oudard, Eng. trans. 1930; A. Tolstoi, Eng. trans. 1936.

Peter II (1715–30). Tsar of Russia. Son of Alexis, the only son of Peter the Great, he was born Oct. 11, 1715, and succeeded Catherine I in 1727. He fell under the influence of Menshikov, and exiled Anna Ivanovna, duchess of Courland, the legitimate heir to the throne. At the instigation of Dolgoruki, Peter threw off the yoke imposed on him by Menshikov, whom he sent to Siberia with his family. He died of smallpox Jan. 29, 1730.

Peter III (1728–62). Tsar of Russia. Born at Kiel, Jan. 29, 1728, he was the son of Anne, eldest daughter of Peter the Great. He ascended the throne Jan. 5, 1762, and immediately reversed Russian policy by concluding a peace with Frederick II of Prussia.

Mentally weak and never a favourite with his subjects, he was the victim of a plot not unknown to his consort, who proclaimed herself empress as Catherine II, July 14. Peter was strangled a few days later.

Peter I (1844–1921). King of Yugoslavia. Son of Alexander I, prince of Serbia, 1842–58, Peter

Peter I,
King of Yugoslavia

Karagevitch was born at Belgrade, July 11, 1844. Exiled with the rest of the family, he received a military education at St. Cyr, and fought with distinction in the foreign legion during the Franco-Prussian War, and in 1875 as a leader of Herzegovinian insurgents. He married in 1883 Zorka, daughter of Nicholas I of Montenegro.

On the extinction of the Obrenovitch dynasty by the assassination of King Alexander, June 10, 1903, Peter was elected king of Serbia by the national assembly on June 15. He was not in a strong enough position to deal justice to the murderers of his predecessor, and the new monarchy was not recognized by Great Britain until 1906. In 1914 he committed the regency to the crown prince Alexander, his second son, but was with his army early in the First Great War, accompanying it in the retreat of 1915–16 to Greece, where he spent his second exile. On the reconquest of Serbia, Peter returned to Belgrade. First sovereign of Yugoslavia, he died Aug. 16, 1921.

Peter II (b. 1923). King of Yugoslavia, 1934–45. Born Sept. 6, 1923, the son of Alexander I, he succeeded to the throne when his father was assassinated in

Marseilles, Oct. 9, 1934, and ruled under a regency headed by his uncle, Prince Paul (q.v.). Peter assumed power when he headed the revolt against the pro-Axis pact, March 25, 1941; but invading German armies forced him to flee with his government, and he took refuge in London, where in 1944 he married Princess Alexandra of Greece. Hostile to the partisan movement under Marshal Tito, he pinned his faith to Mihailovitch, and found himself at odds with the other Allied governments. Throughout 1945 no understanding could be reached between Tito and the king, and on Nov. 29 the new government in Yugoslavia formally abolished the monarchy. Peter, whom strained relations with the Allies had driven to Egypt, was in 1947 deprived of his nationality and his property was confiscated.

Peter THE HERMIT. Medieval French preacher, known for his connexion with the first crusade. He was a priest at Amiens when Pope Urban II in 1095 declared a crusade. Peter was one of the most successful wandering preachers who went through France urging its claims. He led one band of crusaders from Cologne to Constantinople, and after some vicissitudes reached the Holy Land.

He is said to have died in 1115. The medieval writers ascribe to Peter a much larger share in originating the crusade than he actually had.

Peterborough
arms

Peter II,
King of Yugoslavia

Peterborough. City and mun. bor. of Northamptonshire, England. It stands on the Nene, 76 m. N. of London, being an important centre of main rlys. The cathedral of S. Peter occupies the site of a Saxon edifice destroyed by the Danes in 870. Another, built in Edgar's reign, was burned 1116. The third was begun c. 1118 as the

Peterborough, Northamptonshire. The cathedral of S. Peter, showing the magnificent west front

church of a monastery, took over 100 years to build, and contains examples of several styles of architecture. The magnificent west front was restored after 1895. The nave is a noble piece of work, while another feature is the 15th century "new building." Made a cathedral when a bishopric was established here in 1541, it contains the tomb of Catherine of Aragon; Mary Queen of Scots also was first interred here. There are remains of the monastery, including the cloisters, and connected with the cathedral are two gateways, (above one of which is the chapel of S. Nicholas), and the remains of the hospital of S. Thomas Becket. Other buildings include the 15th century church of S. John Baptist; the town hall, a 17th century edifice; almshouses; and a museum. New municipal buildings went up in 1928. There is a corn exchange, but the staple industry is engineering. Bricks are made in the neighbourhood.

The ancient Medeshamstede, Peterborough grew up around a Benedictine monastery founded in 655, and restored after having been destroyed by the Danes. In 1874 it was made a borough on modern lines, having previously had its medieval constitution. It was separately represented in parliament, 1547-1918, and from 1950 gave its name to a co. constituency. The diocese covers the co. of Northampton. Mkt. days, Wed. and Sat. Pop. est. 51,920.

The soke of Peterborough, a district around the city, forms a separate county for administrative purposes. It has an area of 83½ sq. m. Pop. est. 60,877.

Peterborough. Town of Dalhousie co., S. Australia. It is near Terowie, the rly. junction of the line from Broken Hill to Port Pirie and the main line from Adelaide to Perth. Formerly called Petersburg, it has a pop. of 3,059.

Peterborough. City of Ontario, Canada. It stands on the river Otonabee, 75 m. N.E. of Toronto, and is served by the C.N.R., C.P.R., and the Trent Canal. Its public buildings include an R.C. cathedral. It owns the gas, light, water, and power plants, and is the headquarters of the Canadian General Electric Co. Pop. 25,350.

Peterborough, CHARLES MORDAUNT, 3RD EARL OF (1658-1735). English sailor and soldier. Son of John, Viscount Mordaunt (1627-75), he entered the navy in 1675. He proposed the invasion of England to William of Orange and helped to set that prince on the

throne. He was rewarded with the post of first lord of the Treasury, and the earldom of Monmouth, 1689. In connexion with the Fenwick plot he was kept in the Tower for three months, 1697, but that year inherited the earldom of Peterborough. In 1705 he

3rd Earl of Peterborough

shared the command of the Spanish expedition with Shovell. A campaign in E. Spain, including the capture of Barcelona, though represented by himself as brilliantly successful, roused much controversy. Recalled in 1707, he went to Vienna as ambassador in 1710, returning on the accession of George I in 1714, when his official career ended. He lived until Oct. 25, 1735.

Peterculter. Village and parish of Aberdeenshire, Scotland. Also called Culter, it stands on Culter Burn at its junction with the Dee, 7½ m. by rly. S.W. of Aberdeen. Paper making is the chief occupation of a population of 2,000.

Peterhouse, Cambridge. The quadrangle and hall
Country Life

Peter Grimes. First opera by Benjamin Britten, with libretto by Montagu Slater. It is based on an episode in Crabbe's *The Borough*, a poem describing the life of the fishing community at Aldeburgh, Suffolk, in the early 19th century. It was first produced at Sadler's Wells, London, June 7, 1945.

Peterhead. Municipal burgh and seaport of Aberdeenshire, Scotland. The most easterly town in the country, it stands on Peterhead Bay, 34 m. N.N.E. of Aberdeen, with a rly. station. The burgh is in two parts, Peterhead proper and Keith Inch, connected by swing bridge. The harbours include a graving dock

and a patent slipway; a large harbour of refuge in Peterhead Bay was built from 1886 to 1921 by convicts, and work to extend the breakwaters is proceeding by the same labour. The chief industry is the herring fishery, but since 1945 white fishing has rapidly expanded. Peterhead, long the property of the Keith family, was founded and made a burgh in 1593 by George, Earl Marischal. At one time it was the headquarters for the Arctic fisheries. Pop. approx. 13,000.

Peterhouse OR **S. PETER'S COLLEGE.** Oldest college of Cambridge university. It was founded c. 1257 by Hugo de Balsham, bishop of Ely; its charter, on the lines of Merton College, Oxford, is dated 1284. The principal court assumed quadrangular form in the 15th century; the N. range was begun in 1424, and in 1431 a library was planned, of which three windows and the newel-stair survive.

The existing chapel, consecrated in 1632 and designed by Matthew Wren, master, 1625-34, and uncle of the architect Christopher Wren, contains specimens of Munich glass. Cardinal Beaufort, Andrew Perne, Fynes Moryson, John Cosin, Richard Crashaw, Isaac Barrow, Thomas Gray, Lord Kelvin, James Dewar, and A. W. Ward are famous names in the records of the college, which is under a master.

Peterlee. In March 1948 a Peterlee Devpt. Corp. was set up by the Ministry of Town and Country Planning to establish a new town at Easington, Co. Durham, which would house a mining pop. of 30,000. The name Peter Lee was that of a miner who became the first Labour chairman of any county council.

Peterloo OR **THE MANCHESTER MASSACRE.** Name popularly given to an encounter between soldiery and people at St. Peter's Field, Manchester, England, Aug. 16, 1819. It was applied in derision, the battle of Waterloo being still fresh in the public mind. Some 60,000 people had assembled

Peterhouse College arms

for a demonstration in favour of parliamentary reform, and the police, by order of the magistrates, attempted to arrest their leader, "Orator" Hunt. This proving impossible, yeomanry appeared, and finally the magistrate ordered hussars to charge the crowd, with the result that eleven were killed and about 500 injured. The Free Trade Hall stands on the site. *See* Industrial Revolution.

Peter Martyr (1205–52). Italian saint. He was born at Verona, and at the age of 15, admitted, by S. Dominic, to his order. He conducted missions with great success throughout Italy and, appointed in 1232 head of the Inquisition, is said to have acted with greater zeal than mercy. He was murdered while returning from Como to Milan in 1252, and canonised in 1253.

Peter Martyr (1500–62). Italian Protestant reformer, whose surname was Vermigli. Born at Florence, May 8, 1500, he became abbot of an Augustinian monastery at Spoleto and principal of a college at Naples. Turning Protestant, he had to flee to Zürich in 1542, and became professor of theology at Strasbourg. Visiting England in 1547, he was appointed professor of theology at Oxford. On the accession of Mary he returned to Strasbourg, and later became a teacher of Hebrew at Zürich, where he died Nov. 12, 1562.

Peter Pan. Fairy story character invented by J. M. Barrie, and famous as the boy who never

grew up. He first appeared in the closing chapters of *The Little White Bird*, 1902, which describes his adventures in Kensington Gardens. The children's play, *Peter Pan*, was produced at the Duke of York's Theatre, London, Dec. 27, 1904. This depicts the adventures of a group of children who visit the Never-Never Land under the guidance of Peter, meeting with fairies, pirates, and Red Indians. The play is among London's most regular Christmas revivals, and actresses who have played the part of Peter, since it was first portrayed by Nina Boucicault, have included Cissie Loftus, Pauline Chase (1906–13 revivals inclusive), Madge Titheradge, Edna Best, Elsa Lanchester, Jean Forbes-Robertson, Nova Pilbeam, and Phyllis Calvert. A story version of the play, *Peter and Wendy*, was published in 1911.

In Kensington Gardens a bronze statue of Peter Pan, by Sir George Frampton, the gift of Barrie himself, was set up (as a surprise) close to the Long Water in 1912.

Peter Plymley's Letters. A series of ten letters by Sydney Smith (*q.v.*). It was published in 1807 and 1808 with the full title of *Letters on the Subject of the Catholics to my Brother Abraham who lives in the Country*, by Peter Plymley. The letters, full of scathing wit and searching irony, were appeals for the removal of the civil disabilities of the R.Cs.

Peter Rabbit. Animal character in children's books, written and illustrated by Beatrix Potter (*q.v.*). The *Tale of Peter Rabbit* appeared in 1902, the first of a series of little picture books, mainly about animals, which have charmed children ever since, and are often called the *Peter Rabbit* books, although this character appears in only a few of them.

Peters, Hugh (1598–1660). English divine. Educated at Trinity College, Cambridge, he began his career as a lay preacher, but was subsequently ordained and appointed to S. Sepulchre's, London. He settled in Holland about 1629, and became an Independent. In 1635 he went to New England, where he was one of the leading ministers at Salem. Sent to England in 1641 on colonial business, he served as an army chaplain during the Civil War. At the Restoration he was tried for complicity in the death of Charles I, and executed, Oct. 16, 1660.

Peters, Karl (1856–1918). German administrator. Born at Neuhäus, he was educated at Göttingen, Tübingen, and Berlin, and in

1884 went to Zanzibar to organize a German colonial scheme. He secured treaties with native chiefs, and in 1885 returned to Berlin to get them approved, founding a German East African company. In 1891 he was administrator for Germany in E. Africa, but was deprived of his rank in 1891 for cruelty to the natives. Reappointed in 1906, he died at Woltorf, Brunswick, Sept. 12, 1918.

Peters, Matthew William (1742–1814). English painter. Born in the Isle of Wight, he studied at the Dublin school of design. He began to exhibit at the Academy in 1769, became A.R.A. in 1771, and R.A. in 1777. His paintings were chiefly portraits, several of which were engraved by Bartolozzi and J. R. Smith. In 1783 he took holy orders, ultimately becoming a prebendary of Lincoln Cathedral, but continued his work as an artist. Peters died at Brasted, Kent, March 20, 1814.

Petersburg. City of Virginia, U.S.A. It stands on the Appomattox river, at the head of navigation, 24 m. S. of Richmond, and is served by rlys. and by the Appomattox canal. Manufactures include tobacco, cotton, machinery, and silk goods, and there is a trade in timber. Petersburg was laid out in 1733, incorporated in 1748, and chartered as a city in 1850. The first negro congressman, J. M. Langston, was elected by this city in 1888. Pop. 30,631.

Petersburg, SIEGE OF. Concluding phase of the American Civil War, 1864–65. In June, 1864, the town of Petersburg (*v.s.*) was held by a Confederate force of 2,500 men. Recognizing that its possession would place Richmond in his hands, Grant assaulted the place, June 16–18, but was repulsed with heavy losses. The siege which followed was signalled by great valour on the Confederate side, but Lee was eventually reduced to evacuate Petersburg and Richmond, April 2, 1865. Seven days later he surrendered to Grant at Appomattox Court House.

Petersfield. Urban dist. and market town of Hampshire, England. It is 19 m. N.N.E. of Portsmouth, with which it has rly. connexion. The chief building is

the church of S. Peter, partly Norman, and there is a town hall. In the market place is an equestrian statue of William III. Near the town

Petersfield arms

Peter Pan. The bronze statue by Sir George Frampton, R.A., in Kensington Gardens, London

is Bedales school, conducted on co-educational lines. Petersfield was a borough with a merchant

Croatia-Slavonia. It stands on the right bank of the Danube opposite Novi Sad (Neusatz), with which it is connected by two bridges, and is 49 m. by rly. from Belgrade and 174 m. from Budapest.

Pethick-Lawrence, **FREDERICK WILLIAM PETHICK-LAWRENCE**, 1ST BARON (b. 1871). British politician. Born Lawrence, Dec. 28, 1871, he went from Eton to Trinity College, Cambridge, and was 4th wrangler in 1894. He was

editor of *The Echo*, 1902-05; of the *Labour Record and Review*, 1905-07; and, jointly, of *Votes for Women*, 1907-14. In 1901 he married a leading feminist, Emmeline Pethick, and added her surname to his own. His activities on behalf of woman suffrage brought him nine months' im-

prison compound possessing antispasmodic and analgesic properties. Colourless, crystalline, and neutral in reaction, the compound is used in surgery, obstetrics, and for pain in illness or injury.

Petiole (Lat. *petiolus*, stalk or little foot). Stalk of a leaf, continued through the blade as the midrib. A strand of vascular tissue runs through it, by which water from the roots is conducted to the leaf-blade. The upper surface is frequently grooved, and the lower surface may be ridged. In leaves that possess the power of movement, independently of wind, the petiole is swollen at its base into a pulvinus or motile organ. This may be seen in the scarlet runner, which lowers its leaves and leaflets at night. The constant wind movement of aspen and other poplar leaves is due to the lateral flattening of the petiole. In clematis and tropaeolum the petiole twists round any available support, thus enabling the plant to climb. See Leaf.

Pétion de Villeneuve, JÉRÔME (1756-94). French revolutionary. Born at Chartres, he was elected to the states-general, 1789, becoming president of the Assembly, 1790, and mayor of Paris in Nov., 1791. He became first president of the national convention, but a quarrel with Robespierre led to his proscription. He joined the Girondists, and after an unsuccessful attempt at Caen to raise a Norman insurrection he fled into the Gironde, and in June, 1794, his body was found near St. Emilion.

Petition (Lat. *petere*, to seek). Term used for a request, generally one from an inferior to a superior. The word appears much in English history. The right of petitioning the king was claimed at an early date and was established in the time of Henry IV, the reason for this insistence being that many evils could be redressed only by the personal action of the sovereign. In 1689 the right of subjects to petition the king was laid down in the Bill of Rights. Until the time of Henry VII, legislation was usually based on petition, the laws being drafted by the judges from the petitions received. The crown still receives certain petitions.

The modern petition is usually to one of the houses of parliament, generally the commons. This became a frequent practice in the time of Charles I, and petitions are still presented, urging members to act in a certain way. To protect itself from violence, parliament enacted, in 1662, that not more than ten persons shall present a

Petersfield, Hampshire. Market place and parish church of St. Peter, showing equestrian statue of William III

guld in the 12th century, and later a centre of the cloth industry. From 1553 to 1885 it was separately represented in parliament, and from 1950 gave its name to a co. constituency. Annual fairs are held. Market day, Wed. Pop. 6,700.

Petersham. Parish and village of Surrey, England. Part of the bor. of Richmond, and called in Domesday Patricesham, Peter's Dwelling, Petersham once belonged to the abbey of S. Peter, Chertsey, and had a fishery of eels and lampreys. Passing to the crown in 1415, the manor was granted, with Ham (*q.v.*), in 1672, to John, duke of Lauderdale, and later to the earl of Dysart. The church of S. Peter, founded 1505, but mainly dating from 1790, has interesting monuments. In the churchyard are the graves of Mary and Agnes Berry, Horace Walpole's "Elder-Berries," and Vancouver, the explorer.

Peter's Pence. Tax levied in England by the pope from the 8th or 9th century, and subsequently extended to other countries. It was originally called Róm-feoh or Rome scot, and amounted to a silver penny per hearth. It was withheld by England in 1386 in order to bring pressure to bear on the pope to agree to the statute of praemunire, and was abolished by Henry VIII, 1534, though it has been since revived as a voluntary contribution by Roman Catholics.

Peter the Great Bay (Victoria Bay). Inlet of the Sea of Japan, on the S. side of the Russian Maritime Province in Eastern Siberia. It is 90 m. wide, extends 50 m. inland, and contains six bays and several small islands. The chief port is Vladivostok, which is situated on the Muraviev peninsula.

Petervarad, PETERVARDEN, OR PETROVARADIN. Town of Yugoslavia, in the Syrmia dist. of

Lord Pethick-Lawrence, British politician, and Lady Pethick-Lawrence, a prominent suffragist

prisonment for conspiracy in 1912. A pacifist, during the First Great War he advocated peace by negotiation. He was elected to the house of commons in 1923, and was Labour member for East Leicester until 1931, when he lost his seat. Returned for East Edinburgh in 1935, he became a privy councillor in 1937. In the 1929 Labour administration he was financial secretary to the Treasury, and was a member of the Indian round-table conference in 1931. Secretary of state for India, 1945, with a seat in the house of lords, he played an important part in the negotiations for Indian independence. He resigned in April, 1947. He wrote widely on industrial questions, including *This Gold Crisis*, 1931; *The Money Muddle and the Way Out*, 1933; also an autobiography, *Fate Has Been Kind*, 1943.

Pethidine. Synthetic compound introduced in 1939 as a hydrochloride. It is a piperidine

petition. Many legal proceedings—e.g. for divorce—are also begun by petition. See Commons, House of; Parliament.

Petition of Right. In English law, the only method of enforcing claims against the crown until the Crown Proceedings Act of 1947 abolished such petitions and enabled the crown to be sued in the courts in the ordinary way. A petition of right could not be brought for a tort, as the crown was not liable for this, but it was used to enforce contracts or recover property. The petition was presented, and on the attorney-general granting his fiat—"Let right be done"—the proceedings continued almost exactly as in an action between ordinary litigants.

Petition of Right. Statement of constitutional claims presented to Charles I. Having during the first three years of his reign raised money without consent of parliament, and done other arbitrary acts, Charles I encountered a stiff resistance when in 1628 he called his third parliament. Wentworth, Pym, and others drew up the Petition of Right, which passed through both houses, and was signed by the king on June 7. By signing it Charles promised never again to raise money without consent of parliament or to imprison anyone for refusing to pay an illegal tax; not to billet soldiers in private houses, or put martial law into operation. The Petition of Right is frequently confused with the Bill of Rights of 1689.

The Humble Petition and Advice was the name given to an address presented to Cromwell in 1657, urging him to accept the crown and suggesting certain changes in the constitution. See Forced Loan.

Petitio principii (Lat., begging the question). In logic, the fallacy of assuming what is to be proved as the premise of a syllogism, or making use of a premise, the truth of which is not admitted. An instance of this is Aristotle's argument: All bodies tend towards the centre of the universe; all bodies tend towards the earth; therefore the earth is the centre of the universe. How can it be affirmed that all bodies tend towards the centre of the universe, without assuming what it is desired to prove, viz. that the earth is that centre? It is akin to arguing in a circle, or using a premise to establish a conclusion and then proving the premise by the same conclusion. See Logic.

Petit Journal, L^e. Paris morning newspaper, established Feb. 2, 1863, and the pioneer of the popular press in France. By 1917 its circulation exceeded 1,250,000. In 1889 Le Petit Journal started a weekly illustrated supplement in colours, and in 1896 the weekly Petit Journal Agricole and Le Petit Journal Illustré de la Jeunesse. It ceased after the liberation of France in 1944.

Petit Mal. Mild form of epilepsy, not associated with convulsions. It may follow head injuries or war wounds. The condition is characterised by sudden short attacks of unconsciousness, or complete oblivion to the surroundings. The patient does not know he has had the attack, and during it may have performed unusual acts. The condition may last for years or pass into ordinary epilepsy with convulsions. The patient should live a careful life and not follow any occupation which would be dangerous in the event of an attack coming on.

Petit Marseilles, L^e. Daily paper of S.E. France. It was founded in 1868, and eventually achieved a circulation of 500,000. It was moderately Right in political trend. After the liberation of France in 1944 it ceased.

Petit Parisien, L^e. A Paris daily newspaper, founded in 1876. Its circulation, 300,000 in 1888, had by 1917 reached over 2,500,000. It took up no strong political attitude, but relied for popularity upon serial stories and other features. It was suppressed after the liberation of France 1944 on the grounds of collaboration with the Germans during the occupation of France in the Second Great War.

Petkov, NIKOLA (1889-1947). A Bulgarian politician. He was born near Sofia, and entered politics at an early age. After the First Great War he emerged as a leader of the Peasant party. In Sept., 1944, he was one of the signatories of the armistice whereby Bulgaria agreed to fight on the Allied side. A month later he joined the cabinet as vice-premier, but in 1945 resigned. He then headed the opposition to the Communist-dominated government, being arrested in 1947. Accused of planning a *coup d'état*, he was hanged Sept. 23.

P.E.T.N. Abbreviation for Pentaerythritoltetranitrate $C(CH_2ONO_2)_4$, a high explosive extensively developed for military purposes during the Second Great War. Being sensitive to impact, it is used only in admixture with a

less sensitive explosive such as T.N.T. or with a wax. It was employed by the Germans as a priming charge for H.E. bombs, and as the explosive charge of the explosive incendiary bomb. It is made by the direct nitration of pentaerythritol; the latter is prepared by condensing formaldehyde and acetaldehyde in the presence of slaked lime.

Peto, SIR SAMUEL MORTON (1809-89). British contractor and politician. Born at Woking, Aug.

Sir Samuel Peto, British politician

4, 1809, he inherited in 1830 a share in his uncle's business, built the Reform and several other London clubs, and the Nelson Column. In 1846 he founded the firm of Peto and Betts, which constructed rail-

ways in many countries. He entered parliament in 1847, and was made a baronet in 1855. In 1866 financial disaster overtook his firm, which was obliged to suspend payment. Peto gave up his seat in parliament, and passed the rest of his life in retirement, dying Nov. 13, 1889.

Petőfi, SANDOR (1823-49). Hungarian poet. He was born at Kis Kőrös, Jan. 1, 1823. In 1844 he brought out a volume of poems which procured him fame. In 1848, having served the revolutionary cause as poet, orator, and journalist, he joined the Hungarian army, becoming captain and aide-de-camp to Bem.

Sandor Petöfi, Hungarian poet

He fell at the battle of Segesvár, July 31, 1849. A leader of the Romantics, he wrote fine epics like János Vitéz and The Apostle; but his fame rests on shorter poems of love and war, and he is generally regarded as the greatest Hungarian lyrical poet. Sir John Bowring translated his best poems, 1866.

Petone. Suburb of Wellington, New Zealand. Standing on Port Nicholson, it has government rly. works, large refrigerating works, and woollen mills. The first settlement was made in 1840.

Petra (Gr., rock). Ruined capital of the Nabataeans. Known also as Sela, Joktheel, or Reqem, it lies under Mount Hor, 56 m. S. of the Dead Sea, in Transjordan. An extraordinary gorge leads to a masterpiece of Greek art, the Khazne Fir'aoun, a rose-red temple with graceful columns, and sculptures of winged war-maidens, Arab warhorses, and war dances. Beyond is a mountain-ringed oval space, about one mile long and $\frac{1}{2}$ m. broad.

Here stood the vanished city of Petra, which is represented by thousands of rock tombs, ranged in tiers on the iridescent sandstone flanks of encircling mountains. Royal tomb fronts, rising to 65 ft., with decorated windows, large sculptured porches, and two or three storeys of pillars, copy the lost palaces. In noble mansions of death survive the dwelling-places of merchant princes, and square cottages of commoners are represented by small, plain-fronted tombs. In the oldest work, pylons indicate Egyptian influence; later carving shows connexion with Persian art. The Syrian arch is used, and the finest works are in Greco-Roman style, dating from the Augustan age.

As an Edom stronghold, Petra was carried with immense slaughter by the Judeans, under Amaziah, in the 9th century B.C. In Assyrian and Babylonian invasions it became the refuge of the Nabataeans. They used the valley as a burial place and treasure store, and it was raided in 312 B.C. by Macedonians, and later by Pompey's Romans. But the nomads held the desert line from Damascus to the Red Sea, controlling most of the commerce between the Indian Ocean and the Mediterranean. Winning the favour of Augustus by a victory over Cleopatra's Red Sea fleet, they completed their practical monopoly of the trade of the Orient.

Petra, the rock city of Edom. 1. Temple of El-Deir, hewn from the living rock. 2. Tomb of the Three Storeys, the largest sepulchral monument. 3. Rock-hewn building called the Treasury. 4. Theatre, cut out of the cliff, with 33 tiers of seats, accommodating 3,000 spectators

In A.D. 105 Trajan captured the city. What he wanted was its wealth and trade. All he obtained was the shell of it, for the Nabataeans shifted their commerce to Palmyra (*q.v.*). Treasure hunters began to break into tombs, and Saracens of the 7th century A.D. wrecked the town in search of buried spoil. In addition to the empty funeral caves, little remains, even in ruin, except the temple in the gorge, a great amphitheatre, and the wreck of a colossal classic temple on the mountain top of El-Deir. In the First Great War Petra was used as a base by Col. T. E. Lawrence (*q.v.*), in his attack on the rly. and the 4th Turkish army.

Bibliography. Petra, Perea, Phoenicia, A. Forder, 1923; Petra: its History and Monuments, Sir A. Kennedy, 1925.

Petrarch (Ital. *Petrarca*) (1304-74). Italian poet and humanist. Son of a notary, who was exiled with Dante from Florence, he was born at Arezzo, Tuscany, July 20, 1304. Christened Francesco, he

changed his family name of Petrarco to Petrarca. Taken to Avignon at the age of nine, he was educated there, at Montpellier, and at Bologna. He early displayed a love for the classics, but studied for the law, which, after his father's death in 1326, he abandoned for letters.

He took minor orders, found generous patrons, particularly in the Roman house of Colonna, and won the friendship of Azzo di Correggio. In 1327, in the church of S. Clara, Avignon, he first saw the Laura who inspired his muse, and "made to bud forth with the noblest sentiments all the seeds of virtue which nature had sowed in his heart." This lady, to whom he addressed some 300 sonnets, has been doubtfully identified with Laura di Noves, the wife of Hugo de Sade. She was the mother of eleven children when she died of the plague in 1348.

While pursuing ardently his Latin studies, the writings of Cicero, Virgil, Livy, and Seneca, and regarded by his younger

literary contemporaries as their leader, he took a deep and constant interest in public affairs. He travelled in France, Germany, and the Netherlands. Kings and popes competed for his society, he was induced to undertake important public missions, and in letters to rulers and public men he endeavoured to influence their policy to the advantage of his native country. He wrote a treatise on government, and in 1351 his advice was sought in the drafting of a constitution for Rome, in which city, on Easter Sunday, 1341, he had been crowned poet laureate. He disliked Avignon, then the seat of the papal court, and found a congenial retreat at Vaucluse, which he left finally in 1353 for Milan, Venice, and Arqua, since called Arqua Petrarca, a village on the S.E. of the Euganean Hills, near Padua, where he died July 18, 1374.

Petrarch has been called the first of the moderns. A scholar at a time when all books were in MS., and texts were at the mercy of the copyists against whom he declaimed, his fame soon became universal in Europe, largely through his sonnets and other poems, which were written in Italian, and exerted a lasting influence on the love poetry of France and England.

The spiritual and mystical side of his character was in curious contrast to his literary paganism. As

Petrarch. Italian poet, and first of the humanists

a poet he possessed an acute sense of melody, of the beautiful in expression. The first to popularise the sonnet, he set chief store by his Latin works, especially his unfinished epic, *Africa*, which has Scipio Africanus as hero, and his *De Viris Illustribus*, or *Lives of Famous Men*. His letters, of which he kept copies, throw light

on the intellectual life of his time; his dialogues are remarkable for their self-revelation. His friends included Boccaccio, whose story of *Griselda* he translated into Latin. Petrarch, to quote Villari, was the first to write freely of all things in the same way as a man speaks.

Consult Lives, H. C. Holloway-Calthrop, 1907, E. Tatham, 1925-26; also Francesco Petrarch, Poet and Humanist, M. F. Jerrold, 1909; Petrarch, the first Modern Scholar and Man of Letters, J. H. Robinson and H. W. Relfe, 1914; Petrarch Bibliogr., D. W. Fiske, 1915.

Petrel. Storm petrel, *Thalassidroma pelagica*, or Mother Carey's Chicken, of the North Atlantic Ocean

Petrel (Dim. of Peter, from some species appearing to walk on the water). General name for about 100 species of oceanic birds, constituting the order Tubinares. It includes the albatross, diving petrels (*Pelecanoides*), storm petrels (*Procellaria*), flat-billed P. (*Prion*), fulmar P. (*Fulmarus*), and the shearwater P. (*Puffinus*). All have a rudimentary hinder toe, hooked bill, and tubular nostrils. They nest in burrows or rock-clefts, and lay a single egg. The name indicates more particularly the storm petrel, or Mother Carey's chicken (*Thalassidroma pelagica*), which breeds in the U.K., chiefly in Scotland and Ireland, and is found in the N. Atlantic, though it does not nest on the American side. It is a swallow-like black bird, with a patch of white in front of the tail. Normally subsisting upon small surface animals, it often follows, and alights upon, ships to pick up scraps.

Petrie, Sir Charles Alexander (b. 1895). British historian. Born Sept. 28, 1895, he succeeded his brother as 3rd baronet in 1927. He was foreign editor of the *English Review*, 1931-37, editor of the *Empire Review*, 1941-43, and managing editor of the *New English Review* from 1945. Director of a publishing firm, he was honoured by the Spanish, Italian, and Greek governments, and was a corresponding member of the Royal Spanish Academy of History. He wrote *Mussolini*, 1931; *The Jacobite Movement*, 1932; *History of*

Spain (with L. Bertrand), 1934; *The Four Georges*, 1935; *The Stuarts*, 1937; *Life and Letters of Sir A. Chamberlain*, 1939-40; *Diplomatic History*, 1713-1933, 1946. *Proton. Petree*.

Petrie, George (1790-1866). Irish antiquary, born in Dublin. He became a Royal Hibernian Academician and painter of Irish scenery and remains. His *Essay on Round Towers* received the Irish Academy prize, 1830. *Antiquities of Tara Hill*, 1839; *Ecclesiastical Architecture of Ireland*, 1845; and *Ancient Music of Ireland*, 1855, represent researches facilitated by his superintendence of the antiquarian section of the Ordnance Survey of Ireland, 1833-46. After his death, Jan. 17, 1866, his collections were acquired for the Dublin museum.

Petrie, Sir (William Matthew) Flinders (1853-1942). English archaeologist. He was born at Charlton, June 3, 1853. During 1875-80 he surveyed Stonehenge and ancient British earthworks and, applying similar methods to the pyramids of Gizeh, began a series of excavations in Egypt which lasted until 1924, making valuable discoveries at Naucratis, Daphnae, Coptos, Nagada, Abydos, Amarna, Memphis, and Tarkhan. In 1927 he went to Palestine, and was excavating there and in Syria until 1938. He was professor of Egyptology at University College, London, 1892-1933, then emeritus professor; he founded the Egyptian Research Account which in 1905 was enlarged as the British School of Archaeology in Egypt. By a lifetime devoted to patient fieldwork, and by great interpretative ability, Petrie established himself as the outstanding Egyptologist of his time. Knighted in 1923, he died in Jerusalem, July 28, 1942. Besides books covering the whole field of Egyptology, he published *Revolutions of Civilization*, 1911; *Eastern Exploration*, 1918; *Some Sources of Human History*, 1919; *Palestine and Israel*, 1934; also an autobiography, *Seventy Years in Archaeology*, 1931. *See Egypt*.

Petrograd. Former name of the Russian city of Leningrad (*q.v.*). Tsar Nicholas II changed the name of his capital in 1915 from the German (and erroneous) form St. Petersburg to the Russian form Petrograd (city of Peter, after its founder Peter the Great) following the outbreak of war with Germany. It retained this name until 1924, when after the death of Lenin it was renamed Leningrad.

PETROLEUM: ORIGIN AND SOURCES

S. E. Coomber, Lecturer in Oil Technology, Imp. Coll. of Science

An explanation of the probable origin of petroleum is followed by an account of its sources and how they are tapped. Details regarding the products of petroleum will be found under their names, e.g. Kerosine; Gasoline; Naphtha. See also Air Lift; Asphalt; Cracking; Fractionation, etc.

Petroleum (Lat. *petra*, rock; *oleum*, oil) is the name given to certain hydrocarbons which occur naturally in the earth's crust and which may be gaseous (natural gas), liquid (crude oil), or solid (asphalt, ozokerite). Hand-dug shafts, the basis of small local industries in Burma and Europe, date back several centuries, but the systematic exploitation of petroleum by borings began with the first oilwell drilled by Drake in the U.S.A. in 1859. The exploitation of natural asphalt which occurs by itself (pitch lakes) or as impregnations (asphaltic limestone, asphaltic sandstone) is a separate industry.

Petroleum has a complex chemical constitution. It is a physical mixture of a vast number of hydrocarbons belonging to three groups, the paraffins, the naphthenes, and the aromatics; it includes also small proportions of oxygen-, nitrogen-, and sulphur-bearing compounds, which are most abundant in asphalts, and asphaltic oils.

Crude oil is found in pores and fissures of permeable strata which, with few exceptions, are sands and sandstones or limestones. It is associated with natural gas and brine. The origin of petroleum and the mechanism of its accumulation are not fully understood. Chemical, physical, biological, and geological considerations suggest that it may be derived from small forms of life entombed in marine or estuarine sediments and prevented from normal decay by lack of oxygen. Biochemical processes undoubtedly play an important part in the transformation which must then take place. Forces due to compaction, buoyancy, and interfacial and surface tensions cause the minute globules of petroleum, disseminated throughout the muddy sediment in which they were formed, to be concentrated in the coarser strata. Subsequent earth movements which tilt or fold the strata lead to further concentration in the upper parts of the structures so produced. If, after this final concentration, the cover of impermeable rock (cap rock) should be pierced, oil and gas will escape to the surface and form a seepage. Inspissation of seepage oils which are asphaltic leads to

the formation of solid asphalt deposits, some of which are called pitch lakes.

No method, other than drilling, has yet been devised whereby petroleum in its subterranean reservoir rock can with certainty be detected from the surface. The most that the petroleum geologist can do is to point out geological structures in which oil might well be found; they must then be drilled to see if it is there. His conclusions are based on a detailed study of the geological history and types of sedimentary rock in the area. Once the more obvious structures had been found and tested, the petroleum geologist made more and more use of geophysical methods of prospecting.

Oil moves through the reservoir rock by reason of gas pressure, water pressure, or both. Sometimes this is sufficient also to lift the oil to the surface (flowing production), but natural pressure declines until flow can no longer be maintained; most wells never flow unaided. The type of artificial lift used depends on the productivity and depth of the well. When productivity is high, gas-lift is installed; if production is moderate or low some form of plunger pump is used; most wells are pumped in their last stages of usefulness. The total recovery of oil from the reservoir is usually 50-70 p.c. of the quantity originally present; the theoretical maximum is some 80 p.c. Before the importance of production control was realized and the technique mastered, many fields were abandoned after recovery of 25 p.c.

Oil leaving the well is accompanied by natural gas, partly free and partly in solution. There may

Petroleum. 1. Part of the vast oilfield at Signal Hill, California. 2. The pumping station at Haifa, Palestine, terminus of the pipe line from the Iraq oilfields. 3. Oil storage tanks at Constanza, Rumania

After the discovery of oil additional wells are drilled to outline the gas-oil and oil-water contacts and provide data on reservoir conditions, the further development of the field being based on this information. It is general practice to drill wells by the rotary method, beginning with a diam. of 15-20 ins. and finishing with one of 6-12 ins. Oil was obtained in 1947 from a well approx. 14,000 ft. deep. The wells are lined with steel tubes (casing) which are cemented in place and fitted at the top with a system of control valves called a christmas-tree.

also be water, free or emulsified with the oil. Various devices are therefore necessary to free the oil from gas and water. The separated gas is used for gas-lift, for carbon black manufacture, for fuel, or for return to the reservoir to maintain pressure. The oil goes to storage tanks and thence to the refinery. When the quantities are relatively small transport may be by road or rail cars; usually pipelines are used. Sea transport is by tanker.

REFINING AND MARKETING. Crude oil cannot be used without preliminary treatment. In the refinery it is split into a number

ANNUAL WORLD CRUDE OIL PRODUCTION SINCE 1860

Production figures given in thousands of barrels; annual productions of less than 1,000 barrels not included.

*The Pechelbronn field in Alsace passed from Germany to France in 1918.

of products, gasoline, naphthas and white spirits, kerosine, gas oil, lubricants, diesel oils and fuel oils, transformer and switch oils, waxes and petroleum jelly, road oils and asphalts, to name the most important. The basic processes are fractionation and cracking. Some crude oils yield a full series of fractions from gasoline to heavy residual oils; others give little or no gasoline and kerosine, and yield only heavy oils. Some are waxy, whereas others are asphaltic. The products obtained in the refinery from any particular crude oil depend on (1) the composition of the oil, (2) market requirements, for it is possible, by modifying refinery technique, to vary the yields of different products from the same crude oil. Purification of the fractions for the market is generally effected by selective solvents (solvent refining) which remove deleterious compounds. Adsorptive substances, such as specially prepared fullers' earths, are also used.

A development greatly accelerated during and after the Second Great War is the synthesis of organic compounds in the refinery or in an associated chemical works. This applies not only to the production of substances such as isooctane required for aero-engine fuels, but to a multitude of very different substances—alcohols, glycols, various plastics, synthetic rubbers, lacquers and varnishes,

detergents, explosives, solvents, etc. The raw materials for these products are the gases from the cracking plant.

To produce branded products, fractions from various crudes are sometimes blended at the refinery or by firms which specialise in such work. A company which develops its own oilfields, transports, refines, blends, and distributes its own branded products to the retailer is said to be fully integrated.

WORLD PRODUCTION OF CRUDE OIL. The sources and amounts of the world's oil supply are shown in the table. For many years the U.S.A. produced and consumed 60 p.c. of the world's production, but after the Second Great War there [were signs of a change. Increasing consumption and concern for reserves brought that country into the ranks of the importers. At the same time production from the Middle East, which had proven reserves comparable with those of the U.S.A., began to expand and seemed likely to play a dominant part in world oil.

Prospecting, oilfield development, transport, and refining are all activities involving large expenditures, and there is thus a strong tendency to concentrate the control of the industry in large units. The major companies in the international field are: Standard Oil co. of New Jersey, Socony-

Vacuum Oil co., Standard Oil co. of California, The Texas corporation, Gulf Oil corporation, and Consolidated (Sinclair) Oil corporation, all of which are American; Royal Dutch-Shell group, Dutch and British; Anglo-Iranian Oil co., British. These companies operate by themselves and through numerous subsidiaries; they are fully integrated. Smaller British operating companies which are fully integrated are the Burmah Oil co. and Trinidad Leaseholds, Ltd.

No figure is available for the total capital invested in the world petroleum industry. It is probable that for the U.S.A. alone it exceeds £4,000 million. It is likewise impossible to give an average figure for net profits. The gross profits may appear large, but losses are great, and frequently capital, sometimes many millions of pounds, is invested for 10 to 20 years before oil begins to flow.

Oil in bulk is measured by volume and for crude oil the commonly accepted unit is the barrel, equivalent to 42 U.S. gallons (approx. 50 British gallons). This is often converted to tons (long, short, or metric), but if the results are to be accurate specific gravity must be taken into account. For rough estimates it is often assumed that 7 barrels of oil weigh one ton. If the oil is relatively light, sp. gr. 0.8, it will be a short ton; if the sp. gr. is 0.9 it

will be a long ton. Volume measurements are made at, or are corrected to, a temp. of 60° F. Tables are published to facilitate weight-volume conversions.

Bibliography. Petroleum Refinery Engineering, W. L. Nelson, 1936; The Science of Petroleum, ed. A. E. Dunstan, A. W. Nash, etc., 4 vols., 1938; Petroleum Production Engineering, 3 vols., L. C. Uren, 1924-1946; Modern Petroleum Technology, Institute of Petroleum, London, 1947.

Petrolia. Town of Ontario, Canada. It is 50 m. W. of London, having a station on the C.N.R. and Michigan Central rly., and obtained its name from oilfields in the vicinity. Industries include the making of butter, bricks, etc., and those connected with obtaining and refining oil. Pop. 2,684.

Petrology (Gr. *petra*, rock; *logos*, science). Science of rocks. One of the divisions of geology, it overlaps the kindred science of mineralogy, and is concerned with the composition, chemical and mineralogical, the structure, and the evolution or formation of rocks. It involves a knowledge of chemistry and of branches of physics, and the use of the petrological microscope. It differs from petrography, which is mainly the description of rocks.

Petrological study of a group of rocks, or of an area, begins on the ground, where the relationships of various rocks can be observed, and individual types are carefully plotted on maps. By noting the order of bedded rocks, and the intrusive relationships of igneous rocks, a time succession of events can be constructed, and the rocks identified by eye. Specimens of the various types encountered are also collected for detailed examination in the laboratory.

This examination varies with the character of the rocks. Sedimentary rocks, such as shales, sandstones, grits, and limestones, are studied with a view to deciding the conditions under which they were deposited, the source of the detritus from which they were formed, and the climatic or other conditions prevailing at the time. The study of igneous rocks, such as lavas or plutonic masses, is largely concerned with the causes and nature of chemical and physical variation between different rock-types, and the influence of the original country rock on the character of the intruding rock. The effect of hot solutions of steam or water carrying various reagents on the rocks shortly after

they have been consolidated, and the alterations involved, are also petrological problems which lead to the study of ore deposition. By observing the behaviour of artificial melts and the application of physico-chemical principles to the problems of lava consolidation, much has been learned about the way these rocks have been formed.

Investigation of metamorphic rocks involves not only the determination of what the original rock was before it was altered, but also the way in which the changes were brought about. Alteration by heat, pressure, or movement, and introduction of material from outside sources, are all recognized; but the part played by each factor is difficult to estimate. A fundamental problem in petrology is that of granitisation, i.e. the change of pre-existing rocks such as schists or slates into granite without their passing through a liquid stage. *See* Rocks. *Consult* Principles of Petrology, G. W. Tyrrell, 1926; Petrology of the Igneous Rocks, F. H. Hatch and A. K. Wells, 1937; Petrology of the Sedimentary Rocks, F. H. Hatch and R. H. Rastall, 1938.

Petrol Rationing. Measure taken in a number of countries during and after the Second Great War. In the U.K. it came into force at midnight Sept. 22-23, 1939. Private cars got a basic ration for 200 m. a month; supplementary petrol in special circumstances. Allowances according to need were made for commercial vehicles, doctors' cars, etc. The private car ration, twice reduced, was abolished July 1, 1942, allowances being made only for real need. A ration, for 120 m. a month (later 150 m.), was granted June 1, 1945, withdrawn Oct. 1, 1947. A ration for 90 m. a month, with seasonal increases, was granted June 1, 1948, until rationing of petrol ended at midnight May 26-27, 1950. Introduced to conserve supplies for the forces, it was maintained to keep down dollar expenditure.

Petronius (d. A.D. 65). Roman writer, whose full name was Gaius Petronius Arbiter. According to Tacitus he received his last name through being regarded as the supreme judge or arbiter of elegance in the vicious society in which he lived. Although he passed his days in sleep and his nights in business or pleasure, as governor of Bithynia he was a capable administrator. Apparently he aroused the jealousy of Tigellinus, and anticipated his fate by opening his veins in a warm bath.

Petronius wrote a remarkable work of fiction called *Satyricon*, of which fragments have been preserved. It describes the adventures of a Greek freedman in various parts of Italy, and shows a keen sense of humour and an exceedingly shrewd knowledge of human nature; it is valuable, moreover, as throwing light on the social life of the period. Many characters are made to talk in the *plebeius sermo*, or language of the common people, and the difference between this and literary Latin affords important material for the philologist. The best known section of the book is the *Cena Trimalchionis* (Supper of Trimalchio), which describes an entertainment at the house of a parvenu. *Consult* Petronius, Text and Trans., M. Heseltine, 1913.

Petropavlovsk. A town of Kazakh S.S.R. In the N. of the republic, it is on the Ishim and the Siberian rly., about 160 m. W. of Omsk. There are soap works and tanneries and a trade in grain, wool, and cloth. Formerly on a caravan route, the town has an Asiatic aspect. Pop. 91,678. Another Petropavlovsk is a seaport on Avacha Bay on the E. coast of Kamchatka, Far Eastern region of R.S.F.S.R.

Petropolis. Town and summer capital of Brazil, in the state of Rio de Janeiro. Finely placed 2,800 ft. above sea level, on the Serra da Estrella, 34 m. by rly. N. of Rio de Janeiro, in a healthy climate, it manufactures cotton and silken goods, cigars, cheese, and beer. It was colonised by Germans in 1845, and was capital of the state, 1893-1903. It was the scene of an inter-American defence conference convened by the Pan-American Union (*q.v.*), Aug. 15-Sept. 2, 1947, at which a treaty of mutual defence in pursuance of the act of Chapultepec (*q.v.*) was adopted by all the participating countries, except Ecuador (where a revolution broke out Aug. 23). The U.S.A. ratified the treaty Dec. 8. Pop. 45,000.

Petrozavodsk. Capital of the Karelo-Finnish S.S.R. It is built on the W. shore of Lake Onega, 185 m. N.E. of Leningrad, and connected by rly. with that city and Murmansk. There is regular air transport to Leningrad and Viborg (Viipuri). There are several educational institutions and research institutes. Formerly the capital of the government of Olo-nets, Petrozavodsk increased in importance with the creation of the Karelo-Finnish S.S.R., 1940.

Petruchio. Character in Shakespeare's comedy *The Taming of the Shrew*. He weds the notorious scold, Katharina, and by boisterous displays of violence succeeds in reducing her to docility.

Petsamo. Ice-free Arctic port in Murmansk region, R.S.F.S.R. Ceded by Russia to Finland in 1920 (whereby Russia's contact with Norway was cut off), Petsamo, after changing hands several times during the Russo-Finnish war, came firmly into Russian possession on Dec. 14, 1939. By the terms of the 1940 peace treaty, Soviet citizens were permitted to pass freely through the Petsamo area. Finland later joined Germany in the Second Great War, and, under the terms of the Russo-Finnish armistice, signed Sept. 19, 1944, Petsamo was again ceded to Russia, though German troops continued to fight in the area until Oct. 15.

Pett, PHINEAS (1570-1647). English shipbuilder. Son of a shipwright, he was born at Deptford, Nov. 1, 1570. He held various posts under Lord Admiral Howard, and in 1601 became assistant shipwright at Chatham. In 1605 he was appointed master shipwright at Deptford, and in 1607 at Woolwich. In 1630 he became a commissioner of the navy. The Prince Royal, 1610, and the *Soverayne of the Seas*, 1637, were his masterpieces. *Consult* Autobiography, ed. W. G. Perrin, 1918.

Petticoat Lane. Name until about 1830 of Middlesex Street, London, E. Running N. from High Street, Whitechapel, to Widegate Street, Bishopsgate, and extended and partly rebuilt since the latter part of the 19th century, it was known in Stow's time as Hog Lane, being then lined with elms. The French ambassador, Gondomar, is said to have lived in the adjacent Gravel Lane, in which the antiquary Strype was born. In the 17th century Petticoat Lane was the centre of a colony of French

Petticoat Lane, London. A busy scene in this noted Sunday market

refugee weavers, but it has for many years been a Jewish quarter, with clothing shops, and notable for its Sunday morning open-air market. *See* Houndsditch.

Petty, SIR WILLIAM (1623-87). English economist. Born at Romsey, Hants, May 26, 1623, he studied at Leyden and Paris, taught chemistry and anatomy at Oxford, and became professor of anatomy there, 1651. He was also professor of music at Gresham College, London. Employed in distributing forfeited lands in Ireland, he was made surveyor-general there after the Restoration. An M.P., an original F.R.S., and an inventor, he was a pioneer in economics, as shown by *A Treatise of Taxes and Contributions*, 1662, and many other works. He was knighted Dec. 16, 1687. His two sons were earls of Shelburne, and through his daughter, who married the earl of Kerry, his Irish estates descended to the marquess of Lansdowne. *Consult* *Economic Writings of Sir W. Petty*, ed. C. H. Hull, 1899; *Correspondence*, ed. Marquess of Lansdowne, 1928

Petty Officer. In the British navy, rank below and next to warrant officer, corresponding to that of non-commissioned officer in the army. Petty officers are selected from leading seamen of very good character with at least one year's sea-going service. Candidates are examined in general education, seamanship, elementary signals, semaphore, the rule of the road at sea, management of boats under steam, use of compass and lead, anchor work, rigging sheers and derricks, the water-tight fittings, pumps, and constructive details of the ship in which they are serving, and writing up the log book. The candidate must also have a gunnery or torpedo qualification.

In the military branch the petty officers include yeomen of signals, P.O. telegraphists, and sailmakers; in the engineering branch, stoker petty officers, mechanics, and engine-room artificers, the two last being chief petty officers; in the artisan branch, joiners, shipwrights, blacksmiths, plumbers, painters, coopers, armourers, and electrical artificers (the last being chiefs); in the medical branch, sick berth stewards; in the accountant branch, writers, ship's stewards, and cooks; also ship's corporals and masters-at-arms.

Petty Sessions. In English law, sittings of justices of the peace or of a stipendiary magistrate under certain statutes. The courts of petty session are those which try in a summary way, without a jury, certain

minor offences, and the amount of punishment which may be inflicted is strictly limited. *See* Magistrate; Metropolitan Police Court; Police Court.

Petunia. Perennial ornamental herb of the family Solanaceae. A native of S. America, it was introduced into U.K. early in the 19th century. The plants are from 6 ins. to 2 ft. high, and the funnel or salver shaped flowers are chiefly red, violet, blue, and white in various shades. They need ordinary greenhouse culture in spring, and may be planted out in the open garden in May or June. Propagation is by cuttings of old plants, or seeds sown in spring.

Petworth. Market town of Sussex, England. It is near the W. Rother river, 14 m. N.E. of Chichester and 55 m. by rly. S.W. of

Phineas Pett, English shipbuilder After W. Dobson

Petunia. Flower of this ornamental perennial

Sir William Petty, English economist

Petworth, Sussex. East Street and the parish church of S. Mary

London. S. Mary's church, an old building restored, has memorials of the Percy and Wyndham families. Stone quarries are in the neighbourhood, and cattle fairs are held in the town. On Sept. 29, 1942, a German aeroplane dropped a bomb on the school at Petworth, killing the headmaster, a woman teacher, and 30 children. The victims were buried in a common grave. Pop. 2,362.

Petworth House is the seat of Lord Leonfield. It occupies the site of a castle of the Percy family around which the town grew. From the Percys it passed to the duke of Somerset, then to the earl of Egremont. The 3rd earl of Egremont built the present house, about 1800, and in his time it was famous for its hospitality. It contains some fine carvings by Grinling Gibbons, and stands in a park 12 m. in circumference.

Peutinger Table. Only extant pictorial itinerary of the ancient Roman empire. Conrad Celtes, who discovered it at Ratisbon, 1507, bequeathed it for publication to Conrad Peutinger of Augsburg. It is a 13th century copy from a somewhat earlier version of a lost original, compiled probably in the 3rd century from older materials collected by Agrippa (d. 12 B.C.). Upon a strip 24½ ft. by 13½ ins. are 12 panoramic segments depicting—with distances—the military roads and trade-routes from S.E. Britain to the Ganges mouth.

Pevensey. Village of Sussex, England. It stands on Pevensey Bay, 6 m. N.E. of Eastbourne, and 12 m. W. of Hastings, with which it has rly. connexion. It occupies the site of the Roman station of Anderida, and was the landing place of William the Conqueror. A castle, of which picturesque

ruins remain, was built here by the Normans, who erected it within Roman walls that still stand. This is now the property of the nation, to which it was given by the duke of Devonshire. There is an old church, S. Nicolas, and the Mint House is said to be 600 years old. Pevensey, one of the Cinque Ports, was a corporate town from about 1066 until 1883. As the sea receded, the harbour filled with shingle, and the port decayed. Pop. 793.

Peveril of the Peak. Sixteenth of the Waverley novels, published 1823. Its period is 1658–78, and the scene shifts between Derbyshire, the Isle of Man, and London. It introduces the Popish Plot, and deals with the estrangement between the Cavalier Peverils and the Puritan Bridgenorths. The fanatic, Edward Christian, ready to sacrifice his niece Alice Bridgenorth to his revenge against the countess of Derby; Major Bridgenorth; whose enmity against the countess destroys his friendship with the Peverils; Buckingham, the king's favourite; the intriguer Chaffinch and his mistress; and the mercurial earl of Derby are the chief characters. The love interest centres on Julian Peveril and Alice Bridgenorth.

Pew (probably O. Fr. *puye*, a balcony). Name for an enclosed seat in a church; originally any enclosure fitted with writing desk, etc., where a public official could transact his business. Church pews, often elaborately carved, were used in the Middle Ages, but the large, plain, and high-backed box pew came in after the Reformation. The appropriated family pew disappeared shortly after the middle of the 19th century. The partitions between box pews were 4–5 ft. high; and access was through a small door. A few of these survive in English and Scottish churches, but the modern pew is merely a bench with a back. The custom of renting pews has become less general in English parishes.

Pewsey. Town of Wiltshire, England, on the Avon, 11 m. S. of

Marlborough, with which it has rly. connexion. The old church of S. John the Baptist has been restored. The town is an agricultural centre. The valley in which it lies is called the vale of Pewsey. Pop. 1,574.

Pewter. Alloy at one time very largely used for the manufacture of drinking vessels, flagons, salt cellars, trays and plates, inkpots, etc. Its preparation in Great Britain was more or less regulated for many generations by the Pewterers' Company of London. While the composition of pewter has varied much, the commonest variety consists of about 80 p.c. tin and 20 p.c. lead; a class known as "trifle" pewter has tin 79 parts, antimony 15, and lead 6; while a "plate" pewter is made without lead at all, and consists of tin 90 parts, antimony 7, bismuth 2, and copper 1 part. As a metal pewter is soft, somewhat resembling tin in colour, but duller and darker. Owing to the risk of poisoning by lead through the constant use of pewter, its use has been restricted. Old pewter is a favourite of collectors of rare objects. See Alloy; Britannia Metal.

Bibliography. Old Pewter, M. Bell, 1906; Pewter Marks and Old Pewter Ware, C. A. Markham, 1909; Pewter Plate, H. J. L. Masse, 2nd ed. 1910; The Pewter Collector. H. Jenkins, 1921.

Pewterers' Company, THE. London city livery company. With a history going back to the middle

Pewterers' Company arms

of the 14th century, its first charter was granted in 1474, arms being allowed in 1479. It formerly had rights of search and assay. The first hall, in Lime Street, E.C., was built in 1497, and destroyed in the fire of 1666, was rebuilt 1678, again burnt in 1840, and then rebuilt a second time. The address is now 62, New Broad Street, E.C.2.

Pevensey, Sussex. The walls of the ruined Norman castle, from the north-west

Peyotl. Species of spineless cactus (*Lophophora williamsii*), with a large, parsnip-like root. Aztecs cut this root into transverse slices, to be powdered, and ate it, or took it in drink, with religious ceremony, under the name of *teonanacatl*, or "flesh of God." Under its influence the consumer saw visions, and was said to have the power of prophecy. Similar ceremonial use of the plant is made in the present day by various Indian tribes in Oklahoma.

Peyrouton, MARCEL (b. 1888). French govt. official. A colonial civil servant, he held posts in Algeria, Tunisia, and Morocco 1930-36, when he was sent as ambassador to Argentina. After the defeat of France in 1940 he joined the Vichy govt. in July as secretary-gen. for home affairs (minister of the interior), and was responsible for Laval's arrest in Dec. In Feb., 1941, he returned to Argentina as ambassador, resigning next year. Appointed gov.-gen. of Algeria by Gen. Giraud in Jan., 1943, he resigned at the end of May. In Dec. he was arrested, and in 1944 flown to France and interned in Fresnes prison near Paris. Still under arrest, he gave evidence at Pétain's trial in 1945. Brought to trial in Paris, Dec., 1948, on charges of collaboration with the Germans, Peyrouton was acquitted on all counts.

Pézenas. Town of France. In the dept. of Hérault, it stands on the Peyne, near the mouth of the Hérault, about 25 m. S.W. of Montpellier. There is a trade in wines and spirits, and there are iron foundries, oil and brandy refineries, and tanneries. Molière wrote his *Précieuses Ridicules* here. Pézenas is the *Gallio Piscenae*. *Pron.* Paiznah.

Pezinek. Town of Czecho-Slovakia. Formerly it belonged to Hungary, when it was known as Bazin. It is built on the S. edge of the Little Carpathians, 12 m. by rly. N. of Bratislava, and contains mineral springs and baths.

Peziza. Genus of fungi of the family Discomycetes. They are fleshy, brittle fungi, cup-shaped or saucer-shaped, having their spore-producing cells immersed in the flesh of the disk, the exterior scurfy or warty, and often some tint of brown or a brilliant orange. A common form, *P. vesiculosa*, is found on manure heaps and rich cultivated ground.

Pfäfers OR BAD PFÄFERS. Swiss bathing establishment. It is 2½ m. by road S. of Ragatz (*q.v.*) in the

canton of St. Gall. Pop. 1,900. Alt. 2,710 ft. In the romantic gorge of the Tamina, alt. 2,235 ft., it has a saline spring, efficacious in nervous, rheumatic, and scrofulous disorders. The spring (temp. 100° F.) was discovered in 1038, and the first bathhouse was built in 1242. The Benedictine abbey of Pfäfers, founded about 724, was rebuilt in the 17th century; it was converted into a mental hospital in 1847.

Pfennig. Coin of the German currency. Since 1871 it has represented the one-hundredth part of a mark (*q.v.*). It was originally, like the penny, a silver coin 240 of which, according to Charlemagne's regulations, were to weigh a pound. During periods of war and monetary inflation, 1, 5, 10, and 50 pfennig pieces have been made of iron, aluminium, zinc, and various alloys. Normally copper coins of 1 and 2 pfennigs have been issued, and silver coins of 50 pfennigs.

Pfäffer, EDUARD FRIEDRICH WILHELM (1829-1910). German physiologist. Born at Hanau, June 7, 1829, he studied medicine at Bonn, where in 1878 he established an institute of physiology. Researches in metabolism and respiration led him to the discovery about 1859 that the seat of respiration is not in the blood or lungs but in the tissue. Conducting embryological experiments, he succeeded in the cross-fertilisation of the eggs of different species of frogs. He died March 16, 1910.

Pforzheim. Town of Württemberg-Baden, W. Germany. At the union of the Nagold and the Enz, 16 m. S.E. of Karlsruhe, it is a rly. junction. The chief buildings are the town hall, the church, in which are the tombs of some of the margraves of Baden, and the palace in which those rulers lived. The chief industry is making jewelry and gold and silver ornaments; others are the manufacture of machinery, chemicals, paper, and beer. A Roman settlement,

Pforzheim became part of Baden, and from 1300 to 1565 was the residence of the margraves. Reuchlin was born here. Much erudition has been bestowed upon a story that in 1622, after the battle of Wimpfen, 400 citizens gave up their lives for their ruler, but it is now believed to be fiction. The town stands on the N. edge of the Black Forest. Pforzheim was captured from the Germans by units of the French 1st army on April 8, 1945, and came within the French zone of occupation. Pop. (1950) 47,500.

Phaeacians. People represented in the *Odyssey* as inhabiting the island of Scheria in the farthest W. Their king Alcinous (*q.v.*) hospitably entertained Odysseus. The Phaeacians lived in much luxury, and were famed for their dancing: their name became proverbial for persons of self-indulgent disposition.

Phaedo. Greek philosopher. A native of Elis, where he was born towards the end of the 5th century B.C., he made the acquaintance of Socrates at Athens. After the death of the latter, he returned to his native place and set up a Socratic school. He is chiefly remembered in connexion with Plato's dialogue on the immortality of the soul, which bears his name.

Phaedra. In Greek mythology, daughter of Minos, king of Crete, and wife of Theseus, king of Athens. She took her own life because the passion she had conceived for her stepson, Hippolytus, was not returned by him. See Hippolytus.

Phaedrus. Latin fabulist. A Macedonian slave freed by the emperor Augustus, he published a collection of about 100 fables and occasional pieces. The fables, partly imitated from Aesop (*q.v.*), have had wide use as a schoolbook, and served in part as a model for La Fontaine.

Phaestus. Ancient city of Crete. It is 25 m. S.W. of Candia, on a ridge commanding the rich plain of the Messara, and was occupied from Neolithic to Venetian times. Ruins of a great palace, second only to Knossos (*q.v.*), were excavated from 1900 onwards. Beneath the palace, built about 1800 B.C., are the remains of an earlier one. Two miles away, at Hagia Triada on the same ridge, is a small palace of about 1600 B.C., where rich finds were made of inscribed tablets, frescoes, seals, and steatite vases, with realistic reliefs of a harvest procession, games, etc. See Crete.

Peziza badius, the brown species

Phaestus Disk. Clay tablet, now in the Candia Museum, Crete. Discovered in a subterranean palace chamber at Phaestus in 1908, it is attributed to the latest Middle Minoan period. Nearly 7 ins. in diameter, it bears on both sides in spiral lines 241 pictorial characters printed from 45 stamps. The pictures include a mastless galley and seamen with close-fitting caps of northern origin. The script is non-Egyptian and mostly non-Minoan; Evans suggested that it might be a religious chant. See Alphabet; Clay Tablets.

Phaethon (Gr., shining). In Greek mythology, the son of Helios, the sun-god. Attempting once to drive his father's chariot across the skies, he proved too weak to control the spirited horses, with the result that he came so near to earth that a portion of it was burned, the parched condition of the Sahara being attributed to this mishap. Thereupon Zeus killed the presumptuous youth with a thunderbolt, and he fell into the river Eridanus.

Phaeton. Four-wheeled, two-horse mail phaeton

Phaeton. High, four-wheeled open carriage, for one or two horses. Invented in the second half of the 18th century, and named after Phaethon, it was long fashionable, until largely superseded by the landau and victoria.

Phagocytes (Gr. *phagein*, to eat; *kytos*, a vessel). Name given to one type of the white corpuscles of the blood (*q.v.*). The destruction of micro-organisms by the phagocytes is known as phagocytosis.

Phagocytosis. Term for ingestion of foreign particles, *e.g.* bacteria, injured or surplus tissue, by certain white blood cells and by some other cells of the body such as the Kupffer cells of the liver.

Phalangeridae (Gr. *phalanges*, bones of the fingers or toes). Family of small marsupials of arboreal habit, found only in

Australasia, where they are falsely called opossums. Phalangers are distinguished by the curious construction of the hind feet. The first toe has no nail, and can be opposed to the others like a thumb, while the second and third toes are enclosed in a common skin; the foot being much like that of some of the kangaroos. All phalangers have thick, woolly coats, and with the exception of one species have long tails, often more or less prehensile. They move about the trees by night and feed mainly on fruit and leaves; but some species are practically omnivorous. The koala (*q.v.*) belongs to this family, though it has little outward resemblance; and among phalangers we find the only marsupial that has the power of gliding flight. See Flying Phalanger.

Phalanx (Gr.). Tactical formation of infantry introduced by Philip of Macedon and perfected by Alexander the Great. Macedonian spearmen, with very long spears, were arranged many ranks deep, so that many spears projected beyond the first line. With this formation an irresistible charge was made. Alexander's great victories over the Persians at Issus, 333 B.C., and Arbela, 331, were largely due to the phalanx. At the beginning of the 2nd century B.C. the Romans came into conflict with the Macedonians, and a loose formation composed of soldiers armed with short swords, was pitted against the hitherto invincible phalanx. The Romans checkmated the phalanx by giving it no opportunity to charge, luring it on to broken ground, and breaking it up with missiles. The efficacy of these tactics was proved by the signal victories of the Romans at Cynoscephalae, 197 B.C., and Pydna, 168. After Pydna the phalanx was not heard of again.

Phalaris (d. c. 554 B.C.). Tyrant of Agrigentum, in Sicily. Notorious for his cruelty, he is said to have roasted his victims in a brazen bull, invented by Perillus of Athens, who is alleged to have suffered death in it himself. Phalaris held power for about 16 years, at the end of which he was overthrown

and is reported to have been roasted in his own brazen bull. The Letters attributed to him were proved by Bentley (*q.v.*) to have been forged.

Phalarope (Gr. *phalaris*, coot; *pous*, foot). Small, migratory shore bird related to the snipe. Two species occur in Great Britain, the red-necked phalarope (*Phalaropus lobatus*) and the grey phalarope (*P. fulicarius*). The former has plumage of grey and white, with a chestnut neck, and breeds in the Hebrides and Shetlands, nesting on the ground among the heather. The grey variety is an irregular winter migrant to the S. coasts of England.

Phalerum. Former port of Athens, now a seaside resort. It stands on a bay about 3 m. from the town. Up to the time of the Persian wars it was the chief port. *Pro. Fa-leerum.* See Athens.

Phallism OR PHALLIC RITES (Gr. *phallos*, the virile member). Usages and rites concerned with the reproductive forces of nature, as symbolised by the organs of sex. Phallic worship, in the sense of veneration of the symbols or of the deities and powers symbolised, is rarely found. But phallism as a form of ritual magic, widespread in antiquity, still pervades surviving primitive cultures throughout the world.

In the magico-religious phase of man's emotional life the belief that the fertility of crops and herds could be assured by means of sympathetic magic induced practices, generally at seasonal festivals, which are usually called phallism. They apparently arose among settled Neolithic peoples, especially in the regions which gave birth to the Hamatic and Semitic stocks. They survived in dynastic Egypt in connexion with the cult of Min and Osiris, and in W. Asia in connexion with that of Cybele, Atargatis, and Baal. The Greek cult of Dionysus and the ithyphallic (Gr. *ithys*, straight) statues of Hermes at Athens were aboriginal and non-Hellenic. Similarly, Indian phallism is Dravidian rather than Aryan. See Lingayat.

Phaltan. State and town of India, forming, since 1947, part of the United Deccan state. The state is bounded on the N. by the Nira river, and lies E. of the rly. from Poona to Belgaum. Timber and native food grains are the chief products; coarse textiles are manufactured. Its area is 397 sq. m. Pop. 71,473. The town is in the middle of the state, 52 m. S.E. of Poona.

Phantom. Code name of the British G.H.Q. liaison regiment formed in 1940. Its function was to keep army, army group, and base h.q. informed of changes in the battle-front situation, and patrols served in France in 1940, and in Greece, N. Africa, Italy, and throughout the campaigns following the invasion of Normandy. The regiment had a wartime strength of 1,350 officers and men, with its h.q. in huts in St. James's Park, London. The regimental flash was a white P on black. See General Headquarters.

Pharaoh. Kingly title in ancient Egypt. The English spelling is derived from the grecised and hebraised forms of the Egyptian Per-'o, great house. In the pyramid age this term denoted the royal estates, and during the Middle Kingdom tended to be used symbolically. With the new empire it became a personal title, and in Shishak's time accompanied the personal name. The O.T. references to later monarchs, Pharaoh-Necho and Pharaoh-Hophra, were therefore strictly accordant with contemporary usage. Thereafter Pharaoh came to denote colloquially whoever was the reigning king.

The identification of the Pharaohs of the O.T. earlier than Shishak—the first mentioned by name—is uncertain. The Pharaoh to whom Joseph was vizier was apparently a Hyksos king, regarded by late classical tradition as one of the Apepis. The Pharaohs of the Hebrew oppression and exodus from Egypt have long been identified with Rameses II and Merenptah, but the evidence of the Amarna tablets and the Israel stela inclines many scholars to displace these identifications in favour of Thothmes III and Amenhotep II. The daughter of Pharaoh whom Solomon wedded was apparently a daughter of Pasebkhanut II, last of the XXIIst dynasty. See Aaron; Egypt.

Pharaoh's Serpent. Chemical toy. It consists of mercury thiocyanate (sulphocyanide) made into small cones or pills by means of mucilage of tragacanth. When lighted, it forms a long, bulky mass, resembling a serpent. This is due to the decomposition of the mercury sulphocyanide by the heat into mercury vapour and a substance known as mellone. The vapour given off is poisonous.

Pharisees (Heb. *parush*, separated). Religious party among the Jews. They sprang from the Chasidim (*q.v.*), during the Maccabean

wars, and were originally the patriots of the nation, who insisted on the permanent separateness of the Jews from the Gentiles, and upon the eternal and unchanging authority of the law of Moses. Often called Chaberim (scholars), they were collectors of the teachings and traditions of the Rabbis, in contrast with the Sadducees, who maintained that the individual conscience is superior to the teaching of anyone, and that the simple letter of the law is all that is needed for the guidance of the individual. In the time of Christ, as the champions of Jewish nationalism they were politically opposed to the Sadducees and Herodians; but all were agreed in their opposition to the teaching of Christ. The Pharisees became rigid formalists. In the struggle of the Jews for national existence, the Zealots represented the militant section of the Pharisees. See Jews.

Pharmaceutical Society. British body established in 1841 for the purpose of advancing chemistry and pharmacy, promoting the education of those who practise the same, and protecting persons who carry on the business of chemists and druggists. A royal charter of incorporation was granted in 1843. Under the Pharmacy Acts the society conducts examinations in pharmaceutical chemistry, pharmaceutics, and pharmacognosy, qualifying persons for registration as pharmaceutical chemists, or chemists and druggists; and institutes proceedings against persons who contravene the Pharmacy Acts. It publishes the *Pharmaceutical Journal*. The offices are at 17, Bloomsbury Square, London, W.C.1.

Pharmacopoeia (Gr. *pharmakon*, a drug; *poiein*, to make). Authoritative treatise on the preparation, constitution, and dosage of drugs and medicines. The British Pharmacopoeia is issued by the General Medical Council. An international pharmacopoeia was compiled by the World Health Organisation in 1950.

Pharmacy. Greek word meaning originally the use of drugs. It appears to have been at first practised by priests, this being the custom in Egypt and among the Jews, and later in Europe it was largely in the hands of monks. For long a great deal of superstition was mingled with the art. In the 17th century the word began to be used for the compounding of medicines, and the work of the chemist (*q.v.*) became distinct from that of the medical man. An Act of Parlia-

ment protecting the title of pharmaceutical chemist was passed in 1852, and in 1868 another Act required all future chemists and druggists to pass examinations and to be registered. See Dispensing.

Pharmacy and Medicines Act. British Act of Parliament passed in 1941 which amended the Pharmacy and Poisons Act 1933 as regards the sale of poisons. It further prohibited advertisements referring to any article in terms likely to lead to its use to procure abortion or for treating Bright's disease, cataract, diabetes, epilepsy or fits, glaucoma, locomotor ataxy, paralysis, or tuberculosis. (Advertisements advocating the use of articles for treating cancer had already been forbidden in 1939.) The Act further made it compulsory to disclose on the article or on its label or container the composition of any substance sold and recommended as a medicine; and restricted the sale of medicines by persons who are medical practitioners, dentists, authorised sellers of poisons, or otherwise qualified. It also repealed the excise duty on patent medicines.

Pharos. Western extremity of the city of Alexandria. Formerly an island, it was joined to the city by a causeway which divided the harbour into two portions. Here stood the ancient Pharos, or lighthouse, accounted one of the seven wonders of the world, built under Ptolemy II, about 280 B.C., and reaching a height of about 500 ft. The site of the old lighthouse was later occupied by the picturesque Fort Kait Bey. See Lighthouse.

Pharsalus. Town of ancient Greece, in the dist. of Pharsalia, Thessaly. Situated near the river Enipeus, it was the scene of fighting during the war between Rome and Macedonia (197 B.C.).

The battle of Pharsalus was fought Aug. 9, 48 B.C., on the territory (Pharsalia) of the town of Pharsalus, between Caesar with 22,000 men, and Pompey with twice that number. It was the decisive battle of the civil war, Pompey's complete defeat making further organized resistance to Caesar impossible. See Lucan.

Pharynx (Gr., throat). Cavity extending from the base of the skull to the level of the cricoid cartilage of the throat, where it becomes continuous with the oesophagus or gullet. About 4½ ins. long, it lies behind the mouth and nose, and through it food passes from the mouth to the oesophagus, also air between mouth and nose and the larynx.

The Eustachian tubes (*q.v.*) open into the upper part of the pharynx, one on each side.

Inflammation of the pharynx is known as pharyngitis. Acute pharyngitis may be the simple sore

Pharynx. Section of throat showing position of the pharynx. A. Posterior edge of nasal septum. B. Orifice of Eustachian tube. C. Soft palate. D. Palatine tonsil. E. Pharyngo-palatine arch. F. Epiglottis

throat of a common cold, or may be due to more serious infection from scarlet fever, diphtheria, etc. Chronic pharyngitis or "clergyman's sore throat" is a condition met with in speakers, costermongers, and others; resulting from over-use or wrong production of the voice. It may be associated with excessive smoking and drinking. Treatment demands rest of the voice and abstinence from smoking and alcohol. Astringent or soothing sprays may be prescribed. Recurrent loss of voice indicates the presence of septic teeth or tonsils, and a physician should be consulted, lest more serious causes exist. See *Anatomy*; *Man*.

Phase. Electrical term, thus defined by the British Standards Association: in an operation which recurs periodically, the stage or state to which the operation has proceeded; the fraction of the whole time which has elapsed, measured from some fixed origin. The term is most often used in speaking of alternating or oscillating currents or voltages, the peri-

odic variations of which might be represented by the revolution of a radius round the centre of a circle, as shown at *A* in the accompanying drawing.* It is, however, more convenient to project this motion, as seen at *B*, in the form of a sine wave. Equal angular movements of the imaginary radius are then indicated by equal divisions of the horizontal straight line; and the phase at any instant is the angle swept out by the radius between its departure from zero and that instant.

At the end of each cycle, or period, the phase is regarded as having reached 360° and to be starting again at 0° , just as the hour hand of a clock starts again from zero after reaching 12. Electrically, then, it is usual to regard phase as a matter of angle. At *C* the voltage is leading by 90° on the current (or the current lagging by 90° on the voltage), since the voltage has reached 90° before the

current has started to rise. Voltage and current are in phase at *D* and 180° out of phase in the imaginary state of affairs depicted at *E*. Radio waves from the same source, reaching an aerial by paths of various lengths, may arrive in phase, 180° out of phase, or out of phase by any intermediate phase angle. Ordinary domestic A.C. is single-phase, each current cycle consisting of a single alternation. For commercial and other purposes 2-phase, 3-phase and poly-phase currents are used. Current of the 2-phase type consists of "interlaced" alternations 90° out of phase. In 3-phase current the angle between phases is established at 120° .

Phase (Gr. *phasis*, appearance). In astronomy, term used for the different luminous appearances of the moon and certain planets. Phases of the moon are caused as the moon travels in its orbit about the earth, thus altering the amount of illuminated surface which is seen.

The phases of the inferior or inner planets, Mercury and Venus, are similar to those of the moon, but take a complete Mercurial or Venusian year for their accomplishment. The crescent Venus or Mercury occurs as the planets come more and more in line between the earth and the sun. Thus when these planets are nearest the earth less of the surface becomes visible. The exterior planets can never show crescent phases, though Mars may appear gibbous. See *Moon*.

Pheasant. Family (*Phasianidae*) of game birds greatly esteemed for the table. The family includes over 50 genera, and comprises the partridges, quails, domestic poultry, guinea fowl, and peafowl. Typical pheasants, to which belongs the common pheasant of British woods, form the genus *Phasianus*, including over a dozen species. In a wild state the true pheasants range from S.E. Europe across

Pheasant. Cock of the common variety of this bird
W. S. Berridge, F.Z.S.

Central and S. Asia to Japan, and are usually found in wooded valleys. In structure they have much in common with the partridge, but have a long and wedge-shaped tail.

The common pheasant (*Phasianus colchicus*) is a native of Turkey, Greece, and Asia Minor, and is believed to have been introduced into Britain by the Romans. It has been freely interbred with other sub-species introduced later, notably the ring-necked pheasant (*P. c. torquatus*) from China and the green pheasant (*P. c. versicolor*) from Japan.

The pheasant feeds upon insects and snails, in addition to seeds, grain, and berries. It will flourish in coverts without attention if protected from foxes and poachers: it roosts in lower branches of trees. It is polygamous in habit. About a dozen eggs are laid by each hen in April, the nest being placed under a bush, among stubs in

Phase. Diagram illustrating the periodic variations of alternating or oscillating currents. See text

coppie, or in the heather. The hen sits well enough if undisturbed, but, to make sure, it is the practice of gamekeepers to collect the eggs and set them under domestic hens. The chicks are thus practically reared by hand, their food being regularly provided and no inducement given them to stray far from the place of their hatching.

It is now the practice to drive the birds towards the guns by means of beaters, rather than to walk them up over dogs. A few dogs may be usefully employed in picking up wounded birds, but dogs in a big day's pheasant shoot are now seldom in evidence. The birds should be driven away from home. Many varieties of sporting shots may be obtained in pheasant shooting, especially at high-flying birds. The pheasant-shooting season lasts from Oct. 1 to Feb. 1, inclusive. See *Argus Pheasant*; *Beak*; *Birds*, colour plate.

Pheasant's Eye OR **BRAD'S EYE** (*Adonis annua*). Annual herb of the family Ranunculaceae. A native of Europe (rare in the U.K.), W. Asia, and N. Africa. It has short, branching stems, with numerous much-divided leaves, the segments reduced to threads. The flowers are nearly globular. The sepals are like petals, but greenish, and the petals scarlet with a darker spot at the base, which constitutes the pupil of the eye indicated by the name. The name bird's eye is usually associated with the bird's-eye primrose (*Primula farinosa*), and pheasant's eye is also applied to the poet's narcissus. See *Narcissus*.

Pheidias (c. 490-432 B.C.). Sculptor of ancient Greece. Born at Athens, the son of Charmides, he studied in the school at Argos under Ageladas. On his return to Athens he was employed on the famous statue of Athena Parthenos, and, his great gifts being appreciated by Pericles, he became superintendent of all the artistic undertakings carried out during the latter's administration. Thus he is said to have directed the execution and decoration of the whole group of buildings on the Acropolis. Later he was accused of impiety for having sculptured his own likeness on the shield of Athena Parthenos, and of misappropriation of the treasure entrusted to him, and is said either to have died in prison or to have fled to Elis, where he executed the chryselephantine (*q.v.*) statue of Zeus for the Eleians.

Pheidon. King of Argos, who probably reigned during the 7th

or 8th century B.C. An energetic ruler, he enlarged the boundaries of Argos, reduced Corinth and Aegina to the position of vassals, and seems to have contemplated the subjection of the whole of Peloponnesus. He introduced a new standard of weights and measures, and had a mint at Aegina, where silver money, according to some ancient authorities, was first coined. He checked the encroachments of the Dorian oligarchs on the royal prerogatives. He is said to have been killed in battle at Corinth.

Phelps, SAMUEL (1804-78). British actor. He was born at Devonport, Feb. 13, 1804, and

Samuel Phelps,
British actor

made his first London appearance as Shylock at The Haymarket, Aug. 28, 1837. For five years he played with Macready at Covent Garden and Drury Lane. On May 27, 1844, he opened Sadler's Wells Theatre as Macbeth, and gave his last performance there, March 15, 1862, having produced 31 of Shakespeare's plays and made that theatre a power in the dramatic world. He died Nov. 6, 1878. *Consult* Life, W. M. Phelps and J. Forbes-Robertson, 1886.

Phenacetin OR **ACETOPHENETIDIN**. Colourless crystalline substance, a coal-tar derivative, first prepared in 1887. Sparingly soluble in water, odourless, and almost tasteless, it is frequently used to relieve the pain of headache, neuralgia, migraine, sciatica, and locomotor ataxia. Prolonged use may cause haemolysis of the red blood corpuscles.

Phenacite. In mineralogy, name given to beryllium orthosilicate. Colourless, yellow to pale red in colour, transparent to subtranslucent, the mineral is found in pegmatites, veins, and druses associated with granite, also in mica schist. It is cut and polished as a gem, the colourless varieties resembling diamonds when cut. The name of the mineral is derived from the Greek *phenax*, a deceiver, from the fact that the mineral is very similar to quartz in appearance and likely to be mistaken for it.

Phenazonum OR **ANTIPYRIN**. White crystalline powder introduced in 1884 for use as an antipyretic, later employed as an analgesic to relieve the pain of

headache, neuralgia, sciatica, etc. It is soluble in water, alcohol, and ether. The drug is liable to cause a skin rash.

Phenobarbitone. A drug of the barbiturate (*q.v.*) group.

Phenocryst. In petrology, a component crystal of a rock which is conspicuously larger than the average grain-size of the rock, and which, genetically, is considered to have crystallised from the rock-melt before the matrix in which it occurs. This texture is called porphyry, hence porphyry (*q.v.*).

Phenol. Alternative name for carboic acid (*q.v.*).

Phenolic Plastics. Group of synthetic materials. They are in the main based on the condensation of phenol and formaldehyde, first shown to be a commercial possibility by Baekeland in 1908. They are of the thermohardening type, and their development, in the years after the First Great War, laid the foundation of much later industrial change. In 1919 annual production was about 1,500,000 lb.; but by 1948 the monthly production in the U.S. was 29,455,000 lb.

Phenology. Term applied to the study of the time of occurrence of recurring natural phenomena, e.g. the flowering of plants, the leafing of trees, and the first and last appearances of birds and insects, as related to the weather.

Phenolphthalein. Crystalline substance obtained by heating phenol with phthalic anhydride and sulphuric acid, the product being afterwards purified. It is used under various names as an aperient. In chemical analysis phenolphthalein is employed as an indicator, because with alkalis a distinctive pink colour is obtained.

Phenomenalism. A theory which considers that only the phenomena directly presented to us, or the ideas that we derive from them, are real. In the one case it is realistic, in the other idealistic. There are no things-in-themselves, behind, and the cause of, the phenomena, which are really what they appear to us to be. See *Metaphysics*; *Sensationalism*.

Phenomenon (Gr. *phainomenon*, that which appears). Term in metaphysics, denoting that which appears to the senses, conditioned by space and time, as contrasted with that which is apprehended by the mind. It is not the real thing, but only the thing as it appears to us. The term is also applied to any remarkable person or thing, e.g. an infant phenomenon. In science,

the word is used to describe a natural process, e.g. the phenomenon of crystallisation.

Phenotype. Term used in biology, especially in genetics, to mean the type of organism as characterized by its external appearance in contrast to its capacity for transmitting characters to its progeny, i.e. its genotypic constitution. Thus, the tall pea plants which arise out of a cross between a pure breeding tall and a pure breeding dwarf pea plant are tall phenotypes because their observable character is tallness, but are heterozygous genotypes because they inherit genes for both characters and can transmit them severally to their offspring.

Pherecydes (c. 550 B.C.). Greek philosopher, sometimes included among the Seven Wise Men of Greece. He is reckoned the creator of Ionic prose. According to him, Zas (Zeus), Chronos (Time), and Chthoniē (Earth) had existed from the beginning, and the world was the result of the working of Zeus and Chronos upon earth. It consisted of five elements—ether, fire, air, water, and earth. He is said to have been the teacher of Pythagoras, and to have first enunciated the doctrines of metempsychosis and the immortality of the soul. *Prom. Ferrysi-deez.*

Phi Beta Kappa. Oldest college fraternity in the U.S.A. It originated as a secret social club and literary society, Dec. 5, 1776, at William and Mary College, Williamsburg, Virginia. Chapters were established at Yale in 1780, Harvard in 1781, and Dartmouth in 1787. It now includes nearly 100 additional chapters with a membership of about 28,000. Women were admitted in 1875. The

Phi Beta Kappa.
Badge of the
fraternity

society is controlled by a national council, and includes both past and present graduates in arts and science. The badge is in the form of a key inscribed on the obverse with the Greek letters Ph B K (representing *Philosophia Bion Kubernētēs*, Philosophy the guide of life), and a hand pointing to a group of stars; and on the reverse with the letters S.P. (*Societas Philosophiae*), the date Dec. 5, 1776, the names of its owner and his or her college, and the date of his or her graduation.

Phigalia. City of Arcadas, in ancient Greece, on the borders of Messenia. Frequently mentioned by ancient writers, it is chiefly noted for the famous temple of Apollo Epikourios, at Bassae, in its territory about six miles away. The remains of the temple, which was built by Ictinus, the designer of the Parthenon, and was considered the most beautiful temple in the Peloponnese, are in an excellent state of preservation. The frieze, representing combats of Greeks with Amazons and Centaurs, is now housed in the British Museum. Phigalia is the modern Pavlitzia.

Philabeg OR FILLBEG. Kilt of

Scottish Highlanders. The word is derived from the Gaelic *feilidh*, kilt, *beag*, small, as distinguished from the old form which covered the whole body. See Highlands.

Philadelphia. Ancient city of Lydia, Asia Minor. Founded by Attalus Philadelphus, king of Pergamum about 140 B.C., it is now represented by the walled city of Alasehir at the N.E. base of Mt. Tmolus, 104 m. by rly. E. of Izmir. See Alasehir.

Philadelphia (Gr., brotherly love). City and port of U.S.A. It stands on the right bank of the Delaware river, 96 m. from its mouth, and 90 m. by rly. from New York. Built on an almost level plain, it covers nearly 130 sq. m., and is intersected by the Schuylkill river. Third U.S. city in number of its inhabitants, its 1940 pop. of 1,931,334 was somewhat under that of 1930.

Innumerable small homes are a characteristic of Philadelphia. Two and three storeyed houses of red brick, with white marble steps, run for miles along straight, tree-

Philadelphia. Plan of the centre part of the city showing railway communications

shaded streets. Broad Street bisects the city from N. to S., and where Market Street cuts it at right angles is the City Hall Square. The chief wholesale houses occupy Market Street, and just S. of it is Chestnut Street with the leading retail stores and the principal newspaper offices. Rittenhouse Square to the S.W. of the city hall was the 19th century aristocratic quarter; wealthy and conservative families have since lived along the main line of the Pennsylvania Railroad and are nationally known as the "main line" aristocracy. A commentator has noted that "the people who own the city have abandoned it," emphasising the fact that old Philadelphia fortunes are commonly derived from real estate.

The inadequate city revenue and consequent lack of street repairs have given central Philadelphia a somewhat frowsy appearance despite its fine 19th century buildings. Philadelphia's only water supply is the water, rendered harmless by chlorination, of the Delaware and Schuylkill rivers, into which thousands of gallons of raw sewage from the city and from factories upstream

Philadelphia
arms

pour daily. The port of Philadelphia has been described as the "largest and foulest fresh-water port in the world."

William Penn, in 1682, founded Philadelphia as a Quaker colony, absorbing a small Swedish settlement of 1632. The Quakers established a public grammar school as early as 1689. Penn's laws were in advance of his time and Quaker belief in modesty, diligence, and the innate goodness of man worked their way deep into the early community. Many leading Quakers were pacifists during the War of Independence; even Benjamin Franklin, a non-Quaker Philadelphian, was characterised by a contemporary William Penn as "a dangerous man." Franklin and another Philadelphian, Robert Morris, financed the revolution, the former by negotiating loans from France, and the latter originally from his private fortune; and in the days of the revolution Philadelphia was the political centre of the young republic. In Independence Hall the Declaration of Independence was signed, and the Continental Congress sat. Here is the liberty bell, which announced that the declaration had been adopted. Close by is the old Congress Hall, the first regular home of congress, and a few streets away are Carpenters' Hall, belonging to the carpenters' guild, where the first steps in the revolution were taken in 1774, and the old house, 239, Arch Street, where Betsy Ross made the first American flag. Franklin is buried in the graveyard of Christ Church, which has colonial as well as revolutionary memories, and the Old Swedes' church of Gloria Dei occupies the site of a wooden one built in 1646. The Penn Treaty park, in Beach street, commemorates the elm under which, in 1682, Penn made his bargain with the Indians.

The city's intellectual activity has created many noted institutions, among which are the Pennsylvania academy of fine arts, the Library company, Bartram's botanical garden, the American philosophical society, the academy of natural sciences, and the Pennsylvania historical society.

The city hall, an immense white marble structure in the French Renaissance style, covering $4\frac{1}{2}$ acres, with a tower 511 ft. high surmounted by a statue of Penn, houses the state law courts as well as the municipal offices. The masonic temple, with its

250-ft. tower, is also in City Hall Square. Among other outstanding buildings are the Stock Exchange and the Girard bank. The U.S. mint was established here in 1792. Shipyards and locomotive works are among the noted industrial establishments. The U.S. navy has a yard on League Island. The city's 30 m. of river front give it good dock facilities. The university of Pennsylvania, with 17,000 students and 1,530 professors and instructors, occupies 60 acres on the W. bank of the Schuylkill, and is famous for its medical, dental, and law schools. Girard College educates 1,500 poor male orphans according to the will of Stephen Girard (d.1831), but admits no clergyman to its grounds, and the Drexel institute, founded in 1892 by A. J. Drexel, specialises in industrial education.

Fairmount park, Philadelphia's one big park, lies to the N.W. and contains Mount Pleasant, the country home of Benedict Arnold, and some of the buildings of the centennial exhibition of 1876. It covers 3,485 acres and extends for 10 miles along the Schuylkill river and Wissabrickon creek.

Most old and wealthy families of Philadelphia have Quaker blood. The city has 270,000 Jews; 68,000 Italian-born; 38,000 German-born; 52,000 Irish-born; 50,000 Russian-born. Negroes number 220,000, more than 11 p.c.

Lord Bryce, writing of Philadelphia early in the century, noted the frank political corruption of the city. In 1944, a U.S. senator testified to the spending of \$2,367,539, most of it contributed by rich Philadelphians, to buy votes in a political cam-

Philadelphia. 1. The city hall seen from South Broad Street; a 37-ft. high bronze statue of William Penn surmounts the tower. 2. William Penn's house in Fairmount Park. 3. Independence Hall, where the Declaration of Independence was signed. 4. The Parkway, looking N.W. from the city hall

PHILAE: PARTIALLY SUBMERGED RUINS ON THE SACRED ISLAND OF THE NILE

paign. City employees (21,000 in 1946) are proportionately far in excess of those in other large cities; through them, votes are regimented into the political machine. Lord Bryce noted the existence of Quaker democracy and simplicity side by side with a famous Philadelphia snobbery. Invitations to the yearly assembly are issued strictly according to gradations of wealth and length of residence in Philadelphia. Usages from the early days of settlement remain: e.g. the Pennsylvania Company for Insurances on Lives and the Granting of Annuities has not changed its name since it was founded early in the 18th century.

Philadelphians. Name, meaning lovers of the brethren, assumed by a sect founded late in the 17th century by John Pordage, rector of Bradfield, Berks, and Jane Lead. Their object was to put into practice the mysticism of Jacob Boehme, and they taught a form of theosophical pietism, which made contemplation the basis of religious knowledge and life. They seem to have inclined to spiritism, and apparitions of good and evil spirits were a feature in their supposed experience. See Boehme; Mysticism.

Philae. Small island in the Nile near Assuan, celebrated for its exquisite temples. Here are the small unfinished Roman hall colloquially called "Pharaoh's Bed," and two Ptolemaic structures, the Temple of Hathor and the great Temple of Isis. These buildings are now wholly submerged from Nov. to June in each year owing to the building of the dam at Assuan. See Assuan; Nile.

Philately (Gr. *philein*, to love; *ateleia*, freedom from tax). The collection and study of postage stamps, stamped envelopes, etc., is treated under Stamp Collecting.

Philby, HARRY ST. JOHN BRIDGER (b. 1885). British explorer. Born at St. John's, Ceylon, April 3, 1885, he was educated at Westminster and Trinity College, Cambridge. He joined the Indian civil service in 1908 and in 1915 went to Mesopotamia as a political officer. During 1917-18 he was in charge of the British political mission to Central Arabia, where he carried out extensive explorations, being the first European to visit the S. provinces of Nejd. Chief British representative in Transjordan, 1921-24, he became a close friend of Ibn Saud and a Muslim. Philby crossed the Rub-al-Khali desert in 1932 and travelled in the

Sheba country of S.W. Arabia in 1937. Created C.I.E. in 1917, he was elected to the council of the Royal Geographical Society in 1925, when he was awarded the first Sir Richard Burton memorial medal. He published *The Heart of Arabia*, 1922; *Arabia of the Wahhabis*, 1928; *Harun-al-Rashid*, 1933; *Sheba's Daughters*, 1939; *Arabian Days*, 1948.

Philemon (c. 360-262 B.C.). Founder of what is known as the New Greek Comedy. A native of Soli, in Cilicia, or of Syracuse, he spent most of his life in Athens. He was the contemporary and rival of Menander, to whom he was preferred by the Athenians. He wrote 97 plays, of which *The Ghost*, *The Merchant*, and *The Treasure* were adapted by Plautus in his *Mostellaria*, *Mercator*, and *Trinummus*. See Comedy; Menander.

Philemon. Friend and disciple of S. Paul. To him the apostle addressed one of the epistles belonging to the group known as the epistles of the captivity. In it he is described as a fellow worker. It is concerned with a runaway slave of his, who had become one of S. Paul's converts. The slave, Onesimus, had wronged his master and been unprofitable, and S. Paul sends him back, though he would like to keep him, and pleads for his forgiveness.

This epistle is of special interest in that it touches upon the problem of slavery, but it has been rightly pointed out that it is not an abolitionist pamphlet. Slavery is not forbidden, but is to be regulated by the Christian principle of brotherhood. The epistle is included in the Muratorian canon and the canon of Marcion. It would seem to have been written in Rome between about A.D. 60 and 62.

Philemon and Baucis. In Greek legend, an humble and aged couple living in Phrygia, who, when Zeus and Hermes visited the earth in human form and could find no one to give them hospitality, kindly received the two gods. As a reward Zeus changed their cottage into a temple, and ordained that when they died they should die together, so that one should not have the pain of surviving the other. The story is told by Ovid in his *Metamorphoses*. *Philemon et Baucis* is the title of a poem by La Fontaine, and of a three-act comic opera by Carré and Barbier, 1860, for which Gounod wrote the music.

Philharmonic Society. Association for the encouragement

of music, mainly orchestral. The chief and oldest is the Royal Philharmonic Society of London, founded in 1813. At its centenary it was granted the right to prefix the word royal to its title. Similar societies have been founded in Liverpool, New York, Brooklyn, and other places, under slightly differing names. Consult History of the P.S. of London, M. B. Forster, 1913; *Annals of the R.P.S.*, R. Elkin, 1947.

Philip. One of the Apostles. A native of Bethsaida, it was he who estimated the cost of feeding the hungry multitude that had come some distance to hear Christ preaching (John 6). The festival of SS. Philip and James is May 1.

Philip. One of the seven deacons selected by the apostles to relieve them of the work of caring for the poor. He preached for a time in Samaria, and baptized an Ethiopian eunuch of Queen Candace's court (Acts 8). June 6 is his festival.

Philip I (1052-1108). King of France. The eldest son of Henry I, he was named after Philip of Macedon, from whom his mother, a Russian princess from Kiev, claimed descent. In 1059 he was crowned as his father's successor; in 1060 he became sole king; and in 1066 his personal rule began. Though hardly as powerful as some of his vassals, he added much to the effective area of his little kingdom in a series of wars with the rulers of Normandy, Anjou, and Flanders, and other princes. Licentious and extravagant, he sold ecclesiastical benefices, and this and his bigamy led to excommunication by Urban II in 1094. He had married Bertha, daughter of Florence, count of Holland, but during her lifetime married Bertrada, wife of Fulk of Anjou. He died July 29, 1108, his eldest son succeeding him as Louis VI.

Philip II (1165-1223). King of France, known as Philip Augustus. Born Aug. 22, 1165, eldest son of Louis VII, he was crowned as joint king in 1179, marrying Isabella of Hainault and succeeding his father in the following year. His great work was the consolidation of the French monarchy. In a war with Flanders, 1184-85, he gained Amiens and Vermandois, then crushed the revolt of Burgundy, and by supporting the sons of Henry II of England against their father acquired Berry, 1189. Accompanied by Richard I, he joined the third crusade, but returned next year, took Péronne from Flanders, and in 1193 treacherously

invaded Normandy. Richard I obtained the help of Flanders, Champagne, and Brittany, 1198, but his death in 1199 brought the war to an end.

Meanwhile Philip, whose first wife had died, had wedded Ingeborg of Denmark and immediately repudiated her, 1193, marrying Agnes of Meran in 1196. France was therefore laid under an interdict until Philip took Ingeborg back. Claiming the French possessions of John of England, Philip conquered Normandy, Maine, Anjou, Touraine, and Poitou, 1204-06, and by joining in the crusade against the Albigenses gained a footing in S. France. Intervening in German affairs, he supported the

nominee Clement V, who resided at Avignon. He suppressed the Knights Templars, 1310-14, and died at Fontainebleau, Nov. 29, 1314. Philip was a man of great personal courage, but despotic, cruel, and unscrupulous.

Philip V (c. 1294-1322). King of France. A younger son of Philip IV, he became king in Nov., 1316. For a few months he had been regent, waiting for the birth of a posthumous son to his brother, Louis X, but the child lived only a few days. His rival was Jeanne, a daughter of Louis, but the succession of a woman was disliked and Philip secured the throne. He did much for France by way of useful legislation, and was a man

himself of one regent and recalled Philip to assist in the government. In 360 Perdicas was killed in a conspiracy, leaving an infant son. Philip brought home with him the ideas of war and government, and the admiration for Hellenic culture, which he had acquired in his boyhood, and the resolve to make Macedon first of Hellenic powers.

It was an easy matter in 359 to set the crown on his own head instead of that of the infant king. The next step was to bring the Macedonian army under discipline and organization which would make it a first-rate instrument of war. Philip created the Macedonian phalanx, modelled upon the infantry system of Epamin

Philip, kings of France. Left to right: Philip I, 1059-1108; Philip II, 1187-1223; Philip III, 1270-85; Philip IV, 1285-1314; Philip V, 1316-22; Philip VI, 1328-50

Flemish communes, with whose aid he won the great victory of Bouvines over the emperor Otto IV, England, and Flanders, July 27, 1214. His position being now assured, he reformed the administration and judiciary and improved the city of Paris. The greatest organizer among medieval French monarchs, he died July 14, 1223. *Consult Life*, W. H. Hutton, 1896.

Philip III (1245-85). King of France, called the Bold. The son of Louis IX, he was born April 3, 1245, and began to reign in 1270. His personality was colourless and his reign uneventful. No great warrior, in 1284 he engaged in an unsuccessful struggle against Aragon, and this period was marked by the struggles of factions for the mastery. Philip died Oct. 5, 1285.

Philip IV (1268-1314). King of France, called the Fair. Son of Philip III and Isabella of Aragon, he was born at Fontainebleau, married Joanna of Navarre, 1284, and succeeded his father, 1285. In 1293 he ordered Edward I of England to do homage before him, and war broke out with England, 1294-99. Having treated Flanders as a French dependency, Philip was utterly defeated by the Flemish at Courtrai, 1302. At this time began his great quarrel with the papacy over the taxation of the clergy, and in 1302 he burned the bull of Boniface VIII, whom he arrested, 1303, replacing him in 1305 by his own

of some culture and a patron of Provençal poets. He died Jan. 2, 1322, but left no sons, his successor being his brother, Charles IV. Philip is known as the Tall.

Philip VI (1293-1350). King of France, first of the Valois line. Son of Charles of Valois, brother of Philip IV, he was made regent, 1328, and in the same year became king by the Salic law. He defeated the Flemings at Cassel, and in 1329 received the homage of Edward III of England for Guienne, but the Hundred Years' War with England broke out in 1337. Philip suffered his greatest defeats at Sluys, 1340, Crecy, 1346, and Calais, 1347, but by accession and purchase he extended his dominion to Valois, Anjou, Champagne, Brie, and Dauphiné. Disastrous wars and extravagance drained his exchequer, so he depreciated the coinage and taxed salt. Died Aug. 22, 1350.

Philip II (382-336 B.C.). King of Macedonia. The younger son of Amyntas II, he was brought up not in his native country but at Thebes (q.v.) in the brief days of her glory, when Epaminondas was the foremost man in the state. In 364 his brother Perdicas rid

ondas, and he added to it the cavalry organization which gave the combined arms an overwhelming superiority over the traditional Greek tactics. A statesman as well as a soldier, he made himself master of the coastal districts which he needed to provide him with a revenue. During 352-347 he seized territory on the coast of Thrace, invaded Thessaly, and destroyed Olynthus. Meanwhile an aggressive power had arisen in Phocis (q.v.); an act of sacrilege on the part of the Phocians, which stirred the religious sentiment of all Hellas, gave Philip his opportunity for intervention. He crushed the Phocians, and claimed admission in their place into the Hellenic circle, 346.

Philip next subjugated Balkan tribes N. of Macedonia. Athens took alarm at his growing power, when he found further pretexts for intervention in Greek affairs; the Athenians and Thebans united to oppose him, but were decisively beaten at Chaeronea, 338. At a great congress of the Greek states, from which Sparta alone held aloof, Philip was elected captain-general in 337. At once he set about organizing the great invasion of Persia; but before he could start he was struck down by the hand of an assassin at Aegae.

Philip V (c. 237-179 B.C.). King of Macedonia. On the death of his father Demetrius II,

Philip II, King of Macedonia. From a coin in the British Museum

antigonus Doson ruled until Philip reached the age of 17, when the regency ended. The beginning of Philip's responsible reign was

Philip V,
King of Macedonia
From a coin

marked by a war with the Aetolians, which he conducted with great success. In 215 he concluded an alliance with Hannibal, in consequence of which the Romans formed a combination against him in 211, including the Aetolians and Pergamum. This combination kept Philip busy fighting until 205. War was renewed by the Romans in 200, and in 197 Philip was completely defeated by Flaminius at the battle of Cynoscephalae. By the terms of peace Philip renounced all territorial acquisitions outside Macedonia, and agreed to pay an indemnity of £240,000 and to limit his army to 5,000 men.

Philip I (1478-1506). King of Spain. Son of the emperor Maximilian I, and Mary, daughter of Charles the Bold, duke of Burgundy, he was born at Bruges, July 22, 1478. In 1482 he became by his mother's death the nominal ruler of the possessions of the dukes of Burgundy, and in 1496 he married Joanna, the deranged daughter of Ferdinand and Isabella of Spain. After Isabella's death, in 1504, he and his wife were recognized as king and queen of Spain, but soon afterwards Philip died at Bruges, Sept. 25, 1506. Known as the Handsome, he was the father of Charles V.

Philip II (1527-98). King of Spain. He was born May 21, 1527, the son of the emperor Charles V. In 1543 he married Mary of Portugal, and after her death Mary I of England, in 1554. In 1556 his father abdicated, transferring to him the lordship of the Netherlands, together with the crowns of Spain and of the Two Sicilies and the whole Spanish colonial empire, though the German possessions of the house of Hapsburg had already been handed over to Philip's uncle Ferdinand, who succeeded Charles as Roman emperor. On Mary's death Philip offered his hand to her sister and successor, Elizabeth; the offer being declined, he forthwith married the French princess Elizabeth. His fourth wife, from 1568, was Anne of Austria.

After the peace of Cateau-Cambrésis, 1559, Philip ruled terri-

tory immensely larger than that of any other potentate; his weakness lay in the fact that its three main divisions in Europe had no intercommunication by land. He looked upon himself as the champion of the Catholic faith, but as the senior rather than the junior partner of the pope in the task of compelling heretics of all nations to return to the bosom of the Church. His resolution never wavered, his industry was enormous, his piety and conscientiousness were great. But conscience did not forbid him to countenance assassination, the most portentous cruelty, or duplicity in attaining his ends. His industry was marred by a total incapacity for trusting any man who showed ability; his resolution was made futile by slowness, stubbornness, inefficiency, and a persistent belief that when his time came he would strike irresistibly, the result being that his time never did come, because his enemies struck first. The Netherlands revolted under William the Silent. Philip deferred an open rupture with England while she was weak; when in 1588 he delivered what should have been his crushing blow at the island power, his Great Armada was shattered

no knowledge of public affairs. He married in 1599 Margaret of Austria, daughter of the Archduke Charles. The duke of Lerma, who acquired the whole power of the state, provided the king with money and amusement, gave over the finances to courtiers, and pursued the grandiose policy of Philip II with insufficient and dwindling resources. Peace was indeed made with England in 1604, but the war in the Netherlands was continued until 1609. A pious son of the Church, Philip determined to exile from Spain in 1609 the whole Moorish population except Christians and young children. The loss of their labour ruined agriculture and commerce. Philip died March 31, 1621.

Philip IV (1605-65). King of Spain. Born at Madrid on April 8, 1605, the son of Philip III and Margaret of Austria, he succeeded his father at the age of 16. Lerma was dismissed, and Philip, provided with an endless succession of amusements, leaned on the count of Olivares (*q.v.*), who by his aggressive foreign policy brought Spain to the verge of ruin. When at last, after the loss of Portugal and Roussillon, French armies were in Spain, Philip roused himself to dis-

Philip, kings of Spain. 1. Philip I, 1504-1506. 2. Philip III, 1598-1621. 3. Philip II, 1556-98. 4. Philip IV, 1621-65. 5. Philip V, 1700-46.

3 Titian. 4. Velazquez 5. Rigaud

to fragments. Supporting the Catholic League against Henry of Navarre, he failed again. The sole success of the reign was the annexation of Portugal. Philip died Sept. 13, 1598. Consult *History of the Reign*, W. H. Prescott, 1887; *Lives*, M. A. S. Hume, 1897; D. Loth, 1932; W. T. Walsh, 1938.

Philip III (1578-1621). King of Spain. Born at Madrid, April 14, 1578, the son of Philip II and of Anne of Austria, he came to the throne, Sept. 13, 1598. Of naturally weak ability, he had acquired

miss his minister, but was incapable of sustained effort. His armies were defeated by the French under Condé at Rocroi and at Lens, and Spain was compelled to recognize the independence of the United Provinces.

Philip sought in vain in two expeditions to recover Portugal. His reign, though in other respects disastrous, was a brilliant period for art and letters, in both of which the king was a real connoisseur. Velazquez was his court painter. Philip died in Madrid, Sept. 17,

1665. By his first wife, Elizabeth of France, he had six children, only one of whom survived, Maria Theresa, married to Louis XIV of France; by his second marriage, with Maria Anne of Austria, he left a son, Charles II, who succeeded him, and a daughter, Margaret Theresa, who married Leopold I of Austria.

Philip V (1683-1746). King of Spain. Born Dec. 19, 1683, he was the son of Louis, the dauphin of France, and grandson of Louis XIV. On the death of Charles II of Spain in 1700, he was declared heir to the throne of Spain and the whole of the Spanish empire. The inheritance was accepted by Louis XIV and the result was the War of the Spanish Succession (*q.v.*). In the end Philip was recognized as king of Spain, though the Netherlands and the Two Sicilies were separated from the Spanish empire. Spanish affairs were for a short time guided by Cardinal Alberoni, whom Philip was compelled by the European powers to dismiss in 1719; the real director of policy, however, was Philip's queen, Elizabeth Farnese. By joining in the War of the Polish Succession she obtained for her sons dominions in Italy. Philip abdicated in favour of his son Louis in 1724, but on his death a few months later re-ascended the throne, living until July 9, 1746.

Philip (1342-1404). Duke of Burgundy, called the Bold. Son of John II of France, he was born on Jan. 15, 1342, was captured with his father at Poitiers, 1356, and was made duke of Burgundy in 1363. He married Margaret of Flanders in 1369, took part in the English wars, and having defeated the insurgent Flemings at Roosebeke, Nov. 27, 1382, became in 1384, through his wife's inheritance, joint ruler with her of Flanders, Franche Comté, and other districts. In 1392 he became regent for Charles VI of France. He died April 27, 1404, and was succeeded by John the Fearless.

Philip (1396-1467). Duke of Burgundy, called the Good. Son of John the Fearless and Margaret of Bavaria, he was born at Dijon, June 13, 1396, and succeeded his murdered father in 1419. He made an alliance with Henry V of England, but quarrels with the duke

of Bedford led to his withdrawal from the campaign, and he made peace with Charles VII, 1429. The same year he married Isabella of Portugal and instituted the Order of the Golden Fleece. He renewed hostilities, captured Joan of Arc at Compiègne, and finally made the treaty of Arras, Sept. 21, 1435, recognizing the king of France as his suzerain. He suppressed the insurrection of Ghent, 1448-53, supported the dauphin Louis against Charles, 1456, and died at Bruges, July 15, 1467. A patron of learning and arts, in 1421 he founded the university of Dôle.

Philip, PRINCE, DUKE OF EDINBURGH (b. 1921). British prince. Son of Prince and Princess Andrew

Philip the Good, Duke of Burgundy

Prince Philip, Duke of Edinburgh

of Greece, Philip, prince of Denmark and Greece, was born at Corfu, June 10, 1921. A great-grandson of Queen Victoria, he came to England at an early age, where he was brought up by his uncle, later Viscount Mountbatten of Burma. Educated at Cheam School, and Gordonstoun, Scotland, he entered the R.N. College, Dartmouth, at 18. In 1940 he became a midshipman in H.M.S. Ramillies, and was present at the battle of Matapan, 1941, later serving in the Pacific. After the war he became instructor at the petty-officer training establishment at Corsham, Wilts. He became a naturalised British subject, March, 1947, relinquishing his princely titles, and taking the surname of Mountbatten (his mother's family). His engagement to Prin-

cess Elizabeth was announced July 10, 1947. Created duke of Edinburgh, K.G., and a British prince with the style of His Royal Highness, Nov. 19, he married Princess Elizabeth at Westminster Abbey, Nov. 20. Their first child, Prince Charles, was born a year later. Prince Philip was first-lieut. on a destroyer, 1949, and in 1950 was promoted lt.-cdr. and given command of a frigate. He was president of the National Playing Fields Association from 1948, and of the M.C.C., 1949-50.

Philippaugh. Battlefield near Selkirk, Scotland. Here, Sept. 13, 1645, the marquess of Montrose (*q.v.*) was defeated by the parliamentarians under David Leslie. After routing the Covenanters at Kilsyth, Montrose had advanced to the Border. Leslie marched from Nottinghamshire and surprised him at Philippaugh, Montrose fleeing to the Highlands. The victory was stained by a massacre of Irish prisoners and women.

Philippa of Hainault (c. 1314-69). Queen of Edward III of England. Their marriage, Jan. 30, 1328, gave Edward a claim to the alliance of her father, William, count of Holland and Hainault, against the French. In 1330 Philippa bore her first child, Edward, the Black Prince. She was with the king in 1347 at the siege of Calais, where on her intercession he spared the lives of six burgesses who came to yield up the city. Froissart became her secretary in 1361. She died at Windsor Castle, Aug. 15, 1369, having borne seven sons and five daughters. Queen's College, Oxford, was called after her.

Philippeville. Port of Algeria, forming the main entrance to the prov. of Constantine. The city, founded by the French in 1838, is entirely European in character, but stands on the site of an ancient city which has been identified with the Rusica of the Romans. It is a railway terminus, lying 54 m. N.N.E. of Constantine, handles much of the trade of E. Algeria and the Sahara, and has steamer connexion with Algiers and Marseilles. In the neighbourhood wheat, tobacco, cotton, and fruit are produced, iron is mined, and granite quarried. Pop. 64,857.

Philippi. City of ancient Macedonia. Founded by Philip of Macedon, it was situated on a spur of Mt. Pangaeus near the river Gangas. Its gold mines are mentioned by Herodotus, but it is chiefly important historically as the scene of the battle in which Brutus and

Philip the Bold, Duke of Burgundy

Cassius were defeated, 42 B.C., after which it became a Roman colony. One of the first Christian churches was founded here by the Apostle Paul, whose letter to the inhabitants is included in the N.T. See *Philippians*.

Philippi, BATTLE OF. Term applied for convenience to two separate battles fought in 42 B.C. near Philippi in Macedonia between the forces of Brutus and Cassius on one side, and those of Octavian, Caesar's grandnephew and heir, and Antony. In the first battle the wing of Cassius was defeated and the general killed himself, while the wing of Brutus was victorious. In the second battle, 20 days later, Brutus was defeated and committed suicide, and his army was annihilated. The result of the battle was to make Octavian and Antony masters of the Roman world. Philippi is the scene of the last act of Shakespeare's *Julius Caesar*.

Philippians, EPISTLE TO THE. One of the epistles of S. Paul, belonging to the group known as the Epistles of the Captivity. Its authenticity may be said to be fully guaranteed by external evidence. It is included in the Canon of Marcion and in the Muratorian Canon, is referred to by Polycarp, and was accepted by Irenaeus. The internal evidence is equally strong, the epistle bearing unmistakably the stamp of S. Paul's character. It is addressed from prison to the Church of Philippi, which S. Paul founded on his second missionary journey. Since the imprisonment was probably in Rome, rather than in Caesarea, the epistle may be assigned to A.D. 63. It is a very personal letter, expressing S. Paul's thanks for gifts and other friendly acts, and his great joy in the Gospel, and exhorting the Philippians to rejoice with him.

Philippics. Series of speeches delivered by Demosthenes (q.v.) from 351 to 341 B.C. They were so called because their purport was to warn his countrymen against the designs cherished by Philip of Macedon for the overthrow of Greek independence. The speeches contain a great deal of violent personal invective. The name *Philippics* was also given to 14 orations of Cicero against Mark Antony.

Philippine Islands. Extensive group of islands in the N. part of the East Indies, formerly belonging to the U.S.A., but since July 4, 1946, constituting an independent republic. They number more than 7,100, and with the Sulu Is. cover a land surface of 114,830 sq. m. The principal islands are Luzón,

Mindanao, Palawan, Negros, Panay, Samar, Mindoro, Bohol, Cebú, Leyte, and Masbate. Manila is the capital and the leading industrial and commercial centre.

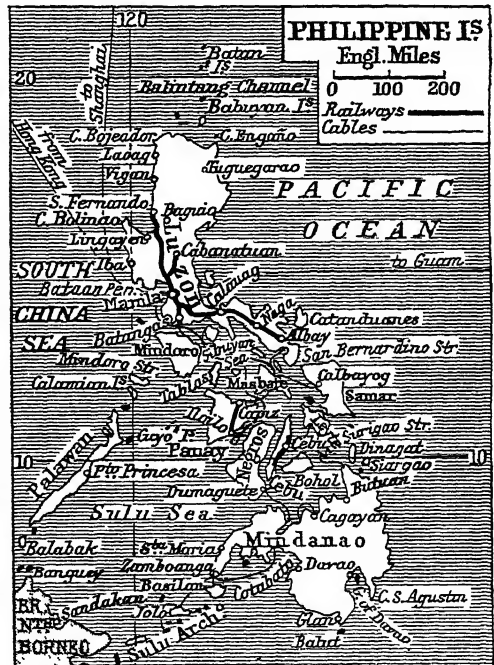

Mainly of volcanic origin, the Philippines are traversed by magnificent and irregular mt. ranges, well clothed with vegetation and separated by plains of great fertility, watered by innumerable lakes and rivers, which afford ample means of transport. The general disposition of the mts. is from N. to S. Parallel with the E. coast of Luzón runs the Sierra Madre, a range extending from the N. point to near Manila and averaging from 3,500 ft. to 4,500 ft. alt. On the opposite side of the island are the Caraballos Occidentales, which attain in Mt. Datá a height of 7,364 ft. Between the two ranges is the fertile valley of the river Cagayán, noted for its tobacco. Apo or Davao, 10,312 ft., an extinct volcano in Mindanao, is the culminating summit.

Several of the rivers and lakes are of considerable size. Cagayán, in Luzón, is the longest river, others being the Agno Grande and Abra, in the same island, and the Pulangua or Rio Grande de Mindanao and the Agusan in Mindanao. Liguasan, Buluan, and Lanao in Mindanao, and Laguna de Bay, Cagayán, and Taal, in Luzón, are the largest lakes.

The climate is tropical, but on the whole not unhealthy. Rain from the S.W. monsoon falls between June and Sept. on the W. coasts, and from Oct. the N.E. trades bring rain to the E. coasts. Typhoons of great violence are most frequent from July to Oct. At Manila the mean annual temperature is 80° F. and the rainfall 80 ins. The indigenous flora is generally similar to the Malayan, with the addition of some more N. varieties, and also a few Australian genera. Large forests of teak, ebony, sandal, and other

useful woods occur, and among valuable plants are the Manila hemp, gomuti palm, pineapple, cotton, tea, coffee, cocoa, indigo, sugar-cane, tamarind, and tobacco. Nutmeg, cassia, clove, and pepper also abound. Rice is cultivated, and maize, wheat, yams, bananas, oranges, lemons, and other tropical fruits are produced. The buffalo is the largest wild mammal, others being antelopes, boars, deer, and monkeys; and among domestic animals are the horse, goat, sheep, and hog. In the woods eagles, herons, wild duck, and many other birds are found, and crocodiles infest the rivers.

Gold is one of the most valuable mineral products, and silver, copper, lead, iron, platinum, and manganese are worked. Mining installations were badly damaged during the Japanese occupation. Among the volcanoes sulphur occurs in considerable quantities. Industries include the cultivation and manufacture of abaca or Manila hemp and the manufacture of tobacco and cigars. Pearls and edible birds' nests are a valuable item of trade with China. In the production of copra and coconut oil the islands rank high among world sources. The Negritos, a pygmy race giving its name to the island of Negros, but inhabiting

Philippine Islands. Map of this Pacific group forming an independent republic, formerly belonging to the U.S.A.

the mountainous districts of the other islands as well, are regarded as the aborigines. The bulk of the people are Malays, the chief types being Tagals in Luzón, and Visayans in the other islands. The official national language is Tagalog, a Malayan dialect. The dominant religion is Roman Catholicism. Pop. 16,971,100.

The Philippines were discovered in 1521 by Magellan, who was shortly afterwards killed during a skirmish on Mactan Island, and were annexed by Spain in 1569, after several expeditions had been made. Manila, which became the Spanish capital in 1571, was occupied by the British, 1762-64. The islands remained a Spanish possession until 1898, when they were ceded to the U.S.A. as a result of the Spanish-American War. Aguinaldo led the Filipinos in a revolt against the Americans which was virtually ended by his capture in 1901. Later a movement for self-government was started by the Filipinos, and on March 24, 1934, F. D. Roosevelt signed an act of congress conferring independence on the Philippines after a 10-year transitional period. As a result of the Second Great War, this period was extended to 12 years.

Bibliography. The Philippine Islands, 55 vols., E. H. Blair and J. A. Robertson, 1903-09; The Philippines Past and Present, D. C. Worcester, 1914; The Philippine Problem, W. H. Anderson, 1939; The Philippines: A Study in National Development, J. P. Hayden, 1942; The Philippine Islands, W. C. Forbes, 1946.

SECOND GREAT WAR. When war in the Pacific began General MacArthur, U.S. commander in the Philippines, had at his disposal some 50,000 men who were, apart from the 31st Infantry, the 4th Marine regt., the Philippine Scouts, and a few companies of national guardsmen, Filipino reservists, poorly armed, equipped, and trained. The Japanese had a large and active fifth column throughout the islands. Political intrigue, both internal and external, combined with apathy in Washington, had left the Philippines almost as helpless as Pearl Harbour.

On Dec. 8, 1941, Japanese bombing raids on Clark Field and Iba airfield eliminated the main strength of the U.S. army air force in the Philippines.

Nichols Field, base for the fighter defence of Cavite naval dockyard, and the airfield at Davao were destroyed very early on Dec. 9; and on the same day Cavite itself

was bombed, the destruction of shore installations depriving the U.S. navy of its only operational base in the Philippines. Most of the U.S. surface vessels were withdrawn to Java, but a few submarines continued to operate against Japanese transports in Philippine waters.

On Dec. 10 the Japanese began landing troops between Vigan and Aparri on the N. and N.W. coasts of Luzón, and after an initial repulse firmly established themselves. One force which landed at Legaspe, in S.E. Luzón, Dec. 13, could not be dislodged. On Dec. 20 landings were effected on Mindanao (*q.v.*). On Dec. 22, a fleet of 80 transports strongly supported by air and naval units landed some six divs. of infantry and armour along the gulf of Lingayen, 125 m. N.W. of Manila, and despite heroic resistance by U.S. and Filipino troops made considerable headway.

With the Japanese rapidly advancing S. from Lingayen, and enjoying undisputed control of the air, Gen. MacArthur had no alternative but to fight delaying actions to cover a withdrawal into Bataan Peninsula (*q.v.*). This followed the official U.S. plan drawn up before the invasion, which, however, assumed that Bataan could hold out for two months until the arrival of reinforcements from the U.S.A. The disaster at Pearl Harbour and Japanese attacks on other U.S. mid-ocean bases had, however, eliminated the possibility of reinforcement.

MacArthur's Withdrawal

Withdrawal to Bataan had actually begun on Dec. 21, and the rapid advance of the enemy threatened to turn the U.S. left flank. A Filipino-U.S. force made a stand along the Agno river and managed to draw off the main Japanese force, so enabling Maj.-Gen. Wainwright, Gen. MacArthur's second in command, to continue the retreat, under constant attack but in good order, and with his supplies and limited armour intact.

Further landings at Antomonan, at Mauban on Lamon Bay and at Nasugbu, 15 m. from Manila bay, resulted in heavy Japanese pressure towards Manila (*q.v.*). A U.S. counter-attack near Laguna de Bay on Dec. 25 failed, and gave the Japanese a clear route to the Philippine capital, declared an open city on Dec. 25, but severely raided from the air before it was entered by the Japanese Jan. 2, 1942. The U.S. withdrawal into Bataan was completed early on new year's day. After three weeks' fighting, the remnants of the U.S.

troops were forced into the islet fortress of Corregidor (*q.v.*).

On Feb. 11, Washington announced that the Japanese had occupied Masbate, central island of the Philippine group. Landings were made on Mindoro (*q.v.*) on March 6, followed by the occupation of the islands of Masharu and Homma. Sporadic fighting continued on many of these islands until the garrison in Corregidor surrendered on May 6, when organized resistance ceased throughout the Philippines, although guerrilla activity continued on many of the 7,000 islands of the group.

MacArthur transferred his command to Lt.-Gen. Wainwright and left Bataan for Australia on March 11, 1942, promising to come back: he insisted already that recapture of the Philippines was essential to an invasion of Japan.

Return of American Forces

The capture of Morotai in the Moluccas (*q.v.*) on Sept. 17, 1944, and of Peleliu in the Palaw group on Oct. 1, in MacArthur's island-hopping campaign across the Pacific had brought U.S. forces within striking distance of the Philippines; and after an initial air and sea bombardment, elements of Gen. Krueger's U.S. 6th army went ashore at Leyte (*q.v.*) on Oct. 20. The original U.S. plan had been to invade Mindanao in Nov., but Japanese weakness in aircraft over Leyte revealed by air combats led to the bringing forward of the date of attack and the changing of the objective to that island. Moreover, the Japanese, anticipating attack on Mindanao, had heavily fortified and garrisoned it.

Within a few hours of their first landings in the Tacloban area of Leyte, the Americans had over 100,000 men ashore and had captured Tacloban and Dulag airfields. By Oct. 22 beachheads were established on the N. coast, giving control of the San Juanico Strait separating Leyte from Samar, where landings were made on Oct. 27. Although a typhoon interfered with operations, the whole E. coast of Leyte was in U.S. hands by the 30th, and nearly the whole of Samar had been liberated. The Japanese navy made desperate efforts to interfere with the U.S. transports and to bring reinforcements from Mindanao and other Philippine islands, but the virtual elimination of the Japanese navy in the sea battles of Oct. 23-27 prevented any large scale Japanese reinforcement. All organized Japanese resistance on Leyte ended on Dec. 25. The capture of Leyte cost

the U.S. forces 2,623 killed and 8,422 wounded; the Japanese lost 113,221 men.

On Dec. 15, U.S. troops went ashore at Mindoro at a point 300 m. N.W. of Leyte and only 75 m. S. of Manila. The landing met with but slight opposition, and the capture of the island by Dec. 29 virtually cut the Philippines in two.

After a feint towards the Verde Is. Passage, S. of Manila bay, designed to give the Japanese commander, Gen. Yamashita, the impression that an assault was about to be made in Batangas area, the U.S. 14th army corps, led by MacArthur in person, landed on the coast of the Lingayen gulf on Jan. 9, 1945, while the 1st army corps simultaneously went ashore at Damortis. The only opposition offered either landing was by pilots of the *Kamikaze* (suicide corps). The Japanese land forces in Lingayen and the central plain withdrew to the surrounding mountains, and the U.S. 37th infantry moved down the central plain towards Manila, capturing Clark Field by Jan. 25. Additional landings were made near Subic bay, Bataan. By Feb. 6, U.S. troops had recaptured Manila, except for the old walled city of Intramuros across the river Pasig, which fell on Feb. 24. Other Japanese formations were rapidly eliminated, Bataan being cleared and Corregidor recaptured on Feb. 16.

With the fall of Manila, Japanese rule in the Philippines ended, but U.S. landings on other islands continued: on Palawan, March 1; Mindanao, March 9; Panay, March 19; Cebu, March 26; Busuanga, April 11, to deliver medical supplies and food to the leper colony at Culion; Bohol, April 13. Only on Cebu did these later landings meet serious resistance; when Cebu was conquered on April 23, resistance was confined to that of isolated groups on Luzon and Mindanao.

On July 5 MacArthur announced that, of the 450,000 Japanese in islands, all but 30,000 men had been annihilated; 17 U.S. divs. had been engaged, and casualties were 54,891, of whom 11,921 had been killed.

Lt.-Gen. Tomoyuki Yamashita, the "tiger of Malaya," conqueror of Corregidor and of Singapore, unconditionally surrendered himself and all remaining Japanese forces in the Philippines to Lt.-Gen. Wainwright (who had surrendered to Yamashita at Corregidor), Sept. 3, 1945. See Pacific War, 1941-45.

David Le Roi

Philippopolis. Old name of the Bulgarian city now usually known as Plovdiv (*q.v.*).

Philippus, MARCUS JULIUS. Roman emperor, A.D. 244-249, often called Philip the Arabian. He was commander of the army which the emperor Gordian III led against the Persians, and incited a mutiny, as a result of which Gordian was murdered, and Philippus was proclaimed his successor. He concluded an ignoble peace with the Persians and celebrated, 248, with secular games of unprecedented magnificence the 1000th anniversary of the founding of Rome. He was slain at Verona by Decius (*q.v.*).

Philips, AMBROSE (c. 1675-1749). English poet. He was born in Shropshire and educated at Shrewsbury and St. John's College, Cambridge. Philips was the author of some indifferent odes, of a tragedy, *The Distressed Mother*, and of some pastorals. He was friendly with Addison and Steele, but incurred the enmity of Pope, who satirises his poems in *The Dunciad*. He died in London, June 18, 1749. The word namby-pamby was coined from his name by H. Carey (*q.v.*).

Philips, JOHN (1676-1709). An English poet. He was born at Bampton, Oxon, Dec. 30, 1676, and educated at Winchester and Christ Church, Oxford. His best known work is *The Splendid Shilling*, a mock-heroic poem which parodies the style of *Paradise Lost*. He died Feb. 15, 1709.

Philistia (Heb. *Peleseth*). O.T. name for the land of the Philistines (Ps. 60, v. 8; 87, v. 4; 103, v. 9). Elsewhere it is rendered *Palestine* (*q.v.*), and it does not occur in either LXX or Vulgate. The land embraced under this name included the coast plain S.W. of Palestine, from Joppa N. to the valley of Gerar S., and from the Mediterranean in the W. to the foot of the Judean hills.

Philistines. Ancient people living along the coast of Palestine. They came from Crete and the Anatolian coast, and established themselves in five cities in Palestine—Gaza, Ascalon, and Esdud on the coast, and Gath and Ekron inland. For a long period down to the reign of Saul they were the dominant race in Canaan. They were intermittently at war with the Hebrews, and were greatly reduced in power by David, but they retained their independence till their subjugation was begun by Tiglath-pileser, 734 B.C., and completed by Sennacherib, 701.

Modern research, by elucidating their racial relationships and culture, has demolished the figment of their artistic insensibility. The main evidences are the Phaestus disk (*q.v.*), the temple-carvings of Rameses III at Medinet Habu (1200 B.C.), and the Gezer and Bethshehem excavations. They dominated the neolithic inhabitants by their knowledge of metals and their early monopoly of iron. The longest Philistine skeleton from Gezer is 6 ft. 3 ins. Their social organization was based on a confederacy of chieftains (*seven*) of early Aryan type (Judges 16). Their non-Semitic speech lingered at Ashdod down to Nehemiah (445 B.C.). See Archaeology; Dagon; Palestine; consult also *The Philistines*, R. A. S. Macalister, 1913.

In the sense of a narrow-minded, uncultured person, the term Philistine became current in English through its adoption from the German by Matthew Arnold. *Philister* is a slang term used by German students for any person not a student.

Philistus (c. 435-356 B.C.). Greek historian. He was born at Syracuse, and was a close friend of Dionysius the Elder until 386, when he was banished for having secretly married the tyrant's niece. He spent the next twenty years in exile, and during that time wrote a history of Sicily, which is mentioned with warm approval by Cicero. On the accession of Dionysius the Younger in 366, Philistus returned to Syracuse, and at the capture of the city by Dion, 356, he went to Italy to raise a force, rejoined Dionysius, and was killed in a naval battle.

Phillimore, WALTER GEORGE FRANK PHILLIMORE, 1ST BARON (1845-1929). British lawyer. Born

1st Baron Phillimore, British lawyer

in London, Nov. 21, 1845, he was the son of Sir R. J. Phillimore, Bt. (*v.s.*). Educated at Westminster School and Christ Church, Oxford, he was made a fellow of All Souls and became a barrister. In 1897 he was made a judge, and from 1913-16 was a lord justice of appeal. He was created a peer in 1918. An authority on ecclesiastical law, Phillimore revised J. J. Blunt's *Book of Church Law*. From 1905 to 1908 president of the International Law Association, he died March 13, 1929, being

succeeded by his eldest surviving son, Godfrey Walter Phillimore (1879-1947). On the latter's death in Dec., 1947, the title passed to the 2nd baron's grandson, Robert Godfrey Phillimore (b. 1939).

Phillimore, Sir Robert Joseph (1810-85). British judge. Born at Whitehall, Nov. 5, 1810, educated at Westminster and Christ Church, Oxford, and called to the bar at the Middle Temple 1841, he obtained a considerable practice. He entered parliament in 1852 for Tavistock, and soon acquired a reputation as an authority on ecclesiastical and international law. He was made Q.C. in 1858 and a knight in 1862. In 1867 he was appointed judge of the high court of admiralty, where he delivered many important judgements. He wrote commentaries on International Law, 4 vols., 1854-61, since revised. Created a baronet, 1881, he died Feb. 4, 1885.

Sir Robert Phillimore, British judge

Phillip, Arthur (1738-1814). British sailor and administrator. Born in London, Oct. 11, 1738, he was educated at Greenwich and in 1755 entered the Royal Navy as a midshipman. In 1756 he served under Byng in the Mediterranean, and in 1761 went to the West Indies, where he was promoted lieutenant. After the peace of 1763 he served for some years with the Portuguese navy, but on the outbreak of war between Britain and France in 1778 rejoined the Royal Navy and was promoted captain the following year. In 1786 he was sent to Australia to establish a convict settlement there. He reached Botany Bay on Jan. 18, 1788, but decided to found the settlement at Port Jackson. This eventually developed into the present city of Sydney. He later established a settlement on Norfolk Island, 930 m. north-east of Sydney, and carried out a number of explorations along the coast. Appointed first governor of the settlement in 1791, he retired in 1793 and returned to England. He was promoted vice-admiral, 1810, and died at Bath, Aug. 31, 1814.

Phillip Island. Islet of Victoria, Australia. With an area of 14 m. by 6 m., it lies off the entrance to Western Port Bay. It was named after the first governor of N.S.W., Arthur Phillip (v.s.).

Cowes, the chief place, is on the N. coast.

Phillips, Sir Lionel (1855-1936). British financier. Born in London, Aug. 26, 1855, he went to South Africa at 20 and engaged in the diamond industry. His first large-scale activity was to buy for £10,000 half the Bonanza mine. He soon became a leading figure in South African diamond and gold mining. He was a leader of the Jameson raid, for his part in which he was condemned to death; but his sentence was commuted to a fine of £25,000, a decree of banishment being remitted on his undertaking to abstain from political activity. Five times president of the Transvaal chamber of mines, he was elected in 1910 to the first parliament of the Union, and with the First Great War became controller of the department for the development of mineral resources under the ministry of Munitions. In 1913 he was severely wounded during a strike on the Rand. His baronetcy dated from 1912. He retired from the chairmanship of the Central Mining Corporation in 1924, and died, July 2, 1936. His account of his life, *Some Reminiscences*, was published in 1924.

Phillips, Stephen (1866-1915). British poet. Son of Dr. Stephen Phillips, precentor of Peterborough Cathedral, he was born July 28, 1866, and educated at Stratford and Peterborough grammar schools. He went on the stage and played many parts in Benson's company. He later became an army tutor.

His first volume of poems, *Marpessa*, 1890, brought him exceptional popularity. He wrote apparently for declamation and had no ear for lyrical measures, but his imaginative language and warm colouring took his readers by storm. Later that very experience in stagecraft, which limited his rhythms, inspired the daring originality of *Paolo and Francesca*, 1899, a drama in verse, the production of which by Tree three years later secured the poet's triumph. If *Herod*, 1900, *Ulysses*, 1902, and *Nero*, 1906, glitter with too much tinsel, there was a genuine poetical beauty in the first of his verse plays. Phillips afterwards became over-violent in poetry and drama,

Stephen Phillips, British poet
Elliott & Fry

and fame deserted him before his death, though his episodic war-play, *Armageddon*, had a success soon after the outbreak of the First Great War. In 1905 he reappeared on the stage as the ghost to Martin Harvey's *Hamlet*. He died Dec. 9, 1915. A play by him in blank verse, entitled *Harold*, about the last Saxon king, was discovered in 1921.

Phillips, Sir Tom Spencer Vaughan (1888-1941). British sailor. Born Feb. 19, 1888, he entered the Royal Navy in 1903. He served in the First Great War, passed through the staff college, and became captain in 1927. In 1932 he was appointed chief of staff to the c.-in-c., East Indies, and from 1935 to 1938 was director of plans at the Admiralty. Then he was placed in command of the Home Fleet destroyer flotillas. He became deputy chief of naval staff, 1939, and in 1940 vice-admiral. Appointed c.-in-c., Eastern Fleet, on Dec. 10, 1941, he led a force consisting of the battleship *Prince of Wales* (his flagship) and the battle-cruiser *Repulse*, with escorting destroyers, in an attempt to intercept a Japanese convoy approaching Malaya. After leaving port he was informed that no air cover would be available, but as visibility was low he continued N. When the weather cleared he turned back, but his force had already been sighted, and Japanese bombers sank both major vessels off Khotu Baru. Phillips was thus lost, Dec. 10, 1941, with his ship.

Phillips, Wendell (1811-84). American reformer. Born at Boston, Mass., Nov. 29, 1811, he was educated at Harvard. Called to the bar, he became the most prominent speaker on the abolitionist side, and was president of the Anti-Slavery Society, 1865-70. He advocated state control of the sale of liquor, and reforms in penal administration and labour conditions, and took up the causes of the Indians and the Irish. He died at Boston, Feb. 2, 1884. He was one of America's greatest orators.

Phillipsburg. Town of New Jersey, U.S.A. It stands on the Delaware, in Warren co., 50 m. N.W. of Trenton, with which there is rly. connexion. It was settled in 1749 and incorporated in 1861. Under one foundry is an iron mine, and all kinds of iron and steel products are turned out by the town, which has also rly. repair shops and silk mills. Pop. 18,314.

Phillipotts, Eden (b. 1862). British novelist and playwright. He was born in India, Nov. 4, 1862, and educated at Plymouth. He

worked for ten years in an insurance office before taking up literature as a profession, making his

his first notable success with *Lying Prophets*, 1897, a story of the fishermen of W. Cornwall. Later he

turned to

Devon, producing his "Dartmoor cycle" of twenty volumes, covering the whole area of the moor. *Children of the Mist*, 1899; *Sons of the Morning*, 1900; *The Secret Woman*, 1905; *The Mother*, 1908; *Widcombe Fair*, 1913; and *Children of Men*, 1923, are noteworthy. In lighter vein he wrote *The Human Boy*, 1899, sympathetic and often humorous study of a group of school-boys. He was also the author of many plays, mostly with a Devon background, the most successful being *The Farmer's Wife* (q.v.), 1917, which ran for 1,329 performances in London, and *Yellow Sands*, 1926, written in collaboration with his daughter Adelaide. During 1932-33 his trilogy of novels, *Bred in the Bone*, *Witches' Cauldron*, and *A Shadow Passes*, later collected in one vol., *The Book of Avis*, created fresh interest in his work.

Phillipotts was sometimes called the "Hardy of Devon," although he asserted that he had not read Hardy's novels when his own Dartmoor stories were planned. His tragic novels, moving with relentless logic towards a predestined end, have at their best, however, something in common with the work of Hardy, and present a curious contrast with the almost farcical comedies on which Phillipotts's stage reputation rests.

Philoctetes. In Greek legend, one of the heroes of the Trojan War. In his youth he was a friend of Hercules, from whom he received the arrows poisoned in the blood of the Lernaean Hydra. On the way to Troy Philoctetes received a wound in the foot, and was left behind on the island of Lemnos, where he remained till the tenth year of the war. Then, when an oracle had declared that the active help of Philoctetes was necessary in order to overthrow the city, Diomedes and Odysseus came to fetch him, and with difficulty persuaded him to accompany them to Troy. Philoctetes was made

the theme of tragedies by Aeschylus and Euripides, of which only fragments remain, and of two by Sophocles. *Prom. Filloc-teetez.*

Philo Judaeus. Jewish philosopher and theologian. Born at Alexandria about 20 A.D., he studied all branches of Greek literature and Hebrew learning. The Jews of Alexandria, who had refused to worship the emperor Caligula, sent him as their advocate to Rome, in A.D. 40, and he wrote an account of his mission. Philo's theology, the influence of which has been far-reaching, teaches that the transcendent and unconditioned Deity manifests Himself in creative activity through manifold "powers" subordinated to the personal Logos (q.v.). Philo thus forms a link between the Platonic and Stoic doctrines, the Wisdom literature, and the theology of the fourth Gospel and S. Paul.

Philology (Gr. *philos*, lover of; *logos*, word, speech). Term with three different meanings. (1) Originally, the study of the written word, of literature, especially that of Greece and Rome. This meaning still holds the field on the Continent, especially in Germany. (2) In English-speaking countries, however, the tendency is to understand by it the study of the words themselves, their origin, meaning, inflexions, and correct usage (syntax), which others regard as accessory indeed, but subordinate. In this sense philology may be described as the science of language, as distinct from (3) comparative philology, which is the science of languages.

Comparative philology is the comparative study of the different sounds and words of languages included in a kindred group. The group specially studied in this connexion is that known as Indo-European, Indo-Germanic, or Aryan, and comparative philology is usually taken to mean the study of the Indo-European family of languages, although it might equally well be applied to any other group, such as the Semitic languages. Its object is to collate and explain varieties in form, and to discover the principles which govern them. With this is also connected the comparative study of the syntax of the languages.

Morphologically (according to the structure of the words) languages are divided into

(a) Isolating, monosyllabic, or radical, distinguished by the absence of grammatical inflexions, the relations of words being shown by the position of the radical or a

difference of tone in pronunciation. To this class belong Chinese, Burmese, and kindred dialects.

(b) Agglutinative (glued together). In these, words are formed by the combination of a root-word with suffixes and prefixes, easily separable from the root-word, which remains intact and uncorrupted. To this class belong the languages of southern India, of the Turks and Hungarians. For example, in Turkish, from *sev-mek* (to love) are formed *sev-il-mek* (to be loved), *sev-me-mek* (not to love), *sev-e-me-mek* (not to be able to love), *sev-dir-mek* (to cause to love), etc.

(c) Inflexional. In these the formative part of the word loses its individual character, and is used merely for expressing grammatical relation. Inflexional languages are further subdivided into synthetic, in which different elements unite to form a compound, and analytic, in which the compound is separated into its constituent elements. Greek and Latin are synthetic; English, Persian, and many of the languages of modern Europe, analytic. The place of the inflexions of a synthetic language is taken by pronouns, prepositions, and auxiliary verbs. It is to the inflexional class of languages that the Indo-European family belongs. It is divided into nine groups.

(1) Indian, the most valuable member of which is Sanskrit. The *Rig-Vedas*, a collection of hymns from the sacred literature of the Hindus, are no doubt of greater antiquity than any other Indo-European literature. Bengali, Hindi, Gypsy, and Prakrit and Pali, belong to this group.

(2) Iranian (Persian), including Zend (Old Bactrian), the language of the Zend-Avesta, the sacred books of the fire-worshipping Zoroastrians, found also in the cuneiform inscriptions celebrating the exploits of the Persian kings Darius and Xerxes. The literature of modern Persia begins A.D. 1000.

(3) Armenian, supposed to be of Phrygian origin.

(4) Greek, with its various dialects (Attic, Aeolic, Doric, Ionic), and modern Greek or Romaic.

(5) Albanian.

(6) Italic, including Latin, Oscan, Umbrian, and the cognate dialects of ancient Italy. Vulgar Latin was the origin of the Romance languages: French, Italian, Spanish, Portuguese, Rumanian or Rhaeto-Romanic (spoken in East Switzerland), Rumanian, and Provençal.

(7) Celtic, including Cymric, still spoken in Wales and Brittany

(Breton, Armorican), and extinct in Cornwall; Gadhælic (Goidelic), of which the three forms are Irish, Manx in the Isle of Man, and Gaelic in the highlands of Scotland.

(8) Teutonic, to which group English belongs. It includes (a) Gothic, spoken in the Roman province of Dacia, preserved in fragments containing the greater part of a translation of the New Testament by Ulphilas (*q.v.*), the oldest record of a Teutonic language; (b) Western Germanic, subdivided into Old High German, the ancestor of modern German; Old Low German, represented in modern times by Low Saxon, spoken in a considerable area of northern Germany; Anglo-Frisian, from which modern Frisian, spoken in the N.E. of the Netherlands and in Slesvig, and English, are descended; Old or Low Franconian, the origin of Dutch and Flemish; (c) Eastern Germanic or Scandinavian, including Danish, Swedish, Norwegian, and Icelandic, the earliest remains of which are the Runic inscriptions.

(9) Letto-Slavonic. (a) Lettic (Baltic), including the extinct Old Prussian, and Lithuanian; (b) Slavonic, comprising Czech (Bohemian), Polish, Russian, Serbo-Croatian, modern Bulgarian, and Slovenian. Of these Old Bulgarian or Ecclesiastical Slavonic, the language of the earliest Christian writings of the Slavs, is the most interesting.

The Finno-Ugrian Group

Only very remotely related, if at all, to the Indo-European group are the Finno-Ugrian languages, spoken in Central Europe from Finland to Hungary. The main member-tongues are Finnish, Lapp, Estonian, Mordvin (spoken about the lower Volga), and Hungarian; dialects of these, having each from 3,000 to 300,000 speakers, number about a dozen. The Finno-Ugrian group is remotely related to Tartar and Mongolian, but this connexion has been greatly obscured by free borrowings from its Germanic, Slavonic, and Persian neighbours.

The relationship of the different languages belonging to the Indo-European group is proved by the identity of some of the commonest words denoting action, existence, and similar notions. Take the present tense of the verb to be: Sanskrit, *asmi, asi, asti, smas, stha, santi*; Latin, *sum, es, est, sumus, estis, sunt*; French, *suis, es, est, sommes, êtes, sont*; brother in Sanskrit is *bhrātā*, Greek *phrater*, Lat. *frater*, Celtic *brathair*, Russian *brat*, German *bruder*, English *brother*.

The first three numerals are: Sanskrit, *ekas (eka-), dvau (dua-), trayas (tri-)*; Gr. *heis, duo, treis*; Lat. *unus, duo, tres*; Celtic *un, dau, tri*; Russian *adeen, dva, tri*; German *ein, zwei, drei*; English *one, two, three*. So many similarities of this kind are found that it is certain that an older language, the parent of all Indo-European languages, once existed. It is possible to a certain extent to reconstruct it.

Indo-European Civilization

A number of words pointing to a certain degree of civilization were also the common property of the Indo-European languages. These show that the parent family was acquainted with the use of domestic animals such as the horse and cow, and tended sheep and herds; they lived in houses or huts with doors, not in caves; used rowing boats, made garments of wool and sheepskin, prepared food at the fire, and knew something of the earliest metals. They reckoned by months, and counted up to a hundred.

The question of their original home has not been satisfactorily answered. Older authorities placed them in Central Asia, but modern philologists favour a locality farther west—the borders of Europe and Asia, or even Europe itself, to the N. of the Carpathians.

A comparison of the older with the more recent forms of the languages belonging to the Indo-European family, for instance, modern English with that of Alfred's day, shows that great alterations have taken place in the form and meaning of words, and such changes are still going on. The comparative philologist examines these changes and, where possible, accounts for them.

Comparative philology was first rendered possible by Sir William Jones (1746–94), who introduced ancient Sanskrit to European scholars. Franz Bopp was his equal in Germany. F. A. Pott (1802–87) was the first to investigate scientifically the whole Indo-European group of languages from the standpoint of etymology. The names of A. Schleicher (1821–68), G. Curtius (1820–85), and W. Corssen (1820–75), were the most distinguished representatives of what is called, somewhat arbitrarily, the old school of Philologists. F. Max Müller (1823–1900) popularised the results of philological study for the ordinary student. Some of his theories did not meet with general acceptance, and his views on the nature of language

and its changes are at variance with those of W. D. Whitney (1827–94), whose work on the Life and Growth of Language gave a new impulse to the study.

ROOTS AND INFLECTIONS. The simplest form of a word is the root, that part of a word which remains after it has been stripped of everything formative and accidental. The next stage is the base or stem, in which the root is prepared to receive the inflexional suffixes. Thus, *da-*, *i-* are roots representing the general ideas of giving, going; *da-tar*, giver, with the addition of *-tar* denoting the agent, is a base. To indicate some special relation of one person or thing and another, an inflexional suffix is added: *da-tar-as*, of the giver. This form of a word is called a case (Lat. *casus*, falling, variation). The number of cases in the parent language was seven: nominative, accusative, genitive, dative, locative, ablative, instrumental. The vocative is merely a stem-form. In addition to two numbers, singular and plural, there was a dual, rarely used. The distinction of gender in nouns seems to have been artificial. In the verb, there were originally two voices, active and middle, the latter fulfilling the function of the passive. There were four tenses: present, future, perfect (imperfect), and aorist, the last three of which might be included in the general term past; and four moods, indicative, imperative, subjunctive, and optative. These inflexional variations can be best studied in highly inflexional languages, such as Greek and Latin, whereas in analytical languages, such as English, they have left hardly any traces.

A younger branch of philology, has received the name Semantics (*q.v.*). See also Grammar; Language; Nominative, Genitive, etc. Consult An Introduction to Comparative Philology, J. M. Edmonds, 1906; Language, O. Jespersen, 1922; The Loom of Language, F. Bodmer, 1944.

Philomēla (Gr., lover of song). In Greek mythology, daughter of Pandion, king of Athens. Dishonoured by Tereus, a Thracian prince who had married her sister Procne, Philomēla, together with her sister, took revenge by serving up to Tereus the flesh of his own son Itys. Procne and Philomēla, pursued by Tereus with an axe, in response to their prayers were transformed into a nightingale and a swallow, while Tereus became a hoopoe. According to another version, Philomēla becomes

the nightingale, and in poetry her name in English, Philomel, is a synonym for that bird. *Pron.* Fillo-meela.

Philopoemen (c. 252–183 B.C.). Greek general and patriot, known as “the last of the Greeks.” Born at Megalopolis, he devoted himself as a young man to military studies, and fought with distinction at the battle of Sellasia, 222. In 208 he was elected general of the Achaean League (*q.v.*), when his technical military reforms bore

excellent fruit, in the form of a defeat of the Spartans, near Mantinea. Recognizing the power of the Romans, he avoided conflicts with them. He took Sparta in 188, and abolished the institutions of Lycurgus. During a Messenian revolt he was captured and compelled to take poison.

Philosopher's Stone. One of the chief objects of search in alchemy (*q.v.*). It was a supposed substance that had the power of turning base metals into gold.

PHILOSOPHY: THE SEARCH FOR WISDOM

Lord Lindsay of Birker, Master of Balliol College, Oxford, 1924–49

This work contains articles on the various systems of philosophy, e.g. Epicureanism; Pragmatism; Scepticism; Stoicism. See biographies of great philosophers, e.g. Aristotle, Descartes, Green, T. H., Hegel, Kant, Plato, Socrates; also Ethics; Metaphysics

Philosophy is a Greek word, invented by Socrates in the 5th century B.C. to express the distinctive attitude which he took up to knowledge. His scientific contemporaries and predecessors had called themselves Sophoi—wise men; he called himself a philosopher—one fond of or seeking wisdom—to show that, while he believed in wisdom or science, he did not think he or anyone else had attained it. The philosopher is someone who is seeking wisdom, and has begun by a consciousness of his own ignorance—and philosophy is the name for the inquiries he makes, or for his thinking.

In the original meaning of the word, then, there was little distinction between philosophy and science, except that the suggestion of seeking conveyed by the word philosophy made men give the name science to those inquiries where knowledge was attained and certain, philosophy to those where the search for knowledge was more obvious than its results. In this sense of the word philosophy, the sphere of philosophy contracts as that of science widens. This is to some extent borne out by history. We find the Greeks, or even a man like Descartes in the 17th century, including under philosophy what we should now certainly call science. This suggests that in time, as the methods of science are applied to every sphere of human inquiry, there will be no sphere left for philosophy.

But the real implications of Socrates's new word were rather different. When he said that he was ignorant, he did not mean that he was ignorant of certain things which the mathematician knew, but that the mathematician did not know as much as he thought

he knew; that the so-called knowledge of his contemporaries was not really knowledge. Philosophy, therefore, with him and his successors, involved a criticism of existing knowledge, an attempt to say what it all comes to. In a famous passage in the Republic, Plato contrasts the methods of the scientist and of the philosopher by saying that the scientist starts with certain assumptions which he takes for granted and does not examine, while the business of the philosopher is to criticise the assumptions of the separate sciences and from such criticism to come to an understanding of the whole.

This suggests two characteristics of philosophy. In the first place its method is reflective. It takes as its data not the data of the sciences, but the sciences themselves. In the second place it is concerned with things as a whole; the sciences are departmental.

The Philosopher's Task

The impulse to philosophy arises from the apparent contradictions of different spheres of human inquiry. Thus in Greece in the 5th century B.C. the growth of science seemed to threaten the moral basis of the Greek city state—science and morality seemed in conflict—and the great Greek philosophers were men who cared for both science and morality. Their task was to show that if the real nature of each was understood, and what each implied, the contradiction vanished. It came only from one or the other inquiry overstepping its proper bounds. So again in the 17th century the new applied mathematical sciences, with their assumptions of a world infinite in time and space, rigorously determined and mechanical, seemed to destroy the foundations both of

religion and of the moral life. The work of the philosophic movement of the 17th and 18th centuries, which began with Descartes and culminated in Kant, was to resolve this apparent contradiction. It did so by seeking first to determine the real nature of science and of religion and morality, and by so doing to determine their bounds.

The general lines of the solution are always the same. Contradictions arise only because men engaged in these different inquiries have not properly understood what they have been doing. They have not made clear to themselves the principles on which their inquiries are based, and so have gone outside their proper task. Religion has talked science, talked it on religious lines and therefore badly, and given its bad science an authority it did not deserve. Science has talked religion, on scientific methods and therefore badly, and given to its bad religion an authority it did not deserve. We can understand what we are doing in these different spheres of life only by reflecting on the principles or assumptions on which our different activities are based. This is the task of philosophy. Thus the business of moral philosophy is not to say what is right or wrong—that is done in moral judgements—but to understand what morality is; as the business of the philosophy of art is not to say what is beautiful or ugly, but to understand what we are doing when we call things beautiful or ugly, and what the relation of that activity is to morality or to science. Philosophy, therefore, is always concerned with the principles or assumptions which lie behind different branches of human activity. It is not concerned with the details of those activities, except in so far as they illustrate the principles.

This concern with first principles is what gives philosophy what is called its *a priori* character. This does not mean, as is sometimes supposed, that philosophy has no relation to facts, and is spun out of the philosopher's inner consciousness. All great philosophies have started with the consideration of special problems presented by the sciences of their day, and have been built on knowledge of and reflection upon those sciences. It has, however, sometimes been thought that it is possible by a study of the first principles implied in science and other human activities to build up a knowledge of the real nature of the universe,

which goes beyond and may have very little to do with our actual knowledge of different facts.

Idealism, as sometimes understood, and materialism, are philosophies which profess to show, by rigorous reasoning, that the only reality is mind or matter. It was the great achievement of Kant to show in his *Critique of Pure Reason*, 1781, that in such a dogmatism, as he called it, philosophy was overstepping the limits of its function, and using conceptions, which were only applicable to what we experience, outside the bounds of experience. Philosophy, he held, should be confined to criticism, to the understanding of the relation of the sciences and other forms of human activity to one another.

Nevertheless, just because philosophy is reflective in the sense described, it is always concerned to see things as a whole, to overcome the departmentalism of the different branches of human activity, and to attempt to say what they all come to.

Its assumption in this task is that the world we live in is an intelligible one. It can also sketch what would be an intelligible universe; what must be the relation of the various things we know, and all that is beyond our knowledge if the whole is to be thought of as intelligible. This is the constructive side of philosophy. No one can read a great constructive philosopher like Plato or Spinoza or Hegel without feeling

that he has, somehow, in the process come to understand more of the meaning of life and of the nature of the world we live in.

It is a mistake, however, to suppose that such constructive philosophy, such a world vision, as the Germans call it, has either the precision of the exact sciences or the rigour of logical criticism. The great philosophies bear upon them the stamp of the personality of their authors. They seem to stand between science and poetry. Their illumination and truth are of the order of poetic rather than of scientific truth. A philosophy has a value all its own, because of its comprehensiveness, because it is the wisdom of a mind which has tried to think through and comprehend the great mass of human knowledge. Such philosophies can never be final. For, as the sum of human knowledge increases, as science lays open new fields to man's understanding, the comprehensive and synthesising work of philosophy has to be done afresh.

MODERN PHILOSOPHY

C. E. M. Joad, M.A., D.Litt

This article explains how 20th century developments, in society itself, in concepts of human motive, and in the attitude to reason, have affected the philosopher's approach to his subject

Modern, that is to say 20th century, philosophy is in a state of confusion. "Philosophy," says Lord Lindsay in the preceding article, is "concerned with things as a whole." He is right; but there is, broadly speaking, no contemporary philosophical view of "things as a whole."

In most of the ages of recorded history and as recently as the 19th century people thought they knew what the world was like and what it was for. The world was a creation by God and it was for the moral training and development of man. That was the religious view. Or, alternatively, it was a collection of material, particles, moving about in space, and it was for nothing at all. That was the scientific view. But neither the religious nor the scientific view is

held with the old certainty. We also live in an age of political disintegration and revolution; and philosophy reflects the conditions of the age in which philosophers live and must try to think.

Lord Lindsay speaks of "constructive philosophy" and its "world vision." In the 20th century, broadly speaking, these no longer exist. Instead, philosophers address themselves to particular problems, tackle them piecemeal, and instead of seeking, as they have done in the past, to deduce by reasoning what must be the nature of the universe as a whole, are content if they can put forward considerations which may be true in regard to separate problems such as the nature of "perception," or the meaning, if any, to be attributed to the term "the

unconscious self." Or they endeavour to suggest fruitful hypotheses for science to explore. In this way philosophy has approximated more closely to science, both in its methods and in its conclusions, than in the past.

There are two main reasons for this narrowing of scope and limitation of aim. First, there is a scepticism in regard to the instrument of knowledge, reason. It is, after all, by means of reason that, men have believed, information about the universe was to be obtained; it is certainly by means of reason that philosophy has been pursued. A number of factors have combined to throw doubt on this traditional view:

(1) Pragmatism (*q.v.*), which has suggested that reason functions only to serve our purposes, and that the so-called truths at which it arrives are, in fact, only those which it suits us to believe.

(2) The influence of the French philosopher, Henri Bergson, whose thought flourished more particularly in the years immediately before 1914. Bergson, in fact, made philosophy fashionable. In a number of works, of which *Creative Evolution* is the best known, he sought to show that the universe is not as it appears, a collection of comparatively solid, static objects occupying space, but is a continuous flow or flux exemplified for us by the stream of our own consciousness. It is by the faculty which Bergson called "intuition" that the true nature of reality as a continuous flow is realized.

(3) The influence of psychology in general and of psycho-analysis in particular, which has thrown doubt upon reason by disclosing the influence upon it of the non-rational factors in our make-up. Reason is thus represented as a handmaid of desire, its function being to invent arguments for what we instinctively want to believe.

A second factor which has led to the abandonment of traditional philosophical claims and methods is logical positivism. This, which originated in the work of Bertrand Russell, is concerned to inquire into the nature and meaning of language, in order to determine whether, when we use such words as "reality," "truth," "justice," "ultimate," "universal," we are really saying anything at all about the nature of the world. If, as the logical positivists assert, we usually are not, the question arises whether the traditional language of philo-

sophy can ever give us information about the universe which exists independently of ourselves.

Logical positivism is, perhaps, the most important 'single movement in contemporary philosophy. Nevertheless, its effect is almost purely destructive. If its contentions are correct, no constructive theory of the nature of the universe can be offered by philosophy or by anything else.

Of the philosophies which follow more traditional methods, two only can be mentioned here. The first, that of Samuel Alexander, is the most complete philosophical expression of the doctrine of evolution, in that it regards the whole universe as evolving, and producing ever higher levels of being in the process of its own development. Of these the highest, God, is regarded as being Himself a product of the evolving universe and sharing, therefore, in the process of its development. The second system, that of A. N. Whitehead, takes its rise from a criticism not only of the traditional scientific view of the universe but also of scientific method, regarded as the sole and exclusive method for the discovery of truth. Science, Whitehead has insisted, must be supplemented by the data provided by art, personal relations, and religion. The view of the universe which results is modelled on the conception of a living organism.

Philostratus (c. A.D. 170–250). Greek sophist. Born in Lemnos, he studied and taught at Athens, and later took up his abode in Rome. At the instigation of his patroness, Julia Domna, wife of the emperor Septimius Severus, he wrote a romantic Life of Apollonius of Tyana, Lives of the Sophists, and a treatise on Gymnastics. Another Philostratus wrote on Paintings.

Phipps, SIR ERIC CLARE EDMUND (1875–1945). British diplomatist. Son of an ambassador, he was born Oct. 27, 1875, and educated in Paris and at King's College, Cambridge. He entered the diplomatic service in 1899, and, after minor appointments, became counsellor of embassy at Paris, 1919, and the following year at Brussels. In 1922 he went to Paris as minister, in 1928 becoming minister in Vienna. His appoint-

ment as ambassador in Berlin coincided with the rise of Hitler, and his reports formed the basis of a white paper which was presented to parliament explaining the German situation. In 1937 he succeeded Sir George Clerk as ambassador in Paris, remaining there until his retirement in 1939. He was knighted in 1927, and he died Aug. 13, 1945.

Phiz. Pseudonym taken by the Dickens illustrator, H. K. Browne (q.v.) to accord with Dickens's pseudonym, Boz.

Phlebitis (Gr. *phleps*, vein). Inflammation of a vein. This condition rarely occurs in a healthy vessel but rather in one that is varicose or has its walls diseased following high blood pressure, conditions like rheumatism, or the infective fevers. The part around the inflamed vein becomes red and hot; there is swelling, and tenderness to touch. A clot commonly forms, and the vein now stands out as a hard raised line. Treatment consists in absolute rest of the part for some six weeks. The risk is that part of the clot will break off and be carried away, either taking the infection with it or possibly causing death by striking a vital organ. Cure occurs after the acute inflammation has subsided by the blocking of the affected vein, the blood finding its way by other routes; or by the blood-stream channelling a path through the clot.

Phlebotomy. Technical term for the process of cupping (q.v.).

Phlegethon (Gr., flaming). In Greek mythology, a river of fire in the lower world.

Phloëm (Gr. *phloios*, inner bark). Botanical term, denoting the bast or soft cellular tissue on the exterior of the vascular bundles found in stems, leaves, and roots of plants. Its cells form the channel through which the sugar and proteins elaborated in the leaves are transmitted to those parts of the plant where they are required for building up and for reserves.

Phlogiston (Gr. *phlogistos*, burnt). Term formerly used in chemistry for a supposed substance contained in all inflammable materials. The phlogiston theory was widely held by leading chemists in the 18th century, it being believed that the more phlogiston present in a substance, the more violently it burnt. The theory was exploded by the researches of Lavoisier and Priestley.

Phlogopite (Gr. *phlox*, flame; *ops*, face). In mineralogy, a magnesium mica. It is a light yellow

to brown and red, and when looked at through a thin sheet it shows star-shaped reflections. It is found in association with ultrabasic igneous rocks and altered limestones. It has value as an insulator in electrical equipment.

Phlomis. Large genus of shrubs and herbs of the family Labiatae. They are natives of the temperate and mountainous parts of Asia and the borders of the Mediterranean. They have yellow, purplish, or white flowers in whorls around the upper parts of the stems. The wrinkled leaves are in many cases cottony or woolly beneath. Some species are very showy.

Phlox (Gr., flame). Genus of about 50 species of herbs, mostly perennials, of the family Pole-

Phlox. Foliage and flower clusters

moniaceae, natives of N. America (chiefly) and Siberia. They have undivided leaves, and showy salver-shaped flowers of some tint of red, violet, or white, borne singly or in panicles. Many have become favourite garden flowers in Great Britain, to which the smooth-leaved *P. glaberrima* was introduced in 1725 from what is now the southern U.S.A. From this and from *P. paniculata* and *P. maculata*, introduced a few years later, most of our garden hybrids have descended. These are perennials, propagated by cuttings and root-divisions; the natural species may also be increased by seed sown as soon as ripe. There are several dwarf perennials, whilst the favourite half-hardy annual is *P. Drummondii*. Phloxes do well in any well-drained garden soil.

Phocaea. Ancient Greek city of Asia Minor. Situated on a promontory N. of the Gulf of Smyrna (Izmir), it became a great maritime and colonising power; the Greek colony of Massilia (Marseilles) was an offshoot from Phocaea. When, with other Greek cities of Asia Minor, Phocaea passed under the dominion of Persia, about the

middle of the 6th century B.C., the majority of the inhabitants emigrated to Corsica and elsewhere.

Phocion (402-317 B.C.). Athenian general and statesman. A competent soldier, he distinguished

Phocion,
Athenian general
From a statue in the
Vatican, Rome

himself at the battle of Naxos in 376, at Tamynae in 354, and by raising the siege of Byzantium in 339. A sincere patriot, noted for his single-minded integrity, he nevertheless belonged to the pro-Macedonian party at Athens, believing that resistance to Philip and later to Alexander and Antipater was useless, and that he was doing a real service to his country by impressing this idea on the Athenians. In 318 Phocion was accused of assisting the son of Polyperchon to occupy the Piraeus, and was condemned to death the next year.

Phocis. Country of ancient Greece. It lay N. of the Corinthian Gulf and W. of Boeotia. It contained the famous Mt. Parnassus (*q.v.*), sacred to Apollo and the Muses, and the equally famous Delphic Oracle (*see* Delphi). The population was chiefly Aeolic, mostly occupied in pastoral pursuits. There were no large towns. The Phocians were not conspicuous in Greek history until the 4th century B.C., when, owing to their failure to assist them at the battle of Mantinea in 362, the Thebans instigated the Amphictyonic Council (*q.v.*) to declare their land forfeited to the Delphian Apollo. The Phocians, led by an able citizen, Philomelus, retorted by seizing the treasure at Delphi and, using it to hire mercenaries, defied Thebes and the Amphictyons for ten years, and only yielded in 346 when Philip of Macedon came to the help of the Amphictyons. The war is known as the Sacred War. *See* Greece.

Phoebē (Gr., bright). In Greek mythology, name given to Artemis as moon goddess, the female counterpart of Phoebus. *See* Artemis.

Phoebus. In Greek mythology, name given to Apollo as sun god. *See* Apollo.

PHOENICIA: ITS CULTURE & COMMERCE

A. D. Innes, M.A., and E. G. Harmer

Related articles that may be consulted are those on Carthage; Jews; Mediterranean; Palestine; Syria; Tyre; Sidon. See also Alphabet

Phoenicia was the small territory on the E. coast of the Mediterranean lying immediately N. of Palestine, between the range of Mount Lebanon and the sea. Its length from Akko (the modern Acre) northwards does not exceed two hundred miles; its breadth averages perhaps fifteen miles. As a military power Phoenicia played no important part in the world's history; but she planted colonies, one of which, Carthage, achieved for a time an imperial position; the skill of the Phoenician seamen gave their fleets a high value in maritime warfare; and their supremacy in regard to seaborne commerce was maintained, in spite of the development of Greek rivalry, until Phoenicia lost her separate existence at the end of the fourth century, and her offspring Carthage was crushed by Rome a hundred years later.

Language and Religion

It is generally agreed that the Phoenicians belonged to the great race group known as the Semites. Their language at least was Semitic, closely related to Hebrew. Their religion was based upon the worship of the male and female principles, commonly associated with the names Baal and Ashtaroth, or Astartē; though in course of time the two were multiplied by a process resembling that by which in medieval times popular superstition tended to make many saints out of one who had several famous shrines. Of Baal and the Baalim we hear much in the Hebrew records; and we know that the worship of Melek, the Moloch of the O.T., was accompanied by human sacrifice, and more particularly by the burning of infant victims; while the worship of Ashtaroth carried with it the repulsive practice of religious prostitution.

The destinies of Phoenicia were determined by her geographical position. The Semitic wave which bears the general name of Canaanite occupied Palestine and the regions to the N. of it a century or two before 2000 B.C. Between 1600 and 1200 the S. portion was conquered by fresh Semitic tribes from the S., the Hebrews, and by the Philistines, maritime invaders from across the sea. But the N. Canaanites, the Phoenicians, were able to hold their own against both the invaders, since they were open to attack only by sea or by the two narrow entries in the N. and on the S.—the mountains of Lebanon

providing them with an effective barrier along the whole rear. This security upon the landward side encouraged maritime development; so that the Phoenicians were already able to resist the attack of the Philistine pirates, and learnt the advantage of devoting themselves to commerce in the centuries when other nations and other races were still engaged in a perpetual struggle to win a foothold in new territories, or to hold these territories against invaders.

The fame of the Phoenicians is due to their supremacy as navigators over all rivals. In the 5th century the pre-eminence for a thousand years which they had inherited was still undisputed. They alone of seafaring men had passed out of the Mediterranean, coasted along Spain and France, established a trade with the "Tin islands"—the Scilly Isles and Cornwall—and penetrated possibly as far as the Baltic, from which they procured amber. Moreover, Phoenician ships in the Egyptian service actually accomplished the circumnavigation of Africa about the year 610 B.C., though the voyage was not repeated. They are the single people in the ancient world who lived for commerce; they sought no territorial dominion; if they planted out colonies, the primary intention at least was merely the establishment of trading stations like those of the English in India during the 17th century; Carthage alone, long after its foundation, sought to develop upon imperial lines, and to establish a political ascendancy where she secured a commercial footing. First of men, the Phoenicians learnt that seafighting is primarily a matter of seamanship, and, being skilled seamen, could defy attacks by sea.

Commercial Importance

Like the maritime Italian cities of the Middle Ages, the Phoenician ports became the commercial emporiums of the ancient world, and they waxed wealthy; but the Phoenicians are not to be credited with any remarkable manufacturing inventions. It was the exploitation of ancient purple dyes, not their discovery, for which they became famous. In the making of glass, wherein they excelled, they only turned to better account processes already invented by the Egyptians, and their reputation as clothmakers was attained by improved methods rather than by original discoveries. Phoenicia

1. Restoration of tomb at Amrith, shown also in 2 in its ruined state. 3. Carved ivory comb. 4. Bowl in repoussé work, from Fraeneste. 5 and 6. Sarcophagi from Sidon. 7. Bronze mirror handle. 8. Pottery vase with typical Phoenician ornament, from Dali, Cyprus. 9. Examples of glass-work. 10. Bead necklaces

PHOENICIA: ARTISTIC HANDIWORK OF THE ANCIENT SEMITIC KINGDOM

With the exception of 8, by courtesy of Chapman & Hall, Ltd

made no original contribution to art; but it was in strict accord with the Phoenician genius that it should have made the great advance upon early systems of script or writing which rendered the Phoenician alphabet the basis of those which ultimately prevailed in the Western world.

Phoenicia never formed a united nation with a common government. It was a group of city-states, of which the most important were Arvad (Aradus), on the N., Gebal (called by the Greeks Byblos and by the Egyptians Kapun), Beirut, Sidon, and Tyre on the S. Early in the 15th century B.C. the conqueror Thothmes III brought them under the Egyptian supremacy (*see* Egypt), and they became tributaries, though otherwise remaining autonomous. At this time Byblos apparently held the leading position. By the 13th century the yoke of Egypt had slipped off. Phoenicia was again independent, and it is this period which marks the beginning of its maritime and commercial ascendancy. Politically, however, Tyre seems soon to have predominated, the result, perhaps, of its extraordinary strength as a fortress; but Sidon probably enjoyed a prestige of its own as the religious centre. In the Homeric poems, not Tyrian but Sidonian stands as the general equivalent for Phoenician. During the 12th century Tyre and Sidon were planting out colonies along the coast of Africa at Utica and elsewhere, and even beyond the straits of Gibraltar in Spain, at Gades and Tartessus, which is usually identified with the Tarshish mentioned by Jeremiah (c. 600 B.C.).

Relations with the Hebrews

In the 11th century the Hebrew records show that Tyre had definitely become the leading Phoenician state. Hiram, king of Tyre, was the ally of David and Solomon during the brief period of Hebrew consolidation and expansion, which broke down with the disruption that followed the death of Solomon. The relations between Phoenicia and the Hebrew kingdoms were maintained, and Ahab, king of Israel, married Jezebel, daughter of Ethbaal, or Ithobal, king of Tyre and Sidon, in the earlier half of the 9th century. It was about this time, however, that the power of Assyria was extending, and Phoenicia before 840 had become tributary to Shalmaneser III.

After 730 Tyre revolted, and successfully defied the power of Shalmaneser V. Phoenicia was again subjugated by Sennacherib,

about 700, and though she again achieved a brief freedom when Assyria was shattered towards the end of the 7th century by the rise of the new Babylonian empire, she soon found herself forced to submit to Nebuchadrezzar, though Tyre, on its island fortress, held out against his attack for 13 years. Phoenicia yielded a ready submission to Cambyzes in 527.

Then for two hundred years Phoenicia formed an autonomous province within one of the great satrapies of the Persian empire, providing the Persian kings with the most efficient contingents of their fleets. In 351, however, Phoenicia revolted. Overwhelming armies were poured into the province; resistance was hopeless; but the people of Sidon rather than submit chose to make a literal holocaust of the city when 40,000 of the inhabitants are said to have perished in the flames (345). Eleven years later, when Alexander the Great invaded Persia, his movements were greatly hampered by the fact that his enemy had command of the sea, because the Phoenician fleet still served the Great King, though its loyalty cannot have been deeply rooted. But after Alexander had put Darius to rout at the Issus (333), the cities of Phoenicia, with the exception of Tyre, broke from the Persian allegiance and submitted to the Macedonian.

Siege of Tyre

Then ensued one of the most memorable sieges in classical history. Tyre, on its island, had defied Nebuchadrezzar for 13 years; now it defied Alexander. It was only by means of engineering operations without precedent or parallel that the great master of war was at last enabled to storm the fortress after an heroic defence; nor would that success have been within his reach but for the accession of the Phoenician fleet, with the exception of the Tyrian navy itself. With the fall of Tyre in July, 332, the separate history of Phoenicia comes to an end. The history of Greater Phoenicia, the independent Phoenician colonies, was to all intents and purposes the history of Carthage.

ARCHAEOLOGY. Material remains of the Phoenician civilization have been sparingly recovered in the homeland. Marked by an imitative rather than a creative spirit, the earlier examples form an imperfect amalgam of Egyptian and Mesopotamian motives, the later an unskilful adaptation of Hellenistic art.

Along the coast are many rock-cut tombs, sometimes with remains of monolithic and other external structures. Some have yielded sarcophagi shaped like swathed mummies. The finest, that of Eshmunazar, in Paris, and that of his father Tabnith, in Istanbul, were both Egyptian importations; the local work is inferior. The primitive temple at Amrith, the only one extant in Phoenicia, copied the Egyptian style. The preference for megalithic masses is shown by the Arvad city walls and the Thapsus harbour works. In 1920 the fortifications surrounding the Sicilian island of Motya were reported traced.

No specimens of Phoenician weaving or dyeing have been identified. The importance of the purple industry is attested by immense shell-mounds near Sidon and Tyre; how far their textile trade was served by native looms is unknown. Glasswork is represented by small ointment flasks tinted with metallic oxides, and by opaque glazes—copied from Egyptian falence—which were used for imitation jewelry, amulets, and the like, produced for export. Terracotta figurines of indifferent quality were turned out for the same trade.

Skill in Metal Work

Excellent work was done in engraving and hammering sheet metal. Cups and platters, or paterae, in silver and silver-gilt, with mythical scenes and illustrations of daily life, sometimes bear Phoenician inscriptions, but the best were Cypriote. One such Cyprus bowl, with the name of Hiram, king of Tyre, exhibits the oldest example of Phoenician writing. Bronze paterae unearthed at Nimrud, associated with ivory carvings, sometimes reveal the names of Phoenician artisans, presumably attached to the Assyrian court. Unimaginative mixtures of styles characterise much Phoenician work, as in the form of the sphinx, which was usually recumbent, as in Egypt, but winged, as in Assyria.

Of the many thousands of inscriptions collected, few are of historical value. The earliest has been mentioned; another, from Sinjerli, preceded the fall of Nineveh. All others, including the famous Yehawmelek stela from Byblos, are subsequent to the Persian conquest. Phoenician seacraft is illustrated on Assyrian wall-reliefs and in Egyptian tomb-paintings. Nothing remains to mark the more distant adventures of the Phoenician seamen in their

voyages round Europe and Africa. *Consult* History of Phoenicia, G. Rawlinson, 1889; Ancient History of the Near East, H. R. Hall, 8th ed., C. J. Jadd, 1932.

Phoenix. In Greek legend, king of the Dolopēs. He became tutor of Achilles, accompanying him to the Trojan War. He was one of the heroes who took part in the hunt for the Calydonian boar.

Phoenix. In astronomy, one of the southern constellations. Named by Bayer, 1603, it possesses a number of well-known double stars, Alpha Phoenicis having a period of 190 days. It was shown by Sir David Gill to be moving away from the sun at over 50 m. a second.

Phoenix. Mythical bird of the Egyptians, sacred to the sun god. In the best-known version of the fable, the bird was supposed to appear at Heliopolis once in every 500 years and build a pyre, on which it was burnt, a new phoenix rising from the ashes.

Phoenix. British assurance company. It was founded in 1782, being one of the oldest associations of the kind. Its assets are over £50,000,000, and the head offices at Phoenix House, King William Street, London, E.C. 4.

Phoenix. City of Arizona, U.S.A., capital of the state and co. seat of Maricopa co. A rly.

Phoenix, Arizona. Air view of the state capital

junction, it is 145 m. N.W. of Tucson. Its industries are concerned with dairy products, it exports citrus fruit, and Indians do a lively trade in precious stones. The dry climate attracting many visitors, during the 1930s Phoenix greatly extended its boundaries. Its buildings are among the most modern in the U.S.A. Pop. 65,414.

Phoenix Islands. Group of eight small islands in the Pacific,

about 1,200 m. N.N.E. of Fiji, in lat. 3°-5° S., long. 170°-175° W. They cover about 16 sq. m. and support a pop. of 850. They are ruled as part of the British colony of Gilbert and Ellice Islands, but the U.S.A. has been granted facilities for communications and aviation on Canton and Enderbury Islands.

Phoenix Park. Public park on the W. confines of the city of Dublin. The name is derived from the Irish *fiann uisce*, clear water. It comprises 1,752 acres, with a circuit of 7 m. Within the grounds are Viceroyal Lodge and the former residence of the chief secretary, the zoological gardens, the people's garden, and an obelisk (205 ft. high) in memory of the 1st duke of Wellington. *See* Dublin.

Phoenix Park Murders. Name given to the murders of Lord Frederick Cavendish and T. H. Burke in Phoenix Park, Dublin, May 6, 1882. On that day Earl Spencer, the new lord-lieutenant, entered Dublin in state, and in the evening Lord Frederick, the chief secretary, and Burke, the under-secretary, set out across Phoenix Park for the former's residence. It was still daylight, but on the way they were attacked by four men with knives and killed. In 1883 a builder named James Carey turned informer, and largely on his evidence 20 men belonging to the Irish Invincibles Society were found guilty and five hanged for the murders. Carey was sent for safety to S. Africa, but, although great secrecy was observed, he was murdered on board. *See* Parnell, C. S.

Phoenix Theatre. London playhouse in Charing Cross Road, W.C. 2. It was opened Sept. 24, 1930, under the management of C. B. Cochran, the first production being Noel Coward's *Private Lives*. Other successes included *Late Night Final*, 1931; *To-night at 8.30*, 1936; revivals of Congreve's *Love for Love*, 1943, and Vanbrugh's *The Relapse*, 1948. The theatre seats 1,011.

Pholas. Genus of marine bivalve molluscs. They burrow in soft rocks, wood, and firm mud around the shore, about four species occurring in Great Britain. They have white shells, and the common species, *P. dactylus*, is

Pholas. Section of soft rock showing examples of *Pholas dactylus* in their burrows

locally known as the piddock, and used for both bait and food.

Phon. Unit of the scale of loudness. It uses an arbitrary zero based on an acoustical pressure of 0.0002 dynes per sq. cm., and has a pure reference tone of 1,000 cycle source of sound. It is numerically equal to the decibel, but is reserved for a standard note, whereas the decibel refers to acoustical intensity. *See* Noise.

Phonetic Alphabet. Accepted, though erroneous, name for the system of letter identification used in telephony and radiotelephony to avoid confusion in the spoken pronunciation of the spelling of transmitted words; sometimes called spelling by analogy. In 1943, when much military traffic was carried over British post-office telephone lines, the Royal Corps of Signals introduced the following phonetic alphabet, afterwards adopted as standard in the U.K. by the P.O., defence authorities, and govt. depts.:

A, Able; B, Baker; C, Charlie;

D, Dog; E, Easy; F, Fox; G,

George; H, How; I, Item; J,

Jig; K, King; L, Love; M,

Mike; N, Nan; O, Obote; P,

Peter; Q, Queen; R, Roger; S,

Sugar; T, Tare; U, Uncle; V,

Victor; W, William; X, X-Ray;

Y, Yoke; Z, Zebra.

Phonetics (Gr. *phoneo*, speak).

Name for the science which investigates the acoustic qualities of sounds of languages, the manner in which they are produced by the larynx, tongue, lips, etc., and the modes of placing them in succession to form words and sentences. The pursuit of this science entails proficiency in the skills of (1) hearing accurately the distinctions between minute shades of sound quality and (2) making unfamiliar sounds with precision and uttering combinations of them with fluency.

Speech sounds are of many kinds. Some are made in the larynx; such are breath (air passing

between wide opened vocal cords), voice (vocal cords close together and made to vibrate), and the glottal stop (a sound resembling a slight cough, often prefixed in English to lay emphasis on initial vowels). Others are articulated in the mouth; such are *p*, *t*, *k*.

Vowels are special modifications of voice, produced with the lips apart and the tongue separated from the palate sufficiently not to give rise to audible friction when the air passes out. The number of tongue positions satisfying this condition is infinite. Consequently there exist an immense number of distinguishable vowel sounds. The degree of spreading or rounding of the lips also affects vowel quality.

Classification of Vowels

Vowels are classified according to (1) the part of the tongue which is raised, and (2) the height of the part raised. There are thus (1) front, central, and back vowels, and (2) close and open vowels with intermediate degrees of which the most important are termed half-close and half-open. Each tongue position may be combined with spread, neutral, close rounded, or open rounded lips. The *i* and *u* sounds of German, Spanish, etc., are close vowels; *i* is front and spread, *u* is back and rounded. Sounds of the *e* and *o* types are more open. Sounds of the *a* type are open and have neutral lips. The German sounds of *ü* and *ö* are front rounded vowels. The English sound of *a* in *about* is a central unrounded vowel.

Consonants are formed by complete or partial closures in the throat or mouth. Complete closures give rise to plosive consonants (e.g. *p*, *k*, glottal stop); closure in the mouth combined with lowering of the velum gives nasal consonants (e.g. *m*, *n*); partial closure by the tongue with opening at one or both sides gives lateral consonants (varieties of *l*); a rapid succession of taps gives a rolled consonant (e.g. rolled *r*); narrowing of the passage to such an extent as to produce audible friction when the air passes gives fricative consonants (e.g. *f*, *v*, *s*, and the Scottish sound of *ch* in *loch*). Gliding sounds which begin at a close vowel position and pass rapidly to a more open one are called semi-vowels; they count as consonants (e.g. English *w*).

Consonants may be produced at various points of the air passage. There are labials formed by the two lips (e.g. *p*); labio-dentals

formed by the lower lip against the upper teeth (e.g. *f*); dentals formed by the tongue tip against the upper teeth (e.g. the English sounds of *th*); alveolars formed by the tongue tip against the upper gum or teeth ridge (e.g. English *t*); retroflex consonants formed by the tongue tip retracted so as to touch the middle of the hard palate (e.g. the Swedish sound of *r* or the *ɻ* of Indian languages); palatals formed by raising the front or fore part of the body of the tongue towards the hard palate (e.g. the French sound of *gn*); velars formed by raising the back of the tongue towards the soft palate (e.g. *k*); pharyngeals formed by a contraction of the pharynx (e.g. Arabic *ħ*); glottals formed by action of the vocal cords (e.g. the glottal stop). Other consonants are made in positions intermediate between some of these; for instance the English sound of *sh* is intermediate between alveolar and palatal. Others again are made with articulations in two places simultaneously; for instance the *gb* consonant of the Igbo language of Nigeria has simultaneous labial and velar articulations, the "implosive *ɓ*" of Zulu has simultaneous labial and glottal articulations, and the Zulu click written *c* has simultaneous dental and velar articulations.

Speech into Writing

Phonetics is concerned not only with the manner of forming speech sounds, but also with the manner of using them in languages, with their lengths, with the stresses or force accents of syllables, and with the intonation (voice pitch) in sentences and the pitches of words in tone languages (such as Chinese). It is concerned, too, with the theory of the representation of speech by writing. When the sound system of any particular language is examined, it is always found that some sounds which are actually different have to be regarded for linguistic purposes as if they were one and the same: the differences are conditioned by the phonetic context, e.g. by the neighbouring sounds in the word or by length or by stress. For instance the *k* sounds in *keep*, *cart*, and *cool* are all different (as can be tested by saying them in isolation), but the variations depend upon the vowel following, and in a phonetic transcription they are all written *k*. Similarly the *l* sound in such a French word as *simple* (said by itself) differs considerably from the usual French

l; it is unvoiced and resembles the Welsh sound of *ll*. This unvoicing is accidental and is due to the presence of the preceding *p*. The voiceless *l* is, therefore, in French, a variant of *l* used in a particular context; it does not need to be written otherwise than by the letter *l*. The similar Welsh sound, however, does need special phonetic representation, since its use is not prescribed by any phonetic context.

The Phoneme

When differences between two sounds are traceable solely to phonetic context, the sounds are said to belong to a single phoneme. Voiced and voiceless *l* belong to a single phoneme in French, but to two separate phonemes in Welsh. The simplest type of phonetic transcript of a language is one which provides a single mode of representing each phoneme of the language. Generally it is advisable to use a single letter to designate each phoneme, but sometimes in order to economise symbols a phoneme may be represented by a digraph, or sequence of two letters. The number of phonemes in languages varies from about 20 (as in Japanese) to about 60 (as in Hindustani). In the standard English of S. England there are 40, including the 9 diphthongal sounds. The Roman alphabet is not adequate for writing languages phonetically. When phonetic writing is needed, new special letters often have to be added. The best known augmented Roman alphabet for phonetic purposes is that of the International Phonetic Association, University College, Gower Street, London, W., of which consult the various publications.

Experimental phonetics has for its object the analysis of speech by means of special apparatus, e.g. by kymographic tracings, cathode ray oscillograms, artificial palates, X-ray photography. Findings by the auditory method may be corroborated or disproved by such experimental means. Gramophones are also useful in certain kinds of linguistic research.

Phonetic science has many useful applications. The best known is its application to the learning of spoken foreign languages. Other applications are in connexion with the teaching of particular types of the mother tongue, the teaching of reading to infants, the curing of certain kinds of individual speech defect such as lisping, the study of the history of languages, and the provision of alphabets for

languages hitherto unwritten or unsuitably written. Experiments with phonetic apparatus have also been made to improve hearing aids for the deaf.

Phonograph (Gr. *phōnē*, sound; *graphein*, to write). Talking machine which records and repro-

Phonograph. A replica of and (in case) the original phonograph invented by Edison in 1877

duces sounds. As invented in 1877, it consisted of an axially-moving rotating brass cylinder, mounted on a screw, and covered with tin foil, against which pressed a needle secured to a thin diaphragm. The needle ran in the middle of a helical groove cut on the cylinders, and, when the diaphragm was not vibrating, the needle forced the tin foil into the groove, whereas, when the diaphragm was vibrated by sound waves entering a trumpet or horn, the movements of the needle made indentations in the tin foil in the groove.

To reproduce the sounds, the needle was drawn away, and the cylinder was rotated backwards until the needle was brought to the point at which it started. The cylinder was then rotated forwards, and the needle allowed to run over the tin foil, the indentations in which caused the needle to vibrate, and the diaphragm to reproduce the original sounds. The metal cylinder was later replaced by wax. The word phonograph is still used for gramophone (*q.v.*) in the U.S.A. See Sound: Amplification and Reproduction.

Phonography. System of rapid writing better known under the name of shorthand (*q.v.*).

Phonolite (Gr. *phōnē*, sound; *lithos*, stone). An igneous rock consisting chiefly of nepheline and sanidine, together with augite, hornblende or biotite. Phonolites have chiefly been formed as lavas, and give out a distinctive clinking sound when struck by a hammer, giving them their alternative name of clink-stones. They decompose easily, owing to weathering into zeolite minerals, and are found in France, Germany, Italy, Cape Verde Islands, Wolf Rock, etc. See Zeolite.

Phoronidea. In zoology, a group of invertebrate, coelomate, unsegmented sea animals. The individual, which is a member of a species of *Phoronis*, inhabits a leathery tube from which the forepart may be protruded. This region bears a horseshoe-shaped structure with many ciliated tentacles, called the lophophore, which produces a feeding current.

Phosgene (Gr. *phōs*, light; *root gen*, to produce). COCl_2 . Alternative name for carbonyl chloride, a gas discovered by J. Davy in 1811, and possessing an unpleasant pungent smell. Used in the manufacture of aniline dyes and other organic chemicals, it is formed when chloroform decomposes, and by exposing equal volumes of carbonic oxide and chlorine to the action of sunlight. It is important in chemical warfare (*q.v.*).

Phosphate Deposits. The mineral apatite is the chief primary source of phosphorus. Although widely distributed in small amounts in most types of igneous rocks and sparingly in sedimentary and metamorphic rocks, workable quantities are restricted to pegmatitic deposits in Canada; segregations in gabbro in Norway; with magnetite at Kiruna and Gellivare, Sweden; and, largest of all, in lenses of nepheline-apatite rock in the U.S.S.R. Rock phosphate also results from the leaching of bird-droppings (guano) and the redeposition of the phosphoric acid as calcium phosphate in underlying limestone. Such deposits occur on numerous Pacific islands and along the Peruvian and Chilean coasts. Other phosphatic rocks are of marine origin and are formed by the accumulations of organic remains. Commercial phosphate deposits are found in U.S.A., the U.S.S.R., Africa, various Pacific is., Christmas Is., etc.

Phosphates. Mineral deposits much used in fertilisers. The phosphate rocks found in most parts of the world consist largely

of fossilised animal remains and excreta. Rocks of this type may contain from 40 to 80 p.c. of tribasic phosphate of lime. Phosphate in its raw state is not soluble in water, and must be chemically treated and turned into superphosphate before its phosphoric acid becomes available as plant food. Phosphate-rich material containing coprolites was discovered below the chalk in Surrey by Henslow in 1845. Since then large deposits of phosphate have been discovered in many parts of the world; France with N. Africa produces most. Nauru (*q.v.*) and Ocean Island (*q.v.*) produce guano derived from sea birds. The U.S.A. has large phosphate deposits, and the U.S.S.R. mines apatite rock in the Kola pen. The use of mineral phosphates for manure began in the middle of the 19th century. In 1939 over 7 million tons of raw phosphates were used in fertilisers.

Phosphor Bronze. Term covering a group of alloys based on copper to which tin and phosphorus have been added. The alloys have a useful range of mechanical properties and good resistance to corrosion. It is convenient to subdivide phosphor bronzes into two classes: (1) Alloys containing up to 7 p.c. tin, to which phosphorus is added to deoxidise the molten alloy; these consist of a single, soft, ductile phase, and can be hot and cold worked. (2) Alloys containing more than 7 p.c. tin, to which is added phosphorus in excess of that required to deoxidise the molten alloy; these have a hard phase (δ), while the excess phosphorus forms another hard phase, Cu_3P . These alloys are used for castings.

Phosphorescence. Power of emitting light possessed by many animals. It occurs frequently among the Protozoa, jelly-fishes, worms, crustaceans, insects, and fishes, and more rarely in other phyla of the animal kingdom. The familiar phosphorescence of the sea is due to the presence of swarms of the protozoon *Noctiluca* (*q.v.*). Another well-known example is seen in the glow-worm, where the light appears to serve the purpose of attracting mates. In the jelly-fishes, phosphorescence accompanies the power of stinging, and is therefore, probably, of a warning character; while the angler fish uses it to attract the small species on which it preys. Among animals of the deep sea it serves apparently as an illuminant.

The means by which the light is produced is by the oxidation of

luciferin. This reaction, which produces light, is essentially the same as any oxidation process, but the energy produced is light only.

A number of substances continue to emit light when placed in darkness after exposure to light. Phosphorus itself does so, and this phenomenon is also due to oxidation. Barium and calcium sulphides, all minerals containing aluminium, etc., are phosphorescent. Dewar has shown that phosphorescence increases markedly at very low temperatures. It has been shown that it depends upon the presence of a metal, a soluble flux, and a sulphide of an alkaline earth. Without them phosphorescence does not exist. See Fluorescence.

Phosphoric Acid. Compound of phosphorus, hydrogen, and oxygen, H_3PO_4 . It may be made by treating bone-ash or mineral phosphate with sulphuric acid or by smelting phosphorus rock with coke to give phosphorus vapours, which are mixed with steam and condensed. It forms a viscous liquid, and is a tribasic acid forming three series of salts, e.g. NaH_2PO_4 ; Na_2HPO_4 ; Na_3PO_4 ; the hydrogen molecules being gradually replaced. The salts of the acid are called phosphates. On heating the acid it is converted into pyrophosphoric acid, $H_4P_2O_7$, and still further heating results in the formation of metaphosphoric acid, HPO_3 , a glassy solid.

Phosphorite. Variety of natural phosphate (*q.v.*) resulting, in important occurrences, from the accumulation of organic remains and bird-droppings upon desert islands, the limestone of the island rock being partially or completely replaced by calcium phosphate. This replacement is caused by the downward percolation of water which leaches out the phosphate from the organic debris and reacts with the underlying calcareous rock.

Phosphorous Acid (H_3PO_3). Acid formed when phosphorous oxide is added to water, the oxide being produced by the slow oxidation of phosphorus. A solution is obtained when sticks of phosphorus are kept exposed to moist air, but the pure acid is made by slowly passing chlorine through phosphorus melted under water. Its salts are termed phosphites.

Phosphorus (Gr. *phosphoros*, light-bringing). Chemical element (symbol P) which derives its name from its property of becoming luminous in the dark. It appears to have been discovered in 1669 by Brandt, an alchemist of Hamburg.

In 1775 Scheele, the Swedish chemist, described a method of making phosphorus from bone-ash.

Phosphorus does not occur in the free state in nature, but exists combined as phosphate. It is always found in plants, from which animals derive the phosphate found in bones to the extent of three-fifths of their weight. Large deposits of mineral phosphates exist.

Phosphorus is chiefly made by the electric furnace process. A mixture of sand, coke, and phosphate rock is heated to a high temperature when silicon dioxide displaces the more strongly acidic phosphoric oxide, which is then reduced to phosphorus by the coke.

Phosphorus is a pale yellow waxy-looking solid which readily takes fire when exposed to the air. It is converted into another variety known as red phosphorus by heating to a temperature of between 240° to 250° C. for a time. This variety is used in the manufacture of matches. Phosphorus is also used in vermin-killers, phosphor bronze, and the preparation of certain organic compounds. (See Phosphoric Acid.)

Acute poisoning by phosphorus has occurred from taking rat-poison, and among children from sucking old-fashioned match-heads. From one to two grains are likely to be fatal. When swallowed, the poison causes a garlic-like taste in the mouth and odour in the breath. Pain, vomiting, and diarrhoea follow in from a quarter of an hour to several hours. Sometimes the symptoms become steadily worse, and delirium, coma, and convulsions precede death. Treatment consists in washing out the stomach, or giving copper sulphate as an emetic. Fatty material, such as milk, should not be given, as it keeps the phosphorus in solution.

Phossy Jaw. Name for a disease of the jawbone common among workers in match factories in the days before white or yellow phosphorus was superseded by red, or by sesquisulphide. Caused by the escape of poisonous fumes, it usually began in a defective tooth.

Phot. Unit of illumination. It is the equivalent of 1.0 lumen (*q.v.*) per sq. cm. One phot equals 1,000 milliphot or 10,000 lux (*q.v.*).

Photius (c. 820-891). Byzantine scholar and prelate. Born at Constantinople of a distinguished family, he became captain of the imperial bodyguard and secretary of state under Michael III. Although a layman, he was appointed patriarch of Constantinople, 857,

deposed 867, reinstated 876, again deposed and banished 886. He died in exile in Armenia. During his second patriarchate the breach between the eastern and western churches became complete.

Photius rendered great service to classical scholarship by two works, both extant in more or less complete form: (1) *Bibliotheca* or *Myriobiblos*, containing a description of 280 works by Greek theological, historical, medical, and miscellaneous writers. It is curious that poets are wholly omitted. The *Bibliotheca* is especially valuable as containing specimens of works, some of the originals of which are entirely lost. (2) A lexicon, in alphabetical order, of the words occurring in the Greek orators and historians.

Photo-Cell. Means whereby variations in light are converted into variations in electric voltage or current. Three types are employed in practice: photo-conductive cells, photo-electric cells, and photo-voltaic cells.

The photo-conductive type is often called the selenium cell, as it depends upon the sensitivity of that metal to light. It is used as a coating about .01-in. thick, spread over a conducting metal plate, the composite disk being enclosed in a glass bulb. A typical selenium cell would decrease in resistance from 5 to 1 megohm when illuminated by 5 ft.-candles. Photo-conductive cells are used for control, communication, and measurement purposes, where the occurrence of a slight time-lag between cause and effect is not harmful, e.g. the automatic lighting of street lamps, telegraphy or telephony along light-beams, and photometry.

Photo-electric cells depend on the facts that metals when heated have the power of emitting electrons and that the alkali metals—lithium, sodium, potassium, rubidium, and caesium—give off electrons when light falls upon them. When the filament of a diode valve is replaced by a silver disk covered with a thin layer of an alkali metal, and a relatively low H.T. voltage is connected between cathode and anode, it will pass currents increasing with the light intensity.

This type of photo-cell is instantaneous in its action, and is employed for talking pictures and television. It is the one most generally employed for industrial control, a special advantage being that it combines well with a valve amplifier.

Photo-voltaic cells have an advantage over all the others in that they require no external source of power. Their construction resembles that of a selenium or copper-oxide rectifier, there being no necessity for an enclosing bulb. A typical form has a copper plate, with one surface oxidised and sputtered with a very thin layer of gold to provide the return circuit.

These cells are more sensitive than the photo-electric type. They have been used in connexion with portable photometers, photographic exposure meters, colorimeters, and such instruments.

Photo-chemistry. Branch of chemistry which deals with chemical changes due to the action of light. If a mixture of chlorine and hydrogen is kept in the dark, no chemical combination takes place, but if a beam of light be allowed to fall on the glass vessel containing the mixture, chemical combination takes place with explosive violence, hydrochloric acid being formed. Light also "reduces" many chemical salts, especially in the presence of organic substances. This fact is the basis of the operations of photography. The silver halides, i.e. bromide, iodide, and chloride of silver, are particularly sensitive to light, and these are used for the sensitive portion of photographic plates and papers.

Many other substances are sensitive to light, and some of these are employed also in photography. Light-sensitive iron salts form the basis of the ferro-prussiate paper devised by Herschel in 1840, and largely employed for making blueprints in engineering workshops. Platinum salts sensitive to light form the basis of platinotype. Another class of photochemical action is seen in Niépce's discovery that thin films of bitumen exposed to light become insoluble in the usual solvents, such as turpentine. Similarly gelatine impregnated with ammonium bichromate becomes insoluble in water after exposure to light; this reaction is the basis of the carbon process of photography.

The fundamental principle of photo-chemistry as first enunciated by Grotthuss (1818) is that only light actually absorbed causes photo-chemical changes. The principles of photo-chemistry have important applications in relation to explaining the mechanism of vision, since the sensitiveness of the eye may be attributed to the presence of a substance, visual purple, very reactive to light.

Photo-electric Cell. This is described under Photo-Cell.

Photo-Engraving. For this subject, see Process Engraving.

Photo-finish Camera. Race-finish recording camera, functioning on the photo-electric cell principle, employed in the accurate determination of the winner of a race, especially a horse race. It

was first used officially in England at Epsom racecourse, April 22, 1947, and has since been officially installed on all racecourses in Great Britain. It is intended not as a substitute for the judge's decision, but to prevent disputes, especially where the angle at the finishing post is deceptive. It assists in confirming distances separating 1st, 2nd, and 3rd runners, and is in use on greyhound racing tracks. It was used for the finish of the 1949 Derby.

The camera is fixed in a small dark room on a 30-ft. tower, 80 ft. from the rails. The judge's box is in the same structure, exactly

Photo-finish Camera. A dead-heat in a horse race recorded by the camera at Newmarket (Burwell Stakes), May 11, 1948

below the camera. Immediately facing, on the opposite side of the course, is a mirror, 7 ft. high by 6 ins. wide, which enables a photo of the runners to be taken as from the opposite side of the course.

Photographic Society, ROYAL. Society founded in 1853 for the advancement of photography and its applications. It issues the monthly Photographic Journal and quarterly and annual publications, and holds meetings, exhibitions, and conferences. Membership is open to those interested; fellows and associates must possess photographic ability. Offices, 16, Prince's Gate, London, S.W.7.

PHOTOGRAPHY: HISTORY & PRACTICE

A. Southgate Quittenton, F.I.B.P., F.R.P.S.

An account of the origins and development of photography, of the processes involved, and its applications. See also articles on Air Photography; Camera; Colour Photography; Exposure; Lens; Panchromatic Photography, etc.

Photography is a development of the 19th century, but the camera (*camera obscura*) which is its basis is old. Leonardo da Vinci found in the 15th century, that by darkening his studio and leaving a small hole, he could get an image of the scene outside projected on to a sheet of white paper held in the room. Later artists found that if a lens were inserted in the hole the image was brighter and more clearly defined; but no means existed of recording that image.

In 1802, Thomas Wedgwood discovered "a method of copying paintings on glass, and of making profiles, by the agency of light upon nitrate of silver." Wedgwood's process was described by Sir Humphrey Davy in the journal of the Royal Institution. In experiments Davy discovered that silver chloride was more sensitive to light than silver nitrate; but neither Wedgwood nor Davy found any method of fixing the image, and their pictures continued to darken on exposure to light.

In 1813, a Frenchman named Joseph Niépce discovered that the solubility of bitumen in lavender oil was affected by its exposure to light. He exposed metal plates coated with bitumen in a camera contrived from a cigar box with the lens from a solar microscope. He swabbed the exposed plate with lavender oil, and a coating of bitumen was left where the light had acted and bare metal where the bitumen was unaffected and soluble. Such plates could be etched subsequently in a bath of acid and printed from in a press. Niépce's process was therefore the ancestor of the photo-mechanical processes. Meanwhile, another Frenchman, Louis Daguerre, was experimenting, and in 1829 he entered into an agreement to collaborate with Niépce, who died, however, in 1833. Daguerre then discarded the bitumen process and evolved a new one. This involved the subjecting of a silver plate, or a copper plate coated with silver, to the fumes of iodine until it was covered with a layer of silver

iodide. The plate thus prepared, after exposure in the camera, was exposed to the vapour of metallic mercury, which formed an amalgam of mercury and silver on the plate proportionate to the light action on the silver iodide, so that the highest lights were whitest. The significance of Daguerre's process was his incidental discovery of the latent image and the possibility of developing it, the foundation of photography as now practised. Daguerreotypes, as they were called, had a tremendous vogue for some 15 years. At first they were fixed in common salt, but when Herschel called attention to sodium thiosulphate (hypo), discovered by himself in 1819, this was adopted, and remained the chief photographic fixing agent. Daguerreotype plates were later made more sensitive by the combination of bromine with iodine (Goddard) and, subsequently, chloride (Claudet). A method of gold toning devised by Fizeau improved colour and permanence.

Fox Talbot's Experiments

An Englishman, William Henry Fox Talbot, who had been experimenting since 1835 on the lines of Wedgwood and Davy, obtained greater sensitivity than they had done by washing his paper with sodium chloride before applying silver nitrate. Finding that excessive sodium chloride had an opposite effect, he used common salt as a fixing agent for a time, but in the end came to hypo, which indeed had been used in 1837 by another English pioneer, J. B. Reade. Fox Talbot's first results were a simple process, printed out in the camera; he communicated his discoveries to the R.S. in 1839. But within two years he had patented his calotype process, in which a latent image was developed with silver nitrate and gallic acid. His pictures were negatives from which any number of positive prints could be made by printing them in contact with paper similarly sensitised, hence Fox Talbot may be considered the father of photography. Some of his original negatives are in existence and still yield beautiful prints. Herschel, discoverer of hypo as a fixing agent for dissolving the unused silver salts, is credited with the coining of the words photograph and photography, and with being the first to use the terms negative and positive in their photographic sense.

Paper negatives, in spite of efforts to make them translucent, gave a very slow printing speed

and recorded the grain of the paper negative in the positive print. Niépce de St. Victor, a nephew of Joseph Niépce, discovered a method of coating glass, using albumen (white of egg) as an initial coating, subsequently iodised and sensitised in silver nitrate.

The Wet Collodion Process

Scott Archer in 1851 discovered the wet collodion process, still used in making negatives for photo-engraving. A solution of nitro-cellulose in ether and alcohol containing iodide is poured over the glass, the iodide forming silver iodide when the plate is bathed in a solution of silver nitrate. This sensitive plate has to be exposed and developed while wet, and can be used away from the studio only with a portable darkroom. Its improvement over the calotype process in sensitivity, clearness, and the grainless character of the negatives produced outweighed the disadvantage that it must be used wet. Dry collodion plates were actually put on the market, though they did not come into general use. The next advances were to form silver bromide in the collodion itself, making unnecessary a separate sensitising bath (Sayce and Bolton, 1864); and to utilise the greater energy of an alkaline developer instead of the acid baths previously used (Russell, 1862).

Dr. Richard Maddox in 1871 invented a coating compound of silver salts emulsified in a solution of gelatine, and attempts were made to produce emulsions with which photographers could coat their own dry plates, as they had been in the habit of coating wet ones, until in 1877 J. W. (after Sir Joseph) Swan put ready coated dry plates on the market. In 1872 Vogel, of Berlin, discovered that the addition of a dye to the emulsion made it sensitive to green and yellow rays; formerly all photographic materials had been sensitive to violet and blue rays only, with a consequent falsifying of tone rendering in coloured subjects. In 1891, Eastman and Walker produced the first film, that is they coated celluloid instead of glass with the emulsion. After that, the basic form of photography remained unchanged, except for the introduction of direct colour photography, attention being turned to increasing the sensitivity of negative materials to all the colours of the visible spectrum and beyond, into the invisible infra-red, ultra-violet, and rays of even shorter wavelength; to producing ever faster emulsions,

reducing granularity, and improving methods of processing.

Printing papers in the early days of photography were coated similarly to the negatives. The first paper produced essentially for printing, and in use during 1850-92, was coated with albumen and ammonium chloride and sensitised by the photographer immediately before use by floating it on a bath of silver nitrate. The print was made by contact in daylight, and the unpleasant reddish tone was modified by toning in gold chloride before fixing in hypo.

From 1891 a gelatine emulsion devised by Sir William Abney was used for a type of paper, still used, called P.O.P. (printing-out paper). Subsequently three varieties of development papers were evolved and came into general use: gaslight paper (*q.v.*), bromide paper (*see Bromide*), and chlorobromide paper, which is between the others in speed and is suitable for either contact or projection printing.

Gum and Grease Process

The gum-bichromate process, which yields prints of superlative richness in the hands of a skilful worker, is derived from the work of Niépce and involves the coating of a paper with a solution of gum arabic to which has been added potassium bichromate and a quantity of finely ground pigment. The paper is dried in the dark and exposed in contact with a negative to strong daylight. The print is developed by floating it face downwards on a bath of warm water; the portions of the coating unaffected by light, being soluble, are dissolved away, leaving the image in pigmented insoluble gum. In the bromoil process a bleached print treated with a tanning solution is made to accept hand-applied greasy pigment in inverse proportion to the resistance offered by the wet gelatinous image; but such processes are not in normal commercial use.

The effect of light on the solubility of bichromated gelatine is exploited in the carbon and carbon printing processes (*see Carbon Process*).

The extreme sensitivity and latitude of current negative emulsions has led to the virtual abandonment of dish development by inspection in favour of standard time and temperature development in a light-tight tank. Increasing use of small negatives has made printing by projection more general than contact printing, and fully automatic enlarging apparatus has been developed.

Apart from its use for portraiture, pictorial work, advertising, illustrated journalism, and amateur snapshots, photography has been made to serve industry, science, and medicine. Radiography is extensively used to test forgings, castings, and welds for internal flaws. Photo-elastic stress analysis is an engineering application. A scale model of the object to be tested is made in a suitable transparent material. Loads proportionate to those acting on the real body are applied to the model and a photographic record is taken of the pattern of light and dark bands which appears when the model is viewed in polarised light. These bands indicate the stresses. When a sheet of metal or plastic has to be cut or drilled to a standard shape to form a template the original drawing can be photographed and projected direct on to the material to be used, which has previously been coated with a light-sensitive emulsion; this is called photo-lifting. The introduction of high voltage gas discharge lamps giving an intense flash of very short duration has made it possible to take action photographs, e.g. of machinery running at high speed, a field in which the high speed cine camera, recording at up to 3,000 frames per sec., has been used. Aerial survey work is now a recognized aid to the cartographer. Medicine and forensic science use the camera extensively in many fields.

Clerc, 1944; History of Photography, J. M. Eder, trans. Ed. Epstein, 1945; Handbook of Photography, Henney & Dudley, 1946.

Photogravure (Gr. *phōs*, light; Fr. *gravure*, engraving). Photo-mechanical process of making intaglio plates from which impressions are printed either by hand or machine. The method was developed as an application of photography during the second half of the 19th century by such workers as Fox Talbot, Sir Joseph Swan, and particularly Karl Klic. Later modifications gave greater speeds of printing, more exact technical control, and reduction in the cost of the process. At first "grain" photogravure, a modification of copperplate engraving, was used for the reproduction of original paintings; but this is a slow process used now only in limited edi-

tions. Rotary photogravure, much used for illustrated periodicals and magazines, is far more common. Anything that can be photographed can be reproduced by photogravure.

A rotary photogravure printing image is composed of tiny square cells etched into the surface of a copper plate or cylinder, the cells being separated by thin walls of metal. These cells are etched to

Photogravure. Exaggerated diagrams illustrating, in section A, how the surface of the printing plate takes the ink in the half-tone; B, how the ink remains in the recesses of the cylinder in photogravure

different depths according to the degrees of light and shade in the illustration; varying tones are obtained by the different quantities of ink required to fill these cells.

To produce large editions of illustrated magazines, transparent photographic positives of the original subjects are made and re-touched where necessary. These positives, in allotted positions, are photographically printed through on to light-sensitive "carbon tissue" of sensitised gelatine on a paper base. Type matter for text and captions is treated in a similar way. The images so formed in the tissue are now divided into tiny squares of equal size by exposing the tissue under a screen with opaque black squares separated by narrow transparent lines. This screen generally has 150 lines to the inch.

After the two photographic exposures, the carbon tissue is carefully pressed into position on a polished copper-plated cylinder. It is developed with hot water, and the paper backing removed, so as to obtain a relief image of the originals, in which the light tones of the illustrations are represented by thick gelatine and the dark tones by thin areas, the entire image being ruled into fine squares by the use of the screen. This image is dried, and those portions of the copper that are not to be etched, for example the margins, are covered with a suitable varnish. The cylinder is etched in solutions of ferric chloride which penetrate the

gelatine and dissolve out the copper image in the form of innumerable square pits of varying depth according to the tones.

For hand printing, a stiff ink is worked thoroughly with a dabber into the warmed plate. Surplus ink is then wiped off the surface, first with canvas and finally with the palm of the hand. The paper is damped, laid over the inked plate and the impression taken by pulling the whole through a copper-plate press.

In the rotary machine process, the cylinders revolve in a trough of thin, liquid ink, which fills up the tiny cells. Superfluous ink is mechanically scraped off the non-image surface of the cylinder as it revolves by a blade. A continuous web of paper is passed round a rubber-covered roller pressing against the printing cylinder, so that the ink in the indentations of the copper cylinder is transferred to the paper. When dried it travels to the second printing cylinder, where the same operations are performed, but on the other side. For colour work, units composed of two printing cylinders and driers are duplicated or triplicated.

Rotary intaglio printing is not confined to illustrations. It is also used for printing on textiles and for wallpaper. See Colour Printing; Half-tone; Linotype; Printing.

Photo-lithography. Method of reproducing a subject photographically on to a flat surface from which the subject can then be printed lithographically. See lithography.

Photometry (Gr. *phōtos*, of light; *metron*, measure). Measurement of intensities of light sources or spectral lines. In the visible region subjective methods—that is, use of the eye—are the

Photometry. Diagram of Rumford type. A. Screen. B. Rod throwing shadow on screen. C. Standard light candle. D. Lamp to be compared with candle. E. Shadow thrown by candle. F. Shadow thrown by lamp. E. F. Measuring scales

most direct, but the sensitivity of the eye varies with wavelength, so that only sources of similar wavelength can be accurately compared. Outside the visible region such detectors as photo-cells and thermopiles replace the eye. Photographic methods of recording may be used in the near infra-red, visible, and ultra-violet regions, and this is especially useful if the sources of light are fluctuating. In the simple type of photometer, used to compare the candle-powers of lamps, use is made of the Inverse Square Law (*q.v.*). According to this law, if two sources of candle-powers c_1 and c_2 produce equal illumination at distances d_1 and d_2 respectively, then—

$$\frac{c_1}{c_2} = \frac{d_1^2}{d_2^2}$$

The Bunsen photometer uses a white screen with a grease-spot at its centre. The sources of light are mounted at opposite sides of the screen. The positions of the lamps are adjusted until the grease spot is no longer distinguishable; the ratio of the candle-powers of the lamps will then be the ratio of the squares of their respective distances from the screen.

Photomicrography (Gr. *phōtos*, of light; *mikros*, small; *graphos*, written). The process of obtaining greatly enlarged photographs of small objects. It is sometimes confused with its converse, microphotography, which entails the photographing of subjects of comparatively large area on to tiny negatives. Enlarged negatives up to 20 or so diameters may be produced without a microscope by means of a short-focus lens and a camera with long bellows extension. Such low power work is known as photomacrography (Gr. *makros*, long or great). In photomacrography the lens acts conversely to usual photographic practice in that its covering power can be limited to the area of the subject irrespective of the size of plate or film.

When large magnifications are required, the microscope is brought into use. An extensible camera may be attached to the top of the microscope by means of a sleeve, allowing movement of the microscope barrel within the sleeve for focusing purposes; or an ordinary hand camera may be focused and set at infinity and clamped in position with the lens just above the eyepiece of the microscope after the latter has been focused, extraneous light being excluded by a surrounding sleeve. In a

third method a fixed-focus camera embodying an eyepiece may be fixed to the top of the microscope from which the usual eyepiece is removed. A similar arrangement may embody an attachment by which a miniature roll-film camera replaces the fixed-focus type.

Still another method of photomicrography, carried out in a dark room, employs a prism set above the eyepiece, which projects the image at 90° on to an easel bearing a photographic plate situated at a suitable distance away. Filters for photomicrography are usually placed over the light source rather than over the lens or objective, and, unless apochromatic objectives are used, a green light and orthochromatic plates give the best results. For the study of biological processes, moving pictures have been taken through a microscope by normal cinematographic methods. See *Microscope*; *Metallography* illus. Consult *Photomicrography, Theory and Practice*, C. P. Shillabeer, 1943; *Practical Photomicrography*, Barnard and Welch, 1947.

Photon. The unit of radiation energy. A light particle or corpuscle or quantum, it is considered as a proton in contact with an electron, the distance between the two being equivalent to the radiation of the electron. Every form of radiation, cosmic, gamma, X-ray, Hertz, etc., releases energy of a specific photon value. The average radio aerial transmits energy equivalent to 10^{32} photons per sec. See *Quantum Theory*.

Photosphere. In astronomy, the visible surface of the sun. It consists of highly incandescent gas at a temperature of about 6,000° C. and gives a continuous spectrum. In a powerful telescope the photosphere is seen to be mottled, the rapidly changing granulations observed being probably the tops of rising convection columns of hot gas about 500 m. across. Where these are absent the resulting "pore" looks relatively dark. Still larger dark areas are the so-called sunspots, first noticed by Fabricius in 1610. These spots vary in size, from a few hundred miles across to huge areas thousands of miles wide, and sometimes last many months. In the neighbourhood of many sunspots there often appear bright streaks or patches in the photosphere. These bright streaks are known by the name of faculae, or little torches. They are more distinctly seen near the edge of the sun, where the general bright-

ness of the surface is lessened by the greater thickness of the absorbing atmosphere. The photosphere does not revolve evenly, the lower latitudes moving faster than the higher, a fact established by observation of the time taken by the spots to travel across the face of the sun, and confirmed by spectroscopic measurements of the speed of rotation at different latitudes. See *Sun*.

Photosynthesis (Gr. *phōs*, light; *syn*, with; *tithenai*, to put). The normal green plant takes up from its environment simple inorganic materials of low energy content and from them builds up its body, which consists of complex organic substances of high energy content. Thus endothermic reactions must occur. The energy necessary for these reactions is derived from light by the chlorophyll in the chloroplastids, in some instances directly, in others indirectly. Those syntheses in which light energy is used directly constitute photosynthesis. One outcome of this process in many leaves is the accumulation of starch, which can readily be shown to occur only in the presence of chlorophyll, light, and carbon dioxide. On this account it was at one time thought that starch was photosynthesised in the plant in the presence of illuminated chlorophyll, acting as a catalyst, from carbon dioxide, derived from the air, and water taken in from the soil, oxygen being produced simultaneously as a waste product.

There is no doubt that oxygen is produced, but it is not now considered probable that starch is the primary photosynthetic product. It has a very large molecule, and it seems more probable that relatively small molecules would be produced first, later to react to give larger ones. Moreover, many leaves never contain starch, and even in those that do other simpler carbohydrates are present, *e.g.* glucose. The view that formation of simple sugars precedes formation of the more complicated carbohydrates is substantiated by the fact that the quantities of the former fluctuate less with alternation of day and night than do those of the latter. Even glucose is somewhat too complex to be easily accepted as a first photosynthetic product, and research suggests that formaldehyde is the precursor.

Chlorophyll undoubtedly acts as a photocatalyst. Light of visible wavelength is essential for the process; but neither of the primary reactants, carbon dioxide

or water, absorbs appreciable quantities of such light, and so by itself cannot obtain thence energy for reaction. The process goes on most favourably in light of wavelength $650\text{--}700\mu$, i.e. red light, and this part of the spectrum is most strongly absorbed by chlorophyll. Thus it is concluded that chlorophyll absorbs energy from light in the visible part of the spectrum and passes it on to the primary reactants, probably in the infra-red part of the spectrum, and perhaps while reactants and pigment are in some form of combination.

If as a result formaldehyde is liberated in an active form it might readily polymerise into glucose, the latter condensing into maltose, starch, and cellulose. Moreover, since it is known that in suitable conditions a pure solution of glucose becomes partially converted into fructose, the formation of fructose would provide material for reaction with some of the unchanged glucose to form sucrose and for polymerisation into inulin.

The rate of photosynthesis increases within limits with increasing carbon dioxide concentration and rising light intensity. Since the one is a raw material and the other supplies the energy, this is as would be expected. On the other hand, temp. affects the rate much more than would be expected in a purely photochemical reaction. For such the temp. coefficient is usually less than 1.4, but the rate of photosynthesis may be more than doubled for each 10°C . rise up to $30^\circ\text{--}40^\circ\text{C}$., giving a temp. coefficient of more than 2. This is much nearer that given by ordinary chemical reactions, and on this account it is generally held that bound up with the photocatalytic reactions there are others dependent for their rate on temp. and on light only so far as photocatalysis supplies the reactants. These reactions are regarded by some as constituting the dark phase of photosynthesis in contrast to the light phase in which photocatalysis occurs. At temps. above $30^\circ\text{--}40^\circ\text{C}$. increasing temp. generally results in a falling off in the rate of photosynthesis.

Phraates. Name of several kings of Parthia. The best known was Phraates IV, who, on coming to the throne, 37 B.C., eliminated possible rivals by murdering his father, his 30 brothers, and even one of his sons. He successfully defended his kingdom against a

Roman expedition under Antony, 36 B.C., but his tyranny caused a revolution and he was expelled. Reinstated with the help of the Scythians, he drove out Tiridates, who had been made king. The latter, however, took with him in his flight to Rome the younger son of Phraates. This boy the emperor Augustus agreed to restore to his father on condition that the Parthians gave up the standards they had taken after the defeats of Antony and of Crassus at Carrhae in 53 B.C. Phraates was poisoned by his wife, Musa, c. 4 B.C. *Pron.* Prayayteez.

Phrase (Gr. *phrazein*, to speak). Literally, two or more words expressing a single idea. In music the term means much the same. Music possesses melodic progressions and harmonic cadences, which largely represent the comma, semicolon, and full stop, and define the subordinate clause, the phrase, and the complete sentence. In musical performance the word phrasing also includes the artistic attachment and detachment of the tiny figures or sub-clauses, the proper use of legato, and the delivery of accents in due proportion.

Phratry (Gr. *phratría*, brotherhood). Tribal or kinship division. In early Athens the tribe comprised three phratries, which developed into politico-religious fraternities. An Australian tribe usually embraces two exogamous moieties, each with a totem-name; for instance, Eagle-hawk and Crow, Emu and Kangaroo. Each phratry includes two or four exogamous classes, thereby securing an equitable distribution of the food-stock. Some N. American Indian tribes were organized into two or more phratries, each comprising one or more matrilineal clans or patrilineal gentes.

Phrenic Nerve (Gr. *phrēn*, diaphragm). Nerve formed by the third and fourth cervical nerves and a branch of the fifth on each side of the neck. It passes down the neck, and, having traversed the cavity of the chest, supplies the diaphragm or large horizontal muscle, which separates the thoracic and abdominal muscles. Division of the phrenic nerve leads to paralysis of the corresponding half of the diaphragm and may cause serious disturbance of respiration. *See* Nerve.

Phrenology (Gr. *phrēn*, mind; *logos*, science). So-called science having for its basis the supposition that mental faculties and traits of character can be gauged from the shape and size of the skull. It is

claimed that the brain is a congeries of organs, through each of which a distinct power of intellect is manifested. The strength of each mental organ is judged by the extent of the cerebral development, due allowance being made for quality of brain, combinations of organs, etc.

The founder of phrenology was F. J. Gall, who sought to demonstrate that there was a concomitance between talents and dispositions,

Phrenology. Diagram indicating the sections into which the skull is divided phrenologically. *See* text

and particular forms of head. Gall mapped out, as it were, the surface of the skull into twenty-six patches, and named them according to the mental or moral faculties he supposed them to represent. J. G. Spurzheim, a German physician, studied the system under Gall, elaborated it, and introduced phrenology to Great Britain. He increased the faculties to thirty-five, and contemporary phrenologists have added to this total a further seven.

The forty-two sections into which most phrenologists would divide the skull are as follows. The position of the sections is indicated by the diagram.

1. Amativeness. 2. Conjugality.
3. Parental Love. 4. Friendship.
5. Inhabitiveness. 6. Continuity.
7. Vitativeness (love of life). 8. Combativeness. 9. Destructiveness.
10. Alimentiveness. 11. Acquisitiveness. 12. Secretiveness. 13. Cautiousness. 14. Approbateness.
15. Self-esteem. 16. Firmness.
17. Conscientiousness. 18. Hope.
19. Spirituality. 20. Veneration.
21. Benevolence. 22. Constructiveness. 23. Ideality. 24. Sublimity.
25. Imitation. 26. Mirthfulness.
27. Individuality. 28. Form. 29. Size. 30. Weight. 31. Colour. 32. Order. 33. Calculation. 34. Locality. 35. Eventuality. 36. Time.
37. Tune. 38. Language. 39. Causality. 40. Comparison. 41. Human Nature. 42. Agreeableness.

Whatever vogue phrenology obtained in Great Britain is due, after Spurzheim, to the Scottish brothers, George and Andrew Combe, who did much to make the system popular. Dr. Bernard Hollander, through his books on the subject, raised the system as near to the level of a science as it is ever likely to become. As an indication, on broad lines, of the power of the faculties, phrenology may be useful, but its specific claims are rejected by science. Even if the localisation of the functions is admitted, there is little or no proof that they affect the form of the skull or that the form of the skull indicates the power or quality of the brain.

Phrygia. Ancient country of Asia Minor. It comprehended roughly the tableland of modern Anatolia as far E. as the river Halys, but its confines varied at different times. It was inhabited by the Phryges, who, according to the researches of archaeologists and ethnologists, in agreement with ancient tradition, were warlike settlers of Aryan descent from Thrace. The inhabitants displaced by these invaders, probably about 1200 B.C., appear to have been of the same mixed race as the Hittites, to whose empire they may possibly have belonged.

Tradition, again confirmed by modern research, asserts the existence of a powerful Phrygian monarchy, beginning at an unknown date and lasting till the beginning of the 7th century B.C., when it was overthrown by the great Cimmerian invasion. The names of Midas and Gordius, well known in legend, are associated with this Phrygian monarchy. When the Cimmerii were driven out by Alyattes, founder of the Lydian empire, Phrygia passed under the dominion of the latter, to fall in turn under that of the Persians, when the Lydians were subdued by Cyrus.

After the overthrow of the Persian empire by Alexander, Phrygia became part of the Seleucid kingdom, and it was during this period, about 260 B.C., that the invasion of Asia Minor by the Gauls resulted in a slice of Phrygian territory, known henceforth as Galatia, being settled by Gauls. Eventually Phrygia became incorporated in the Roman empire. The music of Greece owed much to Phrygia, which was devoted to the wild orgiastic cults of Cybele and Dionysus.

Phrygian Mode. In music, third of the church modes, E being

its final and C its dominant. The semitones fall between the 1st and 2nd, and the 5th and 6th degrees. The Phrygian cadence (minor key only) is when the first inversion of the subdominant precedes the dominant chord.

Phrynē. Greek courtesan of the 4th century B.C. She sat to Apelles as model for his great picture of Aphrodite rising from the sea. Indicted on a charge of profaning the Eleusinian mysteries, she was defended by the orator Hyperides, who is said to have secured the verdict in her favour by rending her robe and exposing her charms.

Phrynichus. One of the oldest Greek tragic poets, a native of Athens. His best-known plays, in which he was the first to introduce dialogue, were the Capture of Miletus by the Persians, which so affected the audience that all future reference to it was forbidden; and the Phoenician Women, a lament for the defeat of Xerxes at Salamis, put on the stage by Themistocles to glorify his share in that event. Another Phrynichus, a sophist of Bithynia, lived in the 2nd century A.D. He was the author of a work called *The Atticist*, containing a collection of Attic and non-Attic expressions.

Phthalic Acid, $C_6H_4(COOH)_2$. White crystalline substance manufactured from naphthalene. The naphthalene is oxidised with sulphuric acid in the presence of mercury. Phthalic acid may also be made by the alkaline hydrolysis of phthalic anhydride. It is a dibasic acid, sparingly soluble in water and ether but soluble in alcohol. Phthalic anhydride, obtained by air oxidation of naphthalene using vanadium as a catalyst, is used in the manufacture of dyes and for making phenolphthalein.

Phthisis (Gr., wasting away). Literally, disease accompanied by much wasting of the tissues. The term is now restricted to tuberculous disease of the lungs. See Tuberculosis. *Pron.* thy-sis or ty-sis.

Phulkian States. Three Sikh states of India, now part of the Patiala and E. Punjab union. They occupy a semi-arid area between the Jumna and the Sutlej, N. of Rajputana. The chief crops are native food grains. The rulers were all direct descendants of Phul (d. 1652), who ruled over the whole area. The states came under

British protection in 1809. See Jind; Nabha; Patiala.

Phumibol Aduldet (b. 1927). King of Siam. Son of the prince of Songkhla, he was educated at Bangkok and Lausanne. He succeeded his brother King Ananda Mahidol, who died in mysterious circumstances, June 9, 1946. His marriage in 1950 to the daughter of the Siamese ambassador in London was followed by his coronation as Rama IX.

Phycomyceteae. Division of fungi consisting of single-celled threads, which form a mould-like feltwork. The familiar white mould (*Mucor mucedo*) on jam is a good example. The erect branches that arise from the feltwork end above in a globular head, which is filled with the dust-like spores. The potato-blight (*Phytophthora infestans*) and the salmon disease (*Saprolegnia ferax*) are also included in this group.

Phylactery or **FRONTLET** (Gr. *phylakterion*, safeguard). Among the Jews, strips of parchment in-

Phylactery and thongs by which it is bound to the forehead or arm

scribed with passages from Ex. 13 and Deut. 6, enclosed in a black calf-skin case, and fastened by thongs to the forehead or left hand or arm, the command in Deut. 6, v. 8, being literally interpreted. Used as early as the 3rd century B.C., and alluded to by Josephus, phylacteries, or tephillin, by reminding the wearer of the Divine law, served to protect him against sin. Modern Jews wear them on an undergarment called a *tallith* or prayer-veil. They are not worn by the Karaites, and are alluded to only once (Matt. 23, v. 5) in the N.T. The word is sometimes used to describe a case containing relics of the dead.

Phyllite (Gr. *phyllon*, leaf). In geology, a group of metamorphosed clay rocks resembling slates, containing muscovite or white mica. Though the rock splits readily, it is uneven in cleavage, and too soft to use for general building purposes. Phyllites are found among older rocks; they are associated with regions where folding has occurred.

Phyllocactus. Small genus of leafless succulent shrubs of the family Cactaceae, natives of tropi-

cal America. They have flattened green stems and branches with notched edges. From the notches are produced the large, showy, red, rose or white flowers, which have a tubular calyx, and numerous petals and stamens, the long style spreading at the top into the many-branched stigma. Several of the species have flowers from six to 12 ins. across.

Phylloxera. Genus of insects of the family Hemiptera, closely allied to the green-fly or aphids. One species, *P. vastatrix*, is a major pest of the grape. It entered Europe about 1863 in vines imported from N. America, and caused enormous damage especially in France. The insect produces galls on the lower surface of the leaves, and knots or swellings on the roots, which may entirely decay. The root forms give rise to males and females. Eggs are laid on the bark of the vine, hatching the following year, when the young insects pass to the leaves where they multiply parthenogenetically and give rise to the galls already noted. Later in the season some of the gall-formers pass to the roots, and it is these which cause the main damage. Certain American vines are not greatly affected by the root form of *Phylloxera* and, by grafting European vines on to American stocks, damage has been greatly reduced.

Phylogeny (Gr. *phylon*, race; *genesis*, origin). Biological term for the study of those parts of an animal which may be expected to throw some light upon the origin of a race or species. See Embryology.

Phylum (Gr. *phylon*, race). The largest and most inclusive groups into which members of the plant and animal kingdoms are classified; such as Pteridophyta, the fern group, or Chordata, animals with backbones. See Animal: Classification.

Physic (Gr. *physis*, nature). Term meaning the science of medicine. It survives in the official titles of certain professors and others, also in the term physician; but in general use it has been supplanted by the word medicine. Physic garden is a term which was used formerly for a botanic garden. A notable physic garden is the Chelsea Botanic, given to the Apothecaries' Society in 1721. See Medicine; Sloane, Sir Hans.

Physical Society. British scientific body. Founded in 1877, it has numbered among its presidents, Lord Kelvin, Sir Oliver Lodge, W. H. Bragg, Sir A. Edington, Lord Rayleigh, and Sir

Charles Darwin. Its offices are at 1, Lowther Gardens, Exhibition Road, London, S.W.7.

Physical Training. Systematic exercise for the promotion of health and the development of the body. The earliest form of physical training or physical education was that practised by the ancient Greeks in the palaestra (*q.v.*), and consisted chiefly of running, jumping, wrestling, and discus throwing. The Greek example was followed by the Romans, and later various kinds of physical training, mostly of an athletic description, were adopted by other European countries; but it was not until the second half of the 18th century that the value of systematic methods was fully appreciated.

Schools of physical culture were established in Germany, Denmark, and elsewhere, one of the most celebrated of these being the Royal Central Institution of Gymnastics, founded in Stockholm in 1814 by Per Henrik Ling, to whom the present high standard of Swedish physical instruction is largely due. His example was followed by Adolf Spiess in Germany, which country much developed its system in the second quarter of the 19th century.

The development of the muscles is not the only consideration in systematic physical training, and careful attention has to be given to the brain, the bones, the ligaments, and the organs. Methods vary according to the country in which they are practised, and the exercises may be performed with or without apparatus.

The Swedish system, often referred to as "free movements," is practised without apparatus, and is now adopted in Great Britain. It forms an important part of the training of the British soldier known as "P.T.," and the basis of the syllabus of physical exercises for schools issued by the ministry of Education. It is divided into groups, each group concentrating on the development of a certain part of the body—the neck, trunk, arm, leg, foot, ankle, etc.—and has the advantage over other systems that it can be practised where space is limited. But in England, as in other countries, *e.g.* France and the U.S.A., the "free movements" are combined with exercises for which appliances are necessary.

Physical training now forms part of the curriculum in the schools of most countries, the pupils of British schools usually practising recreative gymnastics, *i.e.* exercises given in the form of recrea-

tion, such as musical drill. Correct breathing is a vitally important factor in all branches of physical training, and certain exercises consist entirely of inhaling and exhaling. Much benefit may be derived by taking 10 to 15 minutes' Swedish drill night and morning, but where the exercises are performed indoors a window should always be opened. See Drill; Eurhythmics; Gymnastics; Swedish Drill; also *illus.* p. 6494.

Physical Units. Units of measurement used in commerce and scientific work. Most of them are based on the three fundamental units of time, mass, and length. See International Units.

Physician. One who practises medicine. At one time qualifications to practise medicine or surgery in the U.K. could be given separately, but under an Act of 1886 no person can be registered as a medical practitioner unless qualified in medicine, surgery, and midwifery. See Medicine.

Physicians, ROYAL COLLEGE OF. Medical corporation founded by Henry VIII in 1518. Linacre was

Royal College of Physicians arms

its first president. The college was for many years in Warwick Lane, but now occupies a handsome building in Pall Mall East, London. It possesses a fine library containing many rare books, and has an interesting collection of objects associated with great physicians of the past, including portraits. The college consists of licentiates, members, and fellows. The first two are admitted by examination, licentiates being usually physicians who devote themselves to general practice, while members are generally consultants. Fellows of the college are elected from the members in recognition of professional distinction. They are prohibited from suing for fees. The college of physicians issues an official vol., *The Nomenclature of Diseases*.

The Royal College of Physicians of Edinburgh is a Scottish medical corporation founded in 1681. Its present constitution dates from 1861. It unites with the Royal College of Surgeons, Edinburgh, and the Royal Faculty of Physicians and Surgeons, Glasgow, the

Royal College of Physicians of Edinburgh arms

Physical Training. Trunk and limb exercises similar to those adopted as part of the P.T. scheme in English schools and in the British fighting services, and particularly suitable for daily use where space is limited. See text p. 6493
By courtesy of H.M. Stationery Office

to conduct examinations and grant degrees in medicine and surgery in Scotland. Its headquarters are in Queen Street.

The Royal College of Physicians in Dublin was founded in 1654 by Dr. John Stearne, fellow and professor of physic, Trinity College, Dublin, and incorporated by royal charter, 1667. It was re-incorporated in 1692 under the title of The King's and Queen's College of Physicians in Ireland, and in 1890 the title of Royal College of Physicians in Ireland was conferred by supplemental charter. Licences and de-

grees are generally accepted in the U.K. as in Eire.

Physic Nut (*Jatropha purgans*). Shrub or small tree of the family Euphorbiaceae. It is indigenous to tropical America. Its alternate leaves are heart-shaped or three to five-lobed. The small green flowers form small, loose clusters. The black, fleshy berry has three oil seeds with the flavour of almonds. The expressed oil is used in lamps, and in medicine as a purgative.

Physics. General name for the sciences based on the physical manifestations of the various forms

of energy and the properties of matter. The common division of physics is into heat, light, sound, electricity, magnetism, and the properties of matter. The first five are different forms of energy, mutually convertible, and developments in nuclear physics indicate that it is not improbable that matter itself is a further modification of the same fundamental component. While for convenience the natural sciences are still treated as entities, the dividing lines between them are increasingly indeterminate. Broadly speaking, it may be said

that physics comprises the trunk which unifies the whole system of natural science.

Thus, chemistry is so bound up with the properties of matter and changes in energy distribution that it could quite properly be regarded as a specialised branch of physics. All chemical reactions are dependent upon the establishment of an energy equilibrium under the existing conditions, and if these change the course of the reaction may be altered or even reversed. An instance of the practical application of the reversibility of chemical reaction is the lead accumulator, which is of great importance in practical physics and is familiar to nearly everyone in connexion with motor cars or wireless sets. Geology depends on the use of various branches of physics, particularly optics, to interpret the structure and history of the earth's crust. Astronomy is entirely dependent on the knowledge of the properties of light; while biology involves the application of physical methods to living cell structures.

Mathematics is the means of expressing the fundamental laws of physics which have been derived from observed phenomena. The further mathematical development of these laws has made it possible to deduce many properties of matter from theoretical considerations before they could be experimentally demonstrated. This has helped research work to proceed along systematic lines and produced a very much more rapid increase in knowledge than could have resulted from a continuance of the haphazard methods which were perforce employed by the pioneers responsible for the original observations upon which the fundamental laws were founded. The most spectacular progress has been in the field of the structure of matter. The transmutation of one element into another has ceased to be the alchemist's dream and become the physicist's achievement. Enormous possibilities became obvious in the release of energy by controlled atomic fission.

The Institute of Physics, founded in 1920 under the auspices of the Faraday society, the Optical society, and the Physical society of London, has done valuable work in coordinating the efforts of the numerous bodies engaged in the study and application of physical science.

Separate articles in this Encyclopedia describe the scope and use of the various physical sciences.

See Electricity; Heat; Light; Magnetism; Matter; Optics, etc.

Peter F. F. Clephane

Physiocrats (Gr. *physis*, nature; *kratein*, to rule). An 18th century school of French economists. Founded by François Quesnay (q.v.), they taught that the land is the source of all wealth, and agriculture and mining the only industries that produce wealth. They were strongly opposed to the mercantile system then dominant in France and to a lesser extent in England, and demanded that all taxation should be paid from the produce of the land. Their doctrines, put forward earlier by Richard Cantillon, were extended by Quesnay and his friends, calling themselves the Economists. They were a considerable influence in the development of the "single tax" ideas of Henry George (q.v.). Dupont de Nemours, one of the school, was responsible for the name. *See* Smith, Adam. *Consult* The Physiocrats, H. Higgs, 1897.

Physiognomy (Gr. *physis*, nature). Art of judging character from external features, especially the face. Aristotle wrote about it, finding a certain resemblance between men and the qualities of the animals that in feature they resembled. Many other writers, both in classical times and later, dealt with the subject, and it was a popular subject for theories of all kinds. Professors of physiognomy sprang up, many of them charlatans, and in 1743, in England, an Act was passed providing that all those pretending to be skilled therein should be punished. There is, however, a modern and more scientific form of physiognomy, which may be described as a study of the emotions as expressed by the muscles. This is useful in criminology. *See* Criminology; Phrenology; Psychology.

Physiography (Gr. *physis*, nature; *graphein*, to describe). Science which deals with the earth and its place in nature. As a comprehensive study it is chiefly concerned with the coordination of the results of other sciences: from astronomy it accepts the story of the earth as a planet; from geology the account of the structure of the rocks; from meteorology and oceanography the sum of our knowledge of the air and the sea. With these fundamentals it coordinates the facts of physical geography, and includes some account of human activities, and in doing so leads to the more comprehensive study of man in relation to his environment.

Physiology. Branch of biology which deals with the functions, as distinct from the structure, of living organisms, whether plants or animals. The physiology of plants is usually included in the science of botany, and the physiologist is primarily concerned with the functions of animals. The term function is used to mean the characteristic actions performed by an animal or by its constituent parts; thus the ear is concerned with the function of hearing. Physiology is the province of the physician; anatomy that of the surgeon.

The study of even the simplest forms of animal life throws light on the functions of those higher in the scale of evolution, since certain characteristic functions are displayed by all animals. They possess the power to take in food, build this up into their own substance, and reject the waste products formed during this process. The power to grow in size represents one aspect of this function. They are able to reproduce themselves, thereby giving rise to other animals. Finally, they are influenced by changes in their surroundings, which act as stimuli to which they can respond by some alteration within themselves.

The simplest form of animal life consists of a single cell. This is a tiny particle of living material, semi-fluid in consistency, and called protoplasm. Part of this little mass of protoplasm differs from the remainder in appearance and chemical nature, and is known as the nucleus. Chemical analysis of such an organism reveals nothing in its composition which may not occur in dead matter; not by its composition or even its structure, but by its power to move, nourish, and to reproduce itself, do we recognize an animal to be alive.

The physiologist finds that living organisms possess two characteristic properties, upon the possession of which depends their ability to carry out their functions. The first is that the living animal is constantly undergoing change; every day part of its protoplasm is destroyed and is replaced by the building up of new protoplasm. The second is that the animal has the power to store up energy in its body, and to expend part of this energy from time to time.

If, however, the animal is to renew its protoplasm and to store up energy, it must be supplied with food. This, after undergoing a preliminary process of digestion, furnishes the raw material which the living animal transmutes into

living protoplasm, or can utilise as a source of the energy expended in the course of its activities. The processes involved in the building up of food into protoplasm and the breaking down of protoplasm into waste products are included under the term metabolism.

In the lowest forms of animal life all the processes just described take place within the compass of a single cell. But the study of animals higher in the scale of evolution at once reveals differentiation of both structure and function, since these animals consist of many cells, which have become modified in structure and specialised as regards their function. Some cells are gathered together to form organs, possessing the special function of forming the digestive juices and of carrying out the digestion of the food taken into the body. Other groups of cells are transformed into muscles, and are concerned in bringing about bodily movements. Other cells, again, form organs, such as the eye.

An outcome of increasing complexity of structure and specialisation of function in the higher animals is that, as regards their functions, the different organs fall into two main groups. One group is primarily concerned with providing for the nutritive requirements of the body, the supply of oxygen, and the removal of waste products. The other group is responsible for bringing about the reactions of an animal to changes in its surroundings. All higher animals are provided with muscles and these possess the power of altering their shape, thereby bringing about movement of part or the whole of the body; and such movements form the only means by which an animal or man can enter into communication with the outer world.

In the normal animal, however, every muscular movement is controlled by the central nervous system, which consists of the brain and spinal cord; and these are connected with the muscles by delicate threads called nerves. Hence every movement of the body is normally dependent on, and is an indication of, the activity of the brain or spinal cord. If the nerves passing from the nervous system to any particular muscle are destroyed, that muscle becomes useless and is said to be paralysed. The range and variety of movements which an animal can carry out are proportional to the development of its muscular and nervous systems. The brain is connected

by nerves with the surface of the body, with the eye, and with the ear; a ray of light falling into the eye, or an object touching the skin, causes an impulse to pass to the brain, which may respond to this stimulus by setting in action certain muscles.

The student of physiology must proceed along three main lines of inquiry. He must discover as accurately as possible the functions of each organ of the body and the conditions under which these functions are carried out. He must study how the animal reacts to the changes constantly taking place in its surroundings. Lastly, he must ascertain how the activities of the different organs of the body are linked together and co-ordinated so as to promote the highest efficiency of the body as a whole. In the animal world, structure and function go hand in hand; if a similar structure or organ is found in two types of animals, the main function of that organ will be the same in the two animals. The study of the functions of lower animals, therefore, throws light on the functions of the human body. *Consult Applied Physiology, S. Wright, 1940.*

Physiotherapy. Treatment of the human body by physical means. The operator is called the physiotherapist. Forms of physiotherapy include:

(1) Massage, in which the hands of the physiotherapist are used; the main groups of massage are effleurage, pétrissage, tapotement, frictions, and stroking.

(2) Electrotherapy, in which two types of current may be used. Low tension currents, derived from batteries or mains, are named galvanic, faradic, and sinusoidal for therapeutic purposes. They stimulate nerves and produce chemical and biological effects. High tension currents are derived from the mains and passed through step-up transformers. An oscillating system makes the wave frequency so rapid that nerve stimulation and chemical effects cease to take place and the main result is the heating of bones and organs. These currents are known as diathermy or short-wave currents.

(3) Ray therapy, in which electrical currents heat suitable electrodes or filaments or are used to strike arcs to produce the electromagnetic waves of the radiant heat, infra-red, and ultra-violet ray treatments. The first-named rays penetrate to varying depths in the tissues and on absorption cause a rise in temperature of the

irradiated part; the last penetrate only the superficial layers of the skin to bring about chemical change.

(4) Exercise therapy comprises movements by the patients themselves with their own bones, joints, and muscles, often with the help or resistance of the physiotherapist or some apparatus—bars, stools, slings, pulleys, etc. There is one exception, *i.e.* the passive movement, performed by the physiotherapist moving a part of the patient which he cannot or must not move.

Games may be adapted to suit a patient at all stages of recovery and provide a variation of exercise therapy.

(5) Hydrotherapy implies that water is used. It may be applied in small bowls or baths, through sprays and douches or in pools. It eliminates the action of gravity and is used in cases of muscular weakness, joint stiffness, etc. Spa waters are also utilised.

Many of these methods can be used as a preventive, *e.g.* to train a patient before operation in chest, abdominal, or limb movements, and so avoid complications such as collapse of lung, or stiff joints; also in training for childbirth and after labour, to fit the mother to resume normal duties with a good posture, and prevent the occurrence of flat foot, varicose veins, or backache. Physiotherapy is used in *e.g.* infantile paralysis, cerebral palsy, lung operations, abdominal operations, removal of the knee cartilage, dislocations, fractures, sprains, ruptured muscles and tendons, heart diseases, gynaecological operations, flat feet, knock knees, bow legs, anaemia, war injuries, amputations.

Training schools are found in nearly all the large teaching hospitals in London, also in Manchester, Liverpool, Birmingham, Leeds, Newcastle-upon-Tyne, Bristol, Cardiff, Edinburgh, Glasgow, and Dublin. Students take examinations of the Chartered Society of Physiotherapy, the register of which in 1948 contained some 16,000 names.

Physostigmine or **ESERINE**. Substance obtained from the calabar bean (*Physostigma venenosum*) and used for various affections of the eye, *e.g.* to contract the pupil.

Piacenza. Prov. of N. Italy, in Emilia. It lies S. of Milan, E. of Pavia, and W. of Parma. The surface is level in the N. and mountainous in the S. *Pron. Pee-ahen-tsa.*

Piacenza. City of Italy, the ancient Placentia. The capital of the prov. of the same name, it stands on the right bank of the river Po, just below the influx of the Trebbia, and is a junction 92 m. by rly. N.W. of Bologna and 36 m. W.N.W. of Parma. It contains the 13th century Palazzo Comunale, the Palazzi dei Tribunali, and degli Scotti, early Renaissance brick and terra-cotta buildings; the Palazzo Governo, with a famous sundial; the Palazzo Farnese, a huge structure begun in 1558, but unfinished and now used as a barracks; and two episcopal palaces.

The cathedral, dating from 1122-1233, has a handsome belfry. The church of S. Antonino, the original cathedral, was founded in the 4th century, restored in 903, rebuilt in 1104, and altered in 1857. The church of Santa Maria is decorated with mural paintings, while that of San Sisto (1499) formerly held and gave its name to Raphael's Sistine Madonna. The city is walled, and in the Piazza dei Cavalli, the principal square, are two equestrian statues—of dukes Alessandro and Ranuccio Farnese. Manufactures include iron, brass, silk and cotton goods, hats, and pottery; printing and flour-milling are also carried on.

Colonised by Rome in 218 B.C., Placentia was captured by the Gauls in 200 B.C., and by Totila in A.D. 546. In the 12th century it became a leader in the Lombard League. It has several times fallen to the French, and in the vicinity, in 1746, the Austrians gained a decisive victory over the French and Spaniards. The modern history of Piacenza has been closely connected with that of Parma, being merged into the kingdom of Italy in 1860. Entered April 27, 1945, by the Allies without serious German opposition, it suffered scattered but no important damage during the Second Great War. Pop. 79,670. See Parma.

Pia Mater. Middle membrane of the three which surround the brain. It is prolonged downwards to cover the spinal cord. See Brain.

Piana dei Greci. Town of Sicily, in the prov. of Palermo. Situated at the foot of the hill, 11 m. S.W. of Palermo, it was founded in 1488 by Albanian emigrants who fled from the Turks, and whose language and customs survive. Silk and woollen goods are manufactured. Pop. 8,500.

Piankhi. Name of several Ethiopian kings of Napata (*q.v.*). Piankhi I, c. 743-714 B.C., is best

known by his inscribed granite stela, 5 ft. 9 ins. high, erected at Gebel Barkal, near Napata, and now in Cairo. It contains a picturesque account, in 159 lines, of his victorious expedition in a great flotilla down the Nile, which resulted in his conquest of Egypt.

Piano. Italian term used in music to indicate that the performance is to be soft. The term pianissimo is used for very soft. The abbreviations, *p*, *pp*, and *ppp* are more commonly used than the full words. Old music has *pia.* for piano. Pron. pee-ah-no.

Pianoforte (It., soft-loud). Musical instrument. The pianoforte, the name of which is now customarily shortened to piano, is a percussion instrument descended from the dulcimer family. The tone is produced by the impact of felt hammers upon wires or strings of varying gauge, length, and tension. In the lowest part of the compass, for about two octaves, the required gravity is obtained by covered, or wound-round, strings, one or two to each note; above this are three uncovered strings to each note.

The instrument is played from a keyboard composed of a recurring series of long (white) and short (black) levers or keys, seven of the former and five of the latter in each octave, the black notes being in alternate groups of twos and threes, separated by white ones. These, on being depressed by the fingers, set in motion a complicated mechanism (action) designed not only to propel the

hammers against the strings, but further to respond to the player's will, by means of his touch, in the way of graduated tone, and perfect repetition. The action is further complicated by the necessity for dampers to check undesired vibrations when the finger releases the key. The illustration shows the mechanism of the action for treble notes. When the key A is depressed the whole carriage is moved on its centre at L. This movement is transmitted through

Pianoforte. Interior of a barless frame instrument. Top, right, diagram illustrating action. A. Key. B. Jack. C. Notch. D. Hammer butt. E. Hammer head. F. Check. G. Damper. H. Set-off button. J. the jack B which comes in contact with the hammer butt D at the notch C. The set and shape of this notch is the most vital part of the action. The hammer head E is carried forward to strike the string. The set-off button H now comes into play by throwing the jack B from under the notch, thus preventing the hammer head blocking on the string. The hammer being thrown back from the string, the check tail M is caught by the check F, and so held until the key is released. In the upward movement of the carriage the spoon K comes into action by raising the damper G. The carriage and hammer butt are connected by tape N. J is the jack or hopper spring, O the hammer butt centre, P damper lever centre, Q jack centre.

There are usually two pedals; the one on the right suspends the whole damper action when pressed down. That on the left acts in one of three ways: (a) By shifting the action so that the hammers strike only two of the three strings, the unstruck one vibrating in sympathy and thus imparting a somewhat veiled but beautiful change of tone colour; (b) by moving the hammers closer to the strings so as to strike them with less force; and (c) by interposing a strip of felt between the hammers and the strings. The last two are applied to upright instruments and have little to recommend them. In certain cases a third pedal is added by which the performer can sustain a desired note or notes without affecting the right pedal.

In most modern pianos the compass is seven and a quarter octaves, from nearly two octaves below the bass staff to two octaves and a musical fifth above the treble staff. Modern pianos are of two kinds, grands and uprights, the overall dimensions varying with the string lengths employed.

Although the idea of an instrument which should remedy the deficiencies of the inexpressive harpsichord seems to have been working in more than one mind at the beginning of the 18th century, the credit for priority of invention is now generally allowed to Bartolommeo Cristofori (1651-1731), a harpsichord maker of Padua and, later, of Florence. Schroeter in Germany, and Marius in France, were but little later. Subsequent makers have effected numerous improvements, but in all essentials the modern grand is simply a development of Cristofori's *Clavicembalo col piano e forte*. The

light touch and small tone of the older instruments have disappeared, and there is instead a fuller yet wonderfully responsive touch, occasioned by improved action necessary to obtain good tone from much heavier strings, with the result that a concert grand is almost organ-like in its amplitude of sound. To the average player the piano is the instrument offering the maximum of return for the minimum of outlay, enabling him to acquire a personal acquaintance with various forms of music. Small wonder that it has become a household instrument, especially in its upright and "cottage" (small upright) forms, which take less space than the grand. A very large and important trade is the consequence. There is a vast demand for piano music, both original and arranged. This state of things could never have been had the harpsichord retained its supremacy. Cristofori's invention, therefore, may be regarded as one of the chief factors in spreading a wider knowledge of music among the people. See Music; Organ; Player Piano. Consult History of the Piano, E. Closson, Eng. trans. D. Ames, 1947.

Piano-organ. Mechanical musical instrument. Shaped like an upright pianoforte, it is controlled like the barrel-organ, with which it is often confused, by a revolving cylinder and turned by a hand-crank, with pins in suitable position to come in contact with actuating levers. But whereas in the barrel-organ the lovers admit wind to pipes or reeds, in the piano-organ they strike upon strings. The instrument was a favourite with street musicians in the late 19th and early 20th centuries, musical hall songs and operatic arias being rendered in a flat mechanical tinkling tone relieved by an abundance of trills and flourishes.

Piassaba. Fibre largely used for making brushes and brooms. It is obtained from two S. American palms, of the family *Palmae*. The finer kind, known as *Para piassaba*, is the envelope of the young leaves of *Leopoldinia (Cocos) piassaba*, which after it has served its natural purpose hangs down and covers the trunk. The other and coarser kind comes from the leaf bases of *Attalea funifera*, the fruits of which (coquilla nuts) are extensively used by the turner for making knobs and small articles.

Piastre. Name of a Turkish and an Egyptian coin, each being of nickel. According to the country in which they are used,

100 piastres are worth £1 Turkish and £1 Egyptian, but the value of Turkish currency in exchange with sterling was, for some time after the Second Great War, undecided.

Piastre. Obverse and reverse of the Turkish coin. Actual size

P.I.A.T. (PROJECTOR, INFANTRY, ANTI-TANK). Weapon introduced in the British army in 1943. The invention of Brigadier M. R. Jeffries, of the ministry of Supply, it weighed 33 lb., and fired a 2½-lb. bomb with a hollow charge which could penetrate 4 ins. of armour. Fired from the shoulder, its controlled recoil and padded shoulder-piece made it suitable for operation by one man, with a second as loader. It could stop tanks at 115 yds., and was extremely effective against concrete emplacements.

P.I.A.T. British anti-tank weapon introduced during the Second Great War

Piatra. Town of Moldavia, Rumania. It is about 60 m. S.W. of Jassy, and trades in timber. Pop. est. 30,000.

Piahy or PIAUI. State of N.E. Brazil. It is bounded W. by Maranhão, E. by Ceara and Pernambuco, and S. by Bahia. The river Parahyba flows along its W. boundary. The surface is mostly a plain, watered by numerous rivers, and stock-raising is the principal industry. Iron, copper, silver, lead, and salt are found, but are little exploited. Cotton, sugar, tobacco, rice, rubber, and dye woods are produced, and cotton-weaving is carried on. The capital is Therezina (q.v.). The area is 116,494 sq. m. Pop. 832,250.

Piave. River of N.E. Italy. It rises in the Carnic Alps and flows in a S.E. direction to the Adriatic 22 m. N.E. of Venice, after a course of 125 m. At its mouth is Porto di Cortellazzo; its old mouth was at Porto di Piave Vecchia, nearer Venice. Pron. Pee-ahvav.

Piave, BATTLES OF THE. Three battles of the First Great War, fought between Austrian and Italian armies in Nov., 1917, June, 1918, and Oct.-Nov., 1918. The Italians were aided by British forces, the Austrians by German. After their disaster at Caporetto (*q.v.*), Oct., 1917, the Italians took up positions on the W. bank of the Piave. The lower Piave between the Montello and the Adriatic Sea formed a fair defensive front, but to the N. of the Montello the river presents no natural obstacle. The battles of Nov. revolved round attempts made by the Austro-Germans to cross the river at various points. They were successful at only one point, near Zenson on the Lower Piave, though once across they remained pinned against the W. bank until they lost the position in Jan., 1918.

In the Austrian offensive of June, 1918, the main weight of the attack was felt on the line of the Lower Piave. A few crossings were achieved near Neuresa, but little ground was gained in the face of Italian resistance, except in the marshy region nearest the sea. But on June 19 the Piave poured down in flood, and the Austrians were forced back to the E. bank with heavy losses. In short, their offensive failed on the Piave as elsewhere, and the end of June found the Italians re-established solidly along the W. bank.

The third battle was opened Oct. 27, 1918, by Italian and British forces (including one U.S. regiment), the British consisting of the 7th and 23rd divisions. They crossed the Piave N. and S. of the Montello, and pressing the attack had the Austrians in retreat throughout the following days, capturing 50,000 prisoners. By Nov. 3, they had crossed the Tagliamento, representing an advance of some 30 m. along the whole line; and the advance was only brought to a halt with the cessation of hostilities by the granting of the armistice of Nov. 4.

Piazza (Lat. *platea*, broad space). Italian word for a square or open space, surrounded by buildings. The most famous is the piazza of S. Mark at Venice. Some of these squares were surrounded by an arcade, and the word is therefore sometimes used for an arcaded walk. *See* Venice.

Piazza Armerina. City of Sicily, in the prov. of Enna. On a mountain slope, alt. 2,360 ft., 15 m. E.S.E. of Caltanissetta, it has a 16th century cathedral with a fine belfry, and remains of the Norman

period. The inhabitants of Piazza, which was founded in the 11th century, still speak a Lombard dialect. There is a trade in oil, wine, and nuts. Pop. 38,500.

Piazzi, GIUSEPPE (1746-1826). Italian astronomer, born at Ponte in the Val Tellina, July 16, 1746. He became professor of mathematics at Palermo, 1781, and established there an astronomical observatory. After publishing in 1792 corrections of previous estimates of the aberration of light, the parallax of certain heavenly bodies, etc., on Jan. 1, 1801, he discovered the first asteroid (*q.v.*), Ceres. For his two catalogues of fixed stars, in 1803 and 1804, he received recognition by the French Institute. Appointed director of the govt. observatory at Naples in 1817, he died July 22, 1826.

Pibcorn (Gael. *piob*, pipe; *corn*, horn) or **HORNPIPE**. Ancient reed instrument mainly in use among Celtic peoples. It probably gave its name to the familiar dance now associated with sailors.

Pibroch (Gael. *piobaireachd*, art of piping). Music of the Scottish Highlands, suitable for the bagpipes. In form it is of the variation type, an air being given out and then varied by ornamental treatment of all kinds. The variations usually increase in elaboration, sometimes alternating with a slow version. Many pibrochs bear the names of famous pipers or their chieftains, or of legendary stories or events of history. *See* Bagpipe.

Pica. A printing type. Also known as 12-point, it is a size larger than small pica, a size smaller than English, and the largest ordinary size of book type: six lines make an inch in depth.

This line is in pica.

Used as a standard unit of measurement, and also for the point system, it is called *Le Cicéro* in French and *Cicero* in German, the Epistles of the Latin writer of that name having been first printed in type of this size. The Dutch call it *Mediaan*. *See* Printing.

Picardy. One of the provs. into which France was divided before the Revolution. It lay between Normandy, Île de France, Champagne, Hainault, and Artois, and had a frontier on the English Channel. Through it ran the rivers Somme and Oise, and it was divided into N. Picardy and S. Picardy. In it were the cities of Amiens, Laon, Beauvais, Senlis, Soissons and Noyon; also Boulogne and St. Quentin. The name

Picardy appeared about 1300, but much earlier the district had been a possession of the kings of France. Part of it was handed over to the duke of Burgundy in 1435, but this was recovered by the French king in 1477. It was long a prosperous district—a French East Anglia—while the Picard also had a reputation as a fighting man. Today Picardy is represented by the department of Somme, and parts of those of Pas-de-Calais, Aisne, and Oise, in all of which intense fighting took place in the First Great War. *See* Amiens.

Picaresque Novel. Type of story dealing with the lives and doings of rogues and adventurers. The adjective is derived from the Spanish word *picaron*, Eng. *picaroon*, a cheat, an adventurer, or one who lives by his wits. Due to reaction against the degenerate romance of chivalry; the type originated about 1550 with the anonymous Spanish Life of Lazarillo de Tormes, the realistic description of the career of a young beggar. It was followed by Alemán's *Guzmán de Alfarache*, 1599, and by many similar novels in Spain and other countries. Examples are Le Sage's *Gil Blas*; Fielding's *Jonathan Wild*; and Thackeray's *Barry Lyndon*.

Picasso, PABLO RUIZ (b. 1881). Spanish painter. Son of Basque parents, Pablo Ruiz was born at

Pablo Picasso,
Spanish painter

Malaga, Oct. 23, 1881. He later adopted his mother's maiden name as his surname. After some time in Barcelona, where his father was professor at a academy of

arts, he worked at the École des Beaux-Arts, Madrid, and from 1903 made his home in Paris.

His work can be divided into several phases: the realistic period, 1895-1901, influenced by Degas and Toulouse-Lautrec and marked by fine draughtsmanship; the blue period, 1901-04, rendering in melancholy manner harlequins, circus dancers, and pierrots with almost monochromatic colour; the rose period, 1905-06, reminiscent of Cézanne and Van Gogh; the negro period, 1907-08, when he was preoccupied with Fauvist doctrines. In 1909 he began to work with Braque and launched his Cubist formulae—a phase which, lasting until 1914, had a far-reaching influence on painting.

Picasso joined Diaghilev and his Russian ballet in Rome about 1917; he designed the décors of *The Three Corners*, *Hat*, *Pulcinella*, and other ballets. After the First Great War he returned to more classical painting, and many canvases dating from the 1920s were on a gigantic scale. His paintings shortly before and after the Second Great War deepened in harshness and violence, the outcome of his *Guernica*, painted during the Spanish Civil War. After 1945 he turned to a naturalism of great power. His illustrations for Buffon's *Histoire Naturelle*, 1942, were a series of 31 aquatints. Picasso was a supreme innovator, the originator and leader of almost all new departures in painting from 1910. He is represented at the leading European galleries, and at the Museum of Modern Art, New York. The *Château Grimaldi*, near Vallauris, S. France, became a Picasso museum in 1949. *See* Art illus., p. 604; Cubism illus.; Drawing illus. *Consult* works on his art by A. Salmon, 1920; M. Raynal, 1921; G. Stein, 1938; P. Eluard, 1947.

Terence Dennis

Picayune (prob. Fr. *picailon*, a small coin). Name used in Florida and Louisiana for the Spanish half-real, and later for the U.S. 5-cent piece.

Piccadilly. London thoroughfare. It extends W. from Coventry Street and Piccadilly Circus to Hyde Park Corner. One of the fashionable parts of the metropolis, and with a history going back to the early part of the 17th century, it contains the Piccadilly, Ritz,

and other hotels, Burlington House (*q.v.*), Burlington Arcade, and many clubs. Some of the houses for which it was famous still front the Green Park. Devonshire House was pulled down in 1921, but Apsley House (*q.v.*) remains, as does Albany, designed for Lord Melbourne and since 1804 devoted to residential chambers in which Byron, Macaulay, Canning, Bulwer Lytton, Gladstone, Arnold Bennett, and J. B. Priestley resided. In S. James's Church, built by Sir Christopher Wren in 1682-84, and almost destroyed during the Second Great War, Charles Cotton, Tom D'Urfey, and Mark Akenside were buried. In its grounds was laid out a garden of remembrance designed by A. E. Richardson, and opened by Queen Mary, May 12, 1946. The 4th duke of Queensberry, known as "Old Q," lived at No. 138. At No. 145 King George VI resided as duke of York from 1927 to his accession in 1936.

St. James's Hall, once the home of the Moore and Burgess Minstrels, stood on the site of the Piccadilly Hotel. Piccadilly Circus is crossed by Regent Street, while Shaftesbury Avenue, Coventry Street, and Glasshouse Street lead from it. It contains the Criterion Theatre and Restaurant and the London Pavilion, and in the centre is a fountain by Alfred Gilbert, erected in 1893 to the memory of the 7th earl of Shaftesbury (*see* Eros). Piccadilly derives its name from a house built by a retired tailor on the N.W. corner of the Haymarket, and called Piccadilly Hall because its owner had made

foppish doublet trimmings and collars known as peccadils or peckadils. The name Piccadilly is also given to a thoroughfare connecting Market Street and London Road, Manchester. *Consult* Piccadilly, Laurence Oliphant, 1870; *The Ghosts of Piccadilly*, G. S. Street, 1907; *Wanderings in Piccadilly*, Mayfair, and Pall Mall, E. B. Chancellor, 1908; *Piccadilly in Three Centuries*, A. I. Dament, 1920.

Piccadilly Line. Branch of the London underground rly. Opened as the Great Northern, Brompton, and Piccadilly Tube rly., Dec. 15, 1906, it ran from Hammersmith to Finsbury Park. An extension from Holborn to the Strand was added the next year. In 1932 the line was extended from Finsbury Park to Arncliffe Grove; Oct. 23, 1933, a through service was inaugurated between Uxbridge and Cockfosters. By 1947 the line covered 37.81 miles, and had 49 stations.

Piccadilly Theatre. London playhouse in Denman St., W.1. It was opened April 27, 1928, under the management of Edward Laurillard. It seats 1,160.

Piccard, AUGUST (b. 1884). Swiss physicist. Born at Geneva, he was educated at Zürich high

August Piccard,
Swiss physicist

school and Basel university, and in 1925 became professor of physics at Brussels. He specialised in the study of cosmic radiation, and constructed a balloon and

air-tight gondola in which in 1931 he made an ascent into the stratosphere, reaching the then unprecedented height of 51,458 ft. (9.7 m.). On Aug. 17, 1932, he achieved an altitude of approximately 10½ m. In 1945 he turned his attention to the disintegration of sunlight at ocean depths, and in 1947 built a submarine "bathyscaphe," which proved unequal to his intended descent of 2½ m. in the Gulf of Guinea. *See* Stratosphere.

Piccolo. Italian word meaning small, most commonly applied to the little flute which sounds an octave higher than the concert flute. Some piccolos are made a semitone, or a tone and a half, higher than the ordinary piccolo, with open scales sounding E flat and F respectively. The compass of the piccolo is similar to that of the flute, but sounding an octave higher than the flute of the same nominal pitch. The piccolo, however, does not possess the lowest two semitones (C and C sharp), and reaches the extreme upper notes only with shrillness and difficulty. *See* Flute.

Piccolomini. Name of a noble Italian family. Settling in Siena in the early 13th century, its members established commercial houses in Italy, France, and Germany,

Piccadilly, London. View of Piccadilly Circus from Piccadilly, looking up Shaftesbury Avenue, and showing Gilbert's Shaftesbury memorial fountain in the centre surmounted by the Eros statue

and amassed great wealth. Belonging to the Guelph faction, they were alternately in exile and in power, but eventually lost their influence and declined in prosperity. The family produced several important personages, including two popes, Aeneas Silvius, Pius II (*q.v.*), and Francesco, Pius III (1439–1503). Alessandro Piccolomini (1508–78), archbishop of Patras, was a philosopher.

Piccolomini, OTTAVIO (1599–1656). Italian soldier. Born in Florence, Nov. 11, 1599, he belonged to the noble family of which Pius II was a member. He began his military career in the army of Spain, but in 1618, on the outbreak of the Thirty Years War, was with a force sent to fight on the emperor's side. He had a full and varied career both as a diplomatist and soldier before he joined Wallenstein, and, having fought at Lützen, he rose to be a general officer, and shared in the plot that resulted in the murder of his leader. In 1635, having in 1634 helped to win the battle of Nördlingen, he went to aid the Spaniards in the Netherlands, and he remained in high command until the end of the war in 1648, being in its concluding months the imperial generalissimo. He was made duke of Amalfi and a prince. He died Aug. 11, 1656. Piccolomini figures in Schiller's *Wallenstein*.

Pice. Copper coin of India and Pakistan. Four equal one anna (*q.v.*), and the value of one is a farthing. It is divided into three pie.

Picenum. Country of ancient Italy. Lying on the Adriatic, it was bounded N. by Umbria, W. by Umbria and the Sabine country, and S. by the country of the Vestini. The inhabitants of Picenum submitted to Roman rule towards the middle of the third century B.C., but revolted in the Social War, 90 B.C., their town of Asculum being made the capital of the league. Later they secured the Roman franchise.

Pichegru, CHARLES (1761–1804). French soldier. He was born at Arbois, Feb. 16, 1761, and educated

at the military academy of Brienne, to which he subsequently returned as a teacher, among his pupils being Napoleon. In 1793 he became a divisional general in the

Revolutionary army, and in the next two years acquired a great military reputation by his series of victories over the Austrians and their allies. In 1795, however, he began a series of intrigues with the Bourbons, which led eventually to his deportation to the penal colony of Cayenne. Escaping to England, in 1798 he resumed his intrigues, and, with Cadoudal as ringleader, a plot was hatched for the assassination of Napoleon. Cadoudal and Pichegru made a secret visit to Paris, but Pichegru was betrayed and arrested, and on April 15, 1804, was found strangled in his bed.

Pichincha. Prov. and volcano of N. Ecuador. The prov. is S. of Imbabura, E. of Manabi, and N. of Leon. It has many fertile valleys, but is subject to earthquakes. The capital is Quito. Pop. 303,480. The volcano is 8 m. N.W. of Quito, and has an alt. of 15,919 ft., with a crater 2,500 ft. deep. On its slopes was fought, May 22, 1822, the battle which secured the independence of Ecuador.

Pickerel. Name used in the U.S.A. and Canada for small fish elsewhere called pike (*q.v.*).

Pickering. Urban dist. and market town in N. Riding of Yorkshire, England. It is 32 m. by rly. N.E. of York. The chief building is the church of S. Peter, which contains some old mural paintings discovered in 1851, and restored; a Norman font, and some other Norman work. There are ruins of a castle, which existed before the Norman Conquest and was afterwards in the duchy of Lancaster. The chief industry is the manufacture of agricultural implements, and there is a trade in agricultural produce. The vale of Pickering lies between the moors of N. Yorkshire and the Wolds. Market day, Mon. Pop. 3,668.

Pickering, EDWARD CHARLES (1846–1919). American astronomer. Born at Boston, July 19, 1846, he was educated at the Lawrence Scientific School, Harvard. He became Thayer professor of physics, 1867–76, at the Massachusetts Institute of Technology, and professor of astronomy and director of the observatory at Harvard, 1876, a post he held to his death. In 1906 he became pre-

sident of the Astronomical and Astrophysical Society of America. He died Feb. 3, 1919. Pickering made a special study of the light and spectra of stars, in connexion with which he invented the meridian photometer.

Pickering, WILLIAM HENRY (1858–1935). An American astronomer. Born in Boston, brother of E. C. Pickering, he was assistant instructor of physics at the Massachusetts Institute of Technology, 1880–87, and became assistant professor of astronomy at Harvard, 1887. Pickering became famous by his discovery of Phoebe, the faint ninth satellite of Saturn, and in 1921 put forward the theory that there is vegetable life on the moon. He died in Jan., 1935.

Picket. Military term signifying a small detachment of troops used as an outpost or guard. It may also mean a body of troops detailed for certain special eventual duties—the fire-picket being the men instructed to take immediate action in an outbreak of fire.

Picket Boat. Small boat, usually a steam pinnace, carried by warships. See Boat.

Picketing. Term borrowed from the military word picket, and used to describe the practice, common during strikes, of placing men to restrain others from work-

Pickering, Yorkshire, N.R. Main Street, and the spire of the parish church of S. Peter

ing, or to obtain or impart information bearing on the dispute. The Conspiracy and Protection of Property Act, 1875, made it unlawful not only to use violence or intimidation, but also to "watch or beset" the house or place of work of another person with a view to compelling him to abstain from work. The Trade Disputes Act, 1906, clarified the position, making picketing lawful for the purpose of peacefully obtaining information, or of peacefully persuading any person to work or to abstain from working.

Following the general strike of 1926, the Trade Dispute and Trade

Charles Pichegru, French soldier

Unions Act, 1927, was passed, which imposed criminal liability on persons engaged in picketing in a manner liable to intimidate any persons or to cause a breach of the peace. This legislation was repealed in 1946. *See* Osborne Case; Strikes; Trade Disputes Act; Trade Unions.

Pickford, MARY (b. 1893). Canadian film actress. Gladys Mary Smith was born in Toronto April 8, 1893, and was a child actress in East Lynne and Uncle Tom's Cabin—suitable training-grounds for her talents in the unsophisticated films in which she later made her name.

Mary Pickford,
Canadian film actress

In 1912 she joined the Biograph Co., and under the direction of D. W. Griffith appeared in *The Violin Maker of Cremona*. She then played in *Hearts Adrift*, and achieved fame in innumerable short films with a "Wild West" background. With her curls and gingham dresses, and her air of schoolgirl innocence, she was known to millions as "the world's sweetheart." Her best-known films included *Tess* of the Storm Country, *Stella Maris*, *Rebecca of Sunnybrook Farm*, *Daddy Long-Legs*, *Pollyanna*, *Little Lord Fauntleroy*, and *Dorothy Vernon of Haddon Hall*. Her appearances in talking pictures, including *The Taming of the Shrew*, were less successful.

Mary Pickford became head of her own film company at Hollywood, and organized the Pickford-Lasky productions. She published *Why Not Try God?* 1934, and *My Rendezvous with Life*, 1935.

She married 1, Owen Moore; 2, Douglas Fairbanks; 3, Charles (Buddy) Rogers.

Picking. Term applied in metallurgy and mining to one of the preliminary processes by which worthless gangue is separated from valuable ore. The operation consists simply in turning over the mass of crude ore, breaking the larger pieces which is in many cases done by hand, examining carefully the pieces, and picking out and throwing aside those which are obviously of no value. The picking may be performed on the mass in the open as in many metalliferous mines, or it may be performed at the side of a travelling band which carries the crude material along past the pickers as

is done at many modern collieries. *See* Coal; Ores; Mining.

Pickles (Dutch *pekkel*, brine). Articles of food preserved in brine or vinegar. Pickled vegetables and pickled meats formed an important part of the diet of our ancestors, when meat was killed at Michaelmas for the winter and winter vegetables were few. Dry salting in barrels is extensively practised in Holland and Belgium, but not to a large extent in England. Another method is by pickling in strong brine.

Certain kinds of pickles used as appetisers are prepared in a solution of salt or brine, especially olives, capers, and walnuts. Sauerkraut is made by steeping finely shredded white cabbage in a solution of this kind. Other pickles are made by pouring boiling vinegar over the vegetable used, and allowing it to simmer for a short time. Cucumbers, gherkins, green tomatoes, onions, small peppers, beets, and cauliflower are prepared in this way.

Various seasonings, salt, sugar, spices, and occasionally mustard, are added to the vinegar. Most pickles require to be kept for a short time before using.

Pickle the Spy. Name popularly given to Aleslair Ruadh Macdonnell of Glengarry (c. 1725-61), the Jacobite. *See* Macdonnell, Aleslair; *consult also* *Pickle the Spy*, 1897, and *Companions of Pickle*, 1898, Andrew Lang

Pickling. Term used in metallurgy for a method for removing the oxidised film and scale from the surfaces of a metal part or specimen by immersing it in a bath of acid or other liquid which will attack and dissolve the oxidised layer. Different acids are used for differing metals and purposes, and, in some cases, the acid may be heated. The time of immersion varies with the material and purpose. The process is commonly used to prepare the surface for (a) the application of a protective coating, (b) welding, (c) mechanical treatment, such as cold rolling or drawing, or (d) to detect any surface flaws which might be invisible to the naked eye, but which would show through increased corrosion attack, by the acid, in the vicinity of the flaw.

Pickthall, MARMADUKE WILLIAM (1875-1936). British author. Born April 7, 1875, he went to Harrow, and spent some years in travelling throughout the Near East, acquiring a close knowledge of native life and languages in

Egypt, Turkey, and Syria, ably displayed in his novels and other writings. These include *Said the Fisherman*, 1903 (probably his best-known work); *The House of Islam*, 1906; *The Children of the Nile*, 1908; *Knights of Araby*, 1917; *Oriental Encounters*, 1918; and *The Early Hours*, 1921. He died May 19, 1936.

Pickwick Papers, THE. Popular name for Charles Dickens's first long work of fiction, a classic of English humour, of which the full title is *The Posthumous Papers of the Pickwick Club*, edited by Boz. First issued in monthly parts, April, 1836-Nov., 1837, it originated in a suggestion that Dickens, then 24 years old, should provide letterpress to accompany a series of sporting plates by Robert Seymour (*q.v.*). Dickens demanded a freer range; and, following Seymour's suicide after the publication of the second part, he assumed full control of the story, the later plates by Phiz being altogether subordinate to the text. From that moment the publication met with extraordinary success, the print order for monthly parts leaping from a few hundred to 40,000. The book has since been reprinted in countless editions in many languages.

Samuel Pickwick, the elderly, benevolent hero, famous for his spectacles and gaiters, together with the pseudo-sportsman Nathaniel Winkle, the poetic Augustus Snodgrass, and the amorous Tracy Tupman—these four are the "corresponding members" of the Pickwick club, and the work is a chronicle of their farcical misadventures in London, Rochester, Bath, Bury St. Edmunds, Ipswich, and elsewhere, including the fictitious Eatanswill (*q.v.*) and Dingley Dell farm. Between 300 and 400 recognizable characters are introduced. The more famous include Alfred Jingle, the unscrupulous strolling player; Ben Allen and Bob Sawyer, the rowdy medical students; Stiggins, the hypocritical "shepherd"; Mrs. Bardell, the landlady who sues Pickwick for breach of promise; and a host of innkeepers, lawyers, servants, and coachmen, as well as casual humbugs and social climbers. Above all, there are Pickwick's faithful and witty cockney manservant, Sam Weller, and his genial father Tony. There is little plot, but a happy ending is ensured for all who deserve it. In writing this book Dickens discovered his power, and the later chapters are noticeably more mature.

Among many dramatic adaptations, mostly necessarily unsuccessful, two were notable, as in one Irving played Jingle, and in the other Charles Laughton played

1895. He wrote a critical study of Velazquez, 1899. He died at Madrid, Nov. 18, 1923.

Picotée (Fr., marked). Horticultural term for a show class of carnations, in which the petals of the flower are edged with a colour contrasting with the ground tint. They are further distinguished as "heavy" and "light" according to the breadth of the edging, which may be in yellow, rose, purple, or red. See *Carnation*.

Picotite. In mineralogy, one of the spinel group of minerals, magnesian variety of chromite (*q.v.*). It is a chrome-spinel containing manganese, aluminium, iron, and chromium, and is found in black grains and crystals in many basic rocks. See *Spinel*.

Picric Acid OR TRINITRO-PHENOL. High explosive known under several names, of which one in the U.K. is

lyddite (*q.v.*). **Picrite**. In geology, a dark, coarsely crystalline igneous rock of ultra-basic composition. It is intermediate between gabbro and peridotite, differing from the latter in that it contains small amounts of feldspar. Usually it occurs as small intrusions or as parts of larger complex igneous rock masses.

Pictography or PICTURE-WRITING (Lat. *pictus*, painted; Gr. *graphein*, to write). Representation of facts and ideas by means of pictorial symbols. The earliest form of self-explanatory record devised by man, it sprang from the primeval arts of design. In palaeolithic Europe naturalistic paintings on cave-walls became conventionalised, and during the Azilian period pictorial symbolism emerged as an aid to memory and a method of communication. Neolithic Egypt and W. Asia carried it to further lengths. In the early metal age pictographic

symbols passed into ideograms, each definitely related to spoken phrase or word. School-exercises in early Sumerian and Egyptian pictographs are extant. These symbols were destined, in Babylonia, Egypt, the Aegean, and China, to develop into syllabic and alphabetic writing.

The primitive pictography of the pre-metallic age drifted with early migrations to other parts of the world. In neolithic India it was practised by Vindhya hill cave-dwellers, and is still traceable in Melanesia. At the continental extremities it survives among Bushmen, Veddas, and Australian aborigines. Eskimo bone-engravings, which resemble prehistoric hunting scenes, depict not only concrete objects, but also actions and relations. The symbols are more or less self-explanatory, but are transposed into speech in phrases varying with each interpreter. This form of pictography, conveniently called picture-writing, was highly developed among the N. American Indians, while some Brazilian tribes still inscribe pictorial diaries upon dried calabashes. In pre-Columbian America the Maya and Aztec peoples developed pictographic scripts of true ideographic form, and prepared pictorial codices of considerable skill. This achievement may have had behind it some cultural impulse, remotely derived from the Old World systems. They do not appear to have passed beyond the stage of rebus-writing, for proper names. See *Alphabet*; *Aztec*; *Cuneiform*; *Hieroglyphs*; *Maya*.

Picton, SIR THOMAS (1758-1815). British soldier. Born at Poyston, Pembrokeshire, he entered the army in 1771, and took part in the capture of St. Lucia, 1795, becoming governor of Trinidad, 1797. Resigning in 1803, he was acquitted after trial on charges of using torture. As major, Picton accompanied the Walcheren expedition, 1809. He took part in the Peninsular War at Fuentes d'Onoro, Torres Vedras, Badajoz, Vittoria, and elsewhere. He was killed leading a charge at Waterloo, June 18, 1815.

After Beechey

Picton-Turbervill, EDITH. Contemporary British social worker. Educated at the Royal School,

Pickwick Papers. Seymour's design on the front of the original green wrappers in which the monthly parts were published

Pickwick. John Bunby (*q.v.*) appeared as Pickwick in two early silent films based on the book.

Pico. Island of the Azores, midway between Flores and St. Michael's. It culminates in the volcanic height, Gran Pico, 7,613 ft. Much of the surface is covered with lava. The chief product is wine. San Antonio and Lagens do Pico are the chief towns. Its area is 176 sq. m. Pop. est. 15,000.

Pico della Mirandola, GIOVANNI (1463-94). Full name of the 15th century Italian humanist, Mirandola (*q.v.*).

Picón y Bouchet, JACINTO OCTAVIO (1852-1923). Spanish writer. Born in Madrid, Sept. 8, 1852, he established his reputation as a novelist with *Lazaro*, 1883, a study of ecclesiastical problems, which provoked great controversy. Other shrewd and independent works of fiction included *La Hijastra del Amor*, 1884; *El Enemigo*, 1887; *Dulce y Sabrosa*, 1891; *Cuentos di mi Tiempo*,

Bath, she began her social work by helping to improve the conditions of navvies on the Vale of Glamorgan rly. After spending six years in India, when she was secretary to a student movement, she became vice-president of the Y.W.C.A. She sat as Labour M.P. for Wrekin, 1929-31. Council member of the League of Nations union, and of the women's international league, she successfully introduced a bill to prevent the passing of the death sentence on expectant mothers. She became president of the national council of women citizens in 1944. Her books include *Life is Good* (autobiography), 1939; *In the Land of My Fathers*, 1947.

Pictou. Seaport of Nova Scotia, Canada. It stands on a harbour, an inlet of Northumberland Strait, 118 m. by rly. N.N.E. of Halifax. Industries are fishing, lumbering, and exporting coal. Pop. 3,069.

Picts. Name of a people formerly inhabiting northern Scotland. Divided into two nations, the Northern Picts, or Dicaledonae, inhabited the country between the Pentland Firth and the Grampians; the Southern Picts, Vecturiones or Verturiones, that between the Grampians and the Firth of Forth. The Vecturiones represent the Brythons of the kingdom of Fortrenn.

From the 3rd century A.D. the Picts are recorded as resolute and harassing foes of the Roman occupation, allied sometimes with the Scots, the N. Irish race who peopled Argyll and Kintyre, and they were never definitely subdued by the Romans. S. Ninian and S. Columba were among the missionaries who worked to convert the Picts. Oswald of Northumbria held temporary sway over Pictland in the 7th century, and there were constant wars with the Scots and with the Dalriadic kingdom during the 8th century. The peculiar system of royal succession, by which the rule passed to brothers or the son of a sister, led to much confusion, which ended with the establishment of Kenneth MacAlpin, the Scottish chief from Kintyre, but a Pict by maternal descent, as ruler of Scots and Picts in 844.

Picti, the name used by Latin writers, probably identical with that of the Pictones or Pictavi of Poitou, is held to be a Brythonic (Welsh) designation for this people, who, in fact, called themselves the Cruithni or Cruithnig. There has been much controversy as to who the Picts were, and what their racial stock and language. Skene maintained that names of early Pictish kings were purely Gaelic, though

later ones showed a Brythonic origin, but of Cornish and not Welsh dialect; and it is known that the Damnonii settled both in Cornwall and in Fortrenn (Menteith and the Mearns). Rhys contended that the Picts were non-Aryan, as their custom of matriarchy (*q.v.*) indicates, and brought forward evidence to show that the extant Pictish place-names are of Brythonic and not Gaelic origin.

Cruithni means pictured or figured, and the habit of painting the body with figures of birds and beasts was probably widespread. The word Cruithni may well be identified with Brython, Brittones, and Britannia, the Welsh name for Pict being Prydyn. But the question is still obscure, although the old view of the Teutonic (Gothic) stock of the Picts, fostered by Pinkerton and Scott, is abandoned. See Gaelic; Scotland: History; consult *Chronicles of the Picts*, 1867; *Celtic Scotland*, W. F. Skene, 3 vols., 1876-80; *Celtic Researches*, E. W. B. Nicholson, 1904; *Celtic Britain*, J. Rhys, 4th ed. 1908.

Picts' Houses. Name in popular use in Scotland for primitive underground structures of the early metallic age. Their erection is attributed to the Picts, although

innocence remains unimpaired, while his portrait gradually acquires every mark of viciousness.

Picture Post Card. Card sent through the post bearing a printed or photographic picture, which may be a view, portrait, scene, figure, humorous drawing, or reproduction of a painting. Cesare Bertanza, an Italian stationer, introduced the first picture post card in 1865; it carried a view of Lake Garda and enjoyed large sales to tourists. Postcards with views were sold at French shops during the Franco-Prussian war, to soldiers as souvenirs of towns through which they passed.

The first English card, in conjunction with the R.N. exhibition in 1891, bore an outline sketch of Eddystone lighthouse. Commercial cards were sold in 1894 on the summit of Snowdon, a small photograph of which was pasted on them; but these had to bear a penny stamp. In 1895 view cards were published in Great Britain. A great impetus was given to illustrated post cards when in 1898 the official size was increased to 5½ by 3½ ins. In 1904 the left-hand side of the front of post cards was allowed for correspondence hitherto confined to the back.

Picts' Houses. Ground plans and sections of earth-houses. Left, Cairn Conan, Angus; right, near Broomhouse, Berwickshire. In both cases the letters against the sections indicate their positions on the plans

By courtesy of William Blackwood & Sons

they may be of earlier date, and the theory is that they were used as refuges in times of danger. There are several in the Orkneys, but the greatest number are in the western part of Aberdeenshire. They are also found in Angus and other counties N. of the Tay, while there are a few in Berwickshire and other southern counties. See *Earth-house*; *Mousa*.

Picture of Dorian Gray, THE. Novel by Oscar Wilde. It was first published in Lippincott's *Magazine*, 1891. Notable for its scintillating dialogue, it describes the slow corruption of a youth (Dorian Gray) whose appearance of vivid beauty and youthful

The collecting and exchanging of picture post cards attained extraordinary popularity in the first decade of the 20th century, and gave rise to the manufacture of albums, cabinets, etc. A literature sprang up, several magazines being published. The raising of the rate for post cards in the U.K. from ½d. to 1d. in 1918, and in 1921 from 1d. to 1½d., did serious damage to the trade, though cards could still be sent for 1d. if only five words of greeting were written. During the Second Great War the postage rate was raised to 2d.

Pidgin English. Medium of communication in Chinese ports between English-speaking people

and the natives. It is sometimes used as a sort of *lingua franca* even by natives themselves from different districts. Pidgin is a corruption of "business." It is a jargon composed chiefly of English words, although containing an admixture of Chinese, Malay, and Portuguese, corrupted in pronunciation and arranged according to the Chinese idiom. The name is also given to similar jargons in other parts of the world.

Piecework. Term applied to a contract of employment in which remuneration is based on the quantity of work done. In the simplest form of piecework the labour necessary for each "piece" of output is purchased as any other commodity might be. The custom of buying labour by the piece arose in Great Britain in medieval times when middlemen supplied cloth to people working in their own homes, and paid them a fixed rate for making up material. This method of payment is still general with outworkers, i.e. those who work at home on materials supplied to them.

In 1947, in the principal industries of Great Britain, only 23 p.c. of the men and 38 p.c. of the women were on piecework. It was most prevalent for men in the metal, engineering, and ship-building industries, and for women in textiles. In the U.S.A., where methods of payment by results have received much study, only 30 p.c. of employees were on piecework in 1945-46.

Disadvantages of piecework include the possibility of wastage of materials; the difficulty of developing a healthy working atmosphere within the factory; the danger of "going slow" in order to preserve a particularly favourable rate; the problem of fixing rates for various grades. To avoid these disadvantages many employers prefer to pay to a section or a whole shop a group bonus calculated on the difference between the work achieved and that estimated as the standard; or to pay an individual bonus based on the difference between the time estimated and that actually taken.

Early in the 20th century piecework was applied crudely, particularly in the engineering industry, as a means of compelling men to work without respite. High wages earned by a few workmen were used as an excuse for cutting rates. The zealous worker became anathema as a "rate-buster," and most trade

unions did everything possible to resist the introduction of piecework. More recent agreements provide that the piecework wage shall never fall below hourly rates. There is little need for piecework where the conveyor belt principle is used in manufacture, since the individual worker has to keep pace with the conveyor.

Pieck, WILHELM (b. 1876). German politician. He was born at Guben, Jan. 2, 1876, and was a Socialist member of the Bremen diet from 1906 to 1910. He joined the Communist party in 1918, being a member of the Prussian diet 1921-28 and of the Reichstag, 1928-33. As a member of the Comintern executive, he was attacked by the Nazis, but escaped to Moscow in 1933, living there until 1945, when he returned to Berlin. He became joint chairman of the Socialist Unity party, 1946, and first president of the E. German republic, Oct. 11, 1949.

Piedmont (Ital. *Piemonte*, foot of the mountain). Region of N.W. Italy. It is bounded N. by Switzerland, N.W. by Valle d'Aosta, W. by France, S. by Liguria, and E. by Lombardy and a portion of Emilia. It embraces the provs. of Alessandria, Asti, Cuneo, Novara, Turin, and Vercelli. It is mountainous on all borders but the E.; the remainder is a fertile plain. In the N. and N.W. are the Pennine and Lepontine Alps, in the W. the Graian and the Cottian Alps, and in the S. the Apennines and the Maritime Alps. The beautiful Lago Maggiore lies on its E. border. Piedmont is watered by the Po and its tributaries. The chief products are rice, maize, wheat, wine, olives, chestnuts, truffles, hemp, and silk. Silver, lead, coal, copper, and salt are mined and exported. Its area is 10,045 sq. m. Pop. 3,511,000.

In Roman times a part of Gallia Transpadana and Liguria, it was successively a part of the Ostrogothic, Lombard, and Frankish kingdoms, and in the 11th century was mostly acquired by Savoy, of which it became the most important part, Turin being the capital of the dukes. In 1718 the dukes became kings of Sardinia, their realm comprising that island, Piedmont, and Savoy, and this title was retained until Victor Emmanuel II became king of Italy in 1861.

Piedmontite. In mineralogy, name given to a variety of epidote, a manganian epidote, found in manganese ores at Piedmont, Italy; also in certain schists and occasionally in quartz porphyry. It

is reddish black in colour, and is sometimes used as a gemstone.

Pied Piper of Hamelin, THE. Poem by Robert Browning. Written for a child friend, Willie Macready, and published in *Dramatic Lyrics*, 1842, it is based on the old legend of a ratcatcher named Bunting, who, employed to rid the town of Hameln from rats, and denied the promised reward, enticed by his piping all the children of the town into a mountain-cavern, which instantly closed upon them. There are several variations of the story, e.g. those of the Fiddler of Brandenburg and the Hermit of Lorch, and in the folklore of China and Persia.

Piedras Negras. Town of Mexico, in the state of Coahuila. Formerly known as Ciudad Porfirio Diaz, it stands on the Rio Grande, at the S.W. end of the international bridge over this river to the U.S.A. at Eagle Pass, Tex., and is connected by rly. with Mexico City, 850 m. to S. The surrounding district has cattle breeding, agricultural, and fruit growing industries, of which the town is an important centre. It was founded in 1849. Pop. 18,900.

Pie-Powder or **PIEDPOUDRE**, COURT OF. Ancient court of record connected with every fair or market in England. It was the lowest court of justice, and, with the steward of the lord of the manor or the owner of the tolls as judge, administered summary justice for all commercial injuries in any particular fair or market. Its jurisdiction extended to all commercial injuries done in the fair or market, but not in any preceding one. Persons sentenced by the court had the right of appeal to Westminster. The name piepowder is an anglicised form of the old French *pié poudré*, dusty foot, a slang term for pedlar, in allusion to the condition of the accused and witnesses coming before the court. Although the jurisdiction of such courts is now obsolete, a Court of Piedpoudre, founded by Richard III, is held every Sept. in Bristol, and after being formally opened is adjourned.

Pier. In architecture, any isolated vertical mass of masonry, such as the supports of an arch, or the square or round posts on which a gate or bridge is hung. A number of columns grouped or clustered together is known as a compound pier; in this form the pier is a conspicuous feature of medieval architecture from the 10th century.

Bridge piers are the intermediate supports of a bridge, as distin-

guished from its end supports or abutments, and serve to distribute the weight of the superstructure

Pier. Clustered columnar pier in Norman architecture

and its load over a sufficient foundation area to prevent subsidence. They vary from simple timber supports to great masses of masonry on caisson foundations, such as the piers of the Forth Bridge. Timber piers consist of a grillage of cross-piled timber or of vertical posts, or of piles driven into the ground. Small timber piers are termed bents, and high braced piers are usually known as timber trestles. Steel and iron piers consist of columns, pillars, or stanchions resting upon masonry or piled foundations, sometimes braced together and joined at the top by a girder upon which the bridge superstructure bears; high braced piers are known as steel trestles. Masonry piers are of concrete, brick, granite, or other suitable stone built up from their foundations. Cylinder piers are constructed by weighting hollow steel or iron cylinders, sinking them down to the right level, excavating the soil, and filling them solid with concrete upon which the bridge girders rest. *See* Column; Pilaster; Pillar.

Pier. Jetty or staging projecting into a sea, river, or lake. A pier may be built of stone, being then more often called a mole, but usually consists of superstructure beams or girders carried upon intermediate supports, such as piles driven or screwed down to a secure foundation, carrying rly. or other traffic, and providing embarkation and landing facilities. In some waters the depredations of the teredo render timber unsafe and useless in a short time, and often creosoting proves of little use, so that steel and iron piers are constructed. In piers of reinforced concrete the superstructure and piles are of reinforced concrete, the girders and piles being built solid with each other. Along that portion of a pier where ships berth, fendering is provided, either of timber piles or of spring beams, which resist the impact of vessels. Mooring pawls or bollards are also placed.

The length of a pier depends upon the distance from the shore to a sufficient depth of water for vessels to moor alongside, and the length of berthing accommodation required. Often the outer end is enlarged or extended at an angle, as in the rly. pier at Port Limon (Costa Rica), or in the form of a tee head, *e.g.* the rly. pier at Bahia Blanca (Argentina), which supports large grain storage bins and elevators. Promenade piers, intended as no more than an amenity, may be seen at almost every popular seaside resort. Southend, Essex, has an exceptionally long pier for both rail and passenger traffic. Piers for goods traffic are equipped with cranes, conveyers, and other tackle. Piers serve much the same purpose as docks, and are sometimes constructed to serve as landing stages within a large dock. They can be rapidly erected, but owing to their exposed position afford no shelter to vessels, and are themselves liable to damage by storms and collision. During the Second Great War promenade piers on the E. and S. coasts of England had their central spans removed to prevent their being used by the Germans in the event of invasion. *See* Breakwater; Mole; Pile.

Pierce, FRANKLIN (1804-69). President of the U.S.A., 1853-57. Born at Hillsborough, N.H., Nov. 23, 1804, he was called to the bar in 1827. He was member of the lower house of congress, 1833-37, and of the senate, 1837-42, being a strong Democrat and a consistent supporter of slavery. After serving with distinction in the Mexican War, he was elected president in 1852 by a larger electoral vote than any previous candidate. His presidency was marked by the passage of the Kansas-Nebraska Act; the

Ostend manifesto, advocating the acquisition of Cuba by the U.S.A.; the Gadsden purchase; the disap-

pearance of the Whigs and the formation of the Democratic and Republican parties. After his term Pierce took little interest in public affairs, and died at Concord, Mass., Oct. 8, 1869. *See* Gadsden; *consult* Lives, N. Hawthorne, 1852; J. R. Ireland, 1888.

Pierlot, HUBERT (b. 1883). Belgian statesman. He graduated in law from Louvain university and entered politics as a member of the Catholic party. He became prime minister and foreign secretary on Feb. 20, 1939, resigned a week later, and in April formed a new cabinet after a general election. When the Germans invaded Belgium, he escaped to London by way of Spain, and became head of the Free Belgian government in the U.K. After the liberation of Belgium he returned to form a new cabinet in Sept., 1944, but resigned Feb. 10, 1945, upon Left wing demonstrations against him.

Pierola, NICOLAS DE (1839-1913). President of Peru, 1895-99. He was born at Camaná, Jan. 5, 1839, and educated at the college of Santo Toribio, Lima. He was called to the bar in 1860; founded the review, *El Progreso Católico*; and in 1864 became editor of *El Tiempo*. After travelling in Europe, he was appointed minister of finance 1869, but in 1872 was charged with misappropriating public funds, and went to the U.S.A. In 1874 he headed an insurrection, but was

Pier. Promenade pier with T-headed landing stage, showing different systems of construction. Top, plan; below, elevation. AA'. Cast-iron columns planted in firm sand. B. Steel cylinder or caisson planted on rock. C. Steel screw piles driven into firm mud. D. Tram line with crossing at E, where pier is widened to give increased strength sideways. F. Landed stage. G. Low level ditto. H. Timber fenders. J. Mooring pawls or bollards. K. Pavilion. L L. Offices and shops. M. Boat pass

defeated at Sorota, Dec. 3. Revolted again in 1877, he effected a revolution at Lima, and in 1879 became provisional president, but was defeated, and resigned in 1881. In 1894 he organized a revolt, and was president 1895-99. He died June 24, 1913.

Pierre. Capital of S. Dakota, U.S.A., and the co. seat of Hughes co. It is situated on the Missouri, and the Chicago and N.W. rly., 119 m. W. of Huron, and contains a government industrial school for Indians, a federal court house, the state capitol, and S. Mary's hospital. It has a great cattle market, and uses natural gas. It was settled in 1880 and incorporated in 1883. Outside the town is a monument marking "the approximate centre" of the N. American continent. Pop. 4,322. *Prom. Peer.*

Piers Plowman, THE VISION OF. Early English (14th century) allegorical poem written in about 14,000 short alliterative lines on the Anglo-Saxon model. Generally accepted as the work of William Langland, the poem achieved considerable contemporary popularity. Between three and four dozen old MSS. of it are known, these being divisible into three distinct versions. It has been suggested that the poem might be the work of several authors, but the three versions probably represent Langland's first text and two later recensions. The poem throws light on contemporary life and thought, and includes much vigorous satire on the prelates and friars. It was first printed in 1550. Recent editions include one in Everyman's Library.

Pietà (Ital., piety, compassion). Representation, in painting, or sculpture, of the Virgin mourning over the dead Christ taken down from the cross; also of any group of the holy women at the Deposi-

tion. The episode has formed the motive of innumerable pictures, among which those by G. Bellini, Correggio, Quentin Matsys, Van Dyck, F. Francia, and Rubens are noteworthy. *See Michelangelo.*

Pietermaritzburg OR MARITZBURG. City of S. Africa, the capital of the prov. of Natal. It stands 2,218 ft. above sea level near the Umsindusi river, 73 m. N.W. of Durban by rly. The chief buildings are the city hall, opened in 1901; the Anglican and R.C. cathedrals; the buildings where the legislature of Natal meets, and others erected for official use, including the law courts. There are also a university college, in the

Pietermaritzburg arms

suburb of Scottsville, hospital, library, museum, and theatre. The city has a public park, and there is a botanical garden. The barracks at Fort Napier overlooks the city. There are several schools and training colleges. Pietermaritzburg is an important rly. junction being on the main line from Durban to the Orange Free State and the Transvaal. The industries include tanning and brewing, wattle extracting, and the making of wagons, footwear, and furniture. Annual mean temperature is 65°.

Pietermaritzburg was founded by the Boers in 1839, the name

being formed from those of two leaders, Pieter Retief and Gerrit Maritz. It became the capital of Natal in 1842, and was made a borough in 1854. During the First Great War German prisoners were confined at Fort Napier. Pop. 63,162 (35,607 white). *See Natal.*

Pietersburg. Chief town and administrative unit of the N. Transvaal, S. Africa. It stands near the source of the Sand river, 174 m. by rly. N.N.E. of Pretoria. It is the centre for extensive goldfields, and in the neighbourhood copper, antimony, tin, corundum and other minerals are worked, and timber is a thriving trade. The town became an important centre under the Native Trust and Land Act, 1936. The town was taken by the British in April, 1900. Pop. 11,000. Pietersburg gives its name to a district.

Pietists. Word used vaguely for mystics of many types—often as a term of contempt. It refers strictly to a group of Lutheran re-

Pietermaritzburg, Natal. The City Hall opened in 1901. The main hall has a seating capacity of 2,000

formers, who arose in Germany about 1670, under the leadership of Philip Jacob Spener (1635-1705). He was a Lutheran pastor at Frankfort who held devotional meetings called *collegia pietatis*, whence the name, and established a kind of Methodism. He taught no special doctrines, and founded no sect, confining himself to an endeavour to promote spiritual life generally; but some of his followers adopted a dress and customs rather like those of the Quakers. Under A. H. Francke (*q.v.*), Halle became the centre of the movement, which had much influence for good, but afterwards degenerated into bigotry and emotionalism. *See Mysticism.*

Pietra Dura (Ital., hard stone). Inlaid work consisting of black marble, jasper, agate, or other hard stones inlaid in wood or

Pietà painted by Francesco Francia, representing the Virgin holding the dead Christ, with S. John at His head and S. Mary Magdalene at His feet
National Gallery, London

marble. It is sometimes called Roman mosaic, but is not mosaic proper, which is embedded in cement. See Mosaic.

Piezometer (Gr. *piezein*, to press; *metron*, measure). Instrument for measuring the compressibility of liquids under varying pressure. The first piezometer was invented by Oersted in 1882, and consisted of a thick glass tube closed at each end by a brass cap, one of which was fitted with another tube containing a piston or screw plug, for applying pressure to the liquid in the first tube. This latter tube was fitted with a flask, the neck of which was drawn out into a thin tube and graduated. Pressure on the liquid is communicated to the liquid in the flask by a system of valves, and the amount of compression read off on the graduated tube.

Pig. Name applied to members of the family Suidae, which forms part of the even-toed group, the zoological order Artiodactyla or hoofed mammals. This family includes the true pig, bush pig, wart hog, and babirusa. The typical pigs include over a dozen species, the domesticated pig being merely a modified variety of one or more of the wild forms.

Pigs are distinguished from the animals nearly related to them by the very long head, terminating in a flattened disk-like snout, in which the nostrils are placed. The existence of this snout involves the presence of an additional bone in the skull for its support. Pigs have conspicuous tusks in both upper and lower jaws, the upper ones being reflected upwards, instead of pointing downwards as in most other animals. Each foot has four toes, of which only the middle two touch the ground when walking. Most have large and often pendent ears; their hair consists of bristles set comparatively far apart; and the tail is more or less bare, with a tuft at the tip. Pigs are not ruminants, having a simple and undivided stomach.

Of the various wild species, the European wild boar is the best known. All wild pigs frequent marshes and damp places, and this trait is seen in the tendency of the tame pig to wallow in any mud it can find; while the habit of turning up the ground with its snout is a survival of the root-hunting methods of its wild ancestors. The Chinese appear to have been the first race to pay attention to the domestication of the pig, though its remains are found in Swiss lake dwellings. The date of its

domestication in Great Britain is unknown.

There is little doubt that the domesticated breeds are the descendants of the wild swine of the various countries, British breeds being derived from the European wild boar, but they have been greatly modified by crossing with Chinese and other Asiatic breeds. Probably as a result of these crosses, domesticated swine have undergone many modifications, even the number of teeth and the vertebrae having changed. The skull has become altered in shape, for example, so that the straight face of the wild swine has given

ticularly hardy, it yields well in bacon, with a good proportion of lean; though of all breeds it matures probably the latest. It makes a good cross for introducing hardness into a delicate breed.

From about 1930 the Wessex Saddleback increased in popularity, for it is a hardy grazing pig with litter records at weaning time not excelled by other breeds. It is black with a white strip over the shoulder and fore legs. The Essex Saddleback is similarly marked, having four white feet instead of two. Both breeds crossed with the Large White produce excellent "blue grey" pigs for bacon.

Fig. Type of pig-sty suitable for English conditions with yard open to air and sun, and entrance to covered yard protected by veranda

way to the concave one of most of the modern breeds.

Of white breeds, the Large and Middle White (Yorkshire) are most important. The former sometimes reaches a live weight of 10 cwt., yields a better proportion of lean to fat than most other breeds, and turns out equally well for pork or heavy bacon. It is a hardy breed, of quiet and restful disposition—an important point with the fattener. The sow is prolific and makes an excellent mother.

The Middle White is the result of a cross between the Large and now extinct Small White breeds, combining their good points. It has a short head, turned-up snout, and a general air of compactness. It is chiefly in demand for the pork trade, and is useful for crossing with coarse and nondescript breeds to improve their quality. Other white breeds are the Lincolnshire Curly Coat, Cumberland, and Long White Lop-Eared.

Of the coloured breeds, the Tamworth, mainly to be seen around Birmingham, more closely resembles the wild boar, from which it is a more direct descendant, than any other breed. It is long, and nearly straight in the head, and its body is covered with long, red hair. Par-

The Berkshire breed is black, except the face, feet, and tip of the tail; and where colour is not objected to in the market, it is a profitable breed to keep. It is hardy even in hot climates, breeds freely, matures early, and produces fine hams. The Large Black, hardy, prolific, and a good grazer, may be crossed with the Large White for either pork or bacon.

The pig is not naturally dirty, but quite a clean animal if given the opportunity. Hence a dirty pig-sty is quite as wrong and objectionable as a dirty stable or cow-byre, and tends to impair the health of the animals. Sties should have a S. aspect, should be large, well ventilated, well lighted, and scrupulously clean. Frequent whitewashing of the walls of the sty and court greatly conduces to cleanliness. Litter should be provided, peat moss being avoided, as the pigs are apt to devour it. Wheat straw is best for very young pigs, while fattening pigs can entirely dispense with litter. When pigs are kept in confinement a lump of rock salt should be provided.

Pigs are omnivorous, and when they chiefly live on the waste products of the farm are very profitable. Apart from swill, with

whey and buttermilk from the dairy, to which skim milk may with advantage be added, barley meal, brewers' grains, peas, beans, oats, and maize are all useful foods. In the fattening process, which gives the best result if crosses are used, too much maize conduces to flabbiness in the flesh, while an excessive use of peas and beans causes hardness. Various roots are added to the dietary in winter, and such things as clover and vetches in the summer; pigs are often turned out to forage for themselves in grass fields or over stubble. They require frequent feeding, but the food should be given in small amounts.

Pigs are weaned at from six to eight weeks after birth, and until they are able to feed miscellaneously their diet largely consists of a mixture of sharps and bran, with an increasing amount of barley meal, boiled potatoes, skim milk, and various meals as available. Before they reach about five months the sharps and bran should be replaced by meal. See *Animal: Babirusa; Bacon; Mammal; Pork; Swine-fever*.

Bibliography. Pig Breeding and Feeding, E. Forman, 1937; Good Pig Keeping, H. L. Tinley, 1947; Pigs, J. W. Reid, 1948; Production and Marketing of Pigs, H. R. Davidson, 1948.

Pigeon. Name applied to the various species of birds of the order Columbiformes, which includes pigeons proper, doves, and the extinct solitaire and dodo (*q.v.*). There are about 60 genera included in this order, and the typical pigeons, *Columba*, number about 70 species, distributed over nearly the whole world with the exception of the polar regions.

Most pigeons are strong fliers. They are all monogamous and pair for life when under natural conditions, the promiscuous courtships of the domestic pigeon being simply a mark of degeneracy due to life under abnormal circumstances. Both cock and hen assist in the incubation and care of the young. The eggs are always white, and one or two in number. A large distensible crop enables the birds to take huge meals. A pigeon has been known to eat more than its own weight in food at a meal. Another peculiarity of the group is that the young are fed with partially digested food by the parents, whose crops during the rearing season secrete a peculiar fluid—the so-called pigeon's milk.

In Great Britain three species of pigeon occur in the wild state, the stock dove, the wood pigeon, and the blue rock pigeon. The turtle dove also breeds in Great Britain,

but it is only a summer visitor, arriving early in May and leaving in Sept. It is smaller than the other three species and is seldom seen, as it keeps within the densest foliage. It is spread over the whole of Europe, except the extreme N., and in winter migrates to Africa.

The stock dove may be distinguished from the common wood pigeon by its smaller size and plainer grey plumage. It is found mainly in the S. and E. counties of England.

The wood pigeon is much the largest of the three native species, and is one of the common objects of the country, where it does great damage by consuming peas, corn, and newly planted seeds. A white patch on either side of the neck at once distinguishes it from the other species. This is the species common in the parks and open spaces of London.

The blue rock pigeon, a smaller bird with bluish-grey plumage, is mainly found around the N. coasts of Scotland and Ireland, where it nests on ledges in caves or in crevices in the rocks. The various domesticated breeds have been derived from this breed.

The domestication of the pigeon and its use as a message bearer date from an early period. No remains of it have been found in prehistoric encampments or kitchen middens, but it was well known to the Greeks and Romans, who used messenger pigeons, while the rock pigeon and the turtle dove are several times mentioned in the Old Testament. The domesticated pigeon has received great attention at the hands of fanciers, the number of strains is now large, and many of these birds differ in form to such a degree that they appear to be almost different species. Darwin selected this fertile group for the study of variation in relation to the evolution of species.

The pouter is distinguished by its enormous crop, long feathered legs, and upright carriage, which give it an eccentric and uncomfortable air. The carrier, not now the message-bearing bird, is known by the large naked callosities around the eyes and base of the bill. A long massive bill distinguishes the runt. The barb is known by its short broad bill, and broad callosities round the eyes.

The fantails, of which there are several sub-varieties, have upstanding expanded tails, the feathers of which are often directed forwards over the head. The normal number of tail feathers in the typical pigeon is twelve, but

the fantail usually has about 30, and occasionally 40. The owl pigeon and turbit have a very short bill, and the feathers diverge down the front of the neck and on the breast.

The tumbler is a small bird, and gets its name from its habit of tumbling backwards during flight. The Jacobin is easily recognized by the feathers of the neck forming a kind of hood which almost encloses the head. The trumpeter, so called from its peculiar, prolonged coo, has a tuft of feathers at the base of the bill which curl forwards. The homer is the pigeon used for bearing messages.

Pigeons are fairly hardy birds, but need reasonable attention to keep them in good condition. They should have a roomy and well-ventilated loft; be kept dry and guarded against draughts; have varied food, and a good supply of fresh water for both drinking and bathing. It is a criminal offence to kill or wound a tame pigeon. See *Birds colour plate*; *Feather*; *Flight*; *Fruit Pigeon*; *Pigeon colour plate*. Consult *The Book of Pigeons*, R. Fulton, ed. L. Wright, 1895.

Pigeon Flying. Sport in which pigeons race against one another. It developed from the ancient practice of using pigeons to carry messages, and first became popular in Belgium, where races were instituted about 1820, a special type of bird being bred for them. It was introduced into England about 1871, Belgian birds being brought over. In 1880 a club was founded, and in 1896 the National Homing Union, the controlling body of the sport, came into existence. The organ of the sport is *The Racing Pigeon*. About 1875 the sport began to be popular in the U.S.A.

Racing pigeons may be divided into two varieties, sprinters and long distance performers; birds flying any distance up to 250 m. coming in the former category, and those able to accomplish 600 m. in the latter. The usual plan is to take the birds the necessary distance from their homes and then to release them, when they will fly back. Hence the term homing pigeon or homer. Some birds can fly nearly 2,000 yds. a minute, and one has been known to fly over 1,000 m. Squeakers, as the young birds are termed, should be trained gradually by increasing the distance each day, and should be able to accomplish a flight of 100-150 m. by the end of the first season.

Rings with identification marks are placed on their legs.

In the Second Great War, British fanciers placed their homing pigeons at the disposal of the army and R.A.F. All aircraft of Coastal Command carried one or more pigeons to maintain contact with base in the event of their being forced down and their radio transmitters put out of action. See *Animal: Employment in Wartime*; *Homer Pigeon*. Consult *Pigeon Racing*, W. E. Barker, 1913; *Widowhood System of Pigeon Racing*, W. S. Pearson, new edn., 1947.

Pigeon House. Building to accommodate pigeons, known also as a columbarium. In the Middle Ages nearly every castle, manor house, and monastery had a building with nests for pigeons, these birds being a favourite article of food, and their culture inexpensive to the owners, inasmuch as they preyed on the fields of the tenants. The pigeon house was usually a round tower, with an opening at the apex of its conical roof, protected by an upper roof, through which the birds could come and go. Inside, the walls were pitted with small recesses for the nests. In the centre was a revolving post with horizontal arms extending almost to the wall, and at the ends of these arms was fixed a vertical ladder, by means of which access could be had to the nests.

Pigeon Post. Mail service carried on by trained homing pigeons. This method of transmitting news has frequently been employed in wartime, particularly in attempts to maintain communication between the defenders of a besieged town, e.g. Paris, 1870-71, and their friends outside. In 1890 a pigeon post service was established between Suva and the outlying islands of the Fiji group. It is also used by military aircraft on sea-patrol work in case of a forced landing at sea, etc. The message, written in cipher in small compass, is rolled in a quill, which is attached to the bird. During the First and Second Great Wars pigeon services were employed by all the combatant nations. See *Homer Pigeon*.

Pigeon Shooting. Shooting of practically tame pigeons released from traps. It was formerly a popular form of competition at Monte Carlo, but following a campaign against the cruelties involved which was started by *The Times*, 1921, the practice was discontinued, mechanical clay birds being substituted. The practice was also

prohibited in the U.K. by the *Captive Birds Shooting (Prohibition) Act*, 1921.

Pig Iron. Crude form of iron (91-96 p.c. purity) produced by smelting iron ores with fluxes and coke (or charcoal) in the blast furnace. Quality and composition depend on what makes up the ores, fluxes, and coke (or charcoal) charged into the furnace, and on the working conditions of the latter. The quality is usually judged from the appearance of the fractured surface of the iron after it has solidified reasonably slowly, as in a pig bed. Pig iron is either remelted to provide cast iron for castings, or refined to produce steel.

The iron is intermittently tapped from the blast furnace in the molten state, and may then be run into pig beds to solidify. These beds consist of a sand floor in which channels are formed; the molten metal from the furnace runs along a main channel, branches off from this at right angles on either side into subsidiary channels, and again at right angles into smaller channels closed at the far end. The appearance of the metal at this point in the process suggests pigs being suckled by a sow. Pig iron emerging from the blast furnace may alternatively be run into ladles; it may then be poured into metal moulds on a casting machine, or conveyed direct in the molten state to a furnace for refining into steel.

Pigment. In animals, the colouring matter in the dermis or epidermis. Brown to black in most mammals and in man, it is found in the cells of the Malpighian layer. The colouring matter of birds is chiefly found in the feathers. In the case of crustaceans, many fish, and insects there are special colour-secreting cells. Animal pigments consist chiefly of melanin, a black colouring matter insoluble in water, alcohol, acid, or ether; zooerythrin, a red colouring matter; and zooxanthin, a yellow pigment, found chiefly in the feathers of birds, are lipochrome pigments. Certain pigments are confined to certain animals, e.g. the turacin pigment of the Musophagidae. Haemoglobin, the red colouring matter of blood, and its derivatives are the best known animal colouring matters from a chemical point of view, the great majority of animal pigments being present in such small quantities, though giving a large coloration effect, as to make

accurate chemical analysis difficult. Much of the colour of many animals is due to a peculiar absorption of light, and not to pigments. See Colour; Skin.

Pigment. In plants, pigments occur most commonly in colloidal association with the protoplasm of plastids, or distributed in the cell sap. Four are present in most coloured plastids. They are chlorophyll *a* (COOCH_3) ($\text{COOC}_{30}\text{H}_{39}$) ($\text{C}_{32}\text{H}_{30}\text{ON}_4\text{Mg}$), chlorophyll *b* (COOCH_3) ($\text{COOC}_{20}\text{H}_{39}$) ($\text{C}_{32}\text{H}_{28}\text{O}_2\text{N}_4\text{Mg}$), carotin ($\text{C}_{40}\text{H}_{56}$), and xanthophyll ($\text{C}_{40}\text{H}_{56}\text{O}_2$). The first two, both green, are methyl phytyl esters of the acids chlorophyllin *a* and chlorophyllin *b* respectively. They are essential for photosynthesis (*q.v.*). The last two, called carotinoids, respectively orange and yellow in colour, are masked by the relatively large quantities of the chlorophylls in chloroplastids. In the chromoplastids which give colour to some flowers and fruits either carotin or xanthophyll or a mixture of the two predominates, though in red tomatoes and red pepper another carotinoid, lycopin ($\text{C}_{40}\text{H}_{56}$), differing structurally from carotin, is the chief colouring material. Plastids of brown algae contain an additional carotinoid, fucoxanthin ($\text{C}_{40}\text{H}_{56}\text{O}_8$); those of the red algae have a predominating red pigment, phycoerythrin, sometimes accompanied by a blue one, phycocyanin, the reverse being true of the blue-green algae.

Yellow sap pigments, such as provide the colour in the petals of the yellow flowered variety of the snapdragon, are widely distributed in plants, though as a rule their concentration is too low for them to be apparent. Treatment of tissue in which they are present results in a bright yellow coloration. These pigments, of which a number are known, are hydroxyl or methoxyl derivatives of flavone (phenylbenzo- γ -pyrone), flavonol, or xanthone (dibenzo- γ -pyrone), or alternatively such derivatives in glycosidal combination with sugar. They are called the flavonic and xanthonic pigments. A second series of sap pigments, the anthocyanins, give the red, purple, and blue colours to many stems, leaves, flowers, and fruits. They are chemically closely related to the flavone pigments, most of them being reduced flavonol glycosides, and differ amongst themselves like the flavonic pigments in the number and position of the hydroxyl or methoxyl groups. Many anthocyanins change colour with changes of acidity.

Pigments. Coloured substances which, ground to a fine powder, are used in the preparation of decorative and protective coatings. The art of preparing pigments reached a fairly high standard in Egypt 6,000 to 8,000 yrs. ago. Formerly the painter ground his own pigments in the selected medium, but the manufacture of pigments is now a highly specialised industry, and they are supplied to the paint-maker purified and ground ready for incorporation in the intended medium. Pigments should have the required colour and strength, should readily disperse in the mediums, and should give pastes which will remain stable and uniform even if kept for a long time before use.

Most important of the synthetic organic colours used as pigments are the lake colours, which are insoluble compounds formed from the soluble dyestuffs. The acid dyestuffs form insoluble salts with many metals, the chief being barium and aluminium. The basic dyestuffs form insoluble salts with some acids, the chief being tannic and phosphoric. A series of lakes which are very fast to light is formed by using phosphomolybdic or phosphotungstic acids.

These coloured precipitates are very powerful stainers and can be diluted with large quantities of bases such as alumina or blanc fixe (precipitated barium sulphate) which, having no tinctorial power themselves, supply the deficiencies of the pure lake without seriously affecting their colouring power. To ensure perfect admixture of the lake and the base the two are often precipitated together. Well known lakes of this type are the "Helio" reds, blues, and yellows. Some of these synthetic precipitates are among the fastest pigments to light known.

Pigment dyestuffs are insoluble organic dyes which require only to be incorporated with the base to be ready for use. They are very powerful stainers and very fast to light. Lithol and monolite pigments belong to this class.

Adjective dyestuffs, of which the alizarin colours are typical, are insoluble in water and very fast to light.

Monastral blue, an organic pigment introduced in 1935, which has different chemical constitution from other organic pigments, is fast to light and to both alkali and acid, and withstands heat up to 200° C.

Inorganic pigments are of two kinds, those of mineral origin, such as the ochres and red oxides, which owe their colour to iron in various stages of oxidation; and those prepared by chemical processes, *e.g.* Prussian blue, lead chrome, ultramarine.

Pigments of mineral origin are treated by grinding the natural product and removing impurities and coarse particles, usually by levigation. Chemical treatment may be necessary to remove undesirable compounds, *e.g.* in barytes, the finest and whitest of which are treated with acid to remove the last traces of iron and silica. Chemical processes used in preparing pigments vary. Many, such as Prussian blue, are prepared by precipitation; others, *e.g.* ultramarine, are prepared by fusion. Lithopone requires heat treatment of the precipitate to develop its pigment properties. Removal of impurities is invariably essential, and rigid control of conditions at all stages of manufacture is of vital importance.

The Chief Pigments

The principal pigments are: *Alizarin* (*q.v.*) lakes; *Antimony oxide* ("Timonox"), a white pigment, acidic in character, so that it can be used with media which would react with basic pigments such as zinc oxide. The film tends to be soft and elastic. "Timonox" works well with zinc oxide, which has opposite tendencies.

Asbestine, which may be either powdered waste asbestos, a variety of the mineral hornblende (*q.v.*), or talc or French chalk, a hydrated magnesium silicate. Asbestine is not strictly a pigment but is an extender used to prevent the settling of heavy pigments.

Aureolin: a complex nitrate of potassium and cobalt, and a brilliant, pure yellow; used by artists.

Barytes: powdered mineral barytes, a natural barium sulphate; used as a base and extender with pigments of high covering power and with white pigments. It is a hard, inert substance with a crystalline structure. In moderation it improves the durability of the paint film and in undercoats the slight "tooth" it gives improves the adhesion of subsequent coats.

Blanc Fixe. barium sulphate prepared chemically by precipitation, softer and much finer than barytes and used as an extender where softness and fineness are important. It is much used as a base for lake (*q.v.*) colours. In

oil it gives almost colourless films, but in water has considerable opacity. Artists give it such names as permanent white.

Brown Pink: a lake prepared from quercitron bark, of a yellowish brown colour; used by artists.

Brunswick Blue: a reduced Prussian blue (q.v.).

Brunswick Green: a reduced Chrome green (v.i.).

Burnt Sienna: calcined Raw sienna (v.i.).

Burnt Umber: calcined Raw umber (v.i.).

Cadmium Yellow: precipitated cadmium sulphide, a very permanent but rather expensive yellow pigment much used by artists and to some extent in very high class decorative paints.

Carbon Black: prepared by burning natural gas and collecting the soot. By regulating the conditions of combustion, a great variety of blacks can be obtained which give pastes with oil media of a very wide range of physical characteristics. It is of great staining power and much used in printing ink manufacture.

Other carbonaceous pigments are *Vegetable Black*, made by burning vegetable oils, usually colza oil, and collecting the smoke; *Lamp Black*, a cheaper material made by burning a variety of substances and collecting the smoke; *Bone Black*, made by calcining bones; *Ivory Black*, from ivory; *Vine Black*, made originally by calcining vine twigs but now made from various similar vegetable materials; *Drop Black*, bone black mixed with gum water and formed into pellets.

Carmine (q.v.).

China Clay (q.v.).

Chinese Blue: a variety of Prussian blue (q.v.) of high grade and purity.

Chinese White (q.v.).

Chrome Green: a mixture of Prussian blue and lead chrome; the best grades are made by precipitating the two pigments together. The pigment is often made reduced with barium sulphate and called Brunswick green.

Chrome Yellow (q.v.). The usual grades are lemon, pale, mid, and deep. Chromes are the most important yellows used in paint and with Prussian blue give the most important greens for general use. They are durable, fast to light, and have great protective value, particularly on iron work.

Chrome Oxide: green oxide of chromium, a very permanent green highly resistant to chemical action. It is used on walls and

surfaces where attack by alkalis must be resisted, and chrome green therefore cannot be used. It is expensive and somewhat transparent. As an artist's colour it is known as Veridian Green.

Cobalt Blue: a complex phosphate of cobalt and alumina; a very pure transparent blue much used by artists.

Flake White: a variety of White Lead (q.v.).

French Blue: a variety of Ultramarine (v.i.).

Indian Red (q.v.): see Iron oxide pigments below.

Iron oxide pigments: these are of three classes. The first class occur naturally, and are prepared by grinding the mineral and separating the fine particles by levigation. Natural oxides come from Spain, chiefly the Malaga district—c. 10,000 tons a year are imported from Spain by the U.K. alone—and from the Persian gulf, whence a very fine red oxide sometimes called Indian Red is imported from Hormuz.

The second class, chemical oxide pigments, are prepared by heating ferrous sulphate (green vitriol) which, on decomposing, leaves iron oxide, the degree of oxidation, and hence the colour, depending on the conditions of manufacture. Colours range from red to purple red and black. The lightly coloured products are termed Turkey Red, the heavily coloured Indian Reds. These pigments, of great staining power, are much used in paint manufacture, particularly for industrial paints and protective paints for iron. They are chemically stable and unaffected by light.

The third class are precipitated oxides: by varying conditions of precipitation, and blowing in air to promote oxidation, a wide range of iron oxides and hydrated oxides can be produced from green vitriol ranging from yellow to black in colour. These ferrite colours are softer and finer in texture than the other iron oxide pigments.

Light Red: calcined ochre (v.i.). *Lithopone* (q.v.), also called Orr's zinc white, is a white pigment much used particularly for inside decorative work. The films are somewhat soft and lacking in durability and it is therefore often combined with zinc white, which corrects these deficiencies.

Monastral Blue (v.s.).

Ochres (see Ochre). The siennas and umbers belong to the same class of pigment, which includes the earliest used by mankind.

These were the pigments used in crude form by the cave dwellers of prehistoric times, traces of whose work remain in the caves of the Dordogne and elsewhere. The best ochres are a bright yellow and of considerable opacity and staining power; the siennas and umbers are transparent. All are permanent colours much used in the paint trade.

Paris White: the purest and finest grade of Whiting (q.v.).

Prussian Blue (q.v.).

Raw Sienna: a natural earth consisting of clay coloured with iron oxide and smaller amounts of manganese. It is of characteristic brownish yellow shade and transparent in oil media.

Raw Umber: similar in constitution to sienna, but containing more manganese. The colour is dark brown and transparent in oil.

Red Lead: a complex of lead monoxide and lead peroxide. It has been used since at least 100 A.D. It is made by oxidising molten lead by heating in a specially designed furnace. The oxide forms a scum on the surface and is scraped off. This scum, massicot, is bright yellow and of coarse texture. It is ground and heated under carefully controlled conditions, when the red oxide is formed. Red lead is a very heavy, bright red pigment. In linseed oil it acts as a vigorous drier and the paste tends to set hard in a short time, but non-setting varieties have been introduced. Red lead is very valuable in priming and undercoats, where its power of forming a hard uniform film is of advantage in producing durable protective coatings.

Titanium White: introduced in 1927, it consists essentially of titanium oxide. Rutile in Norway is the main European source; monazite sand from India and similar types from S. America are also used. The mineral is extracted with sulphuric acid and the dissolved titanium sulphate precipitated as a hydrated oxide. This is filtered off and calcined alone or mixed with barium sulphate. Titanium white is the purest white known and has great opacity and covering power. It is very inert and, unlike lead, is not discoloured on exposure to sulphurous fumes or attacked by acids. Titanium pigments contain between 25 p.c. and 98 p.c. of the oxide.

Ultramarine: a complex sulpho silicate of alumina and soda. The original ultramarine used by artists in the middle ages was extracted from the valuable min-

eral lapis lazuli. Gurnet in France, Gmelin and Kotting in Germany all solved the problem of producing a chemical substitute almost simultaneously in 1828. A mixture of china clay, soda ash, sulphur, and charcoal is heated under carefully controlled conditions. The mass is broken up, washed carefully, and ground, and the particle size graded by levigation. Various shades can be produced by modifying the process, but the characteristic product is a beautiful pure blue which is transparent in oil and has considerable staining power. It is not affected by alkalis and is therefore used in distempers and water paints containing lime, where Prussian blue could not be used. It is very fast to light but very sensitive to acids. By itself it is not very satisfactory as an oil paint, but with other pigments and extenders is useful. It is much used in industries such as laundering and sugar making to correct a natural yellowish tinge. White lead paints are also often treated with ultramarine to correct their yellowish cast.

White Lead (q.v.).

Zinc White: see Chinese White. See Colour Mixing; Paint.

T. Hedley Barry.

Pigott, RICHARD (c. 1828-89) Irish journalist and forger. A native of Meath and associated with several journals of an extreme Nationalist type, he forged papers purporting to incriminate C.S.Parnell (q.v.) in the murders of Lord Frederick Cavendish and Thomas H. Burke in Phoenix Park, Dublin, May 6, 1882. His guilt having become apparent in cross-examination before the Parnell Commission, he confessed to H. Labouchère, the editor of Truth, fled to Spain, and shot himself in Madrid, March 1, 1889. Consult his Personal Recollections of an Irish Journalist, 1882.

Richard Pigott,
Irish journalist

Pigtail as formerly
worn in China

Pigtail.

Long plait of hair worn at the back of the head. Among the Chinese the shaven head and pigtail were a mark of servitude imposed upon them in the 17th century by their Manchu conquerors. Later it became a source of pride

to the Chinese but went out of favour after the revolution of 1911. A queue or pigtail was worn in the British army and navy until 1808. In the West it is now seen only in the form of the plait of the schoolgirl, which also became less usual after 1925.

Pika OR **TAILLESS HARE** (*Lagomys*). Genus of rodents. Found in Russia, Asia, and N. America,

Pika or tailless hare of the mountains
of Russia and N. Asia

they live among the mountains, burrowing and living in crevices of the rocks, and feeding mainly on grass. The pika is about the size of a guinea-pig. See Rodent.

Pike. Infantry weapon used for thrusting. It consisted of a staff with a long metal lance-head or sharp spike at the end, and sometimes a spike also at the butt for striking into the ground. Its handle or staff was often from 12 to 14 ft. long. Pike-men are first noted as such in the 15th century, and played a great part in the wars of the 17th century. Sergeants in British infantry regiments carried pikes in action until the end of

Pike. Examples of the weapon as used, top, in the Parliamentary army; below, by troopers of Charles II

Pig-sticking. Wild boar hunting. Riding to hog, as the sport is termed, was long a popular form of sport among officers of the British army in India.

the 18th century. Certain Home Guard units in the early part of the Second Great War were armed with pikes until rifles were available. See Arms; Spear.

Pike (*Esox*). Genus of fresh-water fishes. They are found in most temperate regions of Europe,

Pike. Specimen of the voracious
fresh-water fish

Asia, and America. The common pike (*E. lucius*) occurs in British rivers, and is long and narrow in shape, a fine specimen attaining a length of nearly 4 ft. and a weight of nearly 40 lb. The head is broad and flattened, and the protruding jaws are armed with sharp teeth. In colour it is olive grey above, thickly spotted with a lighter tint, and silvery on the under parts. It has the power of considerably modifying its hue to match its surroundings. It is noted for its great voracity, preying not only on other fish, but upon water fowl, water voles, frogs, and worms. Small specimens known as jack afford good sport. See Angling; Fish.

Pike Perch (*Lucioperca*). Genus of fish, belonging to the perch family. They occur in the rivers of E. Europe, Asia, and N. America. Some three feet long, and pike-like in shape, they prey upon other fish.

Pike Perch of East European rivers

Pike's Peak. Peak of the Rocky Mountains, in Colorado, U.S.A. It is 7 m. W. of Colorado Springs, is named after Lieut. Z. M. Pike, who discovered it, 1806. Its alt. is 14,108 ft. and it was first ascended by Major S. H. Long in 1819. A rack and pinion rly., 9 m. long, was opened in 1891, and in 1905 a searchlight was erected.

Pila. Polish name of the Pomeranian town of Schneidemühl (q.v.).

Pilar. Port of Paraguay on the Paraguay R. in a district producing cattle, hides, timber, cotton, and oranges. There are cotton ginning mills, distilleries, and saw-mills. Pop. 10,000.

Pilaster (Ital. *pilastro*, from Lat. *pila*, a pillar). A flat-faced pier engaged with or attached to a wall, from which it projects slightly. It has a capital shaft, and base, and in Roman work was used

as a respond to the column. Renaissance builders often used it, and it figures largely in the Palladian style (*q.v.*).

Pilate, **PONTIUS** (Lat. *Pontius Pilatus*). Roman procurator or governor of Judea A.D. 26-36. His administration was severe and offensive to the Jews, of whom he was contemptuous, but the N.T. narratives of the trial of Jesus before him credit him with a sense of justice and a desire to save Him. Only when the Jews threatened Pilate with a charge of treasonable complicity with a pretender did he hand over Jesus into the hands of His accusers to be crucified (Matt. 27; Mark 15; Luke 23; John 18-19). Called to Rome to answer charges against him, Pilate is said to have been banished to Gaul, and to have committed suicide. The Copts declare that he died a Christian martyr; the Ethiopic Church regards him as a saint, his day being June 25. His wife, Claudia Procula or Procla (Matt. 27), is honoured by the Greek Church as a saint, her day being Oct. 27. Apart from the N.T. the authorities for the character of Pilate are Philo, Josephus, and Eusebius. *See* Jesus.

Pilatus. Mountain mass of central Switzerland. Situated between the cantons of Lucerne and Unterwalden, about 5 m. S. of Lucerne, alt. 6,996 ft., it commands one of the most extensive views in Switzerland. The Frac-

tus Mons of the ancients, in the Middle Ages it was called Mons Pileatus—the capped mountain, from its generally cloud-capped summit. From a misunderstanding of this name arose the legends connecting the mountain with Pontius Pilate. There is a mt. rly.

Pilch, **FULLER** (1803-70). English cricketer. Born at Horningtoft, Norfolk, March 17, 1803, he became a tailor. A keen cricketer, he was soon playing for the county, two brothers winning the same distinction, and was a member of a strong eleven at Bury St. Edmunds. In 1827 he first played for England, and during 1836-54 he played regularly for the Kent team. He died May 1, 1870.

Pilchard (*Sardina pilchardus*). Fish of the herring family. It is found in the English Channel west of Portland, and off the coasts of Portugal and Spain; there is a smaller race in the Mediterranean. It is about 8-10 ins. long at maturity, and may be distinguished from the herring by the larger size and smaller number of the larger scales and by the absence of teeth. Immature pilchards in their first year taken off the W. coast of France and tinned in oil are the true sardines of commerce. Pilchards are taken off the Cornish shore in the late autumn and throughout the winter.

Pilchard. Large-scaled fish of the herring family

The seine net is chiefly used, and the shoals are located by watchers or "huers" stationed on the cliffs, who detect them by the reddish tinge which they give to the water. The immature pilchards are shipped to the Mediterranean, to be reshipped as sardines. The canned pilchards of commerce are an almost similar kind found off the Californian coast.

Pilcomayo. River of central S. America, the chief tributary of the Paraguay. It rises in the S. of Bolivia and flows in a S.E. direction, uniting with the Paraguay near Asunción. It traverses the Gran Chaco (*q.v.*), and forms part of the boundary between Argentina and Paraguay. The principal affluents are the Pilaya and Paspaya. Its length is about 1,300 m.

Pile (Lat. *pilum*, javelin). In heraldry, a wedge-shaped charge, borne pendant from the top of the shield, the point ending a short distance from the base. *See* Heraldry colour plate.

Pile (Lat. *pila*, pillar). In electricity, a voltaic or galvanic dry battery. There are several types, of which Zamboni's dry pile is illustrative. This consists of many paper disks with a coating of tin or silver on one side, and binocide of manganese on the other. Many hundreds or even thousands of these disks may be piled and clamped together by two metallic rods which serve as terminals.

Pile, **ATOMIC**. A device for obtaining a continuous supply of energy from atomic disintegration, which, in the case of uranium 235, may be initiated by slow neutrons. In the process of fission, from one to three neutrons may be released, and these in turn will be able to produce further fission, and so start a "chain" reaction. Rate of transformation may be controlled by inserting rods of cadmium and boron steel, which retard the reaction by their large absorption for thermal neutrons.

Pile, **SIR FREDERICK ALFRED** (b. 1884). British soldier. Born Sept. 14, 1884, he was commissioned in the R.A. in 1904, and served throughout the First Great War. He was promoted col. in 1928 on appointment as assistant director of mechanization at the War office.

Decorated pilaster on an Adam building in the Adelphi, London

Fuller Pilch, English cricketer

Pilatus, Switzerland. The summit of the mountain showing cars of the mountain rly. On the right is seen Lake Lucerne

In 1931 he succeeded to a baronetcy. In 1937 he was made G.O.C. 1st A.A. brigade, T.A., with promotion to major-gen., and in 1939 G.O.C.-in-C. A.A. Command. A general from 1941, Pile retired from the army in 1945, and as director-general, ministry of Works, was to have put through the housing programme, but he relinquished the appointment within a period of six months. He was the author of Ack-Ack (1949), also of the article Anti-Aircraft Command in this Encyclopedia.

Pile Driving. The customary method of providing support in soft or submerged ground for bridges, piers, jetties, and foundations. The piles may project above ground and be part of the superstructure; or be completely embedded and act merely as rigid supports. Piles may be of timber, iron and steel, or concrete. Timber piles are usually of pitch pine, oak, greenheart, or Tasmanian gum, and are sharpened at the lower end and shod with a pointed steel shoe (see Fig. 1). The tops are ringed to prevent splitting.

Steel and iron are used in two forms for piling—interlocking sheet piling, and screw piles. Sheet piling forms a continuous barrier, e.g. a cofferdam or a retaining wall. Steel sheets are specially designed with vertical edges forming interlocking joints. Screw piles are of

Pile-Dwelling. A Malayan village composed of pile dwellings on the banks of the Belawan river, Sumatra

two types: either a hollow cast-iron barrel with a bolted joint similar to a cast-iron pipe with an unusually thick skin, or a solid steel bar. The former, frequently used for pier construction, has the advantage of the resistance offered by cast-iron to corrosion. The solid steel pile bar is frequently used, with diameter of about 6 ins.; attached to it are cast-iron helical screws. These piles are screwed by a capstan.

Concrete piles may be either pre-cast or cast *in situ*. The former are usually of square section, designed to withstand the stresses due to handling, driving, and load carrying, and consist of steel vertical rods, suitably bound horizontally and of sufficient cross-sectional area, embedded in the concrete. The lower end of the pile is pointed and has a cast-iron shoe.

With piles cast *in situ*, a steel tube or casing is driven to the requisite depth. The casing is blocked at its lower end, and when in place is filled with successive charges of concrete, each highly compressed and forced outwards by blows from a heavy drop-hammer while the casing is being withdrawn. If reinforcement is required, it is prepared in advance in the form of a circular cage; this is lowered into the casing, and the hammer works inside the cage.

Pre-cast concrete and steel sheet piles are driven by allowing a

heavy iron ram, known as a monkey, to fall repeatedly on the pile head. The ram is raised by a rope passing over a pulley at the top of a frame, by hand winch or steam or Diesel power, and tripped automatically or by a hand-controlled trigger. Driving is continued until a specific drop is reached or the entry per blow diminishes to a specified figure, known as the set. From a knowledge of the set, the nature of the ground, and the weight and drop of the monkey, the probable bearing capacity of the pile, expressed as a load in tons, can be evaluated from formulae.

J. Kennard, M.Inst.C.E.

Pile-Dwelling. Primitive habitation built on piles. In the Neolithic and early metallic ages the palafitte type was widespread in central Europe. In England, pile-foundations have been found at Walbrook, London; Barton Mere, Suffolk; and Pickering, Yorks. Island strongholds of the fascine type—traceable in Holderness, at Llangorse, Brecknockshire, and in Glastonbury lake-villages—are numerous in Scotland and Ireland. In Bosnia pile-villages were erected along the Danube tributaries during the period from the Neolithic to the early Iron age.

Pile-construction survives in every continent. Pile-houses, observed by Amerigo Vespucci in the Maracaibo Gulf in 1499—whence the name Venezuela, little Venice—are still erected in the Caribbean lagoons. In Florida they are built on flood-land. The use of pile-granaries, even when the dwellings are on the ground level, is widespread in Africa, and occurs in other parts of the world. See Lake-dwelling.

Pile Driving. Details of steam pile driving. 1. Steel-shod toe of pile. 2. Interlocking steel sheets for sheet piling. 3. Octagonal timber pile with screw point. 4. All-metal screw pile. Left, steam pile driving machine.

Pile Fabric. Textile distinguished by the hair (Lat. *pilus*) or fibre left standing upon the surface. Pile can be produced in cloth finishing by breaking or tearing out fibre from the threads of the structure, or may be created in weaving. The pile of a blanket is an example of the former, and that of a velvet of the latter. Woven pile exists first as a loop and is left as such in "terry" goods. The loops may be cut as in plain velvet, the fibres of the yarn being opened out to form a dense cover. As in some figured velvets, cut and loop pile exist in the same fabric, forming regular designs. Plush is a long-piled velvet, and imitation furs made by weaving or knitting are pile fabrics.

Piles. Dilatations of veins in the mucous membrane of the rectum. See Haemorrhoids.

Pilewort (*Ranunculus ficaria*) OR LESSER Celandine. Perennial herb, one of the family Ranunculaceae. It is a native of Europe, W.

Pilewort. Flowers and leaves of the Lesser Celandine

Asia, and N. Africa. The root-fibres develop into a bunch of small tubers resembling on a very small scale those of the dahlia. The long-stalked heart-shaped leaves appear by copse and hedgerow very early in the year, and are soon followed by the bright golden flowers. Though of the same genus as the buttercups, the flowers are more starry than cup-shaped, the petals spreading. The fruits are nutlets (achenes), and are furnished with minute oily food-bodies (elaiosomes). These are eaten by ants, which thus assist in the distribution of the species by carrying the seeds away and dropping them after removal of the food-bodies.

Pilgrim (Lat. *peregrinus*, foreign) One who from religious motives journeys to visit some place considered sacred, as the scenes connected with the life of Christ or the tomb of a saint. Pilgrimages, made often for the cure of sickness or in thanksgiving for cure, are common in the histories of most important religions.

Examples are the pilgrimages of the Jews to Jerusalem during great festivals; of the ancient Greeks to the shrines of Apollo at Delphi, Diana at Ephesus, etc.; of the Indian sects to the shrines of Rama and Krishna; of Buddhists to the scenes of Gautama's life; and of Mahomedans to Mecca.

Among Christians the practice was not unusual as early as the close of the second century. The first notable instance on record is that of Alexander, the friend of Origen, who, in 212, "made a journey to Jerusalem for the sake of prayer and investigation of the places." But it was the visit of S. Helena, the mother of Constantine, to Jerusalem in 326, when she is supposed to have discovered the Holy Sepulchre and the relics of the Cross, that gave the great impulse to the practice of pilgrimage which reached such vast development in the Middle Ages.

Next after the Holy Land, the tombs of the Apostles at Rome became the great centre of pilgrimage. Pilgrims also visited the tomb of S. Thomas in India, that of S. John at Ephesus, Mt. Sinai, and the shrine of S. Martin at Tours. As early as the 7th century, laws were made giving special protection to pilgrims on their journeys; and Charlemagne in 796 exempted pilgrims from tolls. Pilgrims very commonly wore scallop shells as badges, though this was more correctly restricted to those who had visited the shrine of S. James at Compostella. In the Middle Ages the practice of pilgrimages became much abused, and a class of professional pilgrims arose, no better than tramps and mendicants, who led a wandering life and subsisted on charity. The custom died down in the Renaissance period; but still survives locally to some extent, e.g. at Lourdes in the S. of France. In Great Britain the shrine of S. Thomas Becket at Canterbury, of S. Alban at St. Albans, and of Our Lady of Walsingham were noted centres of pilgrimage, among many others. See Lourdes; Palmer; consult also Pilgrimages to S. Mary of Walsingham and S. Thomas of Canterbury, D. Erasmus, trans. J. G. Nichols, 1849; Scudamore, in Dict. of Christian Antiquities, W. Smith and S. Cheetham, 1893; Bede Jarrett, in Catholic Encyclopaedia, 1907-12.

Pilgrimage of Grace. Name given to a rising which took place in the N. of England in 1536 and 1537. The suppression of the smaller monasteries, unemployment caused by the extension of sheep-farming, and other grievances, led to an insurrectionary move-

ment in Lincolnshire, which soon spread to Yorkshire. Under Robert Aske, Lord Darcy, and Sir John Constable, the rebels, estimated at 30,000, entered York, their standard being a banner displaying the five wounds of Christ. They asked for the restoration of the religious houses, the removal of Cromwell from the privy council, and the deprivation of heretic bishops. Marching S. to Doncaster, they met the duke of Norfolk with a royal army by the river Don, and negotiations were begun, for Norfolk was too weak to fight. In the king's name he promised the rebels a free pardon and a parliament at York, and they dispersed.

Nothing being done to carry out these promises, insurrection broke out again in Cumberland and Westmorland. Henry VIII thereupon ordered the arrest of the leaders of the original rising, and, with four abbots and several other laymen, Aske, Darcy, and Constable were executed for treason. Instead of the promised parliament a Council of the North was established at York. See Aske, Robert.

Pilgrim Fathers, THE. Term applied to the English founders of Plymouth Colony, Massachusetts, in 1620. They belonged to the church founded by John Robinson at Leyden, in Holland. Seeking religious liberty, they had separated from the established Church in England, but while well treated in Holland, desired to retain their native language and customs.

Obtaining from the Virginia company a grant of land in New Jersey, and a promise, obtained by Sir Edwin Sandys from the king, that their freedom to worship as they pleased should not be interfered with, they set sail from Plymouth in the Mayflower, in all 78 men and 24 women, Sept. 6, 1620. By stress of weather they were forced to land, Dec. 21, on the coast of Massachusetts, far S. of the territory granted to them, and here they founded Plymouth Colony. The tercentenary of their sailing was commemorated on an extensive scale in England, Holland, and the U.S.A. in 1920, notably at Southampton. The Massachusetts Bay Colony, founded by English Puritans in 1629-30, and Plymouth Colony were united in 1691. The Pilgrim Fathers' Memorial Church in New Kent Road, London, was enlarged in 1856 by Americans in memory of Southwark men who sailed in the Mayflower. See Jordans; Mayflower, The; Robinson, John; Sandys, Edwin; Scrooby.

Bibliography. History of the Puritans in England and the Pilgrim Fathers, W. H. Stowell and D.

Pilgrim's Progress. Characters in John Bunyan's famous allegory, depicted by Fred Barnard. Left to right: The Man with the Muck-rake; Mr. Worldly Wiseman; Giant Despair

By courtesy of A. and C. Black

Wilson, 1849; Story of the Pilgrim Fathers, 1606-23, E. Arber, 1897; The England and Holland of the Pilgrims, H. M. and M. Dexter, 1906; The Pilgrims and Their History, R. G. Usher, 1918; The Pilgrim Fathers of New England, J. Brown, 4th ed. 1920; Saints and Strangers, G. F. Willson, 1947.

Pilgrims, THE. Anglo-American dining club. It has two branches, one founded in 1902 in London and the other in 1903 in New York, and exists to promote good feeling between the two peoples. A well-established tradition is that each new U.S. ambassador to the U.K. makes his first public speech in that capacity to the Pilgrims. The Pilgrims sponsored the proposal to erect a statue in London to F. D. Roosevelt. The offices in London are at the Savoy Hotel, W.C.2.

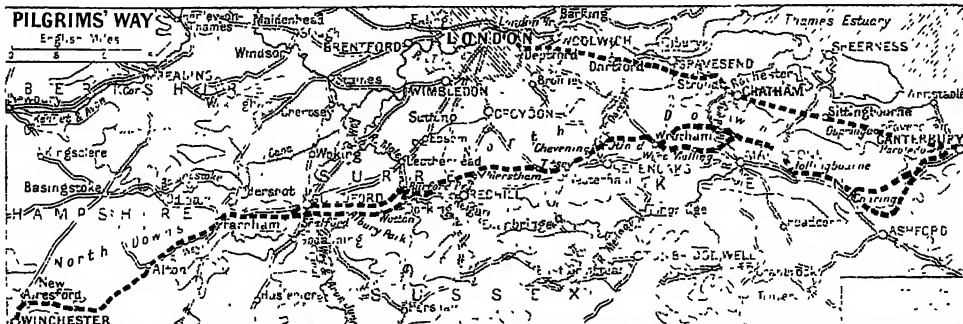

Pilgrim's Progress, THE. Religious allegory by John Bunyan (*q.v.*). The first part, which describes the adventures of Christian and Hopeful on their way from the City of Destruction to the Celestial City, was written in Bed-

ford gaol and first published in 1678. The second and inferior part concerned the journey Heavenwards of Christians, Christian's wife, her four sons, and her friend Mercy, was written at Elstow, and first published in 1684. A host of subordinate characters have their purposes clearly indicated by their names, like Evangelist, Great-heart, Mr. Worldly Wiseman, Giant Despair; and the route of Christian's journey is similarly shown in such places as the Slough of Despond, the Valley of Humiliation, Vanity Fair.

There is much theological disquisition, but for straightforward narrative Bunyan modelled his style upon that of the Bible. No book except the latter has been more widely circulated; six editions came out within a few years, and there are perfect copies of the first in the British Museum and the Rylands Library, Manchester.

Pilgrims' Way, THE. Track along which pilgrims from the W. travelled through Winchester to visit Becket's shrine at Canterbury. Of its 120 m., portions are

traceable over 72 m., mainly along the scarp of the N. Downs, by way of Alresford, Farnham, Shalford, Albury Park, Wotton, Burford Bridge, Merstham, Titsey, Chevening, Otford, Wrotham, West Malling, Hollingbourne, and Charing. Folk names, such as Beggars' Lane, Farthing Copse, and Pray Meadows, survive; and several churches along the Way, Seale, S. Martha's (properly S. Martyr's), and Gatton, were of pilgrim origin. The Way, which is doubled in places and in parts notable for its yew trees, followed a prehistoric track, strewn with many remains. With the exception of some 12 m. between Dartford and Strood, Chaucer's Pilgrims' Way, from London to Canterbury, 56 m., followed the modern Dover Road, touching Deptford, Dartford, Rochester, Chatham, Sittingbourne, Ospringe, and Harbledown. *See* Becket; Canterbury; Chaucer; *consult* The Canterbury Pilgrimages, H. S. Ward, 1904; The Old Road, H. Belloc, new ed. 1911; The Pilgrims' Way, J. Cartwright, 1911.

Pilgrims' Way. Conjectural routes followed by the pilgrims from Winchester to Becket's shrine at Canterbury, and that taken by similar pilgrims from London, as described by Chaucer

Pilgrim Trust. Fund established by the American millionaire E. S. Harkness (1874-1940) for the cultural benefit of Great Britain. A sum of £25,000 was made available in 1940 for the encouragement of the arts; concerts by the London Philharmonic and London Symphony orchestras were financed, and grants voted to the national federation of women's institutes and the rural music schools council. The Pilgrim Trust and the Carnegie Trust (*q.v.*) together approached the Treasury and the board of Education with a scheme which led to the foundation of the Council for the Encouragement of Music and the Arts (*see* Arts Council). The trust purchased on behalf of the Royal Society the manor house at Woolsthorpe in which Newton was born, together with his library of 858 volumes.

Pilibhit. District of the Uttar union of India, in the Rohilkhand division, adjacent to Nepal. Its area is 1,353 sq. m. The town of the same name is a rly. junction. Pop. dist., 490,718; town, 35,000.

Pillar. In architecture, an irregular column, i.e. one not constructed in accordance with the proportions of the recognized orders. The term is loosely applied also to any disengaged column that does not act as a structural support, e.g. a vertical monolith or memorial column, such as Pompey's Pillar, Alexandria. The term may be applied to any material welded together in rough columnar formation. Pillarsaints,

Pillar in architecture

or Stylites, among whom S. Simeon Stylites is prominent, is a term sometimes used for hermits who made a home on the top of a pillar in the open air.

Pillars of Society. Social drama by Ibsen. Published in 1877, it stresses the need of a society which should give ample opportunity for the unrestricted growth of the individual. It was translated into English by William Archer, and performed at the Opéra Comique, London, 1889. Revivals included one at the Royalty Theatre, 1926.

Pillar-Worship. The ritual expression of reverence for natural pillar-shaped objects, especially of

stone, and artificial upright structures of similar form. In the Mediterranean basin sacred pillars were erected by Neolithic peoples, often in association with tree-worship (*q.v.*). Basalt pillars are venerated in negro Africa. *See* Hermae; Menhir; Obelisk.

Pill-box. Popular name for a strongpoint, or machine-gun nest, as first used by the Germans on the

Pill-box. A machine-gun post in a concrete pill-box at an R.A.F. bombing station - British Official

W. front in the First Great War. It was a loop-holed circular turret of armour-plate or a small concrete blockhouse containing infantry with machine-guns. Pill-boxes were erected at strategic points throughout England during the danger of invasion in 1940, and were used by the Germans in Italy, but had no place in the mobile operations which characterised the fighting later in the Second Great War. A pill-box should be distinguished from a bunker (*q.v.*).

Pillion. Originally a pack saddle, a cloth put under a rustic saddle when a woman rode on horseback. Today the term implies the seat on a motor cycle behind the driver. In the U.K. only one passenger, sitting astride, may be carried on a motor cycle; the maximum penalty against a driver for a breach of this regulation is a fine of £5 (£10 later convictions). A motor cyclist holding a "learner's" licence may carry as pillion passenger only somebody who has held a full licence for two years or has passed the driving test.

Pillory (Old Fr. *pilori*, perhaps from Lat. *speculatorium*, a lookout). Instrument of punishment. It consisted of a post surmounted

by a wooden frame with holes through which the head and hands of the culprit were thrust, and fastened to which he was exposed to public contumely for a specified time.

In England, where variations of the device were of old institution, the Statute of the Pillory, 1266, ordained its use as punishment for forestallers and regrators, users of false weights, perjurers, and forgers. After 1637 it became the usual punishment for press offences, such as printing books without licence and libelling the government, with results not always contemplated by the authorities; e.g. Defoe received a popular ovation when pilloried in 1703 for his

famous plea for toleration, *The Shortest Way with the Dissenters*. Others were pelted with garbage. In 1816 its use was restricted to punishment for perjury and subornation, perjurers being still liable to have their ears nailed to the pillory; and in 1837 it was abolished, having last been used June 22, 1830, for the punishment of Peter James Bossy, convicted of perjury. The pillory was used in Germany, in France as late as 1840, and in the U.S.A. until 1839. *See* Torture.

Pillow Lace. Lace made by hand with the aid of a straw-stuffed leather pillow. The design is traced upon parchment attached to the top of the pillow. Pins are inserted at the necessary points of the design, and the worker, using thread wound upon little bobbins, forms

Pillory. Daniel Defoe standing in the pillory at Temple Bar, London. From the picture by E. Crowe

the pattern by twisting or plaiting two or more threads together. Pillow lace is made without any foundation of fabric, and is composed of twisted and plaited thread. *See* Lace.

Pillow Lava. Type of lava which appears to be composed of a pile of pillow or sack-like masses varying from several inches to several feet long. These are commonly basaltic in composition, and develop this peculiar structure when poured out under water. The individual pillows have a tough chilled skin, and the rock inside is either more coarsely crystalline or is filled with steam holes. Pillows were observed developing on an underwater flow by Tempest Anderson. Good examples in Great Britain of ancient pillow lavas are at Pentire Point, Cornwall, and Tayvallich, Argyleshire.

Pillwort or **PEPPER-GRASS** (*Pilularia globulifera*). Perennial herb of the family Marsileaceae. It

Pillwort, showing on the left the globular spore capsules

is a native of Europe N. of the Alps. It is one of the water-ferns, but has a closer superficial resemblance to a delicate grass than to a fern. Its habitat is the margin of ponds and lakes, and ground that is inundated in winter. The creeping rootstock is a mere thread from which the slender bright green fronds unroll. The spores are produced in rough-coated globular capsules at the base of the fronds.

Pilniak, BORIS ANDREYEVICH (b. 1894). Russian writer. His real name was Vogou, and he became known during the 1920s for his descriptions of the Russian countryside and strong, psychological studies of diverse types. Several of his novels and short stories were translated into English. The best-known included *The Naked Year*; *The Red Tree*; *The Volga Flows into the Caspian Sea*; *Machines and Wolves*; *Tales of the Wilderness*.

Pilocarpine. Alkaloid, a white crystalline powder, obtained from the leaves of jaborandi or *Pilocarpus microphyllus* and other species. It is used in medicine to stimulate sweating, particularly in Bright's disease.

Pilot. Person who navigates vessels. A pilot is a person taken on board a vessel at any particular place for the purpose of conducting a ship through a river, road, or channel, or from or into a port. Pilotage was formerly governed by the Merchant Shipping Act, 1894, but the position was very irregular. As a result of a board of Trade inquiry, 1913, the system was reorganized by the Pilotage Act, which established a separate pilotage order for each district. These orders appointed a pilotage authority, which could licence pilots in its district. Trinity House is the pilotage authority for London. The master or mate of a ship may be granted a pilotage certificate entitling him to pilot his own ship. A passenger ship must, with certain exceptions, be piloted by a licensed pilot. Other ships are not, except in a compulsory pilotage district, required to be in charge of a licensed pilot. It is an offence for an unlicensed person to act as a pilot if a licensed pilot has offered his services. *See* Navigation.

Pilot. In aeronautics, one qualified to control an aircraft in flight. There are certain recognized standard tests for pilots of aircraft. Thus the Fédération Aéronautique Internationale, represented in Great Britain by the Royal Aero Club, has laid down tests for the pilots of free balloons, airships, and aeroplanes. Without having passed these tests no pilot is eligible for any sporting competition held under the auspices of the F.A.I. or any of its associated bodies. Under the Air Navigation Acts no pilot may fly outside the confines of an aerodrome without passing tests similar to, but somewhat extended from, those laid down by the F.A.I. In Great Britain, pilots of commercial aircraft have to pass ministry of civil aviation standards of health and professional ability before being qualified to fly "for hire or reward." Large air liners carry a first and second pilot. Non-commissioned pilots in the R.A.F. held the rank of sergeant, flight-sergeant, or warrant officer until 1945, when new ranks were introduced—master pilot, and aircrew I-IV. The chevrons on the upper sleeve were replaced by new

badges worn above the cuff. *See* Royal Air Force.

Pilot Fish (*Naucrastes ductor*). Marine fish, nearly related to the horse mackerel. It is about a foot

Pilot Fish. Marine fish related to the horse mackerel

long and of a bluish colour with dark transverse stripes. It is common in the tropic seas and often accompanies ships, whence arose the old notion that it acted as a pilot and indicated the proximity of land. It also frequents the company of sharks.

Pilotless Plane. An aircraft which becomes airborne and flies a pre-set course without a human pilot. Course is kept by an automatic pilot and direction and duration of flight may be controlled by radio transmission from a land station or from another aircraft. Pilotless planes, Queen Bees and other types, are used by the British army and navy for target practice. The flying bomb (*g.v.*) developed by the Germans in the Second Great War was a pilotless plane which flew on a gyroscope-set course, but its flight was not controlled. In 1947 an American Skymaster flew the Atlantic without a pilot. *See* Automatic Pilot.

Pilot Officer. Lowest commissioned rank in the R.A.F. Established in 1918, it is equivalent to that of a subaltern in the army and a sub-lieutenant in the navy. It is not restricted to aircrew, but is also held by ground personnel, including the R.A.F. Regiment. The insignia is a single ring worn on the sleeve or epaulette. *See* Royal Air Force.

Pilot Snake. Harmless N. American reptile. Common in the middle states of the U.S.A., it is black or dark brown above, spotted with darker shades. It is a little lighter in shade underneath. The snake is remarkable for its extraordinary quietness when captured and the ease with which it can be tamed. It lives mainly in the forests, and feeds chiefly on birds, mice, and other small animals. The name is also given to the copperhead and fox snakes. *See* Snake.

Pilot Whale. *See* Ca'ing.

Piloty, KARL THEODOR VON (1826-86). German painter, born at Munich, Oct. 1, 1826. In 1854 he painted for the Maximilianeum

a picture of the Elector Maximilian adhering to the Catholic League in 1609. This work established him as an historical painter of the new realistic school, and he became a professor of the Munich academy. His *Murder of Wallenstein*, 1864, is a good example of his treatment.

Karl von Piloty,
German painter

died July 21, 1886. His brother, Ferdinand (1828-95), was known as an illustrator of the works of Shakespeare and Schiller. *Prom. Piloh-ty.*

Pilsen OR PLZEN. Town of Czechoslovakia, in Bohemia. It is 52 m. W.S.W. of Prague at the confluence of the Mies and Radbuza and is an important rly. junction. S. Bartholomew's, a 13th century edifice, has a notable spire 335 ft. high. The Renaissance town hall contains the banqueting hall where Wallenstein received the oath of fealty from his generals. Pilsner lager is produced in the municipal brewery. The first printing press in Bohemia was established in Pilsen. Near here is Skoda (*q.v.*). Pilsen was bombed by Allied aircraft during the Second Great War, and captured from the Germans by armoured units of the U.S. 3rd army, May 6, 1945. Pop. 122,753. *See* Czechoslovakia.

Pilsudski, JOSEPH CLEMENS (1867-1935). Polish soldier and statesman. He was born at Zulov, near Vilna, Dec. 5, 1867, and studied medicine at Kharkov university, being expelled for taking part in a meeting of revolutionary students. Arrested by the Russians in 1887, he was exiled to Siberia for five years. On his release he settled at Lodz, joined the Socialist party, edited *The Worker*, a clandestine newspaper, and was again imprisoned, escaping to Cracow in 1901 and forming a Polish legion.

Joseph Pilsudski,
Polish soldier

At the outbreak of the First Great War, Pilsudski invaded Russia at the head of his legion, Aug. 6, 1914. After the Austro-German conquest of Russian Poland he was appointed to the

Polish council of state, but soon resigned. Accused of fomenting opposition to Germany, he was imprisoned at Magdeburg, 1917-18. Liberated by the armistice, Pilsudski became president of the newly-proclaimed Polish republic, 1919, and was given the rank of marshal. Fighting against the Bolshevik army in 1920, he advanced to Kiev, but was driven back to Warsaw. He resigned his post as head of the state in 1921 and as chief of the general staff in 1923; but in 1926 he led a revolt that overthrew the government, and was nominated president, only to decline the honour. As minister of war, and shortly afterwards as premier, he reformed the constitution until it became a thinly disguised dictatorship. In 1928 he resigned but was again premier for a few months in 1930; he remained minister of war and continued in effect as ruler of Poland until his death, May 12, 1935. *Consult* Lives, R. Landau, 1931; E. J. Patterson, 1935; Reddaway, 1939.

Piltown Skull. Fossil skull of the oldest known European race with distinct human traits; the skull, though thick, had a large brain capacity. Its fragments were discovered by Charles Dawson (d. 1916) in Pleistocene gravels at Piltown, Sussex, from 1912 onwards. An outjutting and chinless jaw found near by was long regarded as belonging to a primitive ape and not to the human skull. But in 1949 a S. African palaeontologist, Robert Broom, declared his opinion that both skull and jaw were human, and that the Piltown man (*Eoanthropus*) was a type parallel to, but different from, *Homo sapiens*. At the same time K. P. Oakley, of the British Museum, reported that chemical tests placed the age of both skull and jaw at no more than 100,000 years, thus suggesting that *Eoanthropus* disappeared during the last ice age.

Pima. American Indian tribe in the U.S.A. and Mexico. Their number has been estimated at about 4,000 in the U.S.A., mainly in Arizona, and about 7,500 in Mexico. They occupy nearly the whole W. coast and Sierra Madre region of Mexico and Arizona from the Gila river S. into Jalisco. In 1751 they destroyed all Spanish settlements in their country. They now chiefly reside in the Gila river and Salt river reservations, Arizona. *See* Sonoran.

Pimento (*Sp. pimienta*). Genus of tropical American trees belonging to the family Myrtaceae. They bear cymes of small flowers and

coriaceous leaves. The chief species are *Pimenta officinalis*, the pimento bush, and *P. acris*, the wild clove or black cinnamon tree. The chief use of pimento is as a spice. The oil is used in medicine in the same way as cloves, and in perfumery. The well-known bay-rum toilet preparation is sometimes scented with *P. acris*. *See* Allspice; Cinnamon; Pepper.

Pimlico. Dist. of London between the Thames, to the E. and S., Chelsea, to the W., and Belgravia and Victoria Street, to the N. Pimlico Road links Royal Hospital Road with Buckingham Palace Road. First mentioned in the early part of the 17th century and notable for its ales, Pimlico is said to derive its name from a house of popular resort resembling one of the same name at Hoxton, called after its Italian proprietor. Victoria Station is in the district, which is in the city of Westminster. Much of the land is owned by the duke of Westminster. In the years preceding the Second Great War, many slum houses were pulled down and replaced by a model cottage estate. Dolphin Square, built on the site of a Royal Ordnance factory, consists of huge blocks of residential flats. *See* London.

Pimpernel (*Med. Lat. pipinella*) OR POOR MAN'S WEATHER-GLASS (*Anagallis arvensis*). Annual

Pimpernel. Leaves, stalks, and flowers of the scarlet pimpernel

herb of the family Primulaceae. It is a native of Europe, Asia, and N. Africa. The slender square stem mostly lies along the ground, the branches being more erect. Opposite, stalkless leaves are oval or lance-shaped. The bright scarlet flowers open only in the earlier part of the day, and in clear weather. The fruit is a globular capsule containing many three-sided seeds. One variety has bright blue flowers.

Pin. Device for fastening two or more objects together. The most common type, the domestic pin used for fastening textiles or paper, consists of a short length of wire

pointed at one end and having a rounded head at the other. The firing pin of a rifle or machine-gun consists of a thin steel rod pointed at one end and held by spring-tension to the rear of the breech by a bent which engages with the sear of the trigger. When the trigger is pulled, the pin's sear is disengaged and it moves forward to strike the cap of the cartridge which in turn fires the charge and discharges the bullet. The firing pin is withdrawn to the rear by means of the bolt, so re-engaging bent and sear, and also opens the breech for ejection of the spent cartridge case. The firing pin was invented in 1808.

The earliest forms of pins were made of bone or bronze, and specimens of these are found in Egyptian and Roman remains. Pins

Pin. Various kinds for various purposes: 1, ordinary; 2, safety; 3, tie safety; 4, tie; 5, hair; 6, split; 7, cotter; 8, key (A); 9, 10, drawing; 11, hat; 12, dovetail; 13, belaying; 14, rolling; 15, ninepin

of iron wire were made in England in the 15th century, but the greater part of the pin trade was in the hands of France till the 17th century, when their manufacture was taken up in London, Birmingham, and other places. The pins were all hand made, a length of wire being filed to a point, and the head made by twisting a piece of fine wire round the other end. Solid-headed pins were introduced in 1797, the head being moulded.

Iron, steel, and brass wire are used in modern pins. Correct lengths are cut from a reel of wire in the pin-making machine, the blank is held by a pair of nippers while the head is punched, the points ground by moving the pin across a circular file revolving at high speed, and the completed pin then falls into the receiving pans. The whole operation is automatic, the only attention the machine requires being the renewal of the reel of wire. Two to four hundred pins a minute are made by each ma-

chine. The pin sticking machine holds the pins in rows by their heads, and presses them into crinkled paper.

Safety pins are made on automatic machines which are fed with a continuous strip of metal on the one hand, and with pointed stems on the other. From the strip blanks are cut and these blanks are passed, one at a time, from tool to tool until, as formed caps, they lie in succession under the fastening tools. In a hopper where the pointed stems have been placed in bulk, a single stem is separated, raised, and carried mechanically to tools which form the head and the coil. The coiled stem is lifted away and pushed head and point into the cap lying beneath the fastening tools. The cap is pressed on to the head, and the completely formed pin thrown out of the machine.

In engineering a pin is a short length of metal wire or rod, often tapered, for inserting into a hole to hold one part to another, or to restrain movement. A wheel or pulley in light machinery may be secured to a spindle by a taper pin passing through a hole bored through the hub and coinciding with a hole bored through the spindle. Taper pins are sized by accepted standards, and the British Standards Institution issues specifications for them. A reamer with the standard taper and other dimensions is used to finish the holes for such pins. For light work, split pins are used, made from steel or other metal stock of such a shape that when doubled it forms an approximately cylindrical exterior. Other split pins are solid for the greater part of their length, and are split at the lower end.

Pin. Cask used by brewers. It holds $4\frac{1}{2}$ galls.; formerly a standard measure in England for ale.

Pina Cloth. Yellowish lawn fabric woven from the leaf fibre of the pineapple plant and allied species. It is made chiefly in the Philippine Islands, and is used for handkerchiefs, scarves, etc. In spite of its delicate appearance it is very strong.

Pinafore, H.M.S., OR THE LASS WHO LOVED A SAILOR. Comic opera written by W. S. Gilbert, with music by Arthur Sullivan. It was produced at the Opéra Comique, London, May 27, 1878, attaining a run of 700 performances, and was the first of the great popular successes of the Gilbert and Sullivan partnership. The scene is set on board ship, the characters are the ship's company,

together with the first lord of the Admiralty and his female relatives, and the music is nautical, often mock-Handelian. The most famous numbers are the first lord's song ("Now I am the ruler of the queen's navee") and that of the Pinafore's captain, with the refrain: "What, never? Well, hardly ever."

Pinar del Rio. Province and town of Cuba. The prov., which has an area of 5,206 sq. m. and a pop. of 364,338, produces the famous Vuelta Abajo tobacco, considered the best in the world for cigar making; also sugar, coffee, and fruit; and has lumber and cattle-rearing industries. On the S. slope of the Cordillera de los Organos is the Vuelta Abajo. The town, the capital of the prov., is situated 93 m. W. by S. of Havana, with which it communicates by rly. and by the central motor highway. Pop. 64,823.

Pinch, Tom. Character in Dickens's novel *Martin Chuzzlewit*. Plain and awkward in person, he is a lovable simpleton, completely deluded by the hypocrisy of Pecksniff (*q.v.*), to whom he acts as assistant. His sister, Ruth, is among the most attractive of the author's many "little," dainty, domesticated women.

Pinchbeck. Variety of brass. It was named after Christopher Pinchbeck (d. 1732), a London clockmaker, who is said to have discovered it, although there is no contemporary mention of the fact. His son, another Christopher Pinchbeck (d. 1783), was also a clockmaker who had a number of mechanical inventions to his credit.

The best pinchbeck is obtained by an alloy of copper 89 p.c. and zinc 11 p.c. to 93 copper and 7 zinc. Pinchbeck was at one time largely used for the manufacture of cheap jewelry and watch cases. It wore well when made of good material, and in old watches the inner cases, not exposed to much wear, are as bright and lustrous as they were a century ago. Pinchbeck rather unjustly became a synonym for sham and counterfeit. The material was superseded by "rolled gold" and "gold filled" material, in the best of which the outer surfaces are actually of gold.

Pinckney, CHARLES COTESWORTH (1746-1825). An American statesman. Born at Charleston, South Carolina, Feb. 25, 1746, he was educated in England at Westminster School and Christ Church, Oxford, studied law at the Middle Temple, and afterwards practised in his native town. After serving in the War of Independence, he

took part in the Constitutional Convention in 1787, and was responsible for the clause abolishing

C. C. Pinckney,
American statesman

religious tests as a qualification for office. He was one of the special envoys to France in what became known as the XYZ mission (q.v.). Pinckney was a supporter of slavery, a strong federalist, and twice an unsuccessful candidate for the presidency. He died at Charleston, Aug. 16, 1825.

Pindar (c. 522–443 B.C.). Greek lyric poet. He was born of a noble Dorian family near Thebes. The traditions of the family were musical, and Pindar is believed to have excelled in flute playing. His first poetical composition was a choral ode, written at 20 in celebration of the victory of a Thessalian youth at the Pythian games. He rose rapidly to fame, receiving commissions to write choral songs for special occasions from all parts of the Greek world, from democracies such as Athens and from tyrants such as Hiero of Syracuse in Sicily. He came to be regarded as the great national lyric poet of Greece, and after his death his memory was held in the utmost veneration. When the Spartans destroyed Thebes in the Peloponnesian War, the house of Pindar was spared, and the same honour was paid to his memory by Alexander when Thebes was again destroyed by the Macedonians.

Pindar wrote lyrics of many forms, including hymns to the gods, dancing songs, carnival songs, and dirges; but, except for fragments, all that have survived are his *epinikia*, or odes written in celebration of victories at the great national games of Greece. These are divided into four books according as the victories celebrated were at the Olympian, Pythian, Nemean, or Isthmian games. Not only is the language of the odes epic (with an admixture of Doric and Aeolic), but there is a background of epic legend. Not infrequently the poet

endeavours to inculcate a moral lesson. Much of the beauty of the odes is lost because the modern reader is unable to hear them in the magnificent setting of the festivals at which they were chanted. Yet even in the cold text the wonderful radiance and dazzling rapidity of Pindar remain. The metres, though to an untrained eye apparently irregular, conform to a definite system of prosody. The so-called Pindarics of Cowley, Dryden, and other lesser poets are prosodic absurdities, composed in ignorance of the fact that the Greek lyricist's odes were built up on a precise and accurate system. There is an excellent translation, with parallel text, by Sir J. E. Sandys in the Loeb Classical Library, 1915; and another by R. Lattimore, 1947. See Greek Literature; Ode; consult Pindar, F. D. Morice, 1879.

Pindar, PETER. Pseudonym of John Wolcott (1738–1819), British satirist. He was born at Dod-

Peter Pindar,
British satirist

brooke, Devon, and having qualified in medicine went to Jamaica and became physician-general of the island. Returning to England in 1773, he set up in practice in Cornwall, where his ideas of treatment scandalised his medical brethren, as did his remark that a physician could do little more than watch nature and "give her a shove on the back if

he sees her inclined to do right." In 1781 he gave up practice and came to London, where his satires and lampoons, witty but brutal and sometimes profane, on the Royal Academy, royalty, and other subjects, brought him great fame, though they are now completely forgotten, except for a few pointed aphorisms. Wolcott died Jan. 14, 1819.

Pindaris. Body of brigands and freebooters of all nations and religions of India. They carried on pillaging and marauding expeditions from headquarters in the Vindhya Hills, and in the opening years of the 19th century had become the

scourge of Central India. A Pindari invasion of the British possessions in the Deccan in 1815 brought matters to a head, and the forces of Hastings, the gov.-gen., surrounded the Pindari district in 1817, and crushed the brigand power.

Pind Dadan Khan. Town of the W. Punjab, Pakistan, in Jhelum dist. Situated 5 m. from the Salt Range and 1 m. from the Jhelum, it was founded in 1623 by Dadan Khan, and has considerable local trade, especially in salt. Population 15,000.

Pindemonte, IPPOLITO (1753–1828). An Italian poet. Born at Verona, he was educated at Modena, and at 24 went to Rome, where he became a member of the Arcadian Academy. As such, he undertook a translation of the *Odyssey*, and visited the various places associated with the legend of Ulysses. Having published a volume of poems in classic form, *Poesie Campestri*, in 1788, he travelled in Germany, France, and England. In 1807 he issued a fine poem in reply to Ugo Foscolo's *Sepolcri*, with the same title. His translation of the *Odyssey* into Italian blank verse was completed in 1822. He died at Verona, Nov. 18, 1828.

Pindus. Mt. range of N.W. Greece. Once the boundary between Epirus and Thessaly, it is the continuation S. of the Albanian Mountains and culminates in Veluchi, 7,600 ft.

Pine (*Pinus*). Genus of about 70 species of large evergreen trees, members of the family Coniferae, natives chiefly of the N. temperate regions and the mountains of the N. tropics. The branches form whorls, each whorl marking a season's growth. The lower branches are killed off by the upper ones depriving them of light. The evergreen leaves are needle-shaped, produced in clusters of 2 to 5. The simple flowers have no sepals or petals, and the males and females are on separate branches. The males are clustered in spikes at the base of new shoots and consist merely of scale-like stamens, each with two anther-bags filled with sulphur-coloured powdery pollen. The females are found near the tips of shoots in the form of round, scaly cones, each scale bearing a couple of seed eggs. After fertilisation by wind-borne pollen these develop into the hard woody pine-cones, in which the seeds do not ripen until the second or third year after their fertilisation.

For the production of their valuable soft timber (deal), pines are grown crowded together, in order to

Pindar, Greek lyric poet
From a bust in the Villa Albani, Rome

Pine. 1. Cluster pine. 2. Young cone of cluster pine. 3. Scotch pine. 4. Young cones of Scotch pine. 5. Cones of Austrian pine. 6. Austrian pine

discourage branch growth and increase the length and girth of the

trunk. The Scotch pine (*P. sylvestris*) of Europe and N. Asia is the only British species. It reproduces itself by self-sown seed on heaths and wastes, however poor the soil. Its growth in Britain is more rapid than in the N. of the Continent, and as a consequence the timber is coarse-grained and less durable than that imported from the Baltic region. It abounds in turpentine, and yields tar, pitch, and resin.

Other species of pine introduced and commonly grown in Britain include the Corsican P. (*P. laricio*) from Central and S. Europe, the Cluster P. (*P. pinaster*) from the Mediterranean region, and the Weymouth P. (*P. strobus*) from N. America. Others occur as ornamental trees in parks and large gardens. Pine timber is always in good demand, as it is the general utility wood of the builder for joists, flooring, doors, stairs, window-frames, etc., as well as for the ordinary purposes of the carpenter. Most of the exotic species may be reared easily from seed, and as they are mostly accustomed to grow naturally in poor or shallow soils, they

will thrive in most gardens. The best results are attained by sowing them where they are to remain as trees. See Coniferae; Forestry.

Pineal Gland (Fr. *pinéal*, like a pine-cone). Small body deeply situated in the brain. It is believed to represent morphologically the traces of a third eye, and in certain lizards part of the gland becomes developed into a structure resembling an eye, but covered with skin. Modern researches indicate that it may be a gland, the secretions of which are supposed to influence, particularly in early life, both the mental and physical growth.

Pineapple (*Ananas sativus*). Perennial herb of the family Bromeliaceae, a native of S. America. From the rootstock grows a cluster of long, thin-textured, but rigid sword-shaped leaves with sharp-toothed edges. From the centre of the leaf-cluster rises a short stout stem ending in a conical spike of

flowers surmounted by a crown of small, spiny leaves. The berries succeeding the flowers grow together into a juicy compound fruit—the pineapple. The plant was introduced to Europe in the 17th century, and grown in stove-houses, where fine fruit was often produced; but its extensive field cultivation in the W. Indies and the Azores supplied the markets with

Pineapple. Fruit arising from leaf cluster

an abundance of fine fruit, which has led to the gradual abandonment of stove cultivation.

Pineapples should be grown in pots in a hothouse, should be placed in a sunny position, and the pots plunged into a hotbed at a temperature from 65° to 75° F. The soil should consist of a thoroughly mixed compost of loam, decayed manure, and a little lime, or crushed bones or oyster shells. When established, the temperature may be allowed to drop 10° during winter. Water should be given freely in summer, when the temperature should be brought up to 90° to 90°, but sparingly during autumn and winter. A pineapple stock will yield a ripe fruit every eight months for a number of years. See Hawaiian Islands.

Pine Bluff. City of Arkansas, U.S.A., the co. seat of Jefferson co. It stands on the S. bank of the Arkansas river, 44 m. by rly. S.S.E. of Little Rock, and is served by rlys. Among its educational institutions is the Merrill Institute. Cotton and maize fields begin at the end of the city's wide streets, and cattle are raised. Pine Bluff was organized in 1832 and became a city in 1885. Pop. 21,290.

Pine Creek. Name of many streams and small towns in the U.S.A. In Pennsylvania one of these streams is a tributary of the Susquehanna, 100 m. in length. Its gorge, bounded by rock walls rising 800 ft., is known as the Grand Canyon of Pennsylvania. In Alaska and in the Yukon dist. of Canada there are such streams whence gold is obtained.

In the Northern Territory of Australia, Pine Creek is 146 m. by rly. S.E. of Darwin.

Pinega. River of the N. region of the R.S.F.S.R. It rises near Yarensk, flows N.W. towards Archangel, and discharges itself into the Northern Dvina, near Kholmogory. Its length is 350 m.

Pinene. Hydrocarbon ($C_{10}H_{16}$) of the terpene group. It is the chief constituent of oils distilled from resinous excretions of pine trees, such as turpentine. Pinene is a colourless liquid, which on keeping becomes resinified through the absorption of oxygen from the air. When hydrochloric acid gas is passed into pinene, the hydrochloride known as artificial camphor ($C_{10}H_{16}HCl$) is formed.

Pinero, Sir Arthur Wing (1855-1934). British dramatist. Born in London, May 24, 1855, he was an actor from 1874 to 1881. Then he achieved success as a dramatist with *The Squire*, and in

1885 wrote a farce, *The Magistrate*. Of his romantic pieces, *Sweet Lavender*, 1888, and *Trelawny of*

the Wells, 1895, were outstanding. With *The Second Mrs. Tanqueray*, 1893 (in which Mrs. Patrick Campbell made her début), Pinero became one of the most famous playwrights of his day, and until the First Great War his well-constructed social comedies were thoroughly representative of their time, e.g. *The Notorious Mrs. Ebbsmith*, 1895; *The Gay Lord Quex*, 1899; *His House in Order*, 1906; *Mid-Channel*, 1909. Later pieces included the fantasy, *The Enchanted Cottage*, 1922; *A Cold June*, 1932. Pinero was knighted in 1909, and died Nov. 23, 1934. Consult Sir A. P.'s *Plays and Players*, H. Fyfe, 1930; *Life and Letters*, W. D. Dunkel, 1943.

Pinerolo. City of Italy, in the prov. of Turin. It stands on the river Chisone, at the foot of the Alps, 24 m. by rly. S.W. of Turin. The chief buildings are the cathedral, dedicated to S. Donatus, and the palace, the successor of the famous castle. The city has manufactures of textiles, leather, paper, etc. Pinerolo was at one time one of the strongest places in Italy. It grew up around a castle which about 1190 was taken by the count of Savoy. A later count made it his capital and it remained a possession of the house of Savoy, save for short periods when it was in French hands. During one of these periods, early in the 17th century, the French greatly improved the fortifications. The castle is notable because in it Fouquet and the man in the iron mask were imprisoned.

Pink. Flowers of the sweet-smelling garden plant

Pinfold. Enclosure, or pound, in which strayed cattle are placed. See Potnd.

Ping-pong. Popular name, still frequently used in the U.S.A., for the game now more generally called Table Tennis (q.v.).

Pinguicula (Lat. *pinguis*, fat). Genus of perennial insectivorous herbs of the family Lentibulariaceae. They are natives of the N. temperate regions, the Andes, and the Antarctic zone. Four species grow in Great Britain, where they are known as butterworts (q.v.).

Ping-Yang. Less familiar name of the Korean seaport Heijo (q.v.).

Pinion. Commonly, a small spur- or cog-wheel which gears with a larger wheel, or a toothed rack. When,

to give additional strength, a thickness of metal or material is provided between the ends of the teeth, so that in side elevation the wheel appears circular, a pinion is said to be shrouded. The word is also used for any small wheel having teeth which gear with others on a larger wheel or piece of mechanism.

Pinion. Edge and front views of spin pinion. A. Eye; a. keyway. B. Shrouding to pitch line. C. Full shrouding, p. p'. Pitch lines

Pinite. A yellowish, micaceous alteration product of the rock-forming silicate, cordierite, crystals of which are very commonly replaced by fine aggregates of pinite and sericite (white mica), sometimes completely or along the margins and along cracks.

Pink (*Dianthus plumarius*). Tufted perennial herb of the family Caryophyllaceae. It is a native of Central and E. Europe, whence it was introduced to Britain in 1629. It has become naturalised on old walls in many places. It has slender, rounded, branching stems, 1 ft. high, swollen where the grasslike, glaucous leaves are given off in pairs. The rose-purple fragrant flowers have fringed petals.

Under cultivation it has given rise to numerous varieties, single and double, pure white, or variously spotted and variegated, which are classed as show or laced pinks, and border pinks. They succeed best in rich loam, to which for the production of fine flowers decomposed manure and leaf-mould are added. They are propagated by seeds and cuttings (pipings). These last are taken

in summer from the side-shoots, cleanly cut just below the leaf-joint. The lower leaves are removed carefully, and the pipings inserted in sandy soil in the shade. Large clumps may be divided and replanted in Sept.

Pinkerton, ALLAN (1819-84). American detective. Born in Glasgow, Scotland, Aug. 25, 1819, he emigrated to America in 1842, and immediately opened a detective agency in Chicago. In 1861 he was appointed to guard President Lincoln, and the same year inaugurated the federal secret service. He organized a band of men to protect employers against strike riots, and took a leading part in suppressing the Molly Maguires (q.v.). His agency was responsible for solving many sensational criminal cases, and under his sons, Robert Allan and William Allan, the agency became world-famous. He published *The Molly Maguires and the Detectives*, 1877; *Criminal Reminiscences*, 1878; *Thirty Years a Detective*, 1884. He died July 1, 1884. *Consult* The Pinkertons, R. W. Rowan, 1931.

Pinkerton, JOHN (1758-1826). Scottish historian. Born in Edinburgh, Feb. 17, 1758, he was trained for the law. His interests, however, were literary, and, having settled in Edinburgh, he collected and published some volumes of ballads. From that he turned to antiquarian and historical studies, which culminated in his *History of Scotland*, 1797. His other works include *Essay on Medals*, 1784; *Scottish Biographical Dictionary*, 1799; *Modern Geography*. He died March 10, 1826, and his *Literary Correspondence* was published in 1830.

Pink Eye. Term for horse influenza, first used in America. The first symptom of the disease is a red and swollen condition of the membranes of the eye. In human beings this is a mild form of conjunctivitis (q.v.).

Pinkie, BATTLE OF. Fought Sept. 10, 1547, between the English and the Scots. Somerset, the English protector, wished to unite the two countries by a marriage between Edward VI and Mary, and proposed a treaty to the Scots, which was refused. Somerset crossed the border with some 16,000 men and met a Scottish army, about 23,000 strong, drawn up behind the Esk, at Pinkie, near Musselburgh. The Scots crossed the river to seize some hills on the English left and won an early success. The English foot, however, with whom were some Italian

musketiers, did deadly work and the Scots were soon routed. Some 6,000 of them are said to have been killed.

Pinking. Cutting of eyelets or scallops in cloth. Fabrics for coffin linings are often pinked, and it was common at one time for private dressmakers to send material to the undertaker's to be pinked by the aid of the machine kept by such tradesmen; but pinking scissors are extensively used in the dressmaking trade.

Pinking. Sharp metallic knocking in an internal combustion engine. It may be caused by overheating, driving with the ignition too far advanced, too high compression, or by excessive carbon deposit. Pinking results in a falling off of the power developed, as too high compression causes the mixture in the cylinder to ignite prematurely. At the upper end of its stroke, the piston "chatters" from one cylinder wall to the other, as the pressure is reversed and acts on the crown of the piston. Excessive carbon in the mixture deposits carbon on the cylinder walls and results in uneven thrust. Some types of petrol contain a lead derivative to prevent pinking. *See* Knocking; Motor Vehicle.

Pink Root (*Spigelia marilandica*), WORM GRASS, OR INDIAN PINK. Perennial herb of the family

Pink Root. Leaves and funnel-shaped flowers. Inset, enlargement of flower

Loganiaceae. It is a native of N. America. The opposite, oval lance-shaped leaves are stalkless. The funnel-shaped flowers are red outside and yellow within, grouped on a one-sided spike. Leaves and roots yield spigeline, a powerful worm medicine.

Pin Money. Term used to describe an allowance of money given

to a woman for her own personal expenditure. The phrase originated in the 16th century when wives had a special allowance with which to buy pins, then very expensive.

Pinnace. One of a warship's boats. It may be propelled by

Pinnace, as used in the Royal Navy

oars, sail, steam, or motor. Most pinnaces are motor-driven. When oars alone are used, a pinnace is generally eight-oared and double-banked. The term applies to a light sailing-boat, frequently schooner-rigged, used as a tender. Sailing pinnaces often relied upon oars when the wind fell.

Pinner. Parish and village of Middlesex, England. It is 13 m. N.W. of London, on the Pin, a feeder of the Colne, and is served by London Transport and by main-line rlys. The cruciform church of S. John the Baptist, built on an earlier foundation in 1321, and restored 1879, has a fine Perpendicular tower, and a mural monument to the poet laureate, Henry J. Pyc. In a cottage in Pinner Wood, Bulwer-Lytton wrote *Eugene Aram*. Pinner Park, once forest land in the keeping of the abbots of Westminster, passed to S. Thomas's Hospital, London. Near the rly. station are the Commercial Travellers' Schools, opened 1856. The Queen's Head inn dates from 1705. At Headstone was a residence of the archbishops of Canterbury. Once a hamlet and chapelry of Harrow, Pinner was, by Edward III, granted a market, still held annually on the Wed. following Whitsun. Pop. est. 10,000.

Pinos, ISLA DE, OR ISLE OF PINES. Island in the West Indies. It lies about 36 m. S. of Cuba, of which it is a dependency, and has an area of 1,180 sq. m. Pineapples and tobacco are grown. Cattle rearing is carried on, and minerals, chiefly sulphur and marble, are worked. Santa Fé is the capital. It was discovered by Columbus in 1494, and was for long a buccaneer's stronghold. Pop. est. 4,000.

Pinsk. Town of White Russia S.S.R., in the region of the same name. It is situated 150 m. S.W. of Minsk, on the Pina, and the Brest-Bryansk rly. Here were brick and soap works, and tanneries. In the 15th century it belonged to

the princes of Kiev, then became independent, and after belonging to Lithuania and Poland, passed to Russia in 1795.

Pinsk was captured by the Germans on Sept. 16, 1915, during the Russian retreat from Brest Litovsk, and was in the area secured by Poland from Russia under the treaty of Riga, 1921. Occupied by Russia after the German-Soviet partition of Poland in Sept., 1939, Pinsk was captured by the Germans in June, 1941, during their invasion of Russia. It was recaptured by troops of the 1st White Russian army on July 14, 1944.

Pint. Measure of capacity. The English pint is both a liquid and a dry measure, is the eighth part of an imperial gallon, and contains 34.65925 cubic inches. The pint is subdivided into four gills, and two pints make a quart. The Scottish pint contains a little over three imperial pints, and the U.S.A. standard pint 28.875 cubic inches. In medicine a pint is equivalent to twenty fluid ounces. *See* Weights and Measures.

Pin-Table. Game popular in amusement arcades and bars. On a table, set in a frame under glass and sloping gently towards the player, are a number of holes; on the right is a narrow guide-way from which steel balls are shot one by one, by a piston working against a spring. The aim is to shoot each ball in such a way that, as it returns towards the bottom of the table under gravity, it is caught in one of the holes, each of which records an appropriate score. Pins or other obstacles are placed on the surface of the table to divert the ball. The game is a development of bagatelle (*q.v.*) and its variant Corinthian bagatelle. Pin-tables have been greatly elaborated: on some the contact of a ball with an obstacle illuminates an electric light, the score being shown on an illuminated screen. Usually it is necessary to insert a penny in a slot to release the balls for play.

Pintail Duck (*Anas acuta*). Wild duck, widely distributed over the N. hemisphere and a

winter migrant to British shores. It breeds in Scotland and the adjacent islands. Locally known as the sea-pheasant, it is easily recognized by its slender and graceful form, and long, pointed tail. It occurs in small flocks near the shore and feeds upon weeds, crustaceans, and insects.

Pinturicchio. BERNARDINO (1454-1513). An Italian painter. Bernardinodi Biagio, commonly known as Pinturicchio "the little painter," on account of his small stature, was born at Perugia, studied under Fiorenzo di Lorenzo, and worked in the Sistine Chapel, Rome, 1482. He subsequently visited Orvieto, Perugia, Spoleto, and Milan. At Siena he painted the Life of Aeneas Silvius (Pope Pius II) in the library. The Sistine Chapel and Borgia frescoes at the Vatican were his most successful works. His art deteriorated before his death, which took place at Siena, Dec. 11, 1513. *See* Ceiling.

Pinwell, GEORGE JOHN (1842-75). British painter and illustrator. Born in London, Dec. 26, 1842, he studied at the St. Martin's Lane academy and Heatherley's. He was elected A.R.W.S. in 1869, R.W.S. in 1870, and contributed many water-colours to the society's exhibitions; but he is best remembered by his black and white work in *Once a Week*, *Good Words*, and other journals during the revival of English book illustration in the 1860s. Died at Hampstead, Sept. 8, 1875. *See* Drawing.

Pinxton. Market town of Derbyshire, England. It is 6 m. S.W. of Mansfield, and is served by two rly. stations. By-products of coal, children's clothing, and saccharine packing provide industries. S. Helen's church, dating from the 13th century, was rebuilt c. 1750. Market day, Fri. Pop. 6,000.

Pinzon, VICENTE YAÑEZ (c. 1460-c. 1523). Spanish navigator. Born at Palos, he became a skilful mariner and commanded the Nina on Columbus's first voyage to America, 1492-93. In 1497 he reached the American mainland, and in 1499 discovered the coast of Brazil and the mouth of the Amazon. In 1505 he was made governor of Porto Rico. He went to sea again in 1508, and returned to Spain the next year with a cargo of gold. After 1523 nothing more is known of him.

Piombi (Ital., leads). Name given to a state prison in Venice. It was so called from being situated beneath the lead roof of the doge's palace, and the attic cells were used mostly for state prisoners. Of the inmates, Casanova and Silvio Pellico are the best known. *See* Venice.

Piombino. Former independent principality of N.W. Italy, now included in the prov. of Leghorn. Its area was 138 sq. m. Originally an imperial fief, it belonged from 1399 to 1603 to the Appiani family. It was taken by the French in 1801, and was given by Napoleon to his sister, wife of Prince Bacciocchi. In 1815 it passed to Tuscany and thus to Italy. The most interesting town in the old prov. is Populonia, the Etruscan Pupluna. Situated on a hill, the town is dominated by a medieval castle. It was a valuable port in Roman times when the iron from Elba was smelted there. *From* Peeom-beeno.

Piombino. Town and seaport of Italy, in the prov. of Leghorn. Situated on a promontory opposite the island of Elba, 8 m. by rly. S.W. of Campiglia Marittima, it is the port of embarkation for Elba. It has iron rolling mills.

Pioneer (Fr. *pionnier*, foot soldier, sapper). Word used for soldiers who prepared the way for the march of an army. They did this by clearing and making roads, and their duties included also the preparing of entrenchments, and bivouacs. From this use the word came to mean one who was first in any work of discovery, whether actually, as in unexplored forests, or figuratively, as a scientist.

In the British army a pioneer battalion is a body of troops who prepare positions, lines of communication, and defensive works for the use of combatant units. Until the First Great War pioneer duties in the British army were mainly carried out by Royal Engineers; in 1915, however, labour battalions were raised and became indispensable. In 1939 the Auxiliary Military Pioneer Corps, now the Royal Pioneer Corps, was raised for service in the Second Great War and later placed on the permanent establishment with regimental status.

Pioneer Health Centre, PECKHAM. Centre for the "study of the living structure of society." It began in 1926 when a small group, all under 30, acting under scientific guidance, took a small house in Peckham and invited families living near by to join as families

George Pinwell,
British painter

Pintail Duck. A winter migrant to Britain, it also breeds in Scotland

W. S. Berridge, F.Z.S.

(not as individuals) a health centre or family club. A small weekly subscription was charged, and the centre lasted for three years before it outgrew its premises. From this beginning the Pioneer Health Centre, opened in 1935, developed. Suspended during the Second Great War, it reopened in 1946, but was closed in 1950 for lack of funds. The centre, with 2,000 member-families, was, in the words of its organizers, "a locus in society from which the cultivation of the family—living cell or unit of society—can proceed and from which the family sustained in its own growth and development can spontaneously evolve as part of a larger whole—a living organized society." In addition to the usual and many other medico-social activities of a health centre, it catered for the leisure of every individual in all the member-families, i.e. for all age and all wage levels. The building included a gymnasium, a swimming bath, a theatre and concert hall, and a cafeteria. Periodical health overhaul for every member of member-families was the basis of the centre scheme. Consult The Peckham Experiment, I. H. Pearse and L. H. Crocker, 1943; Biologists in Search of Material, Williamson and Pearse, 1947.

Piotrkow. Town of Poland. It stands on the river Strada and the Warsaw-Vienna rly., 25 m. S.E. of Lodz and 80 m. S.W. of Warsaw. Industries have included tanneries, foundries, and textile factories. In the 15th century the kings of Poland were elected here. Pop. est. 51,000.

Piou-piou. Familiar name for the French soldier of the line. It is more or less equivalent to the British Tommy. See Poilu.

Piozzi, HESTER LYONH (1741-1821). British writer, and, as Mrs. Thrale, friend of Dr. Johnson. She was born at Bodvel, Carnarvonshire, Jan. 16, 1741, and her father, John Salusbury, taking up an appointment at Nova Scotia, she was brought up by his brother Sir Thomas at Offley Hall, Herts. Here she became acquainted with Henry Thrale, son of a rich brewer, whom she married in 1763. They made their home at Streatham Park, near London, where the long friendship with Dr. Johnson began. Mrs. Thrale's energy and business capacity were of immense assistance to her husband when he became financially embarrassed in 1772. Their liabilities were fully discharged by 1781, when Thrale died of apoplexy, his widow selling the brewery to the Barclays.

A friendship formed in 1780 with Gabriel Piozzi, an Italian musician, ripened into passionate attachment, and after much altercation with her children, Mrs. Thrale married him in 1784.

According to Boswell, Johnson did not like the marriage and became much less intimate with her than before. The Piozzis lived first at Streatham Park, and after 1795 in Wales where Piozzi died in 1809. His widow lived until May 2, 1821. Mrs. Piozzi was a woman of great ability and charm, and widely, though not deeply, read. Her Anecdotes of Dr. Johnson, and a collection of letters that passed between them, throw interesting sidelights on the age. See Johnson; Thrale.

Bibliography. Autobiography, Letters, and Literary Remains, 1861; Piozziana, by a Friend, E. Mangin, 1833; Mrs. Thrale, Sketches of Her Life, L. B. Seeley, 1891; Dr. Johnson and Mrs. Thrale, A. M. Broadley, 1910; Piozzi Marginalia; ed. P. Merritt, 1926.

Pipe. Tubular conduit used primarily for the conveyance of gases, liquids, and granular solid matter. The normal circular section combines strength with lightness in structural members in airframes, furniture, scaffolding, and staging. Steam generators, as distinct from boilers, are largely continuous coils of small-bore pipes.

The earliest pipes were of hollowed tree trunks, one end of each sharpened pencil-wise to fit into the bore of the next length. Egyptian relics include stone-cased sheet-copper pipes dating from about 2700 B.C.

Most pipes are made by variants of four main processes: forming, drawing, extruding, and casting. Steel pipes are formed from strip, welded or riveted lengthwise. Flexible metallic pipes, and rubber pipes reinforced with canvas, are made by winding strip helically round an internal mandrel. Seamless pipes of many metals are forged hot from a solid billet pierced to form a short thick-walled pipe which is then elongated over a mandrel. Pipes of lead, aluminium, rubber, and plastics are normally extruded through a cored die from a container of semi-molten material

under hydraulic pressure. Pouring molten or other liquid material into prepared moulds, one of the oldest processes, is useful for ceramics, concrete, iron, and steel. Pottery materials are kiln-baked with or without glazing after casting.

Joining methods vary widely. Welding has largely eliminated screwed, flanged, and other compression unions, except at access points, and for small pipes. Soldering and brazing have wide application on soft metals like lead and copper. Cast pipes often incorporate the spigot and socket joint, which relies for soundness on a caulked packing of lead, cement, or other filling.

Pipe. In music, a general name for wind instruments, more particularly those of the whistle or flute family, and thence by analogy the sound of the song of birds. It is also the medium by which sound is produced in the organ (*q.v.*). Here the pipes vary in (a) length, governing the pitch; (b) scale, or proportion of diameter to length; and (c) material and shape, affecting the quality, though here the question of "voicing" comes in. They may be open, or stopped, and made of wood or metal (tin, "spotted metal," zinc, etc.). A set of pipes having the same quality and ranging through the whole compass is known as "a stop." Stops are composed either of flue pipes or of reeds; if the former, the wind conveyed from the bellows impinges upon the lip of the pipe, thereby setting in vibration the column of air therein; if the latter, the sound is produced by a tongue of metal, the pipe being less important.

Pipe. Utensil for inhaling tobacco smoke; usually a tube of clay or wood, with a bowl to hold the tobacco. Pipes were introduced into England in 1586 by Ralph Lane, governor of Virginia.

Pipe making became an organized craft in London in 1619. Clay was the first material used, and still furnishes the cheapest pipes. Roughly shaped, it is drawn over a steel rod and put in the bottom half of a mould, which, with the top piece, is placed in a press; a lever, with a cone-shaped projection to form the bowl, is pulled down; the top of the bowl is cut clean by a knife drawn through an opening. Placed on a support at each end, the pipe is curved by its own weight; it is then baked, polished, and the end tipped with molten sealing wax to form a

H. Piozzi

mouthpiece. This is the long variety called the churchwarden, but the short clay pipes called cutties in Ireland, or dhudeens, are made by the same method.

Wooden pipes are now in almost universal use, the wood being chiefly that of the tree heath,

Erica arborea, French *bruyère*, whence the popular name of briar pipe. The tree is grown chiefly in S. France, Italy, and Asiatic Turkey, and pipes are

In the 18th century fine porcelain pipes were made at Chelsea, Sèvres, Dresden, Vienna, and elsewhere, and heavy, pendent porcelain pipes, often with metal covers, are still popular among Teutonic smokers. Other materials used in pipe manufacture are meerschaum

Pipes for tobacco smoking. 1. Examples from the Upper Nile. 2. Ainu pipe and holder, Yedo. 3. Bamboo pipe, Torres Strait. 4. Bowls and broken stems of Elizabethan and Carolean clay pipes. 5. Wooden pipe said to have been given to Sir W. Raleigh by Indians; top of bowl indicated by x; mouthpiece extends to left. 6. Stone and clay pipes made by American Indians

1, 2 & 3 by courtesy of British Museum; 6, by courtesy of American Museum Journal

largely manufactured in Nuremberg and E. France. The desired colour is obtained by boiling the blocks, skilfully cut from the roots so as to avoid waste, in a vat.

The oldest pipes known are those found in the so-called pipe mounds of the Mississippi valley. Apart from their archaeological and ethnographic value, they are interesting owing to their want of stems. They were formed of one piece of stone, 3 to 4 ins. long and about 1 in. broad, with the bowl in the centre and the tube leading to it pierced from one end. Notable American pipes are the calumet (*q.v.*), tomahawk pipe, and the whalebone pipes of the Stikine Indians.

(*q.v.*), ivory, glass, horn, metals, cane, and bamboo. Characteristic pipes are the Turkish chibouque, Indian nargileh, and Persian hookah (*q.v.*). Of pipes smoked by half-civilized peoples, mention may be made of the three-bowled pipe of the Kirghiz, bamboo cylinder of New Guinea, the small metal-bowled pipe of the Eskimo, the antelope's horn with upright wooden stem of E. Africa, and the walrus-tooth pipe of the Laplander.

Pipe. Measure of liquid capacity. It varies according to the locality and the liquid measured. The ordinary pipe is two hogsheads, equivalent to 108 imperial gallons, or 126 wine gallons. Two pipes form a tun. A pipe of Madeira contains 92 gallons; of sherry 108; of port wine 115. See Weights and Measures.

Pipe and Tabor. Two instruments formerly much used to accompany morris-dancing, and known popularly as whittle and dub. The pipe was a kind of small recorder (*q.v.*), but with only three holes, two at the front for the first and second fingers, and one at the back for the thumb. The player held it in his left hand, from the wrist of which hung the tabor, a small shallow drum a foot or so across, which was beaten with a stick in his right hand. See Morris Dance.

Pipe Clay. Variety of natural clay. It is used for whitening military accoutrements, etc., and for making certain kinds of pottery.

Pipe-fish. Popular name for a group of long, slender fishes constituting several genera of the family Syngnathidae. The skeleton is incompletely ossified, and the angular, ridged exterior is covered with large, bony plates. There are no ventral or anal fins, and the long dorsal fin is without rays. The jaws are united to form a long tube with the small mouth at its extremity. Gills take the form of paired tufts upon the bronchial arches, and the gill-cover is a large, fixed, bony plate with only a small aperture to admit water to the gills. Usually the males are provided with marsupial pouches in which they carry the eggs until hatched. They live among seaweeds in shallow water.

Pipe-fish. The long, slender fish that lives among seaweeds in shallow waters
W. S. Berridge, F.Z.S.

Five species are found on the British coasts. Of these the straight-nosed pipe-fish (*Nerophis ophidion*) may be 2 ft. in length; the greater pipe-fish (*Syngnathus acus*) and the broad-nosed pipe-fish (*S. typhle*) each 15 ins.; whilst the smooth and cylindrical worm pipe-fish (*Nerophis lumbriciformis*) is only five or six ins. In the last-named the eggs are embedded in the skin of the male.

Pipe Line. Pipe used for conveying fluid over long distances. Fluids commonly transported are natural gas, coal gas, water, crude oil, and refined petroleum products. The pipe is usually of steel, lengths being joined by welding or by special couplings, but concrete and wood are occasionally used. Where practicable, pipes are buried. Corrosion must be prevented and so it is often coated with bituminous paint and wrapped with bitumenized paper or cloth. Corrosion is an electrochemical phenomenon and another preventive measure is to pass an electric current, often generated by windmill, from a conductor, usually some old pipe buried near by, to the pipe line. Choice of a route for the pipe is based on a careful survey to avoid major topographical obstacles. Rivers are crossed sometimes by special bridges, sometimes by laying the pipe in the bed of the stream. When the fall is considerable, e.g. when piping water from a mountainous district to sea-level, it is necessary to break the line at intervals with open reservoirs to avoid too great an internal pressure in the pipe. More frequently the fall between beginning and end of the pipe line is insufficient to maintain the required flow; there may even be a rise instead of a fall. In either case pump stations have to be built along the route. Very viscous oil may be heated to reduce the resistance to flow.

In 1944 pipe lines were laid across the English Channel (see Pluto); and a pipe-line was constructed alongside the Ledo Road (q.v.) running from Calcutta to carry oil to U.S. air forces in Yunnan. Commercial pipe lines have been laid from Montreal to Portland, and in the U.S.S.R., Persia, Iraq, Palestine, Rumania, and in various parts of the U.S.A.

Piper, JOHN (b. 1903). British painter. Born Dec. 13, 1903, he was educated at Epsom college and the R.C.A. He became prominent with water-colour drawings and aquatints of architectural subjects executed in a dramatic style. Dur-

ing the Second Great War he was commissioned to paint the ruins of the house of commons and other famous buildings, and among his finest works was a series of water-colour drawings of Windsor Castle, 1941-42. He also illustrated books and designed décors for the ballet. His publications included *Brighton Aquatints*, 1939, and *British Romantic Painters*, 1942. Piper is represented at the Tate Gallery, and Victoria and Albert Museum.

Piperaceae. Family of herbs and shrubs, widely distributed over the warmer regions of the earth. They have jointed stems and the leaves are mostly alternate or in whorls. The flowers are small, disposed in spikes or sprays. Many of them are aromatic; some produce acrid resin or aromatic volatile oil. There are about 1,150 species, distributed over seven genera. See Betel; Pepper.

Piperine ($C_{17}H_{19}NO_3$). Alkaloid contained in the fruits and seeds of different kinds of pepper, from which it may be obtained by warming with milk of lime, evaporating to dryness, and extracting the residue with ether.

Pipe Roll. Term applied to the Great Roll of the Exchequer preserved in the Record Office, London. It contains the accounts of the revenue collected by the sheriffs, which were called pipes, either because they were sent to the crown office in cylinders, or because of their tubular form when rolled. The records go back to the reign of Henry II, and provide

much information on matters relating to the revenue of the crown, etc. See Record Office.

Pipette. Narrow graduated glass tube adapted to deliver small volumes of liquid and employed in chemical analysis. The liquid is introduced into the pipette by applying suction from the mouth at the upper end, while the lower end is dipped into the liquid. The upper end is then rapidly closed by applying the finger.

John Piper,
British painter

One kind of pipette is adapted for delivering one volume of a liquid, while another variety has graduations throughout its length, and small amounts of liquid can be released by relaxing the pressure of the finger on the upper end.

Pipil. American Indian tribe in S.E. Guatemala and Salvador at the time of the Spanish conquest. An early offshoot of the ancient Mexican people, speaking primitive Nahuatl, they maintained their independence amid the Maya civilization. See Nahua.

Piping Crow (*Gymnorhina*). Genus of birds forming a sub-family of the crows. There are three species, all restricted to Australasia.

They have black and white plumage, and are often called Australian magpies. In captivity they display great skill in learning to whistle tunes and to talk, for which reason they are popular as pets. Their food consists mainly of grasshoppers and other insects.

Pipi Pods. Astringent seed pods of *Caesalpinia pipai*, used as a dye-stuff, but inferior to those of *C. coriaria*. See Divi-divi.

Pipit (*Anthus*). Genus of small passerine birds, related to the wag-tails. Great Britain possesses four

Piping Crow, the
white-backed species

Pipit. - *Anthus spinoletta petrosus*, the
rock pipit of Britain

species. The meadow pipit (*Anthus pratensis*), the commonest, is to be seen almost everywhere in the country, running on the ground in search of insects and seeds. The tree pipit (*A. trivialis*) is migratory, arriving in April and leaving in Sept. In appearance it is difficult to distinguish from the meadow pipit. The rock pipit (*A. spinoletta petrosus*) is the only British song-bird that lives among the rocks on the coast, where it feeds on small crustaceans and worms.

Pipette. Types
used in chemi-
cal analysis

The water pipit (*A. spinoletta*), Richard's pipit, and the tawny pipit are only occasional visitants to the S. of England. The pipits are often mistaken for larks, to which they are very similar, and are locally known as larks, e.g. the tree pipit is called the woodlark in Scotland and the meadow pipit generally is the titlark. See Egg colour plate.

Pippin. Name for many varieties of apple, notably Cox's Orange Pippin, Newtown Pippin, Ribston Pippin. The word was once applied to any apple raised from pips and not by grafting. See Apple.

Piqué (Fr., quilted). Name given to fabrics in which ribs raised in high relief are woven longitudinally.

Piquet. Card game known in England in the 16th century as *la romfe* and subsequently in the time of Charles I as piquet. It is played by two persons with 32 cards, the six down to the deuce inclusive of each suit being discarded from the ordinary pack. The cards rank thus, ace, king, queen, knave, ten, etc.; the ace counts the highest both in cutting and play, and there are no trumps. Each player receives twelve cards, dealt in twos or threes. The remaining cards are laid upon the table face downwards; the three bottom cards being placed in a row, and the other five in another row over them, these forming the stock or *talon*. The object of the game is to score points for certain combinations and for tricks. The game begins by the players examining their hands; if the leader or elder hand (non-dealer) has no king, queen, or knave—termed *carte blanche*—he announces it, and scores 10 points. If the second player has a *carte blanche* hand, he does not declare it until the leader has discarded. The non-dealer has considerable advantage from being elder hand; he can take any five cards from his hand which are least likely to increase his score, and, laying them aside, take as many from the *talon*. The younger hand then lays three and takes the last three of the *talon*.

The following combinations are to be tried for: *Carte blanche*. Having no picture card in the hand; this takes precedence of everything else (= 10 points). *Fours or Quatorze*. Four aces, kings, queens, knaves, or tens (each quatorze = 14 points). *Threes*. In aces, kings, queens, knaves, or tens (= 3 points). *Point*. The greatest number of pips on cards of the same suit (= as many points as

cards). *Tierce*, or three of a sequence (= 3 points). *Quart*, or four of a sequence (= 4 points). *Quint* or five of a sequence (= 5 points). *Sixième*, or six of a sequence (= 6 points). *Septième*, or seven of a sequence (= 7 points). *Huit*, or eight of a sequence (= 8 points).

The elder hand calls what he holds, and his opponent, if he cannot beat it, replies, "Good," and the elder hand proceeds to count it; otherwise his opponent says "Equal" or "Not good." The first procedure is to call and score the *point*, the player holding the highest in this regard only scoring it. The other combinations are then counted aloud by each, after which they proceed to play for the tricks.

There being no trumps the highest card of each suit wins the trick. A player is bound to follow suit if he can, but is not obliged to take the trick. The leader counts one for each card led, whether it wins a trick or not. If the trick falls to the second player he also counts one; then leads the next card, counting one for the card led, and so on. The winner of the last trick counts one extra for the last card. Tricks are placed face upwards, as played. The player who takes the most tricks scores 10; if he wins them all (*capot*) he scores 40. *Pique* is when the elder hand counts 30 in hand or play before his opponent has scored, in which event he adds 30 more to his score. *Repique* is when either player can score 30 from the combinations in his hand before a card is played, in which event he scores an additional 60. A game consists normally of six hands. *Pron. pikett*.

Piracy (Gr. *peirātēs*, an adventurer who makes attacks on ships). The offence by common law of destroying or attacking a ship or taking any part of its cargo on the high seas or of attempting to do so by persons who are not authorised by any state or lawful authority. The British courts may try persons whether British subjects or not for piracy on whatever part of the seas the offence took place. Various Acts of parliament make certain other offences statutory piracy, e.g. a master of a ship who trades with pirates. Piracy if it involves endangering the life of any person on a ship becomes a capital offence. In other cases the maximum punishment for common law piracy is life imprisonment and for statutory piracy three years' imprisonment.

Piracy, as we see from the poems of Homer, was regarded as an honourable calling among the Greeks. The Romans had to deal with pirates in the Mediterranean, where they were again notorious until early in the 19th century. See *Buccaneers*; Kidd, W.; *consult The Pirates' Who's Who*, Philip Gosse, 1924.

The word pirate has been applied by analogy to other forms of illegality; thus pirate music is sheet music printed and sold with slight alteration to avoid the law of copyright; books are pirated in a similar way; a pirate listener in the U.K. is one who avoids paying a licence; and pirate bus was a term applied in London to any privately owned bus using routes and goodwill of the London General Omnibus Co.

Piræus. One of the chief seaports of ancient Greece. Situated on the Saronic Gulf, 6 m. S.W. of Athens, it owed its foundation to Themistocles and Pericles. It was destroyed by Sulla, 86 B.C., and was not rebuilt until the 19th century, after the establishment of the modern kingdom of Greece. Formerly connected with Athens by the well-known "Long Walls," it now has railway communication. It has become the second largest city of Greece with pop. 284,070. *Pron. Py-ree-us*.

During the Second Great War Piræus was occupied by the Germans in April, 1941, and evacuated by them in Oct., 1944. A British Commando unit landed here Oct. 13. Fighting broke out between British troops and Greek *Elas* (left-wing) units on Dec. 7, the latter endeavouring to advance upon Athens. Fighting continued until the signing of a truce, Jan. 15, 1945. See Athens.

Pirandello, Luigi (1867-1936). Italian dramatist. Born at Girgenti, Sicily, June 28, 1867, he

Luigi Pirandello,
Italian dramatist

studied in Rome and at Bonn university, and became a teacher. He published three volumes of verse between 1889 and 1895, then turned his attention to the novel. *Il fu*

Mattia Pascal, 1904, foreshadows the theme (the problem of personality) of his plays, the first of which, *La Morsa*, a one-act drama, was produced in 1912. Thenceforth the stage was his chief

preoccupation. *Se non così*, 1917; *Così e se vi pare*, 1918; *Tutto per bene*; *L'Imbecille*; *Enrico IV*; *Come tu mi vuoi*; and *Ciescuno a suo modo*, were translated into many languages and produced all over the world. In England and the U.S.A., the best known were *Six Characters in Search of an Author*; *And That's the Truth*; *The Mock Emperor*; and *As You Desire Me*. He opened his own theatre in Rome in 1925, and formed a company which toured Europe in his plays. Awarded the Nobel prize for literature, 1934, he died Dec. 10, 1936.

Pirandello's importance in modern drama derives from his ability to create characters of universal significance. His main theme is the power and prevalence of illusion; it is for him the dominant factor in life and its gradual dispelling is tragedy. He maintains that man constructs an identity for himself, sometimes deliberately as in *Enrico IV*, sometimes unconsciously as in *As You Desire Me*, and that he is compelled to realize that he stands alone. At the same time he appears differently to every other person, and no one man's impression of him is more real than another's. *Consult* Lives, W. Starkie, 1926; F. Paiai, 1927.

Piranesi, GIAMBATTISTA (1720-78). Italian engraver and architect. Born at Venice, the son of a mason, he studied under Valeriani and G. Vasi, the engraver. He started practising as an architect in Venice, but was attracted to Rome, where he at once began the engravings of ancient monuments published in 1750 under the title of *Della Magnificenza ed Architettura dei Romani*. He etched nearly 2,000 plates before he died in Rome. A picturesque draughtsman, addicted to moonlight effects with strong light and shade, he drew also with the enthusiasm and knowledge of an antiquary, and his work is of inestimable value to the student of architecture. *Consult* Piranesi: *His Life and Works*, A. Samuel, 1910.

Pirano. Town and port of Italy, in the peninsula of Istria. It is 13 m. S.W. of Trieste. Salt is the chief export from the convenient harbour. Parts of the ancient fortifications still stand; the cathedral rises from massive foundations on the N. shore. Tartini, the composer, was born here in 1692.

Pirate, THE. Sir Walter Scott's fourteenth novel, published in Dec., 1821. It is a romance of Zetland (Shetland) and

the Orkneys at the close of the 17th century, and is remarkable for its scenic descriptions and its reflection of the author's philosophy of life. Cleveland, the pirate, was drawn from John Gow, who was captured in 1725. A notable character is Norma of the Fitful Head.

Pirates of Penzance, THE, OR THE SLAVE OF DUTY. Comic opera written by W. S. Gilbert, composed by Arthur Sullivan. It was produced April 3, 1880, at the Opéra Comique Theatre, London, and had a run of 363 continuous performances. The characters consist of pirates, policemen, and a major-general and his daughters; and the many tuneful and witty numbers include *Poor Wandering One*, *The Modern Major-General*, *The Policeman's Chorus* ("When the foeman bares his steel, ta-ran-ta-ra"), and the song of the Police Sergeant ("A policeman's lot is not a happy one").

Piraya OR CARIBE. Fish (*Serrasalmus ternetzi*) occurring in rivers of S. America. It has a deep, blunt head with powerful jaws and sharp teeth, and is renowned for its ferocity. Swarms of piraya, which normally prey on other fish, have been known to attack human beings. If a man is killed the flesh is neatly picked off the bones without damaging the clothes. The greatest length attained by the piraya is less than 2 ft.

Pirbright. Village of Surrey, England. It lies 6 m. N.W. of Guildford. The church, built in 1785, has a typical "Hertfordshire extinguisher" steeple, and in the churchyard is the granite tomb of Stanley, the explorer. Adjacent to the village is an army camp, and 1 m. N. is the Bisley (q.v.) rifle range. Pop. approx. 4,000.

Pirène. Fountain at Corinth, Greece. It issued from the rock on the Acrocorinthus. It was said to have first gushed forth at the stamp of the foot of the winged horse Pegasus, which Bellerophon (q.v.) caught here.

Pirmasens. Town of Rhineland-Palatinate, W. Germany, 40 m. W.S.W. of Spire. The chief industry is the manufacture of boots and shoes and the preparation of leather. In the 18th century Pirmasens was part of Hesse-Darmstadt, and in 1815 passed to Bavaria. It is named after S. Pirmin, who preached here in the 8th century. After the Second Great War it lay in the French zone of occupation. Pop. (1950) 38,700.

Pirna. Town of Saxony, E. Germany. It stands on the Elbe, about 10 m. S.E. of Dresden, and was in

medieval times a fortified town. The chief industries are making glass and pottery. There is a trade in grain along the Elbe, and stone is quarried in the neighbourhood. Above the town is the Sonnenstein, once a strong fortress commanding the Elbe, and earlier a castle that protected the town, later used as a lunatic asylum. The fortifications, both of the city and on the hill, were destroyed in the 18th century. In early days part of Meissen, Pirna was included in the duchy of Saxony about 1423. After the Second Great War it came within the Russian zone of occupation. Pop. (1950) 38,500.

Piron, ALEXIS (1689-1773). French dramatist. Born at Dijon, July 9, 1689, he settled in Paris in 1719, and first won success with a dramatic monologue, *Arlequin Deucalion*. Of his numerous plays only one survives, *La Métromanie*, 1738, which ranks among the best comedies of the 18th cent. Piron was famous for his wit and caustic epigrams. He died Jan. 21, 1773.

Pisa (Lat. *Pisae*). City of N.W. Italy, capital of the maritime prov. of Pisa. It stands on the Arno,

Pisa arms

7 m. from the Ligurian Sea and 50 m. by rly. W. of Florence. Famous in art and history, its present business is mainly with tourists and the university. The busiest part of the town is built around the banks of the Arno, but the most interesting quarter is the Piazza del Duomo.

The fine cathedral, built 1063-1118, and restored in the early 17th century, is of white marble with an elliptical dome and an arcaded façade. Its roof was slightly damaged by shell fire in 1943. The circular marble baptistery (1153-1278) has an octagonal font and a fine hexagonal pulpit by Niccolò Pisano. The campanile, usually known as the Leaning Tower, was built 1174-1350 and rises to a height of 179 ft. in eight colonnaded storeys. It is 16½ ft. out of the perpendicular, the ground on the S. side having presumably sunk. In 1928 a British firm secured a contract for strengthening the tower. The beautiful cloistered cemetery (Campo Santo) (1275-84), with earth reputed to have been brought from Calvary, built in Tuscan-Gothic style and with medieval frescoes and Etruscan and other sculptures, was partly burnt out in 1944, when precious

frescoes by Gozzoli were destroyed, though parts of them were later laboriously restored.

Among other interesting churches are S. Maria della Spina (1325-29),

Pisa. The famous Leaning Tower built 1174-1350

the basilica of S. Michele in Borgo, (with Gothic façade intact although the north nave was demolished during the Second Great War); S. Paolo and S. Niccolò, both of the 13th century. The university, a 12th century foundation, is housed in a handsome Renaissance building and has a library with over 200,000 volumes and many valuable MSS. The municipal museum has a representative collection of Tuscan paintings and sculptures; there are also a natural history museum, botanical gardens, and an art academy. The leading industry is the manufacture of cottons. In the vicinity are thermal mineral springs and a national stud farm for horses and dromedaries. It was off the village of Gombo, 1½ m. W., that Shelley was drowned July 8, 1822.

Originally a Greek colony, Pisa became later an important Etruscan city and then a flourishing Roman port, whence marble and wood were shipped. After its decline under the domination of the Franks, Pisa rose to importance again by the 11th century, and, after a series of successful conflicts with the Saracen pirates, became a flourishing naval republic, with dominion over Corsica, Sardinia, and the Balearic Isles. In 1099 it sent vessels to the 1st crusade. After continuous struggles with Florence, Pisa was vanquished in 1405, and remained an integral part of Tuscany until the unification of Italy in 1860. On Sept. 2, 1944, it was occupied by the Allied

5th army, the Germans retreating N. Pop. 82,623. See Architecture illus. p. 570; Baptistery; Campo Santo, and illus.; Pulpit, and illus. Consult The Story of Pisa, J. A. Ross and N. Erichsen, 1909.

Pisa, COUNCIL OF. Church council held in 1409 to settle the great schism occasioned by the residence of the popes at Avignon. Summoned by the college of cardinals, the rival popes Gregory XII and Benedict XIII refused to appear, and the council of 24 cardinals, 80 bishops, and many other ecclesiastics of authority declared them both schismatics and elected Peter Philarges (Alexander V) to the papal throne, June 26. The schismatics refused to recognize the authority of the council, and the schism lasted another 30 years.

Pisagua. Seaport of Chile, in the prov. of Tarapacá. It is 46 m. N. of Iquique, with which it is connected by rly. Its chief export is nitrate of soda. In 1868 and 1877 it was almost destroyed by earthquakes. Near the town the Chileans defeated an army of Peruvians and Bolivians. Nov. 19, 1879.

Pisano, ANDREA (c. 1270-1349). Italian architect and sculptor. Born at Pontedera, he constructed a good part of the fortifications of Florence, and the stronghold of Scarperia in the Val di Mugello. His greatest achievement, however, was the decoration in relief of one set of gilded doors for the baptistery at Florence, two other sets being executed by Ghiberti. He worked also at Venice, and died at Orvieto, where he was cathedral architect.

Pisano, NICCOLÒ (c. 1206-78). Italian sculptor, born either at Pisa or in Apulia. His best known works are the sculptured pulpit of the baptistery of Pisa, 1260, and that of Siena cathedral, 1268. These are inspired by the classic remains of Tuscany. He worked also at Bologna and Perugia. Architect and engineer as well, he influenced his many pupils in the direction of a less hieratic art than had previously obtained in Italy.

Pisano, VITTORE, OR PISANELLO (c. 1380-1456). Italian painter and medallist. Born at San Vigilio, he painted frescoes at Verona, Ferrara, Venice, Mantua, excelling in the renderings of animals, particularly horses; an example is the fresco of S. George, painted for S. Anastasia, Verona. Animal life is also well interpreted in his panel, Miraculous Stag appearing to S. Eustace, in the National Gallery, London. A great number of portrait medals of contemporary nota-

bilities were executed by him. He died in Rome.

Piscary, COMMON OF, OR COMMON OF FISHERY. English law term, describing the right of fishing in another man's water. The right is annexed to land. In some ancient manors the whole of the freehold tenants of the manor, and in others the tenants of certain farms, have a right to fish in the rivers or ponds of the lord of the manor. This is the original common of piscary. Sometimes the right extends only to certain seasons of the year, sometimes only to certain kinds of fish. A several fishery is an exclusive right to fish in certain waters. See Angling.

Pisces (Lat., fishes). Zoological name for the class of vertebrates popularly known as fishes. See Animal; Fish.

Pisces. In astronomy, the twelfth constellation of the Zodiac. It contains no bright stars. Alpha Piscium is a variable double star of the fourth magnitude, while Zeta and Eta Piscium are triple. Owing to precession of the equinoxes the first sign of the Zodiac, Aries, is now in this constellation. See Constellation; Zodiac.

Piscina (Lat., a fishpond, cistern). In eccles.

architecture, a bowl for water recessed in a niche, in which the priest could wash his hands or the sacred vessels after the service. Its place was generally in the sanctuary wall, south of the altar; where there was more than one altar, a piscina might be found in the neighbourhood of each. The

piscina and its architectural setting were often very elaborately decorated. In Roman architecture the term signified either a fishpond or a tank for bathing.

Piscis Australis OR THE SOUTHERN FISH. One of the southern constellations. The chief star of the constellation is Fomalhaut or the Fish's Mouth, one of the four ancient royal stars.

Pisé de Terre (Fr., rammed earth). Walling material of wet earth, clay, or chalk mixed with chopped straw and rammed into position in layers. The surface is treated with yellow limewash to

Piscina in the chapel of S. Mary Magdalene, Exeter Cathedral

resist weather and give decorative finish. It is used traditionally for cottage walls, chiefly in Devon, where it is usually called cob, and France, where many old examples still stand. The walls are low and thick, and thatched roofs overhang at eaves to give extra protection against rain. Early in the 20th century it was revived in the S. and W. of England, when a wooden framework was used to hold the cob until it set hard. It was also used in America and Australia.

Pisek. Town of Czecho-Slovakia, in Bohemia. It is 24 m. W.S.W. of Tabor, and is a rly. junction on the Watawa. A medieval castle and fortifications are still preserved. Here is a state school of forestry and agriculture. Woollens and cottons, iron wire, and musical instruments are manufactured. Pop. est. 17,000.

Pisgah. Mt. summit in Moab. From it Moses was permitted sight of the land of Gilead (Deut. 34). The word is usually accepted as an alternative for Mt. Nebo, or as indicating a summit of that mt.

Pishin. Part of the district of Quetta-Pishin, Baluchistan, Pakistan. Occupied by the British from 1878 until the transfer of power to Pakistan in 1947, it lies N. of Quetta. The rly. from Quetta to Kandahar passes through it. Area of Quetta-Pishin district 5,310 sq. m. Pop. 156,289.

Pisidia. Inland dist. of Asia Minor, lying N. of Lycia and Pamphylia. In ancient times the inhabitants, a hardy and warlike folk, succeeded in maintaining some degree of independence even against the Romans.

Piso, LUCIUS CALPURNIUS. Roman statesman. As consul at Rome, 58 B.C., he took a leading part in the proceedings which led to the banishment of Cicero. He was governor of Macedonia, 57-56, and was attacked for extortion by Cicero in two speeches. He was father-in-law of Julius Caesar.

Gnaeus Calpurnius Piso, governor of Syria under Tiberius in A.D. 18, was accused of the murder of Germanicus, and committed suicide before the trial. Gaius Calpurnius Piso conspired against Nero in A.D. 65, and committed suicide on the discovery of the conspiracy. See Germanicus.

Pisolite. In mineralogy, a rounded concretionary structure, often seen in pisolitic limestones, which are formed of granules produced by the deposition of calcium carbonate in successive layers around small nuclei. Pisolite differs from oolite by its larger granules

Pissarro, CAMILLE JACOB (1831-1903). French painter. Born at St. Thomas, in the Danish Antilles, of

Spanish - Jewish descent, he studied in Paris under Antoine Melbye and Corot. His earlier sympathies were classic, but he came under Manet's influence and was one of the first Impressionists of 1874. Later, he launched and led the school of Pointillism (*q.v.*), but did not adhere too strictly to the theory of the division of tones held by this group. He virtually confined himself to landscapes, producing beautiful views of Paris, where he died Oct. 12, 1903. J. Rewald published a study 1946.

His son, Lucien Pissarro (1863-1944), became an exponent of the Pointillist method of Impressionism, though he compromised later between Impressionism and Realism. He exhibited many landscapes both in Paris and in London. As an engraver on wood he reproduced several of his father's drawings. Naturalised as a British subject in 1916, he died July 11, 1944.

Lucien Pissarro's daughter, Orovida Camille Pissarro (b. 1893), was well known as an etcher, several of her works being purchased by the British Museum.

Pistachio Nut (*Pistacia vera*). Small tree of the family Anacardiaceae, indigenous to W. Asia. The leaves are divided into three of five oval leaflets, and the small brownish-green flowers are without

Camille Pissarro,
French painter
F. Hollver

forms of confectionery. The tree also produces galls used in dyeing and tanning.

Pistil (Lat. *pistillum*, a pestle). Term for the gynaeceum (female organs) in a flower, including the ovary, the style, and the stigma. The ovary, containing the ovules or seed-eggs, develops after fertilisation into the seed-vessel. The style may be absent, and the stigma seated directly upon the ovary. The stigma may be thread-like (filiform), knobbed (capitate), lobed, etc.; and is either sticky, rough with raised points, or hairy, to retain the grains of pollen. The latter send out pollen tubes which penetrate the length of the style and enter the ovary, where they fertilise the ovules. See Flower.

Pistoia (anc. *Pistoria*). Walled city of Italy, in the prov. of Pistoia. It stands on the left bank

Pistoia, Italy. The cathedral campanile from the Piazza del Duomo

of the Ombrone, 21 m. by rly. N.W. of Florence. The walls date from 1302 and the cathedral from the 12th and 13th centuries. The Palazzo Pretorio, 1367, and the Palazzo del Comune, with the Ospedale del Ceppo, 1277, are fine examples of medieval architecture. Pistoia, in art history, held rank midway between Florence and Pisa; its early sculpture is especially remarkable.

The industries are connected with iron, steel, glass, paper, silk, macaroni, and oil. Pistoia is known also for small arms manufactures. Catiline was defeated here in 62 B.C. The scene of fierce faction fights in the Middle Ages between the Guelphs and Ghibellines, it fell to Florence in 1351.

During the Second Great War direct bomb hits from the air demolished the cloister and S. nave

Pistachio Nut. Leaves and nuts of the plant. Inset, single nut

petals, the sexes on separate trees. The oval, reddish fruits are about an inch long, and contain a single green, oily seed enclosed in a bony shell. They are eaten dry like almonds, or made into various

Pistol. Early and modern forms of the weapon. 1. Double horse pistol, 16th century. 2. Double pistol, 17th century. 3. Italian dag or short heavy piece. 4. Double pistol with single trigger actuating two hammers. 5. Double-grip saddle pistol with cartridge ejector. 6. Colt's Derringer, single-barrelled pistol. 7. Colt hammerless automatic pistol with 6-shot magazine. 8. Mauser automatic, showing method of inserting clip of 10 rounds

of S. Domenico, and the cupola and many 16th century paintings in S. Giovanni al Corso were destroyed. The city was taken from the Germans, Sept. 10, 1944, by the S.A. 6th armoured div. fighting with the 5th army. Pop. 74,309. *Pron.* Pistô-ya.

Pistol (Fr. *pistolet*, originally a dagger, made at Pistoia). Firearm which can be used from one hand. On this definition it would appear to have been invented about 1500. In 1515 the wheel-lock was evolved, making a great advance in the mechanism of firearms generally, and gave a decided impetus to pistol manufacture, since it was then possible to construct a weapon which could easily be carried or concealed on the person. These pistols were frequently constructed with bell mouths for use at close quarters with a scattering charge. The flint-lock became well known about 1630, but it was some time before it entirely superseded the wheel-lock, retaining its position until about 1825.

Before the end of the 17th century pistols about 18 ins. long were being made, and shortly afterwards, owing to better methods of manufacture and increased accuracy, the size was further reduced. Pistols with a half-inch bore became duelling weapons in 1780. Rifled pistols were often constructed so that the barrel would screw out of the breech block to facilitate loading, and two- and four-barrelled pistols

were introduced, one hammer firing the barrels successively as the various priming pans were brought under it by a hand-operated mechanism. The percussion cap came into use about 1815, and by 1830 had displaced all other types of ignition. By this time the weapons were practically all rifled. By 1835 the revolver was highly developed, and practically no further advance has been made. Now a few breech-loading single-barrel pistols are made, but these chiefly fire the .22 rim-fire cartridge, and are used only for target practice. At one time the .410 single Derringer pistol was much used as a pocket pistol in W. America and is still sold in the U.K.

The next development of this weapon is more recent and concerns the automatic pistol, which in some fields seems likely to displace the revolver. This is an adoption of the machine-gun principle in which the recoil of the weapon actuates mechanism which ejects the empty shell, cocks the pistol, and reloads the chamber from the magazine ready for the next shot. The first weapon of this type was made by Borchardt in 1893; it was large and cumbersome. Next year one was constructed by Bergmann, and this is actually the ancestor of the small flat pocket pistol of today. In 1898 the Mauser was produced, a large weapon provided with a wooden holster which could be

fitted to the butt, converting the pistol into a small carbine. It has an effective range up to 600 yards, and was much used by the Boers in the S. African War. It is still used in the 9-mm. calibre. The Mauser was followed by the Mannlicher, a similar weapon, but arranged to accommodate the magazine in the butt instead of in front of the trigger guard, an innovation which has been retained in this type of weapon ever since. Other automatic pistols are the Browning, Colt, Luger, P38, and Webley. The Luger pistol used by German parachute troops in the Second Great War had a rigid holster which could be screwed to its butt to form a stock like that of a rifle.

All pistols depend on the same principle, the recoil moving the barrel and breech block to the rear, whereby the reloading operation is effected. Cartridges are carried in a magazine in the butt, being forced upwards by a spring so that one is always in the correct position to be fed into the chamber. The weapon can be quickly reloaded. An automatic pistol is lighter and more accurate than a revolver. Being flat, it is much more readily carried in the pocket, and can be fired three times as rapidly. The stopping power is not so good, as the small high-velocity bullets may pass right through an assailant without putting him out of action, and there is a greater tendency for

the weapon to jam if dirty. *See* Ammunition; Duel; Firearm; Revolver.

Pistol. Comic character in King Henry IV, Part 2, The Merry Wives of Windsor, and King Henry V. He specialises in high-flown language and nonsensical boasting, e.g., "What, shall we have incision? Shall we imbrue?" In the first of these plays he is an ancient, one of the tavern companions of Falstaff, who turns him out of the Boar's Head for insolence to Doll Tear-Sheet. In the second he is discharged from Falstaff's service for refusing to deliver a love-letter to Mistress Page, and takes his revenge by mixing as a hobgoblin with the supposed fairies, and pinching Falstaff in Windsor Park. In the third he is married to Mistress Quickly (who dies before the end of the play), and going to the war in France acts as leader to Nym and Bardolph and quarrels with Fluellen.

Pistole. French name of an obsolete Spanish gold coin in use from the 16th century. A double

Pistole. Obverse and reverse of Spanish gold coin. Actual diameter, $1\frac{1}{2}$ in.

escudo, it was worth about 17s. The word was generally applied to similar gold coins, e.g. the louis d'or.

Piston. In its simplest form, a cylindrical plug sliding in a cylinder and transmitting a constant or variable load due to steam, gas, or fluid pressure. In a pump the load may be transmitted direct to the pump plunger by the piston rod. Generally, however, the reciprocating motion is converted to rotary motion of a crank through a piston rod (Fig. 1) or trunk piston (Fig. 2) and connecting rod.

The piston must fit so as to run easily in the cylinder, and leakage is prevented or reduced by elastic rings, fitting in external grooves, which press outward against the cylinder, the number of rings depending upon the maximum

pressure. Steam engines and some large marine internal combustion engines are double-acting; the piston need be long enough only to avoid leakage and sometimes to control port action. The thrust of the connecting rod is taken by an external guide. In a single-acting engine the overall length can be shortened by the use of a trunk piston, which must have sufficient surface to take the thrust of the connecting rod without undue wear. Adequate lubrication is essential. For slow engines the pistons are usually of a special brand of cast iron, but for high-speed engines, where considerable inertia is involved, aluminium or magnesium alloys are used.

Piston. In music, a valve applied to wind instruments for the purpose of obtaining a complete chromatic scale. The series of sounds producible by any tube has, in accordance with acoustical laws, many gaps in it, especially in the lower part of the compass, and inventors from quite early times have endeavoured to overcome this drawback. The solution was found in valves, which, by increasing the length of the tube, supplied other series as desired. The first valve lowers the pitch a tone, the second a semitone, the third three semitones, and the fourth five semitones. When two or more valves are depressed simultaneously the further changes of pitch can be effected. Thus any note can be obtained, and modulating passages are rendered practicable. The instruments to which pistons are applied are horns, trumpets, cornets, and the different varieties of saxhorns. They have been tried for trombones also, but the same end is better attained by slides. Pistons used in the organ are small buttons placed below the manuals, which on being pressed actuate valves so as to effect certain combinations of stops. *See* Organ.

Pita (Span., aloe). Fibre from the American aloe, *Agave americana*, and other species of agave, which grow in all parts of tropical America. The fibre, variously named pita-fibre, pita-flax, pita-hemp, is tough, and is used for making twine, matting, netting, and paper. *A. rigida*, var. *sisalana* (see Sisal), gives the best fibre for ships' cables. Pita as a name is wrongly applied to *A. iztli*, of

Mexico. The name pita is also sometimes given to the cariacus, a South American deer.

Pitcairn. Island in the Pacific Ocean, area 2 sq. m. It is more than 3,000 m. from any mainland, roughly midway between Auckland, N.Z., and Lima, Peru. Of volcanic origin, it consists of a solitary mountain surrounded by coral reefs, and produces coconuts, bananas, oranges, yams, coffee, maize, sugarcane, and other plants. Discovered in 1767, it takes its name from a midshipman who first sighted it. It is peopled by descendants of the mutineers of H.M.S. Bounty (*q.v.*). Great Britain formally took possession of the island in 1839, and it now has local government under the high commissioner for the W. Pacific. In religion the islanders are Seventh Day Adventists. Pop. 126. *Consult* The Heritage of the Bounty, H. L. Shapiro, 1936.

Pitcairne, ARCHIBALD (1652-1713). Scottish physician and poet. Born in Edinburgh, Dec. 25, 1652, and educated at Edinburgh university and in Paris, he became the foremost physician in Scotland. In an age of Puritanism he attracted attention by his scoffing attitude towards religion, which found expression in the satirical poem on Presbyterianism attributed to him, Babel, and a comedy, The Assembly, or Scotch Reformation. He died Oct. 20, 1713.

Pitch. In music, the precise degree of gravity or acuteness of any musical sound, and depending upon the frequency of vibrations. The greater the number of vibrations per second, the higher the pitch. As commonly employed, the term denotes some standard for a given note, but there is no uniformity in this matter, and the nominal pitch has varied very much in different periods. In 1859 the French government fixed the standard for France at A=435 double vibrations per second, and in 1896 a similar standard was unofficially adopted in Great Britain of A=439 at 68° Fahr. This, the new Philharmonic pitch, is now generally used, though military bands adopted it only in 1927.

Pitch. This naturally occurring mixture of hydrocarbons is described under its alternative name of asphalt.

Pitch. Engineering term. For screws the pitch is the axial distance between consecutive threads. In multiple-threaded screws, the true pitch (known as lead) is the axial distance between a point on one thread and the corresponding point on the same thread after one

Piston. Fig. 1, left, and Fig. 2. *See* text

revolution; alternatively, the distance travelled by the nut for one revolution of the screw. For gear wheels, the pitch is the distance between the centres of two consecutive teeth, measured round the circumference. The circumferential pitch is the circumference of the pitch circle divided by the number of teeth. In practice it is found convenient to use the number of teeth per inch. This is often known as diametral pitch, a term which does not conform to the above definition of pitch. The mean pitch of a screw propeller is the distance the ship would travel in one revolution, assuming there is no slip. The term pitch is also applied to the distance between the centres of consecutive holes in a line of rivets.

Pitchblende, OR URANINITE. One of the most important ore-minerals of uranium and radium. The composition of pitchblende is variable, but it may be considered as a uranium dioxide; UO_2 , the natural mineral, is always more or less oxidised containing variable proportions of UO_3 ; together with thorium, zirconium, lead, etc. Radium results from the disintegration of uranium, and uranium minerals contain minute traces of radium (320 milligrammes of radium per ton of uranium). Pitchblende is velvet-black to brownish, resembling pitch in appearance, and is strongly radioactive. It occurs as a primary constituent of igneous rocks, granites, pegmatite dykes and veins; also as a secondary mineral with ores of silver, lead, copper, tin, etc. Deposits occur in the Belgian Congo, Canada, Czechoslovakia, and elsewhere. See Uranium.

Pitcher Plant (*Nepenthes*). Genus and family (*Nepenthaceae*) of shrubs. Growing native in the E. tropics, they have alternate leaves, whose midrib is prolonged beyond the point and enlarged into

a flask- or pitcher-shaped organ with a partly opened lid. The mouth of the pitcher is strengthened by a thick, corrugated rim, which secretes a sweet fluid, the obvious purpose of which is to attract insects. From the mouth to a variable distance downwards the inner wall is polished, and affords no foothold for insects that have been attracted within. They fall into the liquid which partly fills the pitcher. This liquid has digestive properties capable of reducing boiled white of egg, raw meat, or cartilage. It digests the hosts of insects that visit the pitcher. The flowers are small and greenish. See Californian Pitcher-Plant.

Pitchforth, ROLAND VIVIAN (b. 1895). British painter. Born April 23, 1895, he was educated at Wakefield grammar school, and studied art at Leeds and the Royal College of Art. A member of the London Group (*q.v.*), he was visiting instructor at various London schools of art, and was an official war artist during the Second Great War. In his paintings strong draughtsmanship was combined with a satisfying sense of design and an alertness for the decorative quality of much in the modern landscape that others might deem commonplace or even ugly. One of his best-known works, *Night Transport*, was bought by the Tate Gallery, and he is represented in many provincial galleries. He was elected A.R.A. in 1942. For some years after the war he worked in South Africa.

R. V. Pitchforth,
British painter

Pitch Lakes. Depressions in the ground filled with seepage asphalt. They are generally shallow, but may be of considerable area, e.g. the Bermudez pitch lake in N.E. Venezuela which averages four to five ft. in depth and has an area of 1,000 acres. There are similar lakes in Iraq, Mexico, California, Russia, W. Africa, and elsewhere, although all are not specifically called lakes. The most famous pitch lake is that in Trinidad, which was first described by Sir Walter Raleigh in 1596, and is unique. It is 110 acres in area and 285 ft. deep in the centre. The lake asphalt is an emulsion of 39 p.c. asphalt, 27 p.c. silt and clay, and 34 p.c. water, and was most probably formed by seepage of asphaltic oil into very soft mud, emulsification

being aided by churning due to gas escape. The asphalt is dug by hand and taken to a refinery where it is heated to drive off water and then run through a screen into barrels, the refined material being called refined Trinidad lake asphalt or Trinidad epuré. It is used as an asphaltic cement in paving, roofing, and flooring.

Pitchstone. In geology, name given to a glassy igneous rock, remarkable for the amount of contained water in its composition. It is lustrous, and dark grey-green, brown, or nearly black in colour. The best specimens are found in Arran in Scotland, and near Meissen in Saxony. See Obsidian.

Piteå. River of N. Sweden. It rises in two lakes S. of Mt. Sulitelma, and, flowing S.E., enters the Gulf of Bothnia in a bay containing the Isle of Pitholm. Its length is about 200 m. The small town of Piteå is on the coast some 30 m. S.W. of Luleå.

Pithecanthropus Erectus. The erect apeman. The systematic name was given by Eugène Dubois in 1894 to some fossil bones, including the roof of a skull, three teeth, and a thigh bone, which he discovered near Trinil, Java. The earliest anthropoid with human characters yet known, it is held to represent a collateral rather than an ancestral or missing-link stage in human development. The age of the deposits is early Pleistocene or late Pliocene. See Anthropology; Ethnology; Man.

Pithom. Store city built by the Hebrews, according to Biblical tradition, for the Pharaoh of the Oppression (Ex. 1). It was the Egyptian Pa-Tum, and Naville's excavations in 1883 localised it at Tell el-Maskhuta, 11 m. W. of Ismailia. Rectangular brick structures having access only through the roof were regarded by Naville as storehouses, but by later excavators as fort-platforms. The earliest inscriptions are of Rameses II, but evidence is accumulating that the Pharaoh of the Oppression was Thothmes III. See Egypt.

Pitlochry. Tourist resort of Perthshire, Scotland. It is on the left bank of the Tummel, 28 m. by rly. N.W. of Perth. Its bracing climate and picturesque mountainous surroundings have made it a well-known summer resort, and there is a large hydropathic establishment. Tweed manufacture and distilling are carried on. Overlooked by Ben-y-Vraackie, it is at the S. end of the Pass of Killiecrankie (*q.v.*), and near by are the Falls of Tummel. Pop. 2,241.

Pitcher Plant. Example showing the hanging pitchers in which insects are entrapped

Pitman, Sir Isaac (1813-97). British inventor of the phonographic system of shorthand. Born at Trowbridge,

Isaac Pitman

Jan. 4, 1813, he became a schoolmaster in 1832 at Barton-on-Humber, whence in 1836 he went to Wotton-under-Edge. There he established a private school, taught Taylor's shorthand, and published his first treatise, *Stenographic Sound Hand*, 1837. In 1839 he opened a private school at Bath, where he erected a printing press, started, in 1842, the *Phonetic Journal*, later known as *Pitman's Journal*, later still as *Pitman's Journal of Commercial Education*; and laid the foundation of the publishing business of Sir Isaac Pitman and Sons. He was an ardent advocate of spelling reform. Knighted in 1894, he died Jan. 22, 1897. *See* Shorthand; *consult* Lives, T. A. Reed, 1890; A. Baker, 1908.

Pitman, Isaac James (b. 1901). British publisher. Grandson of the above, he was born in London, Aug. 14, 1901, and educated at Eton and Christ Church, Oxford, where he excelled as an all-round athlete. He joined the family publishing firm in 1923, and became chairman and managing director in 1934. He was a director of the Bank of England, 1941-45, and director of organization at the Treasury, 1943-45. He was elected as M.P. (Conservative) for Bath, 1945.

Pitot Tube. Apparatus devised by a French scientist named Pitot for the measurement of the speed of moving fluids or of motion through fluids. It consists essentially of one tube with an open end facing the direction of the fluid's motion, and a second tube, also open to the fluid, but with the opening facing at right angles to the line of motion. Both tubes are thus subject to any steady static pressure on the fluid, and the first one is in addition subject to an added pressure due to the momentum of the fluid impinging on its open end. If a delicate pressure gauge is connected with the two branches of a Pitot tube so as to register the difference of pressure between them, the reading of the gauge is a measure of the speed of the impinging fluid, if the density of the fluid is already known.

A development of the Pitot tube, known as the pitometer, will test

the flow of water in water-mains and detect leakages. Pitot tubes, in conjunction with pressure gauges, are used in aeronautical engineering to measure the speed of currents in experimental work and the air speed of aircraft in flight.

Pitsea. Town of Essex, England. It is $26\frac{1}{2}$ m. E. of London, and has a rly. station on the main line to Southend. Built on a peninsula formed by creeks of the Thames, it is N.W. of Canvey Island. Pop. 3,414.

Pitt, Thomas (1653-1726). British merchant. Born at Blandford St. Mary, Dorset, July 5, 1653, he first figures in the East Indian trade in 1675, when the company's officials resented his presence on the Hooghli as an infringement of their monopoly. Disregarding orders to leave India, he established a house

*Thomas Pitt,
British merchant
After Kneller*

at Balasor, and bought extensively for export. In 1695 he joined the company's staff and was governor of Madras, 1698-1709, during which period he purchased for £20,000 the Pitt diamond, which he sold for £135,000 to the duke of Orléans. He was several times M.P. for Salisbury, Old Sarum, and Thirsk. In 1716 he was appointed governor of Jamaica, but resigned before leaving England, and died April 28, 1726. He was the grandfather of the earl of Chatham.

Pitt, William (1759-1806). British statesman. Younger son of the 1st earl of Chatham (q.v.) and his wife, Lady Hester Grenville, he was born at Hayes, Kent, May 28, 1759. A weakly child, he was educated at home until at 14 he entered Pembroke Hall, Cambridge. He read the classics, and knew a good deal of English literature and something of mathematics. Although he took his degree in 1777, he remained at Cambridge until 1780, when he was called to the bar.

At the general election in 1780, Pitt was an unsuccessful candidate for his university, but was almost at once chosen (Jan., 1781) for the pocket borough of Appleby. In parliament he associated himself with the Whigs, led by Shelburne. On Feb. 26, on Burke's motion for economical reform, he made his first speech, and as an advocate of parliamentary reform quickly became one of the

leading figures in the house. In 1784 Cambridge returned him, and he represented the university until his death.

In 1782, when Shelburne became prime minister, Pitt entered office as chancellor of the exchequer but the ministry lasted only nine months. Pitt declined to join the Fox-North coalition, and while Portland was premier he took his place among the opposition leaders, and visited France. But by Dec., 1783, the ministry was defeated, and Pitt at 24 became prime minister, the youngest in British annals. He himself took the office of chancellor of the exchequer, and, although some associates left him, he soon formed a ministry. He had to face a hostile majority in the commons, but the courage with which he did this heightened his reputation, and the country applauded him still more when, a

W.P.
After J. Hoppner, R.A.

poor man, he refused the rich sinecure of the clerkship of the pells. In April, 1784, when the general election took place, Pitt's supporters in the new house had a solid majority.

Pitt's long premiership divides itself into two periods, one of peace and one of war. From 1784 to 1792 his chief aim was to restore the economic prosperity damaged by the American war. He ordered the finances, established a sinking fund, backed the Eden-Vergennes free trade treaty with France, and, aided by a time of commercial expansion, made his name as a finance minister. These years were marked by the impeachment of Hastings, and the question of the regency. In 1791 the Canada Act

set up the two provinces of Upper and Lower Canada.

Pitt did not receive from his colleagues in the cabinet that support which premiers of a later age look upon as their unquestioned right. He suffered defeats in the commons, not always on minor points, as when his proposals for regulating the commercial relations between England and Ireland were rejected. He showed himself true to his early zeal for parl. reform although his proposals failed; and came out on the side of his friend Wilberforce in the cause of the slaves.

In 1789 the French Revolution opened, but as late as the end of 1792 Pitt did not believe it would lead his country into war. But the French Republic committed one aggression after another, and in 1793 Great Britain entered the struggle. From then Pitt was a war minister. His high courage was specially needed in 1797, when England was left to continue the fight alone, and the seamen mutinied; but the fleet was soon in action again and a new coalition was formed. In 1798 a rebellion in Ireland was crushed, and in 1800 came the union of the parliaments of England and Ireland. Pitt's Irish policy was to complete the union by granting civil liberties to the Roman Catholics. Some colleagues were hostile, but the decisive opposition came from the king, and Pitt resigned in 1801. For two years he hardly appeared in the house, but on May 16, 1803, he returned and favoured what amounted to a renewal of the war. When this came he was again called to the helm (May, 1804). He formed a fresh coalition, and, though the Austrians were beaten at Ulm, the victory of Trafalgar restored the fortunes of the Allies. Then came Austerlitz. On the news of this defeat—when he bade his friends "roll up that map, it will not be wanted these ten years"—he returned from Bath to London, and, already very ill, on Jan. 23, 1806, he died at his house in Putney. He was buried by the side of his father in Westminster Abbey. He never married.

Pitt ranks as one of the greatest of English statesmen and orators. Proud and reserved, he lived a lonely life, but his devotion to his country's interests was never questioned. As a war minister, sending out expeditions that were costly and valueless, and passing measures retarding the liberty of the people, he was not altogether successful, but with a courage that

never faltered he guided his country in a dark hour. As a financial reformer and as a figure in constitutional development he most merits applause. His private life was stainless, his only weakness being a fondness for port wine, while he shared his father's lofty freedom from all taint of pecuniary corruption.

Bibliography. Political Life, J. Gifford, 1809; The Age of Pitt and Fox, D. O. Madden, 1846; Lives, Lord Stanhope, 1862; Lord Rosebery, 1914; Life, and W. P. and the Great War, J. E. Rose, both 1934; George III and W. P., D. G. Barnes, 1939.

Pittacus (c. 652-569 B.C.). Ruler of Mitylene and one of the seven wise men of ancient Greece. A contemporary of Alcaeus and Sappho, he was largely responsible for the overthrow of the tyrant Melanchrus, and commanded the forces of Mitylene in the war with Athens. In 589 he was chosen ruler by the people of Mitylene, and after governing wisely for ten years voluntarily resigned.

Pitt Diamond. Gem found in India in the 17th century. It weighed 410 carats and was bought for £20,000 by Thomas Pitt, governor of Madras, who in 1702 sold it to the duke of Orléans, regent of France, for £135,000. The diamond, called the Great Pitt, was reduced by cutting to 137 carats and renamed the Regent. It was set in the French royal crown, but was stolen during the Revolution. When recovered it was placed in the crown of Charles X, and was later in the diadem of the Empress Eugénie. When the French crown jewels were dispersed by auction in 1887, this diamond was placed in the Louvre.

Pittenweem. Royal and mun. burgh and seaport of Fife, Scotland. It stands on the N. shore of the Firth of Forth, 9 m. S. by E. of St. Andrews, and has a rly. station. The chief building is the parish church, originally that of a priory founded here in the 12th century. The town was made a royal burgh in 1542. Fishing and fish curing are the chief industries, and there is a small harbour. Pop. 1,600.

Pitti Palace. Building in Florence, Italy, containing a famous collection of pictures. Designed in 1449 by Brunelleschi as a residence for Luca Pitti, chief magistrate of the city, it later became the palace of the grand duke of Tuscany, and was added to and improved by successive owners. Shell fire and explosions near by during German demolitions, Aug., 1944, did considerable damage to its roof and

windows; and the corridor linking it with the Uffizi gallery was destroyed. The second largest palace in Italy, it is built of rough-hewn stone, and stands on the left bank of the Arno, between that river and the Boboli gardens. The collection of paintings contains masterpieces of the Italian, Dutch, Spanish and English schools. See Florence; Raphael; Titian.

Pitt-Rivers, AUGUSTUS HENRY LANE FOX (1827-1900). British archaeologist. Born April 14, 1827, son of W. A. Lane Fox, he took up a military career, and rose to be lieutenant-gen., 1882. Inheriting estates from his great-uncle, George Pitt, Lord Rivers, he assumed his final name, 1880. His researches into the history of weapons led to a study of human invention, and the resulting collections, presented 1883, form the nucleus of the Pitt-Rivers museum, Oxford. He became F.R.S., 1876; vice-president of the Society of Antiquaries; president of the Anthropological Institute; and first inspector of ancient monuments. His work on prehistoric remains on his estates is described in Excavations in Cranborne Chase, 1887-96. He died at Rushmore, May 4, 1900. His grandson, George Henry Lane Fox Pitt-Rivers (b. May 22, 1890), was an anthropologist.

Pittsburgh. City and port of entry of Pennsylvania, U.S.A. The capital of Allegheny co. and the second largest city of the state, it occupies an advantageous position at the point where the Allegheny and Monongahela rivers unite to form the Ohio. It is served by the Pennsylvania, the Baltimore and Ohio, and several other lines of rly. The original city was built in the angle of the two rivers, but its limits have been greatly extended by the consolidation of several neighbouring boroughs, among them Union, W. and S. Pittsburgh, Allentown, Birmingham, E. Birmingham, and Allegheny.

Prominent public buildings of Pittsburgh include the Allegheny court house; the city hall; the exposition building; the U.S. arsenal; the Carnegie library and institute in Schenley Park, endowed by Andrew Carnegie in 1905; the Carnegie library of Allegheny; the 335-room Mellon institute, dedicated 1937 to industrial laboratory research; the S. C. Foster memorial building, built 1937, to the memory of the author of My Old Kentucky Home.

Pittsburgh university is housed in a 42-storey skyscraper. Other educational institutions are

Pennsylvania women's college, Pittsburgh academy, Duquesne university (formerly Pittsburgh college of the Holy Ghost), and the Carnegie institute of technology. Highland Park, 366 acres, contains zoological gardens and three reservoirs. The seat of a R.C. and a Protestant bishop, Pittsburgh has fine churches.

Commercial and industrial prosperity is due to the situation on a coalfield and close proximity to an important oil and natural gas producing region. One of the principal centres in the world for the production of iron and steel goods, Pittsburgh has numerous large blast furnaces and rolling mills. It turns out steel rails and bridges, engines, glass, bricks, cement, pottery, tobacco, cigars, electrical and astronomical appliances, and cork. In 1811 the first steamboat designed for western waters was built here, and since then shipbuilding has developed into a leading industry. Financially, Pittsburgh presents one of the greatest concentrations of U.S. wealth, largely (1948) under the control of the family founded by A. W. Mellon (*q.v.*).

Pittsburgh, 150 m. from the great lakes, and more than 200 m. inland from the sea, is a great river port, handling 30,000,000 tons of merchandise annually—more than the Panama canal. Barge traffic proceeds through locks along the Allegheny and Monongahela rivers, tapping coal and steel communities scattered through the states of Pennsylvania, Ohio, West Virginia, and Indiana.

Pittsburgh is the U.S. home of the unskilled, as Detroit is of the skilled, worker. Many Pittsburgh workers are foreign-born; its prosperous upper layer is of Irish and German origin, its less prosperous underlayer being Polish, Italian, and Yugoslav. Negroes form about

10 p.c. of the pop.; they here enjoy most civil rights, attending the state schools and Pittsburgh university in theoretical equality. The Courier, leading U.S. negro weekly, is published here. In 1754 the French erected Fort Duquesne on the present site of Pittsburgh. The following year the British under Gen. Braddock tried but failed to take the fort. They captured it in 1758, and built another fort which they named in honour of William Pitt, then British prime minister. Pittsburgh was incorporated as a borough in 1794, reincorporated in 1804, and in 1816 chartered as a city. In 1845 it suffered a disastrous fire. Pop. (1940) 665,384.

Pittsfield. City of Massachusetts, U.S.A., the co. seat of Berkshire co. It stands on the Housatonic river and is the gateway to the mountain-girt Berkshire valley, 41 m. N.W. of Springfield. Several rlys. run to Pittsfield, which has silk, woollen, and paper mills, foundries and machine shops, and manufactures of cotton, thread, paper, and pianos. At an alt. of over 1,000 ft., it is traversed by streams which afford industrial power. Settled in 1743, Pittsfield was incorporated in 1761 and became a city in 1891. Pop. 49,684.

Pituitary Body (Lat. *pituita*, phlegm). A small lobed gland, about the size of a hazel-nut, situated at the base of the brain. It is regarded as the master-gland among the ductless glands. These it influences through its secretions or hormones (*q.v.*). Extreme wasting or extreme fatness can result from disorder of one secretion; a well known enlargement of the bones from the disorder of another. Without the pituitary, life comes to an end within a few days. See Endocrinology.

Pit-Village. Prehistoric settlement, mostly of the Neolithic and

the early metallic age. The transition from the Palaeolithic cave-dwelling (*q.v.*) to the Neolithic pit-dwelling is traceable at Campigny, France, in S. Russia, and in Holderness, Yorkshire, where excavations in the boulder-clay were sometimes 40 ft. long. Other sites reveal pits for storage and other domestic purposes beneath the flooring of wattled huts, long since perished. Similar structures are found among the Eskimo, on ancient settlements in N.Z., and in Hokkaido, Japan. See Hut Circle; Underground Dwellings.

Pityriasis (Gr., scurf, from *pityron*, bran). Name given to an affection of the skin, characterised by brown, bran-like patches. Though it has been attributed to the growth of a microscopic fungus, and also to toxic action, the actual cause is unknown. No internal treatment has any effect. A simple anti-itch lotion, *e.g.* lead lotion, allays the itch during the four weeks that the rash lasts.

Piura. N.W. maritime dept. of Peru. Partly a rainless desert, it yields petroleum, salt, sulphur, and soda. Its area is 15,190 sq. m. Pop. 408,605. Piura, the capital, stands on the Piura river, 20 m. from the coast, and 40 m. by rly. E. of Paita. The first permanent settlement founded by Pizarro, it is a cotton mart and exports petroleum and cotton. Pop. 20,000.

Pius. Name of twelve popes, of whom the more important are noticed separately. Pius I, the 9th pope according to the earliest lists, whose pontificate was from about 140 to 154, is venerated as a saint and martyr, his festival being kept on July 11. Pius III, who reigned for a few weeks in 1503,

Pittsburgh, Pennsylvania, U.S.A. Left, general view of the city. Right, University building known as the "cathedral of learning." It is 41 floors high and accommodates all the students of the university

was a Piccolomini, and nephew of Pius II. Pius VIII, pope 1829-30, was the candidate of the French and Austrian monarchies; he recognized the revolution which made Louis Philippe king of France.

Pius II (1405-64). Pope 1458-64. Aeneas Sylvius Piccolomini was born at Corsignano, Oct. 18, 1405, of a noble but impoverished Sienese family. He studied at the university of Siena, and as private secretary to the bishop of Fermo attended in 1432 the council of Basel, where he joined the faction opposed to Pope Eugenius IV. Later he entered the service of Cardinal Albergati, who in 1436 sent him to Scotland.

Returning to Basel, he took an official part in the election of the anti-pope Felix V, 1439, and became his secretary. At Vienna he entered the service of the emperor, Frederick III, and having deserted the anti-pope, was in 1445 formally reconciled to Eugenius IV. In 1446 he was ordained, in 1447 was made bishop of Trieste, in 1450 bishop of Siena. Given the red hat in 1456, he was elected pope in succession to Calixtus III. To unite Europe against the Turkish menace, he summoned a meeting at Mantua, where in 1460 he issued his bull *Execrabilis*, in which appeals from the pope to a general council were condemned. The last act of the pope's life was an attempt to lead in person a crusade against Islam. A man of letters and humanist learning, Pius II died at Ancona, Aug. 14, 1464. See Piccolomini.

Pius IV (1499-1565). Pope 1559-65. Born at Milan of a branch of the Medici family, Giovanni Angelo studied at Pavia and Bologna, and in his 28th year gave up law to take orders. He was employed in various offices under Clement VII, Paul III, and Julius III, and was made cardinal by Paul III. In 1559 he was elected pope. On his summons the council of Trent reassembled for the third time, Jan., 1562, and sat until Dec. He died Dec. 9, 1565.

Pius V (1504-72). Pope 1566-72. He was born Jan. 17, 1504, a Lombard named Michele Ghisleri. Entering the Dominican Order, he was ordained, was made bishop of Sutri, 1556, inquisitor general and cardinal, 1557, and elected pope, 1566. He excommunicated Elizabeth and encouraged Mary Queen of Scots. He was no less active in strengthening the work of the Inquisition, and in opposition to the Turks, sending forces to the battle of Lepanto. He died

May 1, 1572, and was canonised in 1712, his festival is on May 5.

Pius VI (1717-99). Pope 1775-99. Born at Cesena, Dec. 27, 1717, he was called Giovanni Angelico Braschi. From 1755 until his election as pope he held various official positions at Rome. His reign was a continuous struggle first with the Catholic rulers of Austria, Spain, and Naples, and later with Napoleon. At the French Revolution Pius refused to acknowledge the civil constitution of the clergy, and France annexed the papal territory at Avignon. After surrendering large portions of the papal states to Napoleon, 1797, the pope declined to acknowledge the Roman republic, set up in 1798. Carried an exile to France, he died at Valence, Aug. 29, 1799.

Pius VII (1740-1823). Pope 1800-23. Luigi, son of Count Scipione Chiaramonti, was born at Cesena, Aug. 14, 1740, and after some years as a Benedictine monk was made bishop of Imola and cardinal in 1785. He was elected pope in 1800 after a three months' conclave. The

Pius VII,
Pope, 1800-23
After Lawrence

great event of his reign was the concordat with Napoleon I, 1801. Pius was subsequently made prisoner by Napoleon, 1809-14. By the aid of Consalvi at the congress of Vienna he obtained the restoration of the papal states. He also re-established the Jesuit Order, 1814. He died Aug. 20, 1823. See Concordat; Consalvi. consult also Life, M. H. Allies, 1897.

Pius IX (1792-1878). Pope 1846-78. Born at Sinigaglia, May 13, 1792, his name was Giovanni Mastai-Ferretti. Ordained in 1819, he was made archbishop of Spoleto, 1827, and was given the cardinal's hat in 1840. He

Pius IX,
Pope, 1846-78

was elected pope on the death of Gregory XVI by the faction which favoured liberal reforms, the Austrian veto on his election arriving too late. His first act was a general amnesty to all political prisoners. This was followed by a constitution for the

papal states, which was a direct cause of the *risorgimento* in the rest of Italy during 1848; but on his declaration against war with Austria a series of riots in Rome ended in the pope's retirement and the establishment of a republic. Restored by French troops, 1850, Pius saw the annexation of the papal states and of Rome to the kingdom of Italy in 1870. That year he convoked the Vatican Council which declared the pope speaking *ex cathedra* to be infallible in faith and morals—an event which made Pius IX familiar under his Italian name Pio Nono throughout the world. He died Feb. 7, 1878. Consult Lives, A. O. Legge, 1875; T. A. Trollope, 1877.

Pius X (1835-1914). Pope 1903-14. Born June 2, 1835, at Rieti, Treviso, he was the son of a postman; his name was Giuseppe Melchiorre Sartorio. Educated in the seminary of Padua, he was ordained, 1858. He was made canon of Treviso, 1875, bishop of Mantua, 1884, and raised to the cardinal archbishopric of Venice, 1893. On the death of Leo XIII he was elected pope by 55 votes out of 60. The pontificate of Pius X was distinguished for the attention given to increasing the discipline of the church and suppressing modernism. In his encyclicals of 1907 and 1910 the whole system of modernism was condemned. He died Aug. 20, 1914. There are Lives by F. A. Forbes, 1918; R. Bazin, 1938.

Pius XI (1857-1939). Pope 1922-39. The son of a silk merchant, he was born at Desio, near Milan, May 31, 1857, his name being Achille Ratti. Ordained in 1879, he became in 1888 assistant to the prefect of the Ambrosian library, and succeeded him in 1907.

Ratti was a mountaineer, and his Climbs on Alpine Peaks was published in English in 1923. From 1910 he was assistant to the prefect of the Vatican library, until in 1918 he went to Poland as nuncio. In 1921 he was made cardinal and archbishop of Milan.

Pius X,
Pope, 1903-14

Pius XI,
Pope, 1922-39

and was rather unexpectedly chosen pope on Feb. 6, 1922. He showed a burning desire for world peace; in 1929 he negotiated the Lateran treaty with fascist Italy, and later signed a concordat with Nazi Germany, but lost no opportunity to condemn the pagan spirit evident in both countries. He died Feb. 10, 1939. Several biographies include one by W. and L. Townsend, 1930.

Pius XII (b. 1876). Pope. Born near Viterbo, March 2, 1876, of a noble Italian family, his

name was Eugenio Pacelli. Soon after ordination in 1899 he was enrolled in the congregation of ecclesiastical affairs extraordinary, and helped Cardinal Gasparri to

Pius XII,
elected Pope, 1939

compile the *Codex Juris Canonici*. In 1917 he went as nuncio to Munich, and in 1920 was appointed to Berlin, but did not proceed there until the conclusion of the concordat with Bavaria in 1924. Cardinal in 1929, next year he became papal secretary of state. He took part in negotiations leading to the Lateran treaty with Italy and the concordat with Nazi Germany. In 1936 he visited the U.S.A. His election to the papacy, March 2, 1939, came as a surprise inasmuch as he had never had a cure of souls. There was criticism of his tolerance of the Italian attitude to the Second Great War; but he was tireless in efforts on behalf of R.C. war victims on both sides. After the war he had to face bitter attacks on his Church in Communist-dominated countries.

Pizarro, FRANCISCO (c. 1475-1541). Spanish conqueror of Peru. The natural son of Colonel Gonzalo Pizarro, he was born at Trujillo, entered the Spanish military service early, fought under Gonsalvo de Cordova in Italy, and then sought fresh fields for his energies in the newly discovered lands in the Far West.

Fired with ambition by the conquest of Mexico (see Cortés), 1520, Pizarro conceived the idea of conquering Peru, the unexplored empire of the Incas, and in 1526 went with a fellow adventurer, Almagro, on a first voyage of investigation. They received little countenance from the governor of Panama, but Pizarro learnt that

rumours which had reached Spain were true, that there actually existed a highly organized empire, immensely rich, and enjoying an advanced civilization. The next

step was to obtain authority for the conquest from Charles V. This accomplished, Pizarro sailed from Spain on Jan. 19, 1530, and from Panama on Dec. 28, 1531, with some 180 men, armed with muskets, and 37 horses.

Pizarro landed in May, 1532, at Tumbez. The crown of the Incas had been seized by Atahualpa, who had deposed the legitimate ruler, Huascar. In Nov. Pizarro reached the town of Cajamarca, which he found empty, while he learnt that Atahualpa was in the neighbourhood with an army of 40,000 men. To attack him openly with fewer than 200 was out of the question, but Pizarro posted his men and his two culverins carefully in Cajamarca, and enticed Atahualpa to visit him in state. At a given signal the Inca king was seized, the Spanish guns opened fire, and the handful of Spanish horse threw themselves between the king's company and the line of communication with the main army. The ensuing fight was merely a massacre. Atahualpa submitted and promised the Spaniards a vast store of treasure if they would restore to him the authority under which they were now professing to act. Nevertheless, fearing internal revolution, he gave orders for the execution of his brother Huascar. Pizarro seized his opportunity; Atahualpa was denounced and executed, Aug., 1533; while another member of the royal family was set up as a puppet emperor.

Almagro was now arriving with reinforcements. The empire was partitioned, Pizarro taking the northern governorship while Almagro went south and made himself master of Chile. No effective resistance was offered to the conquerors until an Indian insurrection broke out in 1536. It was crushed next year by the aid of Almagro, between whom and Pizarro there then arose a contest for supremacy. The latter's brothers defeated and killed Almagro in 1538, but three years

Francisco Pizarro,
conqueror of Peru
Engraving by J. Brown
from a painting in the
Viceroy's Palace, Lima

later Almagro's followers took their revenge, and Pizarro was surprised and assassinated on June 26, 1541. Apart from valour and enterprise, his personal qualities seem to have been odious. See Atahualpa; Lima; *consult* Life, A. Helps, 2nd ed. 1869.

Pizzicato (It., pinched). Effect produced on string instruments by plucking the strings with the fingers, the resultant sound having a dry and evanescent quality of tone. In pizzicato tremolando, invented by Elgar, chords are thrummed with three or four fingers across the strings. See Harp.

Place, FRANCIS (1771-1854). British reformer. Born of working-class parents in London, Nov. 3, 1771, he was apprenticed to a leather breeches maker, and in 1793 organized an unsuccessful strike. Secretary to various trade clubs, he used his leisure for self-education, and became an admirer of Bentham and Godwin. In 1799 he opened a tailor's shop at Charing Cross. Agitation by Place more than anyone brought about the repeal in 1824 of the Combination Acts which forbade trade unions. In 1831 Place worked with Joseph Parkes on preparations for the expected civil war, but the passing of the Reform Bill deprived him of political influence. He died Jan. 1, 1854. A Life, by G. Wallas, appeared in 1898.

Place Names. Geographical and topographical designations. Their study, long the sport of amateurs, was hardly placed on a scientific basis until the 20th century. A branch of philology, it is a valuable aid to the historian and ethnologist, elucidating the movements and boundaries of nations and tribes.

While in Germany place names show the limits of Celtic and Slav settlement, in Spain we can trace the Iberians, Celts, Phoenicians, Romans, Goths, and Arabs by such names as Bilbao, Sigüenza, Cadiz, Zaragoza, Burgos, and Guadalquivir respectively. In England a few river names are probably pre-Celtic, but most are Celtic, e.g. Avon, Exe, Dove, Adur, Wey, Thames, etc., as are many names of hills, Penygant, Brown Willy, Helvellyn, etc., and towns like London, Dover, York.

The great majority of English names of towns and villages contain the name of the man or family that founded the settlement, e.g. Brighton, Brihtelm's stone; Hildersham, Hilderic's home; Hoxton, Hocca's enclosure. Family or tribal names end in the

patronymic *-ing*, as in Dorking, Kettering. The names of saints, exceedingly common in Celtic countries, occur rarely in England apart from Cornwall. Most other remaining English place names are plain prosaic descriptions of the locality. Among the commonest endings are *caster*, *cester*, *chester*, Roman fortress; *ton*, enclosed settlement; *ham*, homestead (sometimes pasture); *wick*, *wich*, village; *bottle*, building; *stead*, place; *thorp*, *trop*, village; *worth*, *worthy*, *wardine*, holding or farm; *stow*, place; *ern*, house; *hope*, enclosure, also hollow; *hall*, *haugh*, river meadow; *holm*, *lea*, *ley*, meadow; *hurst*, wood; *den*, wooded valley; *combe*, valley; *borne*, *bach*, *beck*, brook; *bergh*, *don*, *low*, *law*, hill; *or*, *over*, *er*, bank; and words like wood, field, ford, stone, cot.

Norse names end in *by*, *thorp*, village; *toft*, farm; *argh*, *ergh*, shelter; *thwaite*, clearing; *with*, wood; *dale*, valley; *beck*, *gill*, stream; *force*, waterfall; *keld*, *child*, spring; *wick*, creek; *forth*, fjord; *holm*, *y*, *ay*, island; *fell*, mountain; *how*, mound. The Norman-French element is represented by such names as Bungay, *bon gué*, good ford, and Gram-pound, *grand pont*, great bridge. The name of the Norman owner was often added to that of the village, e.g. Hucknall Torkard. See Name.

Placenta (Lat., cake). Mass of tissue adherent to the inside of the uterus or womb and connected, for purposes of nutrition and excretion, by the umbilical cord with the foetus or growing organism. It is also called the after-birth from its being expelled from the womb after childbirth.

Placentia. Seaport of Newfoundland. It stands on the east side of Placentia Bay, an opening on the S. coast, 75 miles long. See Newfoundland.

Placer Deposits. Mineral deposits formed as a result of erosion. The most common valuable constituents found in placers are gold, cassiterite (tin oxide), columbite-tantalite, zircon, monazite, rutile, diamond, and other gemstones. Minerals frequently associated with these include garnet, staurolite, ilmenite, magnetite, etc. All such minerals are resistant to chemical erosion and possess high specific gravity, for they are concentrated by the removal of lighter and more easily decomposed minerals. According to their mode of origin they are classified as alluvials, eluvials, marine, and

beach placers. They may be further subdivided into recent and fossil placers, the later being formed by similar processes operative in distant geological times. Placer deposits are worked by sluicing, hydraulicking, or dredging in Malaya (tin), Ceylon (gemstones), Australia (rutile-monazite-zircon), West Africa (tin and diamond), America (gold), and elsewhere. The famous gold deposit of the Rand, South Africa, is thought by some to be an old fossil placer deposit. See Gold; Hydraulicking.

Placoid Fishes (Gr. *plax*, flat plate). Name sometimes given, because of the flat nature of their scales, to the Elasmobranchs, a group of cartilaginous fishes which includes the shark, dog-fishes, and rays. See Elasmobranch.

Plagioclase. An important series of rock-forming minerals. The plagioclase feldspars constitute an isomorphous series ranging from sodium aluminium silicate (albite) to calcium aluminium silicate (anorthite); the intermediate members oligoclase, andesine, labradorite, and bytownite, contain various proportions of the two end-members in solid solution. They may be readily identified by means of their optical properties and are valuable index minerals in the classification of igneous rocks, e.g. albite in granites (acid rocks), anorthite in gabbros (basic rocks), and so on. Feldspars appear also in many metamorphic rocks, such as gneiss and schist, and also in sedimentary arkoses and feldspathic sandstones.

Plague (Lat. *plaga*, stroke). Term formerly applied to epidemics of various diseases, but now restricted to that caused by the *bacillus pestis*. It is in the first instance an infection of rats, and is transmitted to man on the death of an infected rat. Fleas, which have bitten the rat, bite a human being, and within a few days the victim develops headache, dizziness, blurring of speech, great mental prostration, and a staggering gait. The disease may then take one of two courses. In the bubonic type buboes or tender swellings appear, commonly in the groin or axilla. These persist and are very painful; but if they burst about the fourth day, recovery usually occurs. If they do not burst, the patient rapidly passes into coma and dies. The other course is septicæmic, in which the manifestations are more violent, in spite of the lower temperatures and the absence of buboes. This variety is almost always rapidly fatal. If the

buboes occur in the lung the disease is called pneumonic plague and may be transmitted by drop-let infection from man to man.

Plague is one of the oldest diseases. In 1348 there was a great outbreak in England, called the black death. In the plague of London (1665) vast numbers died. These epidemics gave birth to the first ideas of isolation for infectious disease, and quarantine was first introduced in Venice.

Modern treatment consists in isolation and careful nursing. A serum prepared from horses has been used, as have the sulphonamides and penicillin. Prevention lies in the control of plague-bearing animals, particularly rats. See Black Death; Great Plague.

Plaques of Egypt. Ten plagues brought upon the Egyptian Pharaoh and his people by Jehovah, when the Israelites were in bondage in Egypt (Ex. 7-12). The plagues were turning of the waters of the Nile to blood; swarms of frogs, of gnats, of flies; affliction of cattle with pestilence; of man and beast with boils and blains; havoc by thunder and hail; swarms of locusts; dense darkness; and, the last and most terrible of all, the death of the first-born of both man and beast.

Plaice (*Pleuronectes platessa*). Important food fish of the family Pleuronectidae. A native of the Atlantic and North Sea, from Iceland and N. Europe to the Bay of Biscay, but not on the American coasts, it is also sometimes found in the Mediterranean. Of a long, oval form, the body of the plaice is

Plaice viewed from above, showing the characteristic orange spots

strongly compressed from side to side, and fringed with the long dorsal and ventral fins, which extend almost from head to tail. The left side is white without any markings, but the right, or upper side, is fully coloured brown, on which are scattered spots of orange or red.

Beginning life as a "round" fish, like the cod, the young plaice soon takes to lying on the bottom on its left side, and the left eye travels round to the right side. The young

flat-fish affects sandy shores in shallow water, going deeper as it gets larger, until as an adult it seeks the spawning grounds in from 10 to 40 fathoms. It is adult when from 2½ to 3 years old, and 10 to 12 ins. long, but if it escapes the trawl may grow to 24 to 30 ins. Its principal food consists of small molluscs, sand stars, and marine worms. The average egg-production of a female plaice is a quarter of a million, though nearly twice this number have been recorded. The eggs, which measure ⅓ of an inch, float a little below the surface. *See Fisheries.*

Plaid (Gael. *plaid*, blanket). Strip of cloth two yards broad and four yards long, used as a garment by Scotsmen, and known as the *breachan feilidh*. *See Highlands* (Highland Dress); Tartan.

Plain (Lat. *planus*, flat). Area of flat or approximately flat land. Plains may be classified, according to their formation, as of accumulation or of erosion.

Plain. Sectional diagrams illustrating (top) accumulation, and (below) formation of plains of erosion

Plains of accumulation are built up of sediment which forms horizontally bedded layers of rocks, so that in these plains the surface corresponds to the structure. The sediment brought down by rivers, or produced by wear and tear of the coast, is spread over the floor of the ocean bordering the land masses. An uplift of the land will raise accumulated deposits above sea level, and produce coastal plains like those stretching along the N. American coast from Mexico to the Hudson River. In the interior of the same continent are vast prairie plains, composed of limestone built up of sediment deposited on the bed of the ancient sea formerly separating the western highlands from the eastern highlands. Uplift raised these deposits and formed plains. The vast S. American lowlands of the Plate, Amazon, and Orinoco valleys, the steppes of Hungary, Russia, and W. Siberia, have all been formed in this manner. Other plains of accumulation are chiefly associated with rivers, many of which accumulate sediment in the form of deltas.

Plains of erosion do not necessarily correspond in surface and in geological structure, for they are frequently ancient folded and contorted highland regions which have

been reduced to rough plains, or peneplains (*q.v.*), by erosion. In the Baltic or Hudson Bay areas there are good examples of plains of erosion. Sometimes they are covered by alluvial deposits.

Plainfield. City of New Jersey, U.S.A., in Union co. It is 24 m. W.S.W. of New York, and is served by the Central Railroad of New Jersey. Now a small manufacturing centre and a residence for New York business men, it was in the 18th century a home of dissident religious sects. It is still the headquarters of the Seventh Day Baptists. Founded in 1847, Plainfield became a city in 1867. Pop. 37,469.

Plainsong, PLAIN-CHANT, OR CANTO FERMO. Ancient system of Gregorian church music. It proceeded by contrapuntal movement in notes of equal length, representing what is now known as the first species of counterpoint. It was written in the eight modes, and on four-lined staves, the notes employed being the long, the breve, and the semibreve. The canto fermo, generally in the tenor part, was the foundation on which the counterpoint was built, though each part was supposed to be of equal interest. The form is still used in Roman Catholic and high Anglican churches, chiefly, however, in the solo verses sung by the officiating celebrant, without contrapuntal additions. *See Gregorian Chant.*

Plain Tales from the Hills. Volume of short stories of Indian and Anglo-Indian life by Rudyard Kipling, first published in Allahabad in 1887. Most of the tales had previously appeared in the Lahore Civil and Military Gazette. It was the first volume of his stories to be issued in book form.

Plaintiff (Fr. *plaintif*, one who laments, complains). In English law, like pursuer in Scots law, the term describes the actor, or person who brings another, called the defendant (in Scotland the defender), into court, seeking relief against him. The plaintiff in a divorce action is called the petitioner. *See Trial.*

Plasterers' Company, THE. London city livery company. Existing as a guild in earlier times, it received its first charter March 10, 1501. The hall at 23, Addle Street, Aldermanbury, E.C., destroyed by fire in 1666, was rebuilt by Wren. The office is 6, Raymond Buildings, W.C.1.

Plasterers' Company arms

Plaistow. District of Greater London. In the co. of Essex, and part of the co. bor. of West Ham, it is 4½ m. by rly. from Fenchurch Street. At the beginning of the 19th century a small village, with large tracts of marshland stretching to the Thames, it is now a residential and industrial suburb, and has chemical, engineering, and other works. Here are the West Ham fever hospital, 1880, and the Y.M.C.A. building (a war memorial 1921), the parish church of S. Mary, S. Mary's hospital (1888), and the grammar school (1926). Among the famous people at one time resident in the neighbourhood were Edmund Burke, Dick Turpin, Dr. Dodd, the forger, and John Curwen, the originator of tonic solfa notation in music. A former meeting house of the Society of Friends here was attended by, among others, Elizabeth Fry. Pop. 58,631. There is another Plaistow, W. of Sundridge Park, in Kent, and one in West Sussex.

Planarians (Tricladida). Sub-order of Turbellarian worms. Of elongated, flat, or cylindrical form, covered with vibratile cilia, and with the mouth near the middle of the underside, they are all carnivorous, feeding upon other worms, molluscs, or insects. There are three families—*Maricola* (marine); *Paludicola* (fresh-water); and *Terri-cola* (land). The *Maricola* are broad and leaf-like, often brightly coloured, and as much as 6 ins. long, and may be found gliding over seaweeds or swimming by means of their cilia. A familiar example of the fresh-water forms is a small, black species (*Polycelis nigra*), abundant in stagnant water, ½ to 1 in. in length, popularly regarded as a young leech. A remarkable example of the land planarians (*Bipalium kewense*) was discovered in Kew Gardens some years ago, to which it had been introduced accidentally with tropical plants. It was 6 ins. or more in length, and could extend to 18 ins. Getting a portion of a large worm into its mouth, it stretched its entire integument over its victim, the operation taking from one to five hours; and the meal supported it for several months. *See Platyhelminthes*; Worm.

Planché, JAMES ROBINSON (1796–1880). British dramatist and antiquary. Born in London of Huguenot ancestry, Feb. 27, 1796, he achieved some success at the age of 22 with a burlesque, *Amoroso, King of Little Britain*, produced at Drury Lane. Later he wrote, translated, or adapted for the stage

over 150 pieces, largely burlesques. In 1854 he was made *Rouge Croix*, and *Somerset Herald* in 1866. Among his works, apart from dramatic writings, are *History of British Costume*, 1834; *The Pursuivant of Arms*, 1852; *The Conqueror and His Companions*, 1874; *Cyclopaedia of Costume*, 1876-79. He died May 30, 1880.

Planchette. Small wooden tablet, usually heart-shaped, mounted on three legs. One of these is a

Planchette, as employed in automatic writing

pencil and the others terminate in small wheels, the whole being so contrived that, when placed on a sheet of paper, it moves at the slightest impulse, and the pencil makes marks. It is frequently employed in experiments in unconscious muscular movement, and by spiritualists as a medium for communication with the unseen world. Two persons place their fingers lightly on the planchette, keeping their hands still and their minds passive, and the instrument will usually begin to move and often trace words and sentences. See *Spiritualism*.

Planck, Max (1858-1947). A German physicist. Born at Kiel, April 23, 1858, he was educated at Munich and Berlin universities, and in 1885 became professor of physics at Kiel. Five years later he went to Berlin as professor extraordinary, and in 1892 was appointed to the chair of experimental physics. He specialised in thermodynamics and radiation and in 1900 published a paper *On the Distribution of Energy in a Normal Spectrum*, which laid the foundation of his quantum or "packet" theory. This work provided the basis of Einstein's photoelectric law (1905) which explained the transfer of energy from light to electrons. Planck's deductions regarding electronic discharge, which suggested that intensity of radiation does not affect the energy of an electron, but only the number of electrons emitted, was in 1903 proved correct through practical measurements made by Rutherford and Geiger, and led to Bohr's quantum theory of spectra.

These theories exercised an influence on modern physics comparable only with those of Einstein. Planck postulated the view, incorporated in the quantum theory (*q.v.*), that energy is not continuous and in many respects resembles the behaviour of particles rather than force. He suggested that energy was radiated in indivisible units; and to these units the term *quanta* is now applied. For the determination of quanta he formulated the constant h , or Planck's constant (*v.i.*).

In 1912 he was permanent secretary to the Prussian academy of science, and in 1913 rector of Berlin university. Awarded the Nobel prize for physics in 1918, he received the Royal Society's Copley medal in 1929. In 1930 he became president of the Kaiser Wilhelm association. He came to England in 1946 for the Royal Society's Newton celebrations, and died in Berlin, Oct. 4, 1947. The British military govt. in Germany announced the formation of the Max Planck society to replace the Kaiser Wilhelm association.

Planck's Constant (h). Fundamental atomic constant having the value 6.622×10^{-27} erg. sec. The energy (E) conveyed by a quantum or photon of radiation is equal to the product of the frequency (ν) of the radiation and Planck's constant, i.e. $E = h\nu$.

Plane (Lat. *planus*). Word meaning flat, level, or even. In aeronautics it is used as a contraction for aeroplane, and also for the wing surfaces of an aeroplane.

In mathematics, plane geometry is concerned with the geometry of plane figures, i.e. figures which lie wholly in surfaces determined by any three points not in a straight line. In ballistics, the plane of departure is the imaginary line taken by a projectile as it leaves the firearm, and is a continuation of the line of departure. The plane of fire is the vertical plane through the tangent to the direction of motion of the projectile at the moment it leaves the muzzle.

The plane of sight is the vertical plane through the line of sight, also the lateral plane through the line of sight. To describe

the adjustment of a telescope in such a manner that the line of sight or optical axis is exactly perpendicular to the axis of movement, the term *plane of collimation* is used. The plane of symmetry is a mineralogical term to describe the condition where two halves of a crystal stand in mirror-image relation to each other. A symmetry plane is revealed by X-ray diffraction photography; the maximum number of planes possessed by any one crystal is nine. The plane of the ecliptic is that of the earth's orbit, and when sun, moon, and earth are all in this plane an eclipse occurs.

Plane (*Platanus*). Small genus of large trees of the family *Platanaceae*, natives of the N. temperate regions. They attain a height of 70 to 90 ft., with a trunk circumference of 10-12 ft., which is occasionally exceeded greatly. The large alternate leaves are palmately divided into five or seven toothed and sharply pointed lobes, and the dilated base of the leaf-stalk is hollow, fitting over the resting-bud of next year's shoot.

The flowers are simple, without sepals or petals, and the sexes separate; they are clustered in spherical heads, the male heads on one branch, the females on another.

Plane. Fine specimen of this tree. Top, left, fruit of London plane and, right, leaf

The fruits are closely packed in spiky balls which hang on long strings through the winter and disintegrate in spring. A peculiarity of the tree which helps it to thrive in soot-laden atmospheres is its habit of throwing off the outer layers of its bark in large or small thin flakes, showing yellow patches of newer bark. The Oriental plane (*P. orientalis*) was introduced to England from the Levant at some date previous to 1548, and the Western plane (*P. occidentalis*) from Virginia about 1640. The maple-leaved plane (*P. acerifolia*) is believed to be a hybrid between the two, originating in the Oxford botanic garden about 1670. The wood of *P. orientalis* is used for carpentry and cabinet work, and is susceptible of a high polish; but that of *P. acerifolia* is of less value, being liable to warp.

Plane. Woodworking tool, formerly used exclusively for flattening surfaces. During the Middle Ages the adze was usually employed for this, planes being rare and coarse in their working. Flat surface planes have become perfected and are in considerable variety, making shavings from the coarsest to the finest. The "trying" plane makes fine shavings where precision is required; the "smoothing" plane, finely set, is for finishing flat surfaces. There are many planes other than the flat

Plane. Diagram illustrating three types of planing. Grooving, left; tonguing, right; and rebate, above

surface type. Wooden moulding planes each make one pattern of moulding. Rebate, shoulder, and filister planes make narrow flat surfaces to a lower level. A range of grooving planes includes those with fixed fences, movable fences, and the plough (*q.v.*) or plow. Tonguing planes make "tongues," which are the counterparts of grooves. Universal and multiple planes are highly complicated metal tools.

Planer. Power-driven woodworking machine for planing flat surfaces. In all types long cutting

irons are fitted into steel cylinders which revolve at great speed. The wood is passed over a steel table, across the centre of which the cutters protrude. If the material being worked is passed over the cutters by hand, the machine is an overhand planer; if the wood passes under rollers, the machine is a panel planer. The usual procedure is to pass one side of the rough board over the overhand. The wood is made as flat on one side as the board will allow, and then passed through the panel planer, so that the board comes out to a gauged thickness. The "four-cutter" and the "five-cutter" are other types of planing machines; the latter makes mass-produced mouldings for carpentry, joinery, and cabinet work.

Planet (Gr. *planētēs*, wanderer). Name given to the chief of the solid bodies that revolve around the sun. Asteroids or planetoids and meteors are not usually included. The planets are Mercury, Venus, Mars, Earth, Jupiter, Saturn, Uranus, Neptune, Pluto.

In the solar system the planets are generally divided into two groups, the inferior planets, those between the earth and the sun, and the superior planets, those farther away from the sun than the earth. All planets travel round the sun in an anti-clockwise direction, viewing the system from the N., and all orbits are elliptical. The plane in which the earth revolves is known as the plane of the ecliptic, and all the other planets revolve in planes which make only small angles with the ecliptic plane.

The relative sizes and distances of the planets may be represented by an analogy in which the sun is a globe 2 ft. in diameter, Mercury a grain of mustard seed 164 ft. away, Venus a pea in an orbit of 284 ft., the earth a pea 430 ft. distant, Mars a pin head 654 ft. away, Jupiter an orange at a distance of half a mile, Saturn a smaller orange four-fifths of a mile away, Uranus a small plum 1½ m. away, Neptune a larger plum at 2½ m., and Pluto a pea at a distance of 3 m. The earth is the densest of all planets, Saturn being only one-eighth, and Uranus one-quarter, as dense. The density of the earth is about 5½ times that of water.

In astronomical tables, almanacs, etc., symbols are given to the various planets and the sun and moon for convenience of tabulation, etc. These symbols are: Mercury, ☿; Venus, ♀; Earth, ☾;

Mars, ♂; Asteroids, ① ② ③ according to the order of their discovery; Jupiter, ♃; Saturn, ♄; Uranus, ♅; Neptune, ♆; Pluto, ♇.

There is considerable uncertainty whether there are other planets not yet discovered. The irregularity of movements of Mercury caused Leverrier to postulate an intra-Mercurial planet (*q.v.*), but the anomalies have since been otherwise explained by the theory of relativity. Planets beyond Pluto may exist, but their perturbing effects on Neptune or Pluto are not apparent.

The origin of the planets is still in dispute. The sun's planetary system may not be unique, as in 1943 irregular movements of two near by stars were discovered, suggesting that large planets may revolve round them. See Asteroids; Astronomy; Nebular Hypothesis; Solar System; Sun; and the articles on each of the planets.

Planetarium. A device for simulating the appearance and motions of the heavenly bodies. A working model of the Copernican system was designed by Huygens and made in 1682, but this kind of instrument is now called an orrery (*q.v.*). A much more elaborate structure, built by Zeiss in 1913 for the Munich museum, carried the observer in a cage round a track representing the earth's orbit and allowed him to look out on moving planets and fixed stars represented by electric bulbs. In the modern Zeiss planetarium, as installed in many Continental and American cities, all the heavenly bodies are simulated by images projected on the inside of a dome 50 ft. or more in diameter.

The projector, which looks like a large dumb-bell, turns on a vertical axis to reproduce diurnal motion, on its own long axis for annual and precessional motion, and on a horizontal axis to allow for change of latitude. Different speeds can compress a year into 3 min., 1 min., or 5 sec. The fixed stars visible to the naked eye (some 9,000 in all) are projected through minute holes in copper plates, the milky way through a photographic negative. There are individual projectors to allow for the extra brightness of Sirius and the fluctuations of the Cepheid variables.

The motions of the planets are arrived at by mounting their projectors on working models of the solar system, and arranging for the beam to shine always in the direction away from the earth. The moon projector has a shutter device for reproducing phases. The

Planetarium. A lesson in astronomy at the Zeiss Projection Planetarium in New York. The speaker at his switchboard, holding a luminous pointer, lectures to his audience on the wonders of the heavens. The arrow thrown on the dome directs attention to the specific body about which the lecturer is talking.

stars are dimmed at rising and setting, and a horizon glow is added. The illusion of the night sky is remarkably complete; when the sun appears, however, it is relatively faint, so that the stars can still be seen in their daytime positions.

Planets. THE. Musical composition by Gustav Holst. This brilliantly orchestrated suite (op. 32), with organ and (in the final section) female chorus, consists of seven tone-poems, each given an astrological interpretation: Mars, the bringer of war; Venus, the bringer of peace; Mercury, the winged messenger; Jupiter, the bringer of jollity; Saturn, the bringer of old age; Uranus, the magician; Neptune, the mystic. Written in 1915, it was first performed at a private concert at Queen's Hall, London, 1918.

Planimeter (Lat. *planum*, level ground; Gr. *metron*, measure). Instrument for measuring the areas of plane figures. Used practically only for measuring irregular figures, the first planimeter was invented in 1814 by Hermann, a Bavarian engineer. The best known modern planimeter is that known as Amsler's. Its essential features are two movable arms, A and B, on the extremity of one of which is a pointed support E, and on the other a pencil or tracing point, F. The latter arm has on it a graduated cylinder, D, which rolls round as the tracing pointer is moved along the perimeter of the area to be measured. A vernier, H, and a horizontal disk, G, worked in conjunction with D, enable the area of the figure to be measured or calculated.

Plankton (Gr. *planktos*, wandering). Name given in 1887 by the German scientist Hensen to the swarms of small or microscopic organisms in the sea, which drift more or less passively with the currents. Lakes and rivers may also contain plankton populations. The microscopic plant plankton includes diatoms and dinoflagellates, most of which, by virtue of possessing certain plant pigments, can synthesise carbohydrates under suitable conditions of illumination, perhaps down to 40 fathoms below the sea surface. This phytoplankton constitutes the basis of animal life in the sea, many members of the animal plankton or zooplankton directly depending on these minute plants for food. Herring, shad, and some sharks feed on the zooplankton, which they strain from the water by closely set bristles or gill rakers; while the whalebone whales feed mainly on euphausians (krill) in the zooplankton, filtered from the water by long plates of baleen suspended in the mouth. Zooplankton includes foraminifera, radiolaria, jellyfish, arrow worms, crustaceans (e.g. copepods), euphausians, and pteropod molluscs, all living permanently in the floating state. The eggs and young of many fish, crustaceans, molluscs, worms, etc., appear in the plankton seasonally. Many zooplankton organisms exhibit powers of diurnal vertical migration.

Planquette, ROBERT (1848–1903). French composer. Born in Paris, July 31, 1848, he studied at the conservatoire there. He composed operettas, including *Les Cloches de Corneville* and *Rip van Winkle*, which gained popularity in both France and Great Britain. Other operettas were *Nell Gwynn*, and *The Old Guard*. He died Jan. 28, 1903.

Planimeter. Diagram showing Amsler's planimeter. See text.

Plant. Organism capable of living upon, and of absorbing into its tissues, a whole range of inorganic substances, and of transforming these into organic compounds. Plants have no specific power of locomotion, neither have they special organs of digestion or of sensation. Plants are members of the vegetable kingdom, which

includes a very wide range of organisms ranging from minute simple-celled plants (without division of labour) to complex forms of plant life such as trees, shrubs, and herbs. The higher plants have distinct parts, e.g. root, stem, leaf, flower, fruit. Each of these organs is subject to considerable modification, and such modifications give some indication of evolutionary development in the higher plant groups. Plants are classified into families, genera, species, strains, and jordanons, using, as the basis of classification, the modifications of various organs exhibited by the several groups. In particular the leaves, flowers, and fruits in all their many forms and placements are used in such classification.

The root of a plant normally inhabits the surface layers of the soil. Its major functions are (1) to anchor the plant in the ground, and (2) to absorb from the substratum (the soil) water and other plant nutriment which are then translocated to the stem, leaf, flower, and fruit, there to be converted into protein and the other complex organic products of the plant. Certain major elements (as well as water) are known to be essential for plant life and health. Elements normally absorbed in solution from the soil through the roots include hydrogen and oxygen (as soil water), calcium, potassium, phosphorus, nitrogen, sodium, manganese, chlorine, and sulphur; also the whole range of so-called trace elements—cobalt, copper, magnesium, zinc, molybdenum, boron, iodine, and selenium. Deficiency of any of these elements in the soil leads to recognizable symptoms of ill health in the plant which can be remedied by the use of a suitable fertiliser. The absorbing organs are the root hairs which normally occur near the growing point of the root (whether main or secondary).

Importance of Leguminosae

Some plants absorb certain elements in solution through the leaves; thus nitrogen and potash starvation can in some cases be quickly corrected (as an emergency measure) by spraying leaves with solutions containing these elements. Members of the family Leguminosae (the clovers) and some other groups absorb nitrogen direct from the soil air. Members of the Leguminosae do this by means of the nodules on their roots. These nodules contain aggregates of bacteria (*Bacterium radicicola*) and exhibit one of the most interesting instances of symbiotic achievement in the whole

vegetable kingdom. Many of the farming systems of the world are based on this one fact of the symbiosis of legume and bacterium, for upon it depends the standard of fertility of the soil.

Many other groups of plants take nitrogen direct from the soil air and through their roots. Some groups do this by the development of mycorrhiza, representing a symbiosis of the higher plant with a fungus (a plant without green matter or chlorophyll). Most of the fungi get their nitrogen by breaking down plant and animal remains. Some forms of bacteria (e.g. *Azotobacter*) living a free life in the soil absorb nitrogen direct from the soil air and thus make it directly available to the higher plants growing in the same soil. Knowledge of forms of plant life in and on the soil is considerable, but far from complete.

Parts of the Plant

The stem of the higher plant is normally above ground, though many plants have underground stems (e.g. the potato). The stem bears leaves, flowers, and fruit. The young, actively growing stem is soft and succulent, but may (as in trees) later harden and become woody. In forest trees the stem (or trunk) may be very massive, enduring to great age. The stem translocates food material and water between the roots and the leaves, flowers, and fruit. The higher plant has two main growing regions, namely (1) the underground root tips, and (2) the aerial shoot tips. Perennial trees have another type of growth, exhibited, e.g., in the annual rings in the British oak.

The leaves of most plants are normally thin and flat, forming an expanse of soft tissue which contains chlorophyll, a material essential for the nutrition of the plant, by which it absorbs the oxygen used in the normal process of respiration. The leaf carries stomata (or breathing pores) through which the plant takes in much of the air from which it extracts oxygen. Carbon dioxide (CO_2) is also taken in through the stomata, and the plant derives the major part of its carbon from this source by photosynthesis (q.v.). In this respect plants stand out in sharp contrast to most members of the animal kingdom. Green plants are able to extract carbon from the carbon dioxide of the air, whereas animals depend upon plant remains for their carbon needs. The leaf of the green plant is therefore (under the

influence of light) a complex system producing organic carbonaceous compounds from the cruder inorganic elements. Without this process of plant life, animal, including human, life would be impossible.

Leaves show a wide variety of modification in relation both to division of labour in the plant itself, and also to environmental conditions. Some leaves are green, broad, and flat; others on the same plant may be modified to form parts of the flower and the fruit. The floral leaves (e.g. sepals and petals) may be highly coloured to attract insects. In other plants the leaf may be modified to trap and to digest insects, e.g. in the *Droseraceae* (q.v.).

PLANT HYBRIDISATION. Some plants are self-fertile, others are self-sterile. In the latter group, of which many grasses (members of the family Gramineae) are good examples, the ovary of one plant must, before it can set seed, be fertilised by pollen from another plant, usually of the same species. Oats (*Avena* spp.), wheat (*Triticum* spp.), and barley (*Hordeum* spp.) are three members of the grass family possessing a high degree of self-fertility. Ryegrass (*Lolium* spp.), cocksfoot (*Dactylis* spp.), timothy (*Phleum* spp.), and most of the perennial legumes (*Trifolium* spp., *Medicago* spp.) are normally only cross-fertile. The cross-fertile grasses are usually wind-pollinated, pollen being carried on wind and air streams. Most cross-fertile legumes are insect-pollinated—chiefly by bees in the U.K.

Plant breeders of the 19th century and earlier were for the most part selectors; but, following appreciation of the work of Mendel, 20th century plant breeders and geneticists produced new varieties of cereals, grasses, and legumes by intentional crosses.

Methods of Plant Breeding

Plant breeding, including intentional crossing and selection, in a plant normally self-fertile, like wheat or oats, is fairly simple and was already used by plant breeders of the 19th century. Plant breeding in a grass or clover normally cross-fertile (and self-sterile) is less simple. One highly successful method used by British clover breeders is as follows: a number of similar genotypical selections are made, and these are closely inbred (mating closely related plants). After several generations, it is usually found that close inbreeding has led to loss of vigour. Vigour is recovered by bulking a number of inbred families, all of

not dissimilar genetic composition. In this way, a new strain is formed. Such a strain shows some variables among its constituent plants, but so long as the type is stabilised, such variation is of no disadvantage to the farmer.

Cereal breeders have, since the middle of the 19th century, bred varieties of cereals capable of producing much increased yields of grain, and varieties resistant to diseases of all sorts. Varieties of wheat have been developed which will grow in colder climates (as in Canada) or in dry regions (as in Australia and the U.S.A.). Grass and clover breeders, in particular of the U.K. and New Zealand, have by careful crossing, selection, and critical agronomic testing, produced new strains of leafy, persistent, and productive herbage plants. The production of these new strains of grasses and clovers have made ley-farming (*q.v.*) possible. See also Fertiliser; Fungus; Mendelism; Virus, etc.

William Davies, D.Sc.

Plantagenet. Name commonly given to the family to which the English kings from Henry II to Richard II belonged. More correctly they are styled Angevins, from Anjou, of which Geoffrey, father of Henry II, was count. Plantagenet was a nickname bestowed on Geoffrey because he wore a sprig of broom plant (Lat. *planta genista*) in his cap, and was not used as a surname for his descendants until later, being adopted first, perhaps, by Richard duke of York, father of Edward IV.

After the death of Richard II, in 1399, the throne passed to the house of Lancaster, and then to that of York, both of these being branches of the Plantagenet family. In the male line the family became extinct when Edward, earl of Warwick, a nephew of Edward IV, was put to death in 1499. The name Plantagenet was borne afterwards as a surname by one or two illegitimate descendants of the kings. Through females all the sovereigns of Great Britain since Henry VIII are descended from the Plantagenets. See Angevins; Anjou; Henry II.

Plantaginaceae. Family of annual and perennial herbs, natives of all temperate regions. As a rule the leaves all spring directly from the rootstock. The flowers are small, green, and inconspicuous, in spikes, and the fruits are small capsules.

Plantain (*Plantago*). Genus of herbs of the above family Plantaginaceae, natives of all temper-

Plantain. Leaves and fruit spikes of *Plantago major*

ate regions. They have inconspicuous green flowers, fertilised by the wind as pollen carrier. The greater plantain (*P. major*), known also as waybread, produces long spikes of fruit, used for feeding cage-birds. In almost every place where Europeans have been this plant is found as an introduced weed, and the coloured races know it as the white man's foot. *P. media*, lamb's tongue, or hoary plantain, is a nuisance on lawns, where its rosette of broad leaves lies so close to the ground that it kills out the grass. See Banana.

Plantain Eaters (*Musophagidae*). Family of birds peculiar to the continental portion of the Ethiopian region. They consist of six genera and about 25 species. They vary in size, ranging from 15 to 30 ins. in length. They have large eyes, long necks, and the red, yellow, or black bill is usually stout and broad. The black feet are strongly clawed, and the outer toe is reversible. Most species have erectile crests on the head, and the plumage is metallic blue and green, or grey-brown, varied with crimson. The red feathers yield a pigment (turacin). Usually found in pairs or small flocks in wooded country near water, their food consists of bananas, tamarinds, papaw, and other fruits, varied by insects, worms, molluscs, and small birds. Their notes are a scream or a catlike mew. They run swiftly, but are caught and eaten by the natives. *Turaco corythaix*, of S. Africa, is known locally as the lory.

Plantain Lily (*Funkia*). Genus of perennial herbs of the family Liliaceae. They are natives of Japan. The perennial organs are a bunch of tubers. The leaves, which spring direct from the crown, are large, oval or heart shaped. The flowering stems rise above the leaves and bear a number of tubular flowers of white or lilac tint, each with a narrow leaf-

like bract beneath its stalk. Several species are cultivated as bedding or border plants.

Plantation. Term applied to a newly planted copse or wood, established either by planting nursery-raised seedling trees, or by the sowing of seed. Plantations in the U.K. are usually made up with mixed trees, the quicker growing conifers being employed to shelter the others from wind and weather. In the course of years, when the conifers, etc., have been cleared away and used for fuel, or commercial purposes, the slower growing trees become technically a wood. In making a plantation of conifers, it is usual to sow gorse or furze seed to act as protection against weather.

The word plantation is also applied to estates devoted to the cultivation of crops which need constant renewal, as rubber, sugar, rice, tobacco, and cotton. Such were the plantations in America and the W. Indies, to which convicts and slaves were sent. The settlement of English and Scottish colonists in Ulster in the time of Elizabeth and James I is known as the plantation of Ulster.

Plant Bug. Popular name for creatures of the order Hemiptera (*q.v.*) and in particular of the sub-order Heteroptera (*q.v.*).

Plantin, CHRISTOPHE (1514-89). French printer. Born at St. Avertin, near Tours, he settled at Antwerp in 1549 as a bookbinder, took up printing in 1555, and founded a business which won for him a European reputation. The most notable example of his work is the Polyglot Bible, of 1569-72. In 1570 Philip II granted Plantin a special privilege as printer of liturgical books, in addition to which he issued fine editions of the classics. He opened branch offices in Leyden and Paris. After his death the business was carried on by his son-in-law, Jean Moretus, the latter's son, Balthasar, and other members of the family. Plantin's home and printing office in Antwerp, from which his descendants issued books for 300 years, was bought by the city of Antwerp, 1876, and became known as the Plantin-Moretus museum. Consult C. P. Imprimeur Anverso, M. Rooses, 2nd ed. 1896.

Planting. Art of placing trees, shrubs, and plants in a proper manner in suitable soil, to ensure their healthy establishment and welfare. In planting fairly large trees the question of aspect needs consideration. Twisting trees and even shrubs round indiscriminately

1. Wheat . ripe ear, flower spike, and foliage 2. Oats 3. Barley . flower spike, ripe ear, and leaves 4. Maize plant and ripe cob 5. Rice . plant and ripe head 6. Tea 7. Hops 8. Vanilla . flower and pod 9. Cotton flower branch and bursting pod 10. Flax 11. Sugar Cane 12. Coffee 13. Cacao 14. Para india rubber plant 15. Tobacco 16. Hemp 17. Indigo

PLANTS CULTIVATED FOR THEIR GREAT COMMERCIAL VALUE

1. Cardiff police officer (summer uniform). 2. Rhodesia
3. New Zealand. 4. Fiji. 5. West Indies. 6. Australia
7. Kent policewoman sergeant. 8. Armed Norfolk
policeman searching a thicket for an escaped prisoner
9. "Courtesy" motor-cycle patrol. 10. Mounted

policeman, London 11. Maintaining radio-telephone
contact between Scotland Yard, London, patrol cars, and
police stations. 12. Thames police patrol launch. 13.
Police van (familiarily known as "Black Maria"),
Scotland Yard 14. Scotland Yard mobile unit

POLICE: OFFICERS AND ACTIVITIES IN THE U.K AND COMMONWEALTH. See text pages 6591-93

to face new aspects retards their growth. Hence before being moved from its original home the side of a tree which has been facing, say, S., should be marked in order that it may be placed in the same direction in its new home. Roots should be disentangled, broken pieces and tap-roots pruned off, and the fibres spread out horizontally.

The quick method of digging a narrow, deep hole, and cramming the roots of a plant or tree into it vertically, is wrong. The soil should be pressed very firmly about the roots of newly planted trees and shrubs, especially when the operation is carried out in the autumn. Spring-planted subjects may be allowed a little more latitude in this respect, as there is less danger of frost to be feared. When planting the young greenhouse-raised summer bedding plants, the soil should be left fairly free and open for the purpose of aeration, but care should be taken to set the roots fairly deep in the ground. The soaking of water which follows the planting of summer bedding plants usually washes the soil down sufficiently close to secure the welfare of the roots of the plants in their new homes. See Forestry; Gardening; Sowing.

Plasencia. City of Spain, in the prov. of Cáceres. It stands on the river Jerte, an affluent of the Alagón, 156 m. by rly. W. of Madrid. Its unfinished cathedral was founded in 1498. Plasencia was founded by Alphonso VIII of Castile in 1189 and created a bishopric next year. It has a palace dating from 1550, a Roman aqueduct, and remains of 12th century walls. The monastery of San Yuste, where Charles V retired after his abdication, lies 24 m. to the E. Pop. 12,000.

Plasma. That part of blood which coagulates is mentioned in the article Blood.

Plasmodium. Biological term for a multinucleate protoplast which is not invested in a wall. It is in this form that the slime fungi (Myxomycetes) pass most of their active life, moving over the surface of plant debris by protruding pseudopodia, by means of which they ingest solid particles for food. Plasmodia of Myxomycetes vary in size from microscopic to some inches in diam. and are more or less completely converted into sporangia containing numerous spores when reproduction occurs.

Plassey. Former village of W. Bengal, India. It was on the Bhagirathi, about 95 m. N. of Calcutta. Here Clive defeated the

nawab of Bengal, June 23, 1757. In 1756 the British at Calcutta were threatened by Suraj-ud-Dowlah, nawab of Bengal, Orissa, and Bihar, who captured the town, and followed this with the notorious atrocity of the Black Hole (*q.v.*). Operations against him were carried on by Clive with varying success through the winter and the spring of 1757. Clive came to an arrangement with Mir Jaffir, the nawab's commander-in-chief, to set him on the throne of Bengal, and on June 13 advanced up the Hooghli from Chandernagore.

His force consisted of about 1,000 Europeans, 2,100 sepoys, and 10 guns, and, informed by Mir Jaffir of the nawab's plans, he advanced to Plassey. Crossing the river on June 22, he faced the advancing enemy on the next day. Suraj commanded some 35,000 foot soldiers, with 18,000 cavalry, and about 50 guns, including some French batteries. After a violent bombardment which strained the nawab's ammunition resources, Clive attacked, and overpowering a stubborn French redoubt, swept the field. Mir Jaffir was installed as nawab, but as he was merely a nominal ruler, Plassey had made the British masters of Bengal at insignificant cost. The river had eaten away the battlefield by 1801. See Clive; India: History.

Plaster. Pasty composition, used for coating walls, ceilings, etc. From remote times it has been a common practice to give a more or less smooth finish to wall surfaces by covering them with a tractable material—plaster, a term that may be held to include the clay-daubing of primitive huts. With respect to materials, choice is limited to earths containing cement, crude or manufactured, and used separately or in combination with other materials, such as powdered stone or marble, asbestos, tufa, sand, hair, fibre; while the addition of agglutinates like molasses or glue facilitates moulding and modelling to decorative shapes.

Ordinary plaster, as used on walls and ceilings, is made by mixing in water slaked lime with twice its bulk of clean, sharp sand—river sand for exterior and pit sand for interior work. Plaster of Paris is used by the plasterer mainly for patching and repairing, but is also mixed with ordinary plaster to quicken setting and to give greater hardness. The cements known as Keene's, Martin's, and Parian all have gypsum as their basis, and in the order given are compounded respectively with alum, carbonate

of potash, and borax. Roman cement is made from septaria found in the London clay.

Rendering is the external application of a Portland cement and sand mix to walls, usually one part cement to four parts sand for the first coat and a slightly stronger mix for finishing. An admixture of hydrated lime lessens the tendency to craze on setting. White or coloured cements are often used in finishing coats, and waterproofed cement for damp-proofing.

Rough-cast is a finish of granite, marble, or stone chippings thrown on the second coat before it has set. Pebble dash is similar.

Stucco, a term loosely used to denote exterior plastering and rendering, was the name given to mortar coverings finished with oil paint, widely popular in the Regency period, especially with John Nash. This work is now superseded by Portland cement renderings.

Interior Work

Fir laths are nailed to ceiling joists and partition studs (upright timbers), with narrow gaps between laths, to provide a key to which the plaster holds. In fire-resisting construction and exterior work, expanded metal lathing is similarly used.

Plaster blocks make thin partitions. Plasterboard, of gypsum plaster cast and compressed between sheets of fibrous paper, lines ceilings, walls, and partitions, and is nailed to joists, studs, or battens.

In the plain plastering of interiors the familiar creamy mixture of lime, sand, hair or fibre, and water, as applied to lathed walls and ceilings, is technically described as render, float, and set, or three-coat work. The rendering, or first coat, consists of coarse stuff—one part fat lime to two or three parts sand, with a pound of ox-hair to 2 cu. ft. of plaster. This coat is left with a rough surface, on which intersecting furrows are scratched with a lath, to form a key for the next coat (floating), which contains less sand and less hair than the rendering coat, and is floated to an even surface by means of straight edges or of a Derby float—a large flat board with two handles at its back. To get a true surface, a general level is indicated by placing fillets of plaster (screeds) at intervals over the surface, the plasterer bringing the intervening spaces to the level fixed by the screeds. A smaller float is then worked over the surface, which finally is scratched with a coarse broom of bristle or a

pointed lath. The setting coat may consist of fine lime plaster with plaster of Paris added.

Decorative plastering—the panelling, covering, gilding, colouring, and general enrichment of walls and ceilings—had become elaborate in Tudor and Jacobean times, and in the late 18th century Adam, Chambers, and Nash designed rich effects in plaster. Ornamental plastering may involve the use of the casting-box and the chisel; but the legitimacy of cutting plaster is disputed, on the ground that sharpness of edge and outline is alien to the essentially “fat and sleepy” character of plaster. Wood or zinc moulds are used in running cornices, and other straightforward ornaments; but rosettes, festoons, cables, and other irregular patterns must be cast from modelled designs, from which moulds are made in gelatine, plaster, or wax.

The form called sgraffito decoration is obtained by placing a transfer design on the second of two finishing coats, the first coat dark, the other light, and scraping away portions of the top coat to form a pattern in slight relief. Pargeting or parge work shows a raised pattern. Fibrous plaster, pre-cast in ornamental character, is used in cinemas, etc.

Plaster Cast. The commonest method of reproducing or giving permanent form to a clay model is by taking a plaster cast from a mould of plaster, gelatine, or wax.

If the model is “in the round,” the model has to be made in several pieces, the joining of these requiring some skill. The dead effect of a plaster cast can be remedied by treating it with French polish or wax. A little colour can be judiciously added. Plaster casts may also be given the effect of bronze by successive applications of bronze powder mixed with French polish, of green or bronze pigment, and of wax, the whole being highly polished.

Plaster of Paris. Partly dehydrated calcium sulphate formed by heating to 120° to 130° C. the mineral gypsum, which then loses three-fourths of its water of crystallisation. On the addition of water equivalent to that removed by calcining, plaster of Paris recrystallises, and sets as gypsum. It is sometimes added to ordinary lime plaster to quicken the setting, or used by itself for forming delicate mouldings and ornaments, or for repairing plaster walls or ceilings. It sets very quickly. Heated to 194° and finely ground, gypsum forms a hard flooring material and is a component of many proprietary flooring compositions. Plaster of Paris bandages, made by saturating bandages with the powder, are used in surgical practice. The bandage is dipped in tepid water at the time of application. The name plaster of Paris is derived from the extensive deposits found near Paris.

materials into large units, chiefly in the form of chains of relatively simple molecules.

For instance, the gas ethylene (C_2H_4) is unsaturated, i.e. it is a substance in which the full combining power of the element carbon has not been utilised. It can be represented graphically thus:

with two of the available carbon linkages inviting continuation. This can be accomplished in a variety of ways, one of which is the union of several ethylene units to form a single chain, thus:

If this process is carried further, a stage is eventually reached when, with many such chains going to form a bundle, the substance actually passes from a gas to a solid, in this case a brittle solid called paraffin wax, of some 20 carbon atoms average chain length. If this reaction is taken much further under the action of several thousand pounds pressure, and in the presence of a chemical driving agent, or catalyst, a very tough solid called polythene emerges, when a stage at approx. 200 carbon atoms chain length is reached. Man had discovered, that is to say, that by a process of repetition of certain characteristic chemical units, as for example ethylene, he could imitate nature's process of molecular chain building, and build up molecular structures to give products to meet many and varied needs. Such, in its broadest and simplest terms, is the scope and technology of plastics.

In some instances the chemist makes up his long chains by the repetition of simple units or their nearly related compounds, i.e. by processes usually called polymerisation. He starts with the simple unit, the monomer, frequently a gas or a liquid, and he finishes up with the polymer which, according to the length or constitution of the chain, may vary from a soft to a rigid material. In other instances the chemist takes simple yet dissimilar substances, such as phenol and formaldehyde, and unites these by processes called condensation, and then further builds these up into long chains by polymerisation.

PLASTICS: A 20TH CENTURY PRODUCT

V. E. Yarsley, D.Sc., Consulting Chemist

See also Cellulosic Plastics; Glass-like Plastics; Glyptal Resins; Laminated Plastics; Melamine Plastics; Methy-Methacrylate Plastics; Phenolic Plastics; Protein Plastics; Vinyl Plastics; etc.; Ethyl Cellulose; Nitrocellulose; Nylon; Styrene; etc.; Buna; Rubber, Artificial, etc.

The term plastics (Gr. *plastikos*, moulded) in its accepted industrial sense embodies those organic materials which at some stage of their production are capable of flow, and which under the combined action of heat and pressure can be caused to flow and take up any desired shape. Most plastics are carbon compounds, complex substances built up by chemical processes, either from naturally occurring raw materials, or from materials which are in themselves breakdown products of those found in nature. They thus cover a wide range of chemicals which differ in their properties from rigid to rubber-like bodies and, within the limitation imposed by the presence of the element carbon, are materials

capable of almost infinite variation in physical properties.

Although many of the fundamental raw materials used in the production of plastics, e.g. benzene, phenol, urea, styrene, acetylene, are as old as organic chemistry itself, the conception of plastics dates from the pioneer work of Baekeland early in the 20th century. Traditional organic chemistry found use only for the clearly defined substances available as liquids or as crystals. Baekeland showed that many products which lay between the two, and had long resulted as sticky masses from chemical reactions, could eventually be turned to good purpose. From his work sprang an entirely new approach to chemistry, the building up of

Plastic materials are divided into two chief groups, thermosoftening and thermohardening. In some, *e.g.* the ethylene polymer cited, the chains are capable of relative motion with respect to one another with increasing temperature, up to the point of decomposition, where the chain is ruptured and reverts to gaseous products of combustion. Such a material is stated to be thermosoftening. The chains formed by the condensation of phenol and formaldehyde, however, when subjected to adequate heat are cross-linked, that is they become rigid with respect to one another, by lateral chemical linkages. Once this cross-linking, or curing, is effected, then further heat cannot cause the chains to move with respect to one another and, short of decomposing, such materials are unaffected by further heat and pressure. These materials, which are thermohardening, include Baekeland's pioneer materials and the urea-formaldehyde family.

Characteristics of Plastics

Plastics containing carbon and hydrogen only, such as the ethylene polymers, are water repellent, corrosion resistant, and wax-like, and have remarkable electrical properties. Those based on nature's own long chain polymer cotton, such as cellulose acetate, which contain hydroxyl radicals in addition to combined acetic acid, are less resistant to water but have other compensating properties. Nylon, the long chain polyamide, follows in simpler terms nature's complex polymer silk. The introduction of halogens, such as chlorine or fluorine, into the molecules has a marked effect on the general resistance of plastics. Those polymers based on tetrafluoro-ethylene (that is, ethylene in which all the hydrogen has been replaced by fluorine) are stated to withstand boiling aqua regia or fused caustic soda. They are incidentally among the most dense of synthetic polymers, having a specific gravity of 2.1 to 2.2. Significant also for the properties of a plastic is the substitution of other elements for carbon in the fundamental structure. For instance, materials (called silicones), in which silicon, closely related to carbon in the periodic classification of the elements, is the centre of the structure, are characterised by their resistance to heat, far exceeding that possible with the heat-vulnerable carbon compounds.

The claim that plastics have "metal strength at wood weight"

can be substantiated; but the popular idea that they are cheap is far from the truth. On the contrary plastics are costly. Many of them possess, however, unique properties which more than offset their cost. They also lend themselves to mass production of finished items so that the comparatively low labour cost of their manipulation compensates for the relatively high cost of the material.

RAW MATERIALS FOR PLASTICS.

The materials from which plastics are prepared are widely distributed over the earth's surface, but the chemist finds only a few long-chain products to hand in nature. These include cellulose, available as wood pulp and cotton linters, and the protein-containing materials such as casein, soya, and coffee beans. These need chemical treatment to bring them to the required state of purity before they can be further processed to produce such plastic substances as celluloid, cellulose acetate, and casein.

Most other materials used by the chemist to start his chain building are relatively simple, and many of them he obtains from coal and oil—both of which, still used, in general most uneconomically, chiefly as sources of power and heat, will probably eventually be conserved for a much more important rôle as nature's chemical storehouse. The gasification of coal and the cracking of oil yield a large number of fundamental raw materials such as ethylene, benzene, phenol, cresol. Coal and lime yield carbide, which in turn yields acetylene which, besides being a most important raw material for the engineering industry, is the starting point for many plastics. Another key material for plastics is formaldehyde, used in industry as a 40 p.c. aqueous solution, formalin, which is produced synthetically from carbon monoxide and hydrogen via methane. Incidentally, sewage, disposal of which was once simply a matter of public health, is potentially the most economic source of methane, valuable both as a fuel and a chemical raw material.

THERMOFTENING PLASTICS.

The pioneer plastics of the cellulose family are based on cotton linters or purified wood pulp. Cotton linters treated with suitable mixtures of nitric acid, sulphuric acid, and water yields cellulose nitrate, which is used in plastics at a nitrogen content of 10.8–11.9 p.c. (At a nitrogen content of more than 13 p.c. it is the explosive gun cotton.) Cellulose nitrate with

camphor and alcohol is the plastic celluloid. Cotton linters treated with mixtures of acetic anhydride, glacial acetic acid, and sulphuric acid yields cellulose acetate. This when mixed with plasticisers, such as dimethyl phthalate and solvent acetone, yields cellulose acetate plastic, available in powder form for injection or extrusion moulding, and as free-flowing solutions for making films and lacquer coatings.

Styrene and the Vinyls

Some of the more important synthetic materials are based on the aromatic hydrocarbon benzene. This is converted via ethyl benzene into styrene, a limpid liquid which polymerises to the glass-like polystyrene, produced in vast quantities in the U.S.A. and Canada during the Second Great War in the manufacture of synthetic (Buna) rubber. Closely allied to styrene, but aliphatic rather than aromatic in general character, are the vinyls, which are essentially derivatives of vinylalcohol. Acetylene and acetic or hydrochloric acids produces vinyl acetate and vinyl chloride respectively. These build up to give "straight" or co-polymers, which can be almost illimitably varied, and give products which may be rigid or may be numbered among the synthetic rubbers or elastomers.

Still within the vinyl family, and based on acetone, is methyl methacrylate, from which a transparent plastic is produced. Here again the changes can be rung through the various esters to pass from the rigid methyl polymers to the rubber-like octyl and decyl derivatives. Benzene can be converted into adipic acid and this into hexamethylene diamine, and these two together build up the long-chain nylons, known chemically as the polyamides.

THERMOHARDENING PLASTICS.

Phenol or one of its related products, such as cresol, together with formaldehyde yields a resinous mass (P.F. resin), which with 50 p.c. of wood "flour" admixed, and in powder form, forms the compression moulding powder in the process invented by Baekeland. Urea, or related melamine, and formaldehyde yield thermohardening resins, which with light coloured α -cellulose fillers, can be used to produce another type of moulding powder.

Though of small consequence in the plastic industries, yet constituting more than half of the synthetic resins produced, are the products obtained by condensing glycerine with phthalic acid. The

chief use of these alkyds or glyptals is in surface coatings.

PROCESSING. (1) *Compression Moulding.* In this the moulding powder or preformed pellets are introduced into the mould, and then formed by heat and pressure. This is applied in the main to the thermohardening plastics. The moulding cycle is sufficiently long not only to form the unit, but also to effect the necessary cross-linkage, or cure, of the plastic.

(2) *Injection Moulding.* In this the plastic is first liquefied by the application of controlled heat, and in this condition is forced into the cooled mould, from which it is rapidly ejected. Injection is applied to thermosoftening materials, so that no cure of the plastic has to be effected.

(3) *Extrusion Moulding.* The processes for forming units, such as tubes, rods, or varied sections, by extruding the plastic through a suitable die orifice are very similar to injection moulding. Units of regular cross-section are produced continuously and cut up into lengths as desired. Extrusion moulding can be applied to both thermohardening and thermosoftening plastics, but is usually confined to the latter. It is sometimes used in the production of relatively thin sheets, particularly of celluloid or cellulose acetate, though these are more usually prepared by slicing the sheets at the desired thickness from consolidated blocks of the plastic. The sheets thus produced show the "knife" lines, and a final polish is imparted to them by hot pressing between highly polished nickel plates. By hot embossing, patterns are produced on the surface of such sheets, or they may be reinforced by hot pressing with wire mesh or decorative fabrics.

(4) *Laminated Materials.* Solutions of thermosoftening or thermohardening plastics, chiefly the latter, are used to impregnate sheets of paper or fabric, including glass fabric. These are then bonded together to give laminates of great variety and strength. Sheets up to a tensile strength of 50,000 lb./sq. in., with a density of little more than half that of duralumin, have been produced in this way. (See Laminated Materials.) The advent of the catalyst cured polyesters has made lamination possible at pressures little more than is necessary to maintain contact between the constituent plastic-impregnated fabric layers.

An important side of the processing of plastics is the mani-

pulation of sheet materials. The plastic sheet is heated above its softening point, and is then, with the aid of suitable moulds, pressed or blown into the desired shape. For this thermosoftening materials are chiefly used, but certain post-forming laminates (called P.F. sheets) can be heat-formed into shapes which have limited "draw."

Moulding and Casting

Moulded plastics usually require expensive moulds to withstand the high pressures applied, but suitable plastics in syrup form can be shaped in inexpensive metal (lead) or flexible (P.V.C.) moulds. These casting processes can be applied to both thermohardening and thermosoftening plastics, suitable catalysts being used to effect the necessary build up of the molecules from the short chain length syrups to the long chain rigid cast plastic units. The inexpensive moulds used in the casting process make it possible economically to produce a few units, whereas with the expensive compression or injection moulds a run of 50,000 units is the economic minimum.

Before the Second Great War Germany, the U.K., and the U.S.A. were the principal producers of plastics, production per head of population in 1937 being 1.5 lb. in Germany, 1.45 lb. in the U.S.A., and 1.1 lb. in Great Britain. After the war, owing to intensive wartime development, plastics production in the U.S.A. had greatly risen both absolutely and relatively. But the plastics industries continued to be small compared with such old established industries as iron and steel, total world production of all plastics (excluding the synthetic rubbers) being about 1,000,000 tons per year. The production of plastics in the U.K. in 1946 was between 80,000 and 85,000 tons with a value of £18 to £20 million, and employed 80,000. (1947 coal production was 200,000,000 tons valued at £400 million and employing 700,000 workers; agriculture at £500 million with one million workers.)

The first official British statistics relating to the production of plastics, were in the Annual Abstract of Statistics, No. 84, 1935-1946 (H.M.S.O., 1948), and gave the following figures for 1946: cellulose acetate 5,737 tons, celluloid 2,100 tons, phenolic (and cresylic) moulding powders 25,221 tons, urea moulding powders 6,471 tons, polyvinyl chloride (all types) 15,548 tons, acrylic resin 3,949 tons. Total production in 1947 in the U.S.A. (according to Modern Plastics for

April, 1948) was 849,022,972 lb., with production for Jan., 1948, 81,107,358 lb.

Bigelow, 1945; Plastics Applied, V. E. Yarsley, 1945; British Catalogue of Plastics, 1947; Chemistry of Commercial Plastics, R. L. Wakeman, 1947; Practical Plastics, ed. F. Smith, 1947.

Plastic Surgery. Sub-division of surgery. It aims at restoring form and function to the human face and limbs where these have been injured. Bone grafting and transplanting of skin and flesh to replace tissues lost by burning or other disaster, are in its special province. See Surgery.

Plastid. Botanical term applied to definitely shaped masses of protoplasm, sometimes containing pigments, found embedded in the cytoplasm of many plant cells. The chloroplastids present in green leaves, prothalli of ferns, mosses, liverworts, and some green algae are biconvex. In other green algae their shape is more elaborate, star shaped, or ribbon-like, or a cylindrical net. All contain chlorophyll and have for their chief function the process of photosynthesis (*q.v.*). In many, sugar may be converted into starch as a temporary means of reducing the sap sugar concentration. Photosynthesis is also carried on by the phaeoplastids of the brown algae and comparable bodies in many other autotrophic but not obviously green organisms. Chromoplastids, a term sometimes used to include all coloured plastids containing a preponderance of xanthophyll and/or carotin occur in some flowers and fruits. Their angular or thread-like shape is imparted to them by the tendency toward crystallising inherent in their chief pigments. Other than that of imparting colour they have no known function.

Leucoplastids lack pigments, occur in parts of plants which are not illuminated, and generally serve for the deposit of starch for prolonged storage. A like function is carried out by the pyrenoids embedded in the chloroplastids of some algae, and elaioplastids, said to occur in some seeds, serve for the accumulation of fat. To what extent the various kinds of plastid are homologous is in doubt, but in higher plants plastids are known to develop from minute rudiments called proplastids and

in some measure to be intermutable. Leucoplastids on exposure to light become green, chloroplastids deprived of it lose their colour and in ripening fruits become chromoplastids. See Pigment (in plants).

Plastiras, NICOLAS (b. 1884). Greek soldier and statesman. Born 1884 in a village in Thessaly in a poor home, he made a successful career in the army, was promoted, during the Balkan wars, to col. and gen. and, after the unsuccessful war against Turkey, 1920-22, during which he opposed its supreme command, staged with Gen. Gonatas a revolution in Athens, Sept. 28, 1922, which ended with Constantine's abdication and exile, and the execution of five of his cabinet ministers, a step for which Plastiras was blamed. He continued as dictator and, Dec. 1923, forced Constantine's son George to abdicate. Subsequently Plastiras went abroad for health reasons, returned, was exiled by Pangalos in 1925, returned again in 1926, confining himself to military duties, until in 1933 he assumed dictatorship for one day. This coup failing, he escaped abroad, and was sentenced to death in his absence. A lifelong republican, he lived in the S. of France until recalled to Greece by Papandreou, Dec., 1944. He was prime minister Jan.-April, 1945, and again from April, 1950.

Plataea. An ancient city of Greece, in Boeotia, on the N. slope of Mt. Cithaeron. Leaving the Theban league, Plataea became an ally of Athens, and sent 1,000 men to the battle of Marathon. In the second Persian War, Xerxes destroyed the city at the instigation of Thebes, 480 B.C. The Persian army under Mardonius, with a Theban contingent, fought the allied Greeks under Pausanias of Sparta before Plataea in 479.

Pausanias was forced to withdraw in some confusion, but rallied his army, and the heavy armed Greeks drove the Persians back to their camp, which was stormed with the aid of the Athenians, the Persian army being almost annihilated. This victory, following upon that of Salamis, decided the struggle.

The independence of Plataea was then guaranteed by the Greek states, but in the Peloponnesian War (*q.v.*) it was besieged, 429-427, and destroyed by Thebes and Sparta. In 372 the Thebans again destroyed it. See Greece.

Plate (late Lat. *platta*, a thin sheet of metal; cf. Gr. *platys*.

flat). Word used in various derivative senses, all suggesting something thin and flat. In household use, plates or platters were commonly made of wood or pewter until earthenware came into general use. In engineering, iron or steel plates are used in the construction of boilers and the hulls of ships.

In farriery the shoe put on a racehorse is called a plate, and the same word is also used for any prize given in horse-racing without any stakes provided by the owners of the horses engaged.

River Plate Battle. The scuttling of the German pocket battleship Admiral Graf Spee four days after taking refuge in the port of Montevideo, whither she had been driven by the naval force under Commodore Harwood

In photography, a plate is a glass support, coated with a sensitive emulsion. In metallurgy a plate is a sheet of metal above $\frac{1}{8}$ of an inch thick; such plates are made by rolling out an ingot or a billet in a suitable hot working temp. in lengths up to 40 ft., widths up to 12 ft., ordinary thicknesses up to 3 ins., armour-plates to 18 ins. In engraving, a plate is the metallic surface on which the engraving is done, and, by transference, the impression from the engraved plate. A general term for gold or silver articles, the word is also used in mineralogy and anatomy. In heraldry it means a rounded argent. See Electro Plating; Sheffield Plate.

Plate. Name sometimes given to the S. American estuary better known as the Río de la Plata, or River Plate. See La Plata.

Plate, BATTLE OF THE RIVER. Sea battle of the Second Great War, fought Dec. 13, 1939. Before the outbreak of war the Germans had sent the Admiral Graf Spee (14,000 tons; six 11-in. guns, eight 5.9-in. guns) out into the Atlantic ready to attack commerce. With two sister ships, she had been specially designed for this purpose, combining with an armament heavier than that of any

cruiser armour and a speed greater than that of any existing British battleship.

Indications of the raider's movements had been gathered from distress signals received by wireless from some of her victims. Commodore Harwood, in command of the S. America div. of the R.N., judging with a seaman's vision the Graf Spee's next move, concentrated 150 m. off the Plate estuary, in a focal trade area, three cruisers, the Ajax (his own ship) and the Achilles (manned by the R.N.Z.N.),

twins of about 7,000 tons each armed with eight 6-in. guns, and the Exeter, 8,390 tons, mounting six 8-in. guns. The Admiral Graf Spee was in theory capable of sinking all three of her opponents. Yet throughout the action her chief endeavour was to disengage herself, a course in which she was frustrated by the superior speed and determined pugnacity of the British ships.

Fire was opened at 6.18 a.m. on Dec. 13. At the outset the German captain made the mistake of dividing his fire between the Exeter on the one hand and the Ajax and the Achilles on the other, but on finding the 8-in. guns of the Exeter troublesome, he concentrated attention on that ship. In the first 20 mins. four out of her six 8-in. guns were disabled, but she continued to fire from her after-turret.

In the meantime the other two cruisers had been making excellent shooting with their more rapid firing 6-in. guns, and the action developed into a chase, the German ship making for the Plate estuary and putting out a smoke screen. After an hour, however, the Admiral Graf Spee appeared to find the situation intolerable, and steered directly for the Exeter as though she intended to finish off

the damaged cruiser. So effective was the fire of the Exeter's consorts, however, that the "pocket battleship" soon swung back on her original course, a fire appearing amidships as she did so.

Five minutes later the Ajax received her first heavy hit from an 11-in. shell. It put both her after-turrets out of action, reducing her armament to four 6-in. guns. In another five minutes the Exeter had to break off the action as her remaining turret ceased to operate through flooding. She had been on fire and had many casualties.

Almost at the same time the Ajax and the Achilles deliberately closed the range with the object of inflicting further damage on the enemy, in spite of the fact that at this juncture another of the Ajax's guns could not be fired owing to an accident, leaving her with only three in action. The Admiral Graf Spee turned away and zigzagged, putting out fresh smoke screens. All this time the gunfire of both British cruisers had been punishing the German ship severely.

By 7.40 the rapidity of the fire was threatening to exhaust the ammunition of the cruisers, so Commodore Harwood decided to hold off for a while and close in again at nightfall, when torpedoes might be used. For 12 hrs. the raider was shadowed, until she was well into the Plate estuary. From the fact that she had ceased firing with her after-turret it was conjectured that this had been put out of action. With the onset of darkness the cruisers closed in, regardless of an occasional 11-in. salvo, but the Admiral Graf Spee made for the port of Montevideo and anchored in the roads just after midnight. Four days later she came out of port and scuttled herself rather than renew the fight with the Ajax and the Achilles, by then reinforced by the Cumberland, mounting eight 8-in. guns. See Admiral Graf Spee; Harwood, Sir Henry; Pocket Battleship.

Francis McMurtrie

Plateau. In physical geography, a broad, flat, elevated region, or raised plain. Plateaux or tablelands may be classified as follows: (1) those built of accumulated materials; (2) those produced by the elevation of a former plain; (3) highland areas which have been denuded to plateaux. Examples of the first type are found in the W. Cordillera of N. America, and in similar highland regions.

The high plains, the famous ranching lands, stretching from Alberta to Texas, situated E. of the

Rocky mts., are plateaux caused by the raising of the adjacent plains resulting from the uplift of the Rockies. They, like similar regions E. of the Andes in S. America, and the Allegheny plateau W. of the Appalachian mts., are examples of the second type. To the third class, i.e. plateaux which are worn-down highlands, belong the Laurentian plateau of Canada, the Piedmont plateau E. of the Appalachian mts., the plateaux associated with the ancient highlands of Australia and the Highlands of Scotland. The most extensive plateau in the world is the continent of Africa, for the whole of that land mass, with the exception of the extreme N.W. and S.W., is of this type of relief. Owing to their elevation, plateaux have a cooler climate than neighbouring lowlands, but they are frequently arid.

Plateau Basalt. In geology, basaltic lava which, being very fluid, forms widespread flat flows. These flows piled one above the other form extensive plateaux. The lava is an olivine basalt, and its composition is remarkably constant wherever it occurs, so much so that many believe there is a worldwide layer of basaltic material of this character lying below the crust. Eruptions of plateau basalt are not violently explosive; the lava wells up quietly from fissures, as from the Laki Fissure (*q.v.*) in Iceland, and does not form volcanoes of the cone type. Extensive floods of plateau basalt have in the past been poured out in the Thulean area of N.W. Scotland — Iceland — Greenland; Snake river area in western U.S.A.; the Deccan, India; Patagonia, etc. See Geology; Igneous Rocks.

Platelayer. Term used for a man who lays and maintains the permanent way of a railway. Such men are so called from the type of rail first used, which was known as the plate rail.

Platen (French, *platine*). In printing, flat metal part of a press that, by pressing the paper against the type, makes the impression. A platen machine is one that has a flat as distinct from a cylindrical method of impression. See Printing.

Platen-Hallermund, AUGUST, COUNT VON (1796-1835). German poet. He was born at Anspach, Oct. 24, 1796, and entered Würzburg university in 1818, moving to Erlangen in 1819. After 1826 he lived chiefly in Italy, and he died at Syracuse, Dec. 5, 1835. In his Ghaselen, 1821 and 1823, Poems, 1833, and Polenlieder (Polish

Songs), 1831, he wrote Oriental and other pieces that contain his best work. As a dramatist he

Count von Platen-Hallermund, German poet

enjoyed success notably in the comedies *Die Verhängnisvolle Gabel* (The Fatal Fork), 1826; and *Der Romantische Oedipus* (The Romantic Oedipus), 1828, in which he assailed the ex-

ponents of the Romantic movement so strongly as to be himself bitterly attacked by Heine and other writers. Another notable play was *Die Liga von Cambrai* (The League of Cambrai), 1833. His collected works were pub. in 1839.

Plate Powder. Powder for cleaning silverware. Powdered chalk and jeweller's rouge in the proportions of three of the former to one of the latter, with enough water to make a paste, form a plate powder. It is applied wet with a rag, and polished off when dry with a soft cloth or brush.

Platinum (Sp. *platina*, dim. of *plata*, silver). Rare metallic element of great value. Spanish explorers found it in S. America before 1550 in the river sands, but the Spanish govt. would not allow it to be exported lest it be used to adulterate gold; as a result, quantities were thrown into the sea. It was first brought to England in 1741, and fused for the first time by Macquer and Beaume in 1758, by focusing the sun's rays on to it with the aid of a mirror.

The element, chemical symbol Pt, is the third transitional element in the third long period of the periodic table, being preceded by osmium and iridium, while it bears a marked resemblance to its neighbour palladium. Its atomic number is 78; atomic weight, 195.23; specific gravity, 21.4; melting point, 1,773° C.; boiling point, about 4,300° C.; electrical conductivity, 16 (silver being 100); crystal structure, face-centred cubic, with lattice constant $a = 3.915$ and an interatomic distance of 2.768 Å.u.

Quantities of platinum and the platinum metals were discovered in the Urals at the beginning of the 19th century, and these deposits remain the richest known. Other deposits of alluvial platinum occur, but except in Colombia and Abyssinia, these have been worked to ex-

haustion. In all these deposits platinum occurs chiefly in the metallic form. Crude platinum is always associated with varying amounts of osmium, iridium, rhodium, palladium, and ruthenium; also with gold, copper, and iron. The Ural mineral contains about 78 p.c. platinum, that of Abyssinia about 72 p.c., and of Colombia about 85 p.c. Up to 1916 over 90 p.c. of the world's production came from these deposits, but since then the main source has been the low-grade copper nickel ores of Sudbury, Ontario, Canada. Although this ore does not contain more than 0.007 fine oz. of platinum per ton, this becomes concentrated with the copper and nickel, and thousands of tons of ore are worked annually. World production is some 500,000 fine oz. a year.

The alluvial deposits are treated for recovery of the platinum metals by hydraulic concentration, and the crude metal is delivered to the refineries for further treatment. The Canadian ores need different treatment. Most of the platinum metals in them are recovered from anode slimes, resulting from the electrolytic refining of the base metals.

Methods of Refining

The crude metal, anode slime, or jewellers' scrap, is refined by a wet process. Preliminary concentration is carried out by smelting with lead, the lead ingots being cupelled and the silver-rich precious metal alloy attacked with sulphuric acid, which dissolves out the base metals and silver, leaving gold and the platinum metals. The residue is attacked with aqua regia, resulting in solution of gold, platinum, and palladium, but leaving rhodium, iridium, ruthenium, and osmium undissolved. The soluble portion is treated with ferrous sulphate to precipitate the gold, which is filtered off, refined, and marketed. Ammonium chloride is added to the filtrate, giving a precipitate of ammonium platinum chloride. After this has been ignited to sponge platinum, the liquor is made ammoniacal and the palladium is precipitated as palladous ammine chloride by the addition of an excess of hydrochloric acid, and this is ignited to crude palladium, which can be similarly refined. The insoluble portion from the aqua regia attack is smelted with lead, cupelled, and parted with nitric acid.

Rhodium is extracted by fusion with potassium bisulphate and

precipitated several times as ammonium rhodium nitrite, which is converted to the chloride and ignited to metal. The residue is fused with potassium hydroxide and nitre, giving soluble ruthenium and osmium compounds, leaving the iridium undissolved. This insoluble portion is dissolved in aqua regia and treated for precipitation of ammonium chloridate, which, after refining, is ignited to iridium. Ruthenium and osmium are distilled off from the filtrate and ultimately separated by volatilisation of osmium tetroxide. By this process each of the platinum metals is obtained pure.

Platinum is a white metal with a high metallic lustre, similar in appearance to silver, but with a greyish tinge. The metal, obtained in the form of sponge, can be compressed in a steel mould under a pressure of 5 tons per sq. in. and heated to 1,500°C., so forming an ingot which can be forged. It can be melted by an oxy-hydrogen flame in a stone hearth; more quickly in a high-frequency induction furnace. The ingot can be forged and rolled red-hot and finally either drawn or rolled cold, being readily reduced to foil or wire of a diam. less the 0.0005 in. By a special process even finer wire down to 0.00003 in. diam. can be produced. The annealed metal has an ultimate tensile strength of 10 tons per sq. in. with an elongation of 40 p.c. and a Vickers hardness of

50, but by cold work the tensile strength can be increased to 15 tons per sq. in. and the hardness to over 120. Platinum can readily be hammer- or fusion-welded. It does not oxidise even at high temps. Aqua regia will dissolve it, but it is virtually unattacked by other acids and only slightly by alkalis. It forms low-melting alloys with several metals.

Apart from its use in fine jewelry, platinum is widely used in the electrical industry for contacts, for which purpose it may be alloyed with iridium or ruthenium to make it harder. The wire is used for lead-in wires in thermionic and X-ray valves. Platinum resistance thermometers are used for precision measurement of extreme temps.

In chemical engineering, platinum is used for crucibles for molten glass and containers for corrosive chemicals; also as a catalyst. Platinum and its alloys have many applications in the dental industry, for laboratory ware, and for spinnerets for making glass fibre and rayon.

Platinum is available in several grades, the normal commercial alloy containing a small amount of the other platinum metals to increase hardness, while the purest, used for thermocouples, exceeds 99.999 p.c. platinum. For chemical plant, platinum of 99.99 p.c. purity is used. See Copper; Iridium; Gold; Osmium; Palladium; Rhodium; Ruthenium; Thermocouple. F. D. L. Noakes

PLATO AND PLATONISM

T. Callander, M.A., Former Professor of Greek, Queen's Univ., Canada

Related articles are those on Aristotle; Socrates; and other great philosophers. See Academy; Idea; Neo-Platonism; Philosophy; Sophists; also Greece; Greek Literature

Born at Athens, or in the island of Aegina, of distinguished family, Plato spent most of his life in the city of Athens, immersed in the study and the teaching of philosophy. He is said to have visited Egypt, Magna Graecia, and Sicily, and to have been captured and sold as a slave at Aegina, but the trial and execution of his teacher Socrates, 399 B.C., was by far the most moving incident in his long career.

Henceforth there was only one career for him, to carry on the mission of his martyred teacher. The record of that mission is set forth in the rich collection of Dialogues that have come down to us. Of the 35 treatises—many critics reject the Letters—ascribed to Plato, some 24 are probably

from his hand. Through these works his influence has been perpetuated throughout the civilized world to the present day.

In the make-up of Plato are discerned three strains seldom found so conspicuously united in a single mind. The acuteness and subtlety of the logician, the imagination of a seer and poet, and the enthusiasm of a shrewd but austere moralist are his in the highest degree. Typical of the first is the Theaetetus, with its keen analysis of logical scepticism as taught by Heraclitus and Protagoras; the second strain is dominant in the Phaedo and Phaedrus; the third in the Laws; while the Republic exhibits in perfection the blending of all three.

Plato, or Aristocles, as he was

originally named, was born two years after the death of Pericles, and the world in which he grew up was one possessed by a desire to correct and restore the distracted social and political system of Hellas. That system culminated in the city state of Athens, a thoroughgoing democracy. Plato set himself to understand Hellenic society in all its extent and depth, with the practical object of pointing out weaknesses and indicating reforms. In so doing he struck out a system of philosophy based on contemporary experience, designed to set forth the principles of life and conduct exhibited therein. The note of his conclusions everywhere is idealistic, and the whole question of the interpretation of Platonism depends on an understanding of these "ideas."

Theory of Knowledge

In discussing logical and metaphysical problems, Plato took over certain results attained by his predecessors, including Socrates. His primary task here was the refutation of various logical heresies advocated by famous philosophers or sophists, these comprising the leading educators of the period, in which sense Socrates himself was a sophist. To take an example: There was a treatise by Gorgias, written to maintain the disconcerting thesis—nothing is; if anything is, it cannot be known; if anything is and can be known, it cannot be expressed in words. As against this nihilistic doctrine, Plato built up a theory of knowledge that would account for the fact that men know and reason and act intelligently in a world not wholly incomprehensible.

Plato's argument starts from certain assumptions, of which three are often combined to form the outline of a logical theory, more or less consistent. First, it is plausible to hold that the world of things is composed of particular objects, all existing independently, despite mutual action and re-action; secondly, within the world of knowledge we are aware of a collection of thoughts each different from all the rest; again, particulars in the external world, objects in space, appear to have an existence of their own, separate and independent of thoughts about them. Plato, in his long series of dialogues, forces to the front the truer view: first, that the multitude of objects in space, while each is separate and individual, yet possess each a character which is shared by other objects; secondly, that the simplest thoughts, although they occur as particulars, are likewise each recognizable as

more or less the same as other thoughts; thirdly, that things in space not merely correspond to thoughts in the mind, but that they are capable of being known.

Particular things and particular thoughts are, he holds, what they are because, somehow, they embody a universal nature or form. As to particular objects in space, we are easily led to allow that there are such "universals," which enable us to recognize instance after instance of the same object in the external world. Further, we admit readily that thoughts in the mind may exhibit a sameness which in this region too compels us to con-

Plato, Athenian philosopher

cede these universals. But, when we are asked to admit that there is a common ground or character as between objects in space and thoughts in the mind, we are far from unanimous. The vast majority of philosophers part from Plato here, and diverge into the numerous forms of nominalism, sensationalism, and materialism which deny the ultimate identity of thought and things.

Particulars and Universals

The effort to expound the true relation of universals to particulars absorbs a great deal of Plato's energy. It speedily led him to lay stress on thought as the active principle in the world which we know. Ideas, he argues, are in the last analysis the substance of the world which we experience, and much of his language lends itself to the popular picture of this system as one which confused ideas with solid realities, and maintained that ideas were real and things unreal. This picture of Platonism ignores his strenuous search into the true relations between particulars and universals, facts and ideas. It cannot be said that Plato quite satisfied himself

as to his exposition of that relationship. He tried "imitation," "communion," "participation," as explanations, and found none of them adequate. His conclusion, however, is not far removed from that summed up in a modern formula like "identity in difference." Plato's dictum "what is wholly real is wholly knowable, and what is utterly non-existent is completely unknowable," answers to the modern assertion of "the unity of the intelligible world with itself and the mind that knows it."

His Idea of the Good

In the region of ethics and politics, Plato was the first thinker to offer a satisfying account of the principles that form and govern conduct and character. Socrates had dealt with the fluid and confused conceptions about right and wrong, vice and virtue, by persistent questioning of all who were thrown in his way. By exposing the contradictions involved in popular opinions about these matters, Socrates gradually moved towards a solution of his own perplexities; and the most remarkable of his conclusions is the familiar "virtue is knowledge." The intellectual aspect of morality implied by this definition, indeed, is frequently arraigned as a prejudice infecting Greek ethics in general. It is too much a matter of the head, too little of the heart; and the stress in that respect is differently placed in Christian ethic. But in Plato morality is far from being intellectual in the sense of abstract at any rate. Plato's "justice" is the virtue of the good citizen, and his idea of the good is to be realized in the life of the commonwealth. In the Republic it is from the larger life of the justly organized state or society that he reads off the features of the good life of the individual. Here is the embodiment, the actuality, even if imperfectly attained, or the idea of the good, which for Plato solves the riddle of the universe. In this idea of the good, which corresponds to the Christian God, he finds not merely the end of life, but the ground and cause of all existence.

The influence of Plato is to be estimated by the numberless thinkers and poets who have drawn inspiration from him. Plato was succeeded by disciples who undertook to carry on his teaching; but his true successor was Aristotle, who developed Platonism on more scientific lines.

particular note. The bellows act on the suction principle, the notes of the piano being actuated by the air which is drawn in when the holes in the perforated roll coincide with those in the tracker-bar. By levers the speed and the soft and sustaining pedals can be controlled, and expression and special melodic effects secured.

A later development was the introduction of separately controllable mechanism which reproduced with the utmost fidelity the individual performances of great artists. The piano is thus available in three distinct ways: (a) as an ordinary instrument; (b) as a mechanical player giving the performer's own interpretation; and (c) as a reproducer of the performances of celebrated pianists.

Playfair, LYON PLAYFAIR, 1ST BARON (1818-98). British chemist and politician. Born at Chunar, Bengal, May 21, 1818, and educated at St. Andrews and Glasgow universities and at Giessen, he became in 1842 professor of chemistry at the Royal Institution, Manchester. He was appointed chemist to the geological survey, 1845, and professor at the school of mines. He carried out a series of important investigations into nitroprussides, coals for steam navigation, the gases of the blast furnace, etc. Professor of chemistry at Edinburgh in 1858, in 1868 he was elected M.P. for Edinburgh and St. Andrews universities. In 1873 he became postmaster-general, presiding in 1874 over a commission on the civil service which introduced a new system called the Playfair scheme. He was M.P. for South Leeds in 1885, was made a peer in 1892, and died May 29, 1898.

Playfair, SIR NIGEL (1874-1934). British actor and theatrical manager. Born in London, July 1,

Sir Nigel Playfair,
British actor

1874, he made his stagedébut at the Garrick Theatre, London, in 1902, and developed into a character actor. He assumed control in 1918 of the Lyric Theatre, Hammer-
smith
(*q.v.*), where as sponsor of notable productions he revived interest in Restoration and 18th century drama, *e.g.* The Beggar's Opera (*q.v.*); The Way of the World; The Rivals. Other successes included an intimate revue, River-

side Nights, 1926; A. P. Herbert's Tantivy Towers, 1931. Playfair, who was knighted in 1928, severed his connexion with the Lyric in 1932. He died Aug. 19, 1934. He published The Story of the Lyric Theatre, 1926; Hammer-smith Hoy, 1930.

Playhouse, THE. London theatre situated in Northumberland Avenue, W.C.2. Built on the site of the Avenue Theatre which was partially destroyed in 1905, it was opened Jan. 28, 1907, under the management of Cyril Maude (*q.v.*), the first production being Toddles. Gladys Cooper, who had appeared here in 1920 in Home and Beauty, and who leased the theatre during 1927-33, played on its stage in many dramas and comedies, *e.g.* The Sacred Flame, 1930; The Painted Veil, 1932; The Rats of Norway, 1933. The theatre seats 679.

Playing-Card Makers, THE. London city livery company. It was granted a charter Oct. 22, 1628. The office is at Dacre House, Arundel St., London, W.C.2. See Cards, Playing.

Plea (late Lat. *placitum*, decree, decision). Formerly, a document in which the defendant in an action answered the plaintiff's declaration or statement of claim. A plea might be to the merits, or it might be in bar, or it might be a dilatory plea. The science of pleading was highly technical, and there was a race of great lawyers who did little else but draw these documents. The plea is now abolished, except in the lord mayor's court, London. Pleas of the crown is the English legal term for all criminal suits or causes in which the sovereign appears as the plaintiff.

Pleadings. In English law, the documents in which the plaintiff and defendant respectively state their cases. When, therefore, the case comes into court, the parties and the judge know what is the issue to be tried. Under the present system the plaintiff must first set out the facts on which he relies in a statement of claim. The defendant answers in a defence, in which he either admits or denies each or any of the plaintiff's allegations, and sets out also any affirmative facts on which he relies for a defence.

Pleasure (Fr. *plaisir*, from Lat. *placere*, to please). An agreeable state, due either to physical sensations or to a variety of

mental causes. These are originally of three kinds: those caused by exercise of body or mind; the pleasure of achievement; specific pleasures which accompany satisfaction of instinct, *e.g.* eating. To these are added as experience accumulates the pleasure of anticipation and other states of stimulation. Even the presence of danger may afford this type of satisfaction, but such tension passes over into pain if unduly intense or prolonged.

All healthy creatures seek pleasure and avoid pain. In human beings this mechanism is controlled to a large degree both by reason and by conscience. Neurotics who suffer from feelings of excessive guilt may reach a point where they cannot experience pleasure without its causing anxiety (see Inferiority Complex). Other anxious and guilty types feel a continuous need for pleasure, *e.g.* criminals seldom save money or put it to any useful purpose.

Psychologically, pleasure is a good. It alleviates anxiety, lessens irrational guilt, and encourages important virtues. A human being tends to be more reasonable, generous, and tolerant when happy than when suffering from frustration or pain. A thing that gives pleasure must be regarded as good, unless this attribute is swamped by other effects of the activity, *e.g.* in drug addiction. Most philosophers recognize pleasure as a major good; some think it the only good. Most religions regard it with suspicion if not with entire disapproval; Buddhists and Taoists consider that blessedness can be achieved only by the renunciation of all earthly desire. The common tendency is to divide pleasures into innocent and guilty, placing emphasis upon the danger of those connected with the sexual instinct. Most psychologists, however, would agree that the value of any pleasure must depend entirely upon its actual results in a given case and at a given time, *i.e.* upon its effects on the mental and physical health of the individual. See Pain.

Plebeian. Name given to the common people (*plebs*) of ancient Rome, as opposed to the ruling order of patricians. They were originally the subject peoples, resident aliens, and even fugitive slaves; but, as time went on and many of them attained to wealth and influence, they demanded some share of the political power which the patricians kept

Playing-Card
Makers' arms

in their own hands. The struggle lasted more than 200 years. In 494 B.C. the plebeians gained the right of electing special magistrates of their own, called tribunes: in 451 the Decemvirate was created to codify the laws and equalise them as between the two orders. The republican magistracies were successively thrown open to them, ending in 300 with the last of the priestly offices. See Patrician; Rome; Tribune.

Plebiscite (Lat. *plebs*, people; *scitum*, degree). Term originally applied to a law passed by the Roman people assembled in *comitia tributa*, i.e. by tribes. Such laws, at first binding only on the plebeians, or commons, were subsequently extended. In modern usage, a plebiscite is a vote by all enfranchised persons on a clearly defined issue. Such a vote decided the election of Louis Napoleon as prince-president of France in 1848, and again three years later. After the First Great War some frontier districts of Germany, notably Upper Silesia and S. Slesvig, voted to decide to what state they should belong. In 1935, a plebiscite of the local population returned the Saar to Germany. A plebiscite held in Greece in 1946 resulted in a vote by more than two to one for the king's return.

Essentials for carrying out a plebiscite so as fairly to reflect the will of the people are the careful framing of questions. In Austria in 1938, the chancellor, Schuschnigg, offered to put two questions to the electors: "Are you for the independence of Austria with Schuschnigg; yes or no? Are you for the independence of Austria without Schuschnigg; yes or no?" This proposal did not satisfy the Germans, who occupied the country by force on the night on which the plebiscite was to have been held. By the plebiscite held under German auspices a month later, over 99 p.c. of the electorate approved the Anschluss—a much higher proportion than would have been likely without intimidation. *Pron.* plebbissit. See Referendum.

Pledge. The delivery of goods by a debtor to a creditor as security for a debt. Pledges given to pawnbrokers are subject to special rules. The pledge which total abstinence societies invite the public to sign is a promise to become a life-long abstainer from alcoholic liquors. The actual form, of course, varies with different societies. See Pawnbroker.

Pléiade, THE. Group of seven 16th century French poets, Pierre de Ronsard, Joachim du Bellay, Daurat, Baif, Rémy Belleau, Jodelle, and Pontus de Thyard. They occupy an important position in literature from their determination to treat of great subjects. Consult Ronsard and La Pléiade, G. Wyndham, 1906; Literary History of France, E. Faguet, 1907.

Pleiades. In Greek mythology, the seven daughters of Atlas and Pleione, and companions of Artemis. When pursued by Orion they prayed to be turned into doves. Their prayer was granted, and they were placed among the stars.

Pleiades. In astronomy, a group of conspicuous stars marking the shoulder of the constellation of Taurus. To the eye six stars only are usually visible, but in the telescope over 2,000 can be seen. A typical open galactic cluster, the group is about 35 light-years in diameter and lies at a distance of 350 light-years, immersed in diffuse nebulosity.

Plein Air School. Name given to those painters who followed Manet in aiming at the realistic rendering of objects in full daylight, rather than in the modified and controlled light of a studio.

Pleistocene (Gr. *pleistos*, most; *kainos*, new). In geology, name given to the period of time between the end of the Tertiary and the beginning of history. It is also known as Post-Tertiary, Glacial, and Ice age, the two latter from the fact that it was a period of great cold and glacial formation. See Glacial Period; Horse; Ice Age; Megatherium; Tertiary.

Plender, WILLIAM PLENDER, BARON (1861-1946). British accountant. Born Aug. 20, 1861, he became senior partner of the firm of Deloitte, Plender, Griffiths and Co. in 1904. He served on the committee on Irish finance, 1911; the royal commission on railways, 1913; the committee on national expenditure, 1931; the coal mining royalties tribunal, 1937. Knighted in 1911, baronet in 1923, raised in 1931 to the peerage, the first chartered accountant so honoured, he died Jan. 19, 1946, leaving no heir.

Plenipotentiary (Lat. *plenus*, full; *potentia*, power). Diplomatic representative. He is accredited direct to the sovereign or head of the state. His full title is

envoy extraordinary and minister plenipotentiary. See Ambassador; Diplomacy; Envoy.

Plenty, BAY OF. Wide opening of the N.E. of North Island, New Zealand. Motiti, Mayor, and White are the chief islands. Numerous Maori settlements occur between the bay and Rotorua. Capt. Cook discovered the bay in 1769 and gave it its name.

Pleochroism. Optical property shown by certain minerals which absorb light differentially in different crystal directions. Sections or grains of some non-opaque minerals assume different colours as they are rotated on the microscope when viewed by transmitted plane-polarised light. Tourmaline, biotite, and many amphiboles show pleochroism.

Pleonaste. Name given to a mineral of the spinel group. In pleonaste the usual magnesium is partly replaced by iron. It is a black opaque mineral found in gneiss and the ejecta of some volcanoes. From its occurrence in Ceylon it is sometimes called ceylonite, or ceylanite.

Pleroma (Gr., fullness). Term meaning that which is filled or that which makes up the fullness. Of frequent occurrence in the N.T., it is used of God or Christ (John I, v. 16; Col. 1, v. 19; 2, v. 9; Eph. 1, v. 23; 3, v. 19; 4, v. 13). It implies the fullness of the Divine attributes which dwell in Christ and that of the virtues displayed by Him, both of which are imparted to true believers, as suggested in the parable of the vine and its branches, and should therefore animate the ideal Church. See Kenosis.

Plesiosaurus (Gr. *plēsios*, near; *sauros*, lizard). Extinct marine reptile found as fossil remains in Liassic rocks. Members of the order Sauropterygia, they had thick, lizard-like bodies, long flex-

Plesiosaurus. Fossil skeleton of the extinct marine reptile Victoria and Albert Museum, S. Kensington

ible necks with small heads, strong tails as long as the body, and powerful paddles for swimming. The length of the animal varied from 10 to over 40 ft., according to the family to which it belonged, and the jaws of the relatively small head were armed with powerful teeth, those of *pliosaurus* measuring 1 ft. in length. They must have been very common in the seas of the Lias. In 1928 the skeleton of one of these reptiles was unearthed at Harbury, Warwickshire, and is now in the Natural History Museum, South Kensington. See *Dinosaur*; *Lizard*.

Pleurisy. Inflammation of the pleura (*see* Lung), the serous membrane which covers the lung and forms the pleural space, in which the lung can move freely. There are two forms—dry or fibrinous pleurisy, and pleurisy with effusion.

Dry pleurisy can follow exposure to cold; it is a usual sign at the onset of pneumonia, and common in cases of pulmonary tuberculosis. The patient complains of acute pain, worse with every breath and with the dry cough which accompanies it. The sounds of friction are heard through the stethoscope; they are caused by the movement of the roughened surfaces of the membrane. The disease can cause adhesions between the two layers; these usually disappear in pneumonia, but where the disease is a sign of tuberculosis they become permanent. They may interfere with the movement of the lung, and can cause failure of the treatment of pulmonary tuberculosis by artificial pneumo-thorax (*see* Tuberculosis).

Sometimes dry pleurisy occurs at the base of the lung—diaphragmatic pleurisy. In this case the patient complains of pain in the shoulder of the same side. The condition can occur after chills or exposure; but is often a sign of tuberculosis, and sometimes indicates the presence of abdominal disease, particularly conditions which affect the liver. Occasionally intercostal nerves are inflamed by exposure and produce discomfort in the side of the chest; this is called pleurodynia, and is not connected with the lung.

Wet pleurisy, called also pleurisy with effusion, is more common than the other type. The onset is usually the same, except that in children and in elderly people it is often insidious. A predisposing factor is exposure, and while the underlying causative lung condition at all ages may be pneumonia or broncho-pneumonia, the

diagnosis of tuberculosis must always be considered, especially in adolescence and early adult life. At ages over 45 the possibility of a new growth in the lung or on the pleura should be borne in mind. As fluid is present in the pleural space, it compresses the lung, altering breath sounds to the stethoscope. Temperature lasts for a variable time and takes longer to subside where there is an underlying lung disease. In all cases a sample of fluid should be withdrawn by the physician, in order to examine its colour and consistency, and in particular to find its cellular and possible bacterial content. All cases of wet pleurisy should also have X-ray examination.

Every case of pleurisy in adolescent or adult life should be considered as tuberculous unless proved to be otherwise. The safest course is to avoid return to ordinary conditions of life and work within four months after the temperature is normal. It has thus been found possible to avoid the breakdown with active tuberculosis of the lung which often occurs three or four years after inadequate treatment.

Plevna or PLEVEN. Town of Bulgaria and capital of the co. of the same name. It stands about 90 m. N.E. of Sofia, on the Sofia-Varna rly., and has a branch line to Nikopolis, on the Danube. It is famous as the scene of great battles and of a siege (*v.i.*) in the Russo-Turkish War, 1877. Normally it has a large trade in cattle, and the country around produces good wine. Pop. 31,520. Plevna co. covers 5,960 sq. m. Pop. 996,686.

Plevna, SIEGE OF. Incident in the Russo-Turkish War of 1877. After its occupation by Osman Pasha, with an army of some 10,000 men, the Russians advanced against Plevna in the middle of July and invested the town. After a brief bombardment, they launched an attack, which was repulsed by the Turks with heavy losses, July 20. Five weeks later a second attempt was defeated with heavy losses. Extensive preparations were then made by the Russians, who collected 100,000 men and over 400 guns. Osman's troops numbered 30,000, and gave battle, Sept. 6-7, despite a furious Russian bombardment, succeeding in repulsing the Russians, who had called in Rumanians to their aid. But the investment of Plevna was tightened, and by Dec. 9 Osman found himself starved into submission, having withstood the

enemy's attacks with the utmost gallantry for over four months.

Pleyel, IGNAZ JOSEF (1757-1831). Austrian composer. Born at Ruppersthal, June 1, 1757, he became a pupil of Haydn. After having served as choirmaster at Strasbourg Cathedral, he conducted concerts in London and then settled in Paris, where he founded a piano business, which still flourishes, and where he died, Nov. 14, 1831. Pleyel composed much—symphonies, quartets, and an opera—but most of his work is now forgotten.

Plimer, ANDREW (1763-1837). British miniature painter. Born at Bridgwater, Somerset, he settled in London, and exhibited constantly at the Academy from 1786. His most notable miniatures were those of the Rushout family, especially the group of the Three Graces, representing the daughters of Lady Northwick. He died Jan. 29, 1837. His elder brother, Nathaniel (1751-1822), also made some reputation as a miniaturist.

Plimsoll, SAMUEL (1824-98). British politician. Born in Bristol, Feb. 10, 1824, and educated at

Samuel Plimsoll,
British politician

Penrith and Sheffield, he became a clerk in Sheffield, and in 1851 was honorary secretary for the Great Exhibition. In 1853 he settled in London as a coal mer-

chant and made attempts to enter parliament. He had already given much attention to the loss of life at sea caused by unseaworthy ships being sent out, and his entry into the house of commons as Radical M.P. for Derby, in 1868, gave him opportunity to draw attention to the subject. He introduced bills and wrote *Our Seamen*, 1872, the first result being the appointment of a royal commission, and the second the important Merchant Shipping Act of 1876. He resigned his seat in 1880, and spent the rest of his life in attempts to improve the conditions of seamen. He died at Folkestone, June 3, 1898.

Plimsoll Mark. Circle with a horizontal line drawn through it carried on both sides of all British-owned merchant vessels. It indicates the maximum depth to which they may be loaded, according to the season and the ocean, and takes its name from Samuel Plimsoll. *See* Load Line.

Plinth (Gr. *plinthos*, brick or tile). In architecture, the plain surface under the base moulding of a column or any other member. In classic building it was a low, square block, and square or octagonal plinths were retained long after circular capitals had become universal. In joinery, the plinth is the broad, flat part of a base board. See Architecture; Column; Masonry.

Plinth beneath base of a column

Pliny (A.D. 23-79). Roman soldier and writer, whose full name was Gaius Plinius Secundus. He was called Pliny the Elder to distinguish him from his nephew. Born at Novum Comum (Como), he went to Rome at an early age, and, having entered the army, held a cavalry command in Germany. He returned to Rome in 52, and, after some years spent in his native place, was in 67 appointed procurator in Spain. His last official post was that of commander of the fleet at Misenum, when he met his death at the eruption of Vesuvius, which he had gone on shore to examine. His nephew in his Letters has left a detailed account of his end. A man of unwearied industry, he was a prolific writer.

In addition to a handbook on using the lance, histories of the wars with Germany and of his own times, a manual of rhetoric, and a grammatical and stylistic treatise, he was the author of an encyclopedic work entitled *Natural History* (in the widest sense) in 37 books, dedicated to the emperor Titus in 77, in the compilation of which he read more than 2,000 volumes. After a general introduction, a sketch of the phenomena of the universe, and a gazetteer, the work deals with anthropology, zoology, botany, materia medica, mineralogy, painting, and sculpture. The whole is an ill-arranged collection of notes, but in the Middle Ages it was much read and imitated. There is an Eng. trans. with notes, J. Bostock and H. T. Riley, 1855-57.

Pliny, Roman writer From a statue

Pliny (A.D. 61-c. 113). Roman writer, whose full name was Gaius Plinius Caecilius Secundus. He was called the Younger to distinguish

him from his uncle. Born at Novum Comum (Como), he was adopted by his uncle, from whom he received an excellent education. Beginning as a pleader in the law courts, he had a successful public career, becoming quaestor in 89, tribune in 91, praetor in 93. His correspondence with the emperor Trajan when he was governor of Bithynia (c. 111) shows Pliny to have been possessed of high ideals, though narrow in outlook and lacking in initiative.

This correspondence is of peculiar interest, inasmuch as it contains Trajan's rescript on the treatment of Christians. Another letter is that to Tacitus describing the eruption of Vesuvius in 79 in which the elder Pliny lost his life. Pliny's Letters, published in nine books, suffer from the fact that they were obviously written for publication; to a certain extent they lack freshness and spontaneity. Yet they are of great value for the light they throw upon the life of the time. An edition by W. M. L. Hutchinson came out in 1915.

Pliocene (Gr. *pleion*, more; *kaínos*, new). In geology, name given to the uppermost division of the Tertiary system. Pliocene deposits are chiefly found in Europe, especially in France, Spain, Italy, Greece, and on a smaller scale in England, Belgium, etc. Norfolk and Suffolk crag, the Coralline crag, etc., consisting of shelly sand and clays, represent the Pliocene deposits in England. The Pliocene is comparatively poorly represented in N. America, though the Merced series of San Francisco run to a thickness of 6,000 ft.

The Pliocene deposits, the accumulations of shallow seas, and the estuaries of large rivers, are rich in fossils, particularly of molluscs, extinct fishes, reptiles, amphibians, and birds. The remarkable fossil of *Pithecanthropus erectus* (q.v.) probably belongs to this geological epoch. See Tertiary.

Plöck. Town of Poland, capital of the dist. of the same name. It stands on the right bank of the Vistula, 60 m. W.N.W. of Warsaw. There are manufactures of agricultural implements, matches, sugar, and soap; grain, timber, and sugar-beet are exported. There is steamer traffic by river to Warsaw. The 12th century Romanesque cathedral contains tombs of Polish dukes and kings. Plöck was formerly the capital of the principality of Masovia. It was captured by the Germans in their invasion of Poland in 1914, and was the scene

of a fight between Bolshevik and Polish troops in 1920. Overrun by the Germans in the second week of Sept., 1939, it was in German hands until liberated Jan. 21, 1945, after being bypassed two days earlier, during the rapid Russian advance into E. Prussia. *Pron.* Plotsk.

Ploegsteert. Village and wood of Belgium, in the prov. of W. Flanders. Known as Plug Street to British troops of the First Great War, the village is 8 m. S. of Ypres, and figured prominently in operations conducted by the British in the Ypres salient. Here is a memorial to 11,447 missing men. See Ypres, Battles of.

Ploesti. Town of Rumania, in Bucegi dist., 35 m. almost due N. of Bukarest. A centre of the great Rumanian oil industry, as a junction of railways and roads it is strategically important. During the First Great War it was captured by the Austro-Germans, Dec. 6, 1916. As Germany's main source of natural oil after 1941, it was heavily attacked by Allied aircraft in the Second Great War. The Germans fought bitterly against the Russians to hold Ploesti, Hitler having issued an order that it was to be held at all costs; but it fell Aug. 30, 1944, to troops of the 2nd Ukrainian army. Pop. 105,114. *Pron.* Ploy-esh-ti.

Plombières. Town and watering-place of France. In the dept. of Vosges, it stands in the valley of the Augronne, 7 m. S.W. of Remiremont, and is famous for mineral springs. Good for gout, rheumatism, and nervous complaints, these were known to the Romans, and there are remains of their extensive baths. Napoleon III, by frequent visits to Plombières, made it fashionable, and it was here in 1858 that he arranged with Cavour to assist Sardinia against Austria. The springs, 27 in number, are the property of the state. The chief buildings are the bathing establishments, casino, and others for the comfort and pleasure of visitors. The chief street is the Rue Stanislas, which took its name from Stanislas, duke of Lorraine.

Plöner See. Lake of Slesvig-Holstein, Germany. Midway between Kiel and Lübeck Bay is a group of lakes of glacial origin set amidst beech woods. The largest are Eutin and the Great Lake of Plön; others are Lanker, Keller, and Diek. The great lake is 6 m. long, 5 m. wide; on its shores is Plön, a steamer station, which reaches W. to the small Plön lake.

Plotinus (c. 205–270). Roman philosopher. Except that his parents were Roman, and he was born in Egypt, little is known of his early life because his contempt for material things led him to refuse to discuss them. He appears to have adopted early an asceticism, but it was free of any masochistic trait. About 233 he moved to Alexandria, where he came under the influence of Ammonius. He accompanied Gordianus to Persia in 242 to study eastern philosophy, but returned after the murder of the other. Teaching in Rome, Plotinus induced many of the wealthy to realize their property and embark on a life of asceticism. About 265 he secured from the emperor Gallienus two cities in Campania where he proposed to set up a replica of Plato's Republic; but difficulties had not been overcome before he died at Puteoli.

Plotinus has become to posterity a figure of great importance. He represents the attempted synthesis of all Hellenic wisdom, and is often regarded as the last great Grecian philosopher; but also he is the founder of Neo-Platonism, a doctrine of supreme influence in the history of Christianity. His teaching was based on the Platonic theory of ideas, into which he tried to incorporate the learning of Anaxagoras and Parmenides. His system arranges the universe in a number of planes which form a hierarchy; on each plane the soul has affinities, but the higher, non-material planes are most worthy of man's contemplation. The influence of Plotinus is found not only in all Christian philosophy, but upon all the realists from Spinoza to Whitehead. His *Enneades*, 54 treatises, were first edited by Porphyry and published in a Latin translation by Ficinus in 1492; the best-known English translation is by S. MacKenna, 1917. The finest English authority is W. R. Inge, whose standard works include *The Religious Philosophy of P.*, 1914, and *The Philosophy of P.*, 3rd ed. 1928.

Plough or Plow. Woodworking tool for "ploughing out" grooves. In contradistinction to other grooving planes, the fence of the plough can be set so that the grooves may be quite near the edge of the work, several inches away, or any distance between. There is a set of plough irons (usually eight) varying in width from $\frac{1}{8}$ in. to $\frac{1}{2}$ in.

Ploughing. Method of preparing the soil for crops. In the

cultivation of the soil, the plough is the most widely used implement. Although there are references to ploughing in the authorised version of the O.T., the modern plough has undoubtedly been developed from that used by the Saxons. The principle has always been the same: to invert the soil so that any vegetation or manure is buried and the underside of the soil exposed to the action of weather. With mechanical power almost any soil can be pulverised sufficiently to give what is called a seedbed or tilth; but the best tilth, which remains friable for weeks or even months, is obtained by weathering after ploughing. This leaves a film of moisture around each particle of soil, which

Ploughing. The body of a plough, showing principal parts

reduces the tendency of many soils to set hard after rain.

The plough is therefore the basic tillage implement. The backbone or beam of a plough for horse draught is a slightly bent steel member to which the following parts are attached: (1) Hake and chain, to which the horses are coupled. (2) Wheels; a furrow wheel to run in the furrow and a smaller land wheel to move along the unploughed side. The relative height and horizontal distance between these can be adjusted, so as to regulate the depth and breadth of the furrow. (3) Coulter, a knife for making the vertical cut in the furrow slice; its length and angle can be adjusted, and it is sometimes in the form of a revolving cutting disk. (4) Skim coulter, a sort of little ploughshare, used to pare off surface vegetation or turn in a top dressing of manure. (5) Handles, or stilts, used by the ploughman for guiding the plough.

The general pattern described was set in 1730 by the Rotherham plough. Shares were first used about 1785, and in the early 19th century types of breast or mould-board were introduced to meet the different requirements of autumn and spring work. A long breast with gentle twist (lea type) to set up the furrow slice on edge is used for autumn work; the short,

sharply-curved breast of the digger breaks up the slice in spring. That is the guiding principle, but a compromise between the two types is often used at any season.

Ploughing matches came into vogue at the end of the 18th century and still serve a useful purpose in encouraging efficient work, i.e. neat, straight, and complete inversion of the soil with ploughs adjusted to do their work with minimum draught and wear.

The one-way plough is reversible so that it may work to right or left. It carries two ploughing bodies secured above and below the beam so that one plough is in the air while the other is in use. They swing over at each end of the field for the return journey. On a disk plough the disks, usually about 24 ins. in diameter, are mounted at an angle so that they act as a scoop; but this method is not suitable for the general run of British conditions.

Up to the 1920s nearly all ploughing was done by horses, teams up to eight being used for such deep work as preparing for potatoes, although the more common sight was a pair with one man driving them and controlling the plough at the same time. With the development of the internal combustion engine for land use, ploughing was the first task to be mechanised. A 25-h.p. tractor pulls two or three furrows simultaneously, each cutting to a depth

Ploughing. Scheme for ploughing on a hillside

of about 8 ins., with 10 or 12 ins. as the customary depth. A standard figure for the power required for ploughing medium soil is 7 lb. per sq. in. of furrow cross-section. With crawler tractors of 90 h.p., work up to 30 ins. in depth is not unusual in Lincolnshire, and there is a general tendency to plough to a greater depth in all parts of the country.

Ordinarily, the soil is turned to the right hand, so that to start ploughing a ridge is formed by driving across the field, turning round, and coming back alongside the first cut. Several of these ridges are formed parallel to one another and furrows turned round and between them. The headland, which is left for turning, is ploughed when the main part is finished. In a few districts short turns at each end are avoided by ploughing round and round. The modern tendency is to mount the plough at the rear of the tractor so that it becomes an integral part of the power unit. This method ensures penetration and even depth of work in hard ground and makes the outfit more easily manoeuvrable than a tractor with trailed plough. Whereas one acre takes a man and two horses a day, between four and five acres a day is usual by medium tractor and two-furrow plough.

Plough Monday. In England, the Monday after Epiphany or Twelfth Day, after which the countryman's labours, symbolised by the plough, are resumed after the Christmas holidays. It was customary on that day, particularly in the N. and E. of England, for the ploughmen, decked with ribbons and sometimes wearing their shirts outside, to yoke themselves to a plough and drag it from door to door, begging plough money. In London a grand court of wardmote is held by the lord mayor at the Guildhall on Plough Monday, followed by a banquet.

Plovdiv. City of Bulgaria. Formerly known to Europeans as Philippopolis, it was so named after Philip of Macedon. Situated on the navigable Maritza, it is about 100 m. W.N.W. of Edirne (Adrianople) on the Sofia-Istanbul rly. The seat of a Greek archbishop and of Bulgarian and R.C. bishops, it contains fine churches and mosques. There is a court of appeal. A trading centre, the city makes silks, woollens, leather goods, and tobacco, exporting also grain, rice, and wine. In Roman times it was the chief town of Thrace; under the Turks it was capital of the

prov. of E. Rumelia. An earthquake brought disaster in 1818. The rly. yards were heavily bombed by the R.A.F. during the Second Great War on March 18 and April 17 and 19, 1944. Plovdiv, with a pop. of 99,883, second largest city in Bulgaria, gives its name to an administrative div. with an area of 6,115 sq. m. and pop. 801,755.

Plover. Name given to a large family of shore birds (Charadriidae), including the plovers proper, stilts, oyster-catchers, curlews, sandpipers, godwits, snipe, and others. Numerous species occur in Great Britain. The golden plover (*Pluvialis apricaria*) has

Plover. Hen of the Kentish plover, *Leucopollus alexandrinus*

greyish-black plumage spotted with yellow on the upper parts, and black below, and is about 11 ins. long. It is not common, especially in the S. counties, but it breeds in many localities in the N., nesting on the ground among the heather. As it is highly esteemed for the table it is given little chance of increasing in numbers.

The grey plover (*Squatarola squatarola*) closely resembles it in size and appearance, but is without yellow spots. It no longer breeds in Great Britain, but is found near the shore as a winter migrant. The Kentish plover (*Leucopollus alexandrinus*) is small and pale in colour, with black and white head, and occurs in summer along the coasts from Sussex to Yorkshire. The ringed plover (*Chadrius hiaticula*) is distinguished by its black and white collar, and is nearly eight ins. long. Around the coasts it feeds upon small crustaceans, nesting in the sand or shingle a little above high-water mark. The green plover is very common, and is better known as the peewit or lapwing (*q.v.*) See Dotterel; Egg colour plate.

Plug. Material fitted into a hole made in a wall, etc., for holding a screw. This screw or

nail holds in turn a fitting in wood, metal, or other material; alternatively a picture or mirror may hang from a small fitting fixed into a plug. Formerly plugs were of wood. It was thought by many that large plugs, having greater holding area, also had stronger grip, but this theory was disproved by the introduction of an ingenious patent fibre plug which is cylindrical and hollow, and is made in various sizes to suit the gauge of screw used. The plugging process is as follows: the hole is hammered into the wall with the patent bit and bit holder supplied with the plugs, the bit being revolved slightly after each stroke; the plug is then tapped in; and the screw is entered, the effect being to swell the plug, and compress it into the fabric of the wall. Great holding power results.

Plug. Apparatus used by the electrical engineer for speedy connexion or disconnexion of a portable appliance or instrument to or from a fixed set of electrical contacts. The plug consists of a number of brass pins of round, square, or oblong cross-section fitted to an insulated base and cover, with terminals for the connexion of a multi-cored flexible lead. The socket outlet into which the plug fits has circular or flat contacts. Three-pin plugs are largely used, the third conducting to earth. Standard sizes are 2 and 5 amperes for lighting circuits; 15 amperes for electric heating circuits. An all-purpose fused plug and socket of 13 amperes maximum capacity is also standardised. Socket outlets are sometimes combined with a switch and over the live contacts have shutters which close when the plug is withdrawn.

Plug. A three-pin electric plug

Plum (*Prunus*). Fruit-bearing trees of the family Rosaceae. The genus includes damson, greengage, bullace, sloe. The ordinary plum (*Prunus domestica*), though found wild, is not a native of the U.K.; it usually forms the stock upon which are grafted the choicer varieties, of which there are now in cultivation close upon 200. The plum flourishes in a fairly light soil, with a mixture of lime for preference. The more highly cultivated sorts like shelter, and are best grown as bushes, espaliers, fans, or cordons against walls.

They are propagated by grafting in spring or by layering in autumn. In dry seasons the soil round the stems of the trees should be mulched with manure, as the plum is a shallow-rooting subject. Standard plum trees should be planted 15–20 ft. apart; espaliers 12 ft. apart. Standard trees need only sufficient pruning to keep the centre of the tree open, in order to admit light, air, and sunshine. On walls the pruning necessary to keep trees in shape will be found ample for all needs. *See* Bladder Plum; Damson; Fruit; Greengage; Sloe.

Plumage. Collective term for the feathers with which birds are clothed. The plumage of young birds differs from that of adults of the same species, and after they have reached maturity they are subject to periodical moultings, in some species once, in others twice a year. The Importation of Plumage (Prohibition) Act, 1921, forbids the importation of plumage of most birds. Exceptions are jays, magpies, ostriches. *See* Birds colour plate; Feather; Protective Colouring, colour plate.

Plumbaginaceae OR **PLUMBAGO FAMILY.** Family of herbs and a few shrubs, natives of all regions. They have regular flowers, with a tubular, five-lobed calyx, and five petals with long claws which are usually united to form a tube. There are about 300 species in ten genera, which include the familiar sea pinks (*Armeria*) and sea lavenders (*Statice*).

Plumbago (*Plumbago capensis*). Climbing or trailing shrub of the above family Plumbaginaceae, native of S. Africa. It has alternate, oblong leaves, and short spikes of pale blue, salver-shaped flowers.

P. rosea, from the East Indies, has an erect stem, branching above, and long spikes of rosy-scarlet flowers. The Chinese plant called Lady Larpent's plumbago (*Ceratostigma plumbaginoides*) belongs to an allied genus.

Plumbago. Alternative name for the mineral form of carbon more commonly known as graphite (*q.v.*). It is widely used for the manufacture of refractory crucibles in metallurgy. Owing to its lack of plasticity, it is mixed with 50 p.c. of refractory clay. After moulding, the crucibles are dried and then burnt in kilns, but they tend to pick up moisture and

Plum. Two varieties of the fruit produced by cultivation. Above, Pond's Seedlings, and, left, Coe's Golden Drop
Photos: C. W. Teager

should be slowly heated to a red heat before use. The amount of water absorbed can be considerably reduced by applying a waterproof glaze. The crucibles withstand rapid and repeated changes in temp. without cracking.

Plumber (*Lat. plumbum*, lead). Term for a worker in lead, but now used for any workman who is concerned with the fixing and mending of pipes, etc., used for water supply, and sanitary fixtures of a building. A plumber's work also consists in protecting roofs with sheet lead, the fixing of water gutters and other rain-water conductors, pipes, and their connexions. The term plumber is occasionally used for workmen who fit any kind of piping. *See* Plumbing.

Plumbers' Company, THE. London city livery company. Its records date from about 1365, but it was first incorporated in 1611. The hall in Chequer Yard, Dowgate Hill, rebuilt 1830, was removed in 1865, and the site is covered by Cannon Street rly. station. In recent years the company has done much to promote the technical education and registration of plumbers. The office is at Temple House, Temple Avenue, E.C.4. *Consult* The Plumbers' Company in Ancient and Modern Times, 1902.

Plumbing (*Lat. plumbum*, lead). Working with lead. Plumbing is a very ancient trade, recognized even in Roman times as liable to injure the health

(Vitruvius, Bk. viii, cap. 6, "deep Plumbers' Co. arms

palor," of plumbers). Strictly it should include only actual lead work, such as structural shaping and laying of sheet lead coverings on roofs; making flashings to render joints waterproof, *e.g.* between chimney stacks and roof covering or the valley junctions of two roof slopes; making and fixing lead gutters and lead pipes. But the

term has come to connote not only lead work but also the installation and maintenance of all water and drainage pipes and fittings in buildings.

Plumbing formerly involved beating out lead from "pigs" or ingots into the shapes required, or a sheet. Now it is sold in machine-rolled sheets, and in seamless pipes extruded from a press. In structural plumbing sheet lead is cut and beaten to shape to fit the place to be covered, and secured in place by tacks or screws. Contiguous sheets are joined by "burning" with a blow lamp or lead burning machine, or soldered with a suitable soldering iron. The solder is usually a mixture of tin and lead, and a flux may be necessary to make it flow and adhere. Solder can be bought made up with the necessary flux, so that nothing but heat is required to make it flow on to and attach itself to the parts to be treated, which must be clean.

Sanitary plumbing may still, and often does, involve the use of lead pipe, but it is now possible to form a complete sanitary installation without the use of lead. Details of each system must conform to the regulations of the local authority, though in general plan all installations are similar.

WATER SUPPLIES IN BUILDINGS. The water supply system consists essentially of an incoming supply pipe, which can be isolated from the main by a valve or stop-cock. The pipe should be protected against frost. A supply pipe connected to a public main may at times bring in water at a temp. so much below that of the air inside the building that moisture will condense from the air on to the pipe in sufficient quantity to drip off. This can be prevented

by coating the pipe with a protective sweat-preventing paint or by any suitable thin lagging, two or three thicknesses of newspaper usually being enough to slow down the rate of heat exchange between the pipe and the air to such a rate that condensation will not take place. The supply pipe may be connected to the cold water flow pipes and taps direct, or it may deliver into a storage tank or cistern through a ball valve which will stop the inflow before the tank overflows. If this arrangement is adopted some local authorities insist on the provision of a tap to deliver drinking water on the pipe supplying the tank. This is necessary only if the storage tank is not properly covered and protected from contamination.

The hot-water system must be fed through a ball-valve controlled cistern, and must contain a hot-water storage tank, usually called a cylinder, because it is generally convenient to use a cylindrically shaped tank. As a rule the pipe from the cistern is led to the bottom of the cylinder, from which a pipe called the return pipe is led to the boiler. The flow pipe leads from the boiler to the top of the cylinder. The flow and return pipes must be so arranged that as the water becomes hot and lighter it will rise and let the heavier cold water follow it into the boiler, setting up a steady circulation through the system. An expansion pipe must be led up from the top of the cylinder to above the water level of the storage tank, to permit the escape of air driven out of the water, or of steam if any is formed. The delivery pipes to the taps may be taken off the flow pipe before it enters the cylinder, but are more usually taken off the top of the cylinder, which enables the user to draw hot so long as there is any in the cylinder.

Central heating by hot water (described under Heating) is also the concern of the plumber in the contemporary meaning of the term; its design and installation requires theoretical knowledge as well as practical experience.

HOUSE DRAINAGE. The essential feature of a good drainage installation is the rapid removal outside and away from the building of all dirty water in such a way that no nuisance can arise from the presence of foul gases. The discharge from water-closets and from kitchen sinks is taken in a continuous pipe, usually 4 ins. in diameter and called the soil

pipe, from the fitting to the house sewer. Some British local authorities allow bath and wash-basin water into the soil pipes, others insist on a separate down pipe for them, which may be 3 ins. in diam. delivering into the house sewer through a back entry gully trap. When a separate pipe is used, it is common to cut off, in the air above the head of the down-pipe, the actual discharge pipe from the fitting.

All fittings must be provided with a waterseal to prevent any gas from passing back from the system into the house. Even when a discharge pipe is cut off in the air above a down pipe, a water seal should be inserted in the discharge pipe, for even a short length of unsealed pipe can give rise to odours, chiefly derived from the decomposition of soap, which, though generally harmless, are yet extremely unpleasant.

In the U.K. water-closet fittings must conform to local by-laws. The essentials are a flushing cistern capable of discharging its whole contents, $2\frac{1}{2}$ to 3 gals., at one pull of the operating chain or lever, and refilling quickly, and a bowl of non-absorbent material of such a shape as to hold sufficient water for the excreta to fall into it free of the sides of the pan, and also of such a shape that when the flush is operated the whole contents of the pan will be swept out. The bowl must discharge into the house sewer through a trap or water seal which is usually a pipe formed in the shape of a capital P, or a capital S, laid on its side, in which water will always be left standing high enough in the dip to leave no passage for air over its surface. Where water-closets discharge into one soil pipe, an air pipe called the antisiphonage pipe must be led up from the discharge pipe of each water-closet just after the seal to a point above the highest water-closet connexion in order to prevent the rush of water down the soil pipe from one closet acting as a vacuum pump and sucking the water out of the seal of another. The anti-siphonage pipe can be taken itself above roof level, or connected into the soil pipe above the connexion to the highest water-closet. To ensure efficient ventilation the soil pipe must extend backwards from the water-closet junction to a point above all windows, and preferably above roof level. The entry of foreign bodies should be prevented by a wire mesh cap.

The house sewer, usually 4 ins. diam. and laid if possible on a

gradient of 1 in 40, leads to the nearest public sewer or, where there is no public sewer within reasonable distance, may terminate in a cess pit or cesspool (*q.v.*).

PIPES AND FITTINGS. Formerly all the pipes used in a building were made of lead. From c. 1850 cast iron, wrought galvanized iron, or copper has tended to replace lead. Down pipes for rain water and 'soil pipes for sewage are nearly always made of cast iron. The former are usually loose jointed, the spigots resting in the sockets; the former are joined with yarn and lead caulking or, occasionally, cement. Water supply pipes are usually galvanized wrought iron tubes, screwed into sockets, in all the straightforward lengths, taken round corners or divided into branches by screw-socketed or screw-spigoted special shapes. It is common to use short lengths of lead pipe to connect them to the fittings, partly because it is easier to shape lead pipe to suit each place than to bend iron pipe, and partly because there is much less danger that lead pipe will put a strain on the earthenware of wash-basins, etc., which might crack it. The junction between lead-pipe and galvanized pipe, and between lead pipe and taps and fittings, and even between two lead pipes, is usually by a "wiped" or "soldered" joint, effected by pouring molten solder on the joint and "wiping" it to shape by a hand encased in a thick, well-greased glove. Copper pipes are made with specially prepared spigots and sockets which need only to be fitted into one another and heated, with a blow lamp, to form a braised joint. Lead and cast-iron pipes and even galvanized iron pipes in course of time are liable to corrosion by soft, slightly acid waters. Copper pipes are free from this disadvantage.

Whatever pipe system is installed, stopcocks should be inserted which will make it possible to isolate parts of the system while effecting minor repairs, such as renewing tap washers, without shutting down the whole. See Drainage; Sanitation; Sewerage.

F. C. Temple, M.Inst.C.E.

Plumb Level. Device used for maintaining a vertical surface. It consists of a narrow length of wood having parallel edges and a straight line scored down the centre from the top to a hole cut to receive the weight of a plumb line (*v.i.*). The line is secured in notches at the top of the wood, and when

the length of wood is vertical the line lies in a groove. Some plumb levels have a spirit level in the top.

Plumb Line. Device used by builders to determine the verticality of a surface. A length of cord has at one end a cone-shaped plummet of brass or lead. When fixed or held by its free end, the plumb line adopts a position so that the point of the weight is directed to the centre of gravity of the earth. If the object being tested is not truly vertical, the space between the plumb line and the object will taper towards the top or bottom.

Plume Bird. Name sometimes applied to the genus *Epimachus*. See Bird of Paradise.

Plume Moths. Small, elegantly shaped moths belonging to two families. The wings are cleft into narrow plume-like divisions fringed with hairs along their margins. In the family *Pterophoridae* the forewings are longitudinally cleft into two or, more rarely, three or four divisions, and the hind wings into three. Some 32 species are British. In the *Orneodidae* family both pairs of wings are cleft into six or more divisions; only one species is British.

Plumer, HERBERT CHARLES ONSLOW PLUMER, 1ST VISCOUNT (1857-1932). British soldier. Born March 13, 1857, he went from Eton to a commission in the York and Lancaster Regiment in 1876. He served in the Sudan, 1884, and in 1896 as a major raised and com-

Lord Plumer, British soldier

manded a mounted force during the Matabele rising. After service in the S. African War he became a major-general. He was made quartermaster-general, with a seat on the army council, 1904, and during 1911-14 commanded the northern district. In 1906 he was knighted.

Plumb level and line

In Jan., 1915, Plumer was sent to France to lead the 5th corps, and in May assumed command of the 2nd army. The great British attack on Messines (*q.v.*), which Plumer directed in 1917, was regarded as one of the best planned and executed operations of the First Great War. From Nov., 1917, to March, 1918, he was G.O.C. of the expeditionary force to Italy, and then returned to the 2nd army. In 1919 he was made a field-marshal and a baron. Governor of Malta, 1920-24, and high commissioner for Palestine, 1925-28, raised to a viscounty in 1929, and died July 16, 1932. The 2nd viscount died, Feb. 24, 1944, leaving no heir. *Consult* Plumer of Messines, C. Harrington, 1935.

Plumpton. Village of Sussex, England. It is 44 m. S. of London and is served by rly. The church is mainly Early English, and there is a racecourse at which meetings are held from Sept. to May. Pop. 764. There is also a Plumpton in the W. Riding of Yorkshire 2 m. from Knaresborough.

Plum Pudding. National Christmas dish in England. It is composed of raisins, sultanas, currants, lemons, chopped apples, candied peel, sugar, breadcrumbs, flour, suet, salt, spice, and eggs. These mixed materials are generally, though not necessarily, moistened with beer or stout and brandy. The quality of the pudding largely depends on the stirring and mixing. When ready it is either put into a pudding basin with a cloth tied tightly over it, or boiled in a cloth. In either case the time of boiling should be from six to eight hours. In Elizabethan times neither cloth nor basin was used, and the dish from which the Christmas pudding has evolved was known as plum porridge.

Plumstead. London district. Part of the met. bor. of Woolwich, it is in Kent, 10½ m. by rly. E. of Charing Cross, and is served by tram and bus. The church of S. Nicholas, with early 17th century square tower, was displaced in 1864 as the parish church by S. Margaret's, built 1858. In High Street are public baths, public library, opened 1904, and S. Nicholas hospital. In addition to the marshes, the open spaces include Plumstead Common, Bostall Heath, acquired for the public in 1877-78, and Bostall Woods, acquired in 1892, in all nearly 134 acres. Woolwich Arsenal football ground was once in the dist. Plumstead was heavily bombed in 1940 and 1944. Pop. est. 50,000.

Plumstead manor was given by King Edgar in 960 to the abbot and monks of S. Augustine's, Canterbury, and in the 18th century passed to Queen's College, Oxford. The marsh was walled by the monks of Lesnes or Lessness Abbey, but after 1527 its 2,000 acres lay under water for 36 years, until the work of reclamation was begun in 1563 by Giacomo Aconzio; part is used for gun-testing.

Plunket, WILLIAM CONYNNGHAM PLUNKET, 1ST BARON (1764-1854). Irish lawyer and politician. Born

Plunket

at Enniskillen, July 1, 1764, he studied law at Dublin university and Lincoln's Inn, London, and was called to the Irish bar in 1787. Plunket entered the Irish parliament in 1798 in the Whig interest, and strongly opposed the Union. He was Irish attorney-general, 1805-07, and again in 1812. He first sat in the British parliament in 1807, as a champion of Catholic Emancipation. From 1812 to 1827, with one short interval, he represented Dublin university, and then was appointed chief justice of the common pleas, entering the house of lords as Baron Plunket. In 1830 he was made lord chancellor of Ireland, retaining the office until 1841. He died Jan. 5, 1854.

Plunket, WILLIAM CONYNNGHAM PLUNKET, 4TH BARON (1828-97). Irish prelate. A son of the 3rd Baron Plunket, he was born in Dublin, Aug. 26, 1828. Educated at Cheltenham and Trinity College, Dublin, he was ordained in 1857. In 1869 he became precentor of S. Patrick's cathedral, Dublin; in 1876 was consecrated bishop of Meath; and from 1884 to 1897 was archbishop of Dublin. A leader among evangelicals, he took a prominent part in resisting disestablishment and afterwards in directing the Church on its altered career. He succeeded to the title in 1871 and died April 1, 1897.

The 7th baron, Patrick (b. Sept. 8, 1923), succeeded his father in the peerage in 1938.

Plunkett, SIR HORACE CURZON (1854-1932). Irish statesman. Third son of the 16th Baron Dunsany, he was born Oct. 24, 1854, and after passing through Eton and University College, Oxford, made a fortune as a cattle-rancher in Montana, 1879-89. A strong sup-

porter of cooperative methods in agriculture, he founded the Irish Agricultural Organization Society in 1894. He sat as Unionist member for Dublin co. S., 1892-1900; acted as chairman of the Irish Convention, 1917-18; was a senator of the Irish Free State, 1922-23; and died March 26, 1932. Among his writings are Ireland in the New Century, 1904; A Better Way, 1914; Home Rule and Conscription, 1918.

Pluralism. Practice of holding more than one ecclesiastical benefice at the same time. The abuse of pluralities arose early in the history of the Church, for it was forbidden by the council of Chalcedon, 451, and again by the second council of Nicaea, 787. It was forbidden in England by Act of parliament in 1529, but during the Georgian period it revived to a scandalous extent. Acts of 1838 and 1885 made pluralities illegal, except in respect of very small livings with few parishioners, in which case the archbishop can grant a dispensation, if he thinks fit, for a clergyman to hold two livings, providing that the churches are within four miles of each other, and that the annual value of one of the livings does not exceed £400. See Benefice; Ecclesiastical Law.

Plural Voting. Name given to an electoral system that allows a man to have more than one vote at the same election. In the U.K. a person might be on the register of voters for several constituencies, e.g. in one as a resident, in others as an occupier of business premises, or as a university graduate. After 1918 he could exercise only two votes, one in respect of residence and another of any other qualification. An Act of 1948 abolished all forms of plural voting, including the university franchise.

Plus Fours. Article of male attire. A form of baggy knickerbockers, originally worn when playing golf, the dress became popular between the Great Wars. The name is believed to have originated during the First Great War, when Guards officers wore wide trousers and puttees with khaki service

Plus Fours as worn by a golfer

Pluto. Statue of Pluto and Persephone by Bernini
Borghese Museum, Rome

dress; regulations required the trousers to hang over the tops of the puttees, plus four inches below the knee. Another suggestion is that the term was derived from the largest official golf handicap, plus four.

Plush (Fr. *peluche*, from Lat. *plius*, hair). Fabric with a pile longer and more open than velvet. It is used for cloaks and upholstery. Plushes have a pile normally of silken mohair. Hatter's plush, used to make men's silk hats, is a special variety.

Plutarch (c. 48-122). Greek biographer and philosopher. He was born at Chaeronea, and appears to have spent a considerable time in Rome, where he lectured on philosophy and enjoyed the favour of Trajan and Hadrian, but his declining years were passed in his native town. Plutarch's fame rests almost entirely on his *Parallel Lives*, a collection of 46 biographies of notable men, nearly all in pairs, one Greek, the other Roman—e.g. Alexander the Great and Julius Caesar. The resemblance between the pairs is often slight. They are of great historical interest, much of the matter being based on authorities now lost, and much historically inaccurate. Shakespeare drew upon Plutarch through North's translation for his classical plots. Plutarch was also the author of numerous essays on a wide variety of subjects, grouped under the general title *Moralia*.

Bibliography. Translations of the *Lives* by Sir T. North, 1579; J. W. Langhorne, 1770; B. Perrin, 1914; *Roman Lives*, G. Long, 1844-47; Popular Introduction to Plutarch, R. C. Trench, 1873; The Religion of Plutarch, J. Oakesmith, 1902.

Pluto (Gr. *Ploutōn*). Roman name for the god of the lower regions, more commonly known to the Greeks as Hades. He is regarded as (1) the stern and relentless ruler of the horrible underworld; (2) a beneficent chthonian deity, who distributes to mankind the products of the earth, both mineral and grain. His wife was Persephonē, whom he carried off while she was gathering flowers at Enna in Sicily. He is not to be confused with Plutus, the god of wealth, although etymologically they are identical. See Hades; Persephonē; Tartarus.

Pluto. Planet, ninth in order from the sun, discovered photographically by Tombaugh at the Flagstaff observatory in 1930. Calculations by Lowell in 1915 had predicted, with a degree of uncertainty, the position of a planet beyond Neptune, having a disturbing influence on Uranus. After examination of over half a million star images, an object of the 15th magnitude moving at about the predicted speed, was discovered on Jan. 23, 1930. The actual orbit of Pluto is much closer to that predicted than the accuracy of the observations warrants, and to that extent the discovery was by chance; but without Lowell's work the search would probably not have been made.

The period of Pluto is 248.4 years and its mean distance from the sun 3,675 million m. The eccentricity of its orbit is so great that the planet actually comes within Neptune's orbit when it is closest to the sun. It is too small to be seen as a disk in the biggest telescopes, and therefore little is known for certain of its physical characteristics.

Pluto, OPERATION. Code name for Pipe Line Under The Ocean, the petrol supply pipes laid across the bed of the English Channel to supply the Allied armies which invaded the Continent in 1944. The pipes were of two types: one resembling a submarine electric power cable without the cores, 3 ins. in diameter and armoured to withstand working pressures up to 1,300 lb. per sq. in., was made in 70-m. lengths; the other was a 3-in. diameter steel pipe welded into continuous lengths of 30 m., and had the code name Hamel. The pipes were flexible and wound on large floating drums. As the drums were towed by a tug the pipe was unwound and sunk to the seabed. Pluto was connected to the 1,000-m. network.

Plymouth, Devon. Plan of the city, and the docks and shipbuilding yards at Devonport, before the devastation of 1940-44

of oil pipe lines laid across England early in the Second Great War to link ports with the internal distributing centre. High-pressure pumping stations on the S. coast forced the oil through the under-water pipes, which at the height of the campaign in Europe were carrying 3,000,000 gallons a day.

Pluto Monkey (*Cercopithecus pluto*). Species of guenon monkey, better known as the black-bellied monkey. It occurs in Central Africa, and the general colour of its hair is black, grizzled on the head and back. It is conspicuous for its bushy whiskers.

Plutonic Rocks. In geology, name given to those igneous rocks which have consolidated at considerable depths below the surface of the earth, and have been brought to the surface by various agencies. They are distinguished from the volcanic rocks formed near the surface. Granites are plutonic rocks. See *Igneous Rocks*.

Plutonium. Radio-active element, at. no. 94, first discovered in 1940 as a product of the bombardment of uranium 238 with deuterons, and isolated in 1942 as plutonium 238. Very much larger quantities of another isotope (plutonium 239) were obtained from the bombardment of uranium 238 with slow neutrons in atomic

piles. Evidence has since been found for the occurrence of very small traces in natural uranium deposits. Plutonium 238 and 239 emit α -rays, with half-lives of 50 and 24,110 years respectively; plutonium 241 (from the bombardment of uranium 238 with helium nuclei) emits β -rays. All forms undergo fission on bombardment with neutrons over a wide range of energies, so that a chain reaction as with uranium 235 is possible; plutonium therefore provided an alternative material for atomic bombs. A plutonium pile for the controlled production of atomic energy was set up at Los Alamos, N.M., in 1946.

Pluviôse. The fifth month in the year in the calendar of the French Revolution. It began on Jan. 20 or 21 and lasted 30 days. The word means the month of rain.

Plymouth. City and co. bor. of Devon, England. Since 1914 it has included Devonport and Stonehouse, being popularly known as "The Three Towns." It is situated at the mouth of the Plym at the head of Plymouth Sound, one of the deep and commodious estuaries formed by the submergence of a river valley characteristic of S.W. England. It is served by British Rlys. (W. Region) and has extensive docks;

within the breakwater a large number of ships can find safe anchorage in Sutton Pool, Millbay, the Catwater, the Hamoaze, in readiness to enter the floating basin, graving docks, or to reach the dock wharves.

Plymouth is a mail station for fast traffic from overseas to London, and is one of the chief fishery stations on the S. coast. The naval station is at Devonport. Plymouth Hoe is a ridge between Millbay and Sutton Pool; it is the property of the town council, and on it are a fine statue of Sir Francis Drake, and part of the old Eddystone Lighthouse as a monument to Smeaton. On the Hoe, too, is the Citadel and a memorial to men of the Royal Navy who fell in the First Great War.

Plymouth was the first town in England incorporated by act of parliament, Nov. 12, 1439. During the mayoralty of Sir Francis Drake in 1585 were constructed the municipal waterworks, reputedly the oldest in England. Called by the Saxons Tamarworth, and Sutton by the Domesday chroniclers, the town became Plymouth

Plymouth arms

in the reign of Henry VI. From the port sailed the Black Prince for France and the victory at Crecy; Drake, Hawkins, and Cook on their celebrated voyages. Hence sailed the Mayflower in 1620. From 1642 to 1646 the town was frequently and desperately attacked by the Royalists. In 1688 Plymouth early supported William of Orange, in whose reign the building of the dockyard was begun.

Plymouth is the seat of an R.C. bishopric, founded 1851. It formerly elected three M.P.s, but this number was reduced to two in 1950. Lady Astor (*q.v.*), the first woman to sit in the house of commons, was returned for Sutton division of Plymouth in 1919.

The city was severely damaged by air raids, March and April, 1941, when much of the central area was totally destroyed. Among the important buildings which then disappeared were the Guildhall and other municipal offices, and S. Andrew's church, while the Barbican, whence the Pilgrim Fathers sailed, was much damaged. Sir P. Abercrombie, in conjunction with J. P. Watson, the city engineer, prepared a plan for rebuilding the city centre, and the work began at the end of the Second Great War. The new main E.-W. and N.-S. roads (Royal Parade and Armada Way) were formally named by King George VI in 1947.

Plymouth was one of the concentration and embarkation points for the allied armies invading Europe in 1944. Pop. 220,800.

Plymouth, Devon. The Hoe, with the old Eddystone lighthouse, seen from the fort. Top, site of the busy city centre, devastated by German bombs during the Second Great War

disembarked is marked by Plymouth Rock, a granite boulder, now covered by a fine granite canopy. Other objects associated with the Mayflower Pilgrims are a national monument, 1858-88, and Pilgrim Hall, which houses a collection of relics. For 300 years the town kept its character as a stronghold of Puritanism; up to 1840 Christmas was not observed as a festival. Pop. 13,100. See Pilgrim Fathers.

Plymouth, Borough of Pennsylvania, U.S.A., in Luzerne co. It stands on the Susquehanna river, 4 m. N.W. of Wilkes Barre and is served by rly. It lies in a valuable anthracite region, and its chief industries are associated with the working of coal. Mining tunnels have caused houses to cave in. Plymouth was settled in 1768 and incorporated as a borough in 1866. Pop. 15,507.

Plymouth, Chief town and capital of Montserrat, Leeward Islands. It lies on the W. coast and trades in cotton, limes, tomatoes, and onions. Pop. 1,893.

Plymouth Brethren. Protestant sect, which arose about

Plymouth. Town and port of entry to Massachusetts, U.S.A., the co. seat of Plymouth co. It stands on Plymouth Harbour, a branch of Massachusetts Bay, 36 m. S.E. of Boston. It was the landing place of the Pilgrim Fathers in 1620, and the spot at which they

1830 in Plymouth and Dublin. One of its chief founders was John Nelson Darby (*q.v.*), after whom the Brethren were formerly called Darbyites. He gave up his position in the Church and travelled about the country, forming small societies of Evangelical Christians for Bible study and the promotion of spiritual life. These gradually formed small congregations, which met in houses and halls for worship. The Plymouth Brethren, numbering about 80,000, have no organic unity and no creed. In doctrine they are Calvinistic; they usually baptize by immersion; and observe the "breaking of bread" every Sunday. They object to any fixed ministry.

Plymouth China. Variety of chinaware. It is a hard paste biscuit ware, in which kaolin and flintstone are used, dipped in glaze, and fired at a high temperature. It was manufactured at Plymouth by William Cookworthy, 1768-74. The table services, salt cellars, and centre pieces generally bear rock-work and shell decoration. See colour plate facing p. 2041 and China Marks illus. p. 2043.

Plymouth Rock. Popular "utility" breed of fowls, originating in the U.S.A. from crossing a Black Java hen with a Grey Dominique cock. Robust, hardy birds, their blue-grey plumage is uniformly barred with black; the bill, legs, and feet are yellow, and the single comb is upright. Cocks weigh 10 or 11 lb., hens 2 lb. less.

Plymouth, Massachusetts. The old burying ground in which are buried some of the Pilgrim Fathers

Their eggs are large and brown. The chickens soon make good table birds. See Fowl colour plate.

Plymouth Sound. Deep inlet of the English Channel, between Cornwall and Devon. Into it flow the river Tamar from the W., and the river Plym from the E. The estuary of the Tamar, known as the Hamoaze, is 4 m. long by $\frac{1}{2}$ m. wide, and is the chief anchorage for war vessels in Plymouth Harbour; while the estuary of the Plym, called the Catwater, is a

capacious anchorage for mercantile vessels. The sound is protected by a breakwater nearly 1 m. long.

Plympton. Market town of Devon, England. It is 5 m. E. of Plymouth, on the Plym, and consists of two adjacent places, Plympton St. Mary and Plympton St. Maurice, or Plympton Erle. It has a rly. station. The buildings include a fine old church, and a grammar school at which Sir Joshua Reynolds, born here, was educated. Plympton had a castle and an Augustinian priory. It was made a borough in the 13th century, and from 1295 to 1832 sent members to parliament. One of the stannary towns, it had fairs and markets. Its privileges as a borough were taken away in 1859. Population 9,000.

Plymlimon OR **PLYNLEIMON.** Mountain of Wales. It stands on the borders of Cardiganshire and

Plymlimon, Wales. A distant view of this triple-peaked mountain

Montgomeryshire, and has three summits, the highest being 2,465 ft. high. The word is said to be a corruption of a Celtic term for five rivers, as five rivers rise hereon—Wye, Severn, Rheidol, Ystwyth, and Llynfiant. On and around the mountain are a number of bogs.

Plywood. Name given to sheets of wood of various thicknesses built up of thin layers. The layers (plies) are glued together; the grain of each ply is arranged at right angles to that of the ply on either side of it. Plywood cannot shrink, has great strength, and may be very wide; the material has therefore revolutionised most of the industries in which wood is used, and is almost as important as ordinary timber.

Three-ply is made in thickness from less than $\frac{1}{8}$ in. to about $\frac{1}{2}$ in. Multi-ply is plywood with more than three laminations, the number always being odd. In block-board, two outer layers have between them a core of narrow strips cemented side by side and placed the opposite way of grain to the outer sheets. Lamin-board is made on the same principle but is of superior quality. The plies of plywood are either produced by

the rotary system, in which the log is placed in a special lathe, the leaf being peeled off until the core of the log is about the size of a large domestic mangle roller; or cut off the flat of the log and jointed. See Joinery; Timber.

Pneumatic Appliances. Class of machine or instrument in which compressed air is the main source of power. Compressed air can be conveniently stored and is conveyed by pipes to the point of use. It requires no insulation against heat loss in transmission, involves neither fire nor shock hazard, and is flexible, compact, and powerful. It has a wide variety of uses; hundreds of specific applications of compressed air could be mentioned and the list would still be incomplete.

AIR COMPRESSORS. Air is compressed from atmospheric pressure (zero gauge pressure) to a

this class of compressor can be arranged so that air is drawn in and compressed on one side of the

Pneumatic Appliances. Hand-held rock drill, weighing 30-60 lb. which drills holes 2 or 3 ins. in diam. in rock to depths of 20-30 ft.

piston or on both sides (respectively single-acting and double-acting). When the final pressure is reached in one cylinder this is known as single-stage compression. Where the air is partially compressed in one cylinder and then passed on to one or more subsequent cylinders in each of which it is compressed to a higher pressure, this is multi-stage compression. There can be two stages, three stages, four stages, etc., depending on the final working pressure required. Compressing by stages and cooling the air between compressions result in lower maximum temps., reduction in power required, and an increase in the amount of air actually delivered by the compressor. The saving in h.p. as between single-stage and two-stage compression for a discharge pressure of 100 lb. per sq. in. gauge is about 15 p.c., and there is a further saving of about 5 p.c. if three-stage compression is used. A two-stage compressor is normally used for 100 lb. discharge pressure except on machines of small capacity where the saving in power would not compensate for the greater first cost.

Air compressors can be driven by electric motor, steam engine, water wheel, or, on portable units used on the roads to drive concrete breakers, diesel—or petrol—engine.

PNEUMATIC HAMMERS. In a large number of hand-held tools and other machines compressed air is made to move a piston or hammer backwards and forwards in a cylinder, the piston exerting a blow at the end of one of its strokes on the striking end of a

Pneumatic Appliances. Section of a concrete breaker, showing trigger-controlled air inlet-valve, piston anvil block, and "moll" pointed steel pick

cylinder being provided with air admission and discharge valves;

pick, spade, chisel, rivet set, rock drill steel, or some other similar attachment. The smallest such tool is the carver or stone tool used by stonemasons and sculptors. Other small tools are the pneumatic pick, clay digger, chipping and caulking hammers, riveter, and rivet buster (the last used for knocking out old or badly driven rivets). Larger tools are concrete breakers (sometimes called road drills), rock drills, either hand-held (Jackhammer) or the much heavier "drifter" drill mounted on a cradle and carriage and having an air-driven motor feed for advancing the drilling machine as the hole gets deeper. Such machines are used for tunnel driving and in large quarries, the holes being drilled to take explosives.

Air driven tampers for ramming the sand around patterns in foundries, rammers for consolidating loose ground, forging presses and great "steam" hammers striking blows up to 20,000 lb., are all available for use with compressed air. Air-operated

Pneumatic Appliances. 3. Pneumatic circular hand saw, which uses 12 in. circular saws for cutting wood up to 4 ins. in thickness

chucks for holding the work on lathes and other machine tools, which are fast and safe and require only one hand to operate, are virtually standard equipment in machine shops.

PNEUMATIC ROTARY MACHINES. A wide range of air-powered motors either of the piston or air-vane type are used to drive hand-held power drills for drilling holes in wood, coal, and metals and for reaming or tapping threads in metal assemblies. Such tools are to be found in nearly every industry. Air-powered screw-drivers, wrenches, grinders, sanders, and polishers are other examples of common pneumatic tools, as are also direct lift and

Pneumatic Appliances. 4. Wood borer, drilling 3 in. holes in hard wood with air-operated, piston type drill. The rate of drilling is about 8 ins. a minute

pull type hoists from 100 lb. to 10 tons capacity.

OTHER USES OF COMPRESSED AIR. The "air-lift" system of pumping wells and getting water out of flooded mines depends on the fact that a column of water in which air bubbles are introduced at the bottom of the column has a lower density than that of water only. The principle is explained in the entry Air Lift.

The application of paints and other fluids by air spraying is now common; metal spraying also has been introduced into many industries. Rlys. use compressed air to operate automatic signals and moving points, for air-brakes, for opening and closing train doors, and for cleaning carriages and locomotives. Materials such as coal, cement, grain, broken rock, etc., are readily transported through pipes either by compressed air or by air suction. Conveyance of materials through tubes by compressed air has been in use since about the middle of the 19th cent.; perhaps the most common example is the pneumatic dispatch system used in large stores and warehouses for sending cash or messages to and from a central accounts department or office. Consult Handbook of Pneumatic Equipment, issued by the British Compressed Air Society.

D. Y. Marshall

Pneumatolysis (Gr. *pneuma*, vapour; *lyein*, set free). In geology, name given to the formation of minerals produced by the action of volatiles, e.g. steam, with compounds of chlorine, boron, fluorine, carbon dioxide, etc., derived from

masses of igneous rock. The cooling and crystallisation of the igneous intrusion eliminates the molten rock-matter in which the gases were dissolved, and the latter are in consequence driven out. They may soak through the rocks, or travel along planes of weakness, so forming veins. The chemical agents which are active at this stage cause widespread alteration of the pre-existing rocks: feldspars are decomposed. The Cornish china clay deposits were formed by this process. Topaz, tourmaline, axinite, scapolite, etc., and some valuable ore deposits owe their origin to pneumatolytic action. *Pron.* new-ma-tolly-sis.

Pneumogastric. For this anatomical term, see Vagus Nerve.

Pneumokoniosis. The general term given to changes in the lung resulting from the inhalation of dust. These changes consist of a type of fibrosis, which varies according to the type of dust, so that such varieties occur as anthracosis from coal, asbestosis from asbestos, lithosis from stone, siderosis from iron and metallic dusts, and silicosis from silica.

The commonest form is anthracosis, which is found to some degree in all town dwellers, and especially among coal miners. It tends to block the lymph channels of the lung but causes no damage to the lung structure unless the coal dust contains silica. If this is so, silicosis results. If the patient leaves the mine, the disease does not progress; if he continues, the lymph channels can become completely blocked and parts of the lung substance become consolidated. Breathlessness increases and forces the patient to stop work. A dry cough supervenes, and an ever greater tendency to bronchitis. Complications are chronic bronchitis, emphysema, dilatation and infection of bronchial tubes leading to bronchiectasis, heart failure, or pulmonary tuberculosis.

The disease can be prevented by the use of masks, by proper ventilation, and by water sprinklers which prevent the formation of dust. All who are employed in occupations of the kind indicated should have periodic medical examination, including X-rays, of the chest, with a view to change of occupation if the disease has developed.

Pneumonia (Gr. *pneumōn*, lung). Inflammatory disease of the lung substance, which fills the air sacs of the affected part with an exudate. The acute form has two

varieties—lobar or croupous pneumonia and lobular or bronchopneumonia.

Lobar pneumonia attacks one or more lobes of the lung (*q.v.*). It is specific and infective, and is caused by the *streptococcus pneumoniae* or pneumococcus. The disease is most common in temperate climates and in the U.K. it formerly caused more deaths than any other acute disease. It is rare between the ages of six and fifteen; while children usually recovered, the mortality increased steadily after the age of 30, and over 60 it was almost invariably fatal. 70 p.c. of adult cases occur in males. The commonest causative factors are those reducing defence against infection: old age and chronic debilitating diseases, such as pulmonary tuberculosis, cirrhosis, nephritis, diabetes, mental illness, and chronic alcoholism. Cold, exhaustion, and a preceding attack of influenza are predisposing factors in young adults.

There are three stages in the effects of the disease on the lung. The first is a congestion stage, and this is followed by two forms of solidification, red and grey hepatization. Thereafter there is recovery, with absorption of the exudate, or death, which usually occurs within ten days of the onset. The disease usually begins suddenly, often with rigor and a temperature which rises to 103° F. or over on the first day. The high temperature is continuous for a period of from five to nine days, when it falls suddenly at what is known as the "crisis"; at this point the patient's distress gives way to a sudden feeling of comfort. Generally the patient first complains of shivering and intense pain in the side from the pleurisy which accompanies the disease. He has a painful dry cough, very tenacious phlegm, often tinged with blood and giving the typical rusty sputum of pneumonia. He lies on the affected side, breathing rapidly and jerkily and dilating his nostrils. Commonest complications are empyema and pericarditis.

The most important measures for treatment are to ensure abundant fresh air and complete rest. Fluids containing glucose are prescribed, together with light food such as milk, jellies, and fruit juices containing sugar. Morphine may be necessary to ensure ample rest, give relief from pain, and combat delirium. M and B (*q.v.*) is now universally prescribed, and is always advised where the patient has effects of toxæmia. It reduces

the temperature, combats the toxic effects of the disease, and almost invariably brings recovery. It does not remove the exudate, however, and therefore as much time is still required for convalescence as was necessary before its introduction. No patient should be allowed to return to work under at least two months after the temperature has become normal.

Pneumo-thorax. Presence of air in the thoracic cavity, *i.e.* between the lung and the chest wall. The condition may be due to rupture of the lung, so that air finds its way between the layers of the pleura or to an external injury perforating the wall of the chest and allowing ingress of air from the outside. Pneumo-thorax results in a certain degree of collapse of the lung. The condition may be induced artificially in the treatment of phthisis so that the affected lung may be rested.

Pnom Penh or PHNOM-PENH. Capital of Cambodia, Indo-China. It stands on the Mekong, 130 m. N.W. of Saigon. While under French suzerainty, the city was transformed by the construction of fine public buildings and spacious boulevards. Cotton gins and rice mills provide employment. The chief buildings are the palace of the Buddhist priests and the pagoda. The city is a great centre of trade, especially for the district round the Great Lake to the N.W., and there is regular steamer connexion with Saigon. It is the terminus of the Singapore and Bangkok rlys. Population 102,678.

Pnyx. Place of meeting of the ecclesia (*q.v.*) or general assembly of the people of ancient Athens. It was probably in the neighbourhood of the Acropolis and the Areopagus, but the exact identity of the place is doubtful.

Po (anc. *Padus*). River of Italy. It rises in the Cottian Alps (*q.v.*) by Mt. Viso, and flows in an E. direction through Piedmont, Lombardy, and Venetia to the Adriatic, which it enters by several mouths. About 415 m. in length, it is navigable for over three-quarters of its course. The drainage area is about 28,000 sq. m., and the chief tributaries are the two Doras, Sesia, Ticino, Adda, Oglio, Mincio, Tanaro, Trebbia, and Secchia.

The valley is an ancient arm of the Adriatic Sea, which has been gradually silted up with the off-scourings of the Alps and Apennines; the process continues even now, despite the regulating embankments and dikes, for the delta is growing steadily eastwards. In

former times forested and marshy, it has been so altered by man that it is one of the most productive agricultural areas in Europe, the rice crop grown on the irrigated areas yielding 10 million cwt. in a normal year.

Historically the Po valley has been one of the cockpits of Europe. Numerous invading hordes swept into the N.E. across the low saddle of the Carso, conquerors, including Hannibal and Napoleon, entered the N.W. over the Alpine passes. It has been for long a battleground between Austria and Italy, which accounts for the importance to Italy of the Trentino (*q.v.*).

In the Second Great War, the Po constituted one of the barriers which had to be forced during Gen. Alexander's campaign against the German armies in Italy. The river was crossed by 23 road and rly. bridges, over which most of the German supplies were carried. Alexander had intended capturing the bridges intact with airborne troops, but the depletion of his forces in preparation for the Riviera landings and the necessity of disrupting enemy communications led to his ordering the Tactical Air Force to destroy the crossings. This it achieved during July 12-15, 1944. Thereafter the Germans were obliged to maintain communications by emergency bridges which were used at night and dismantled and hidden by day. On April 24, 1945, the Allied 5th and 8th armies both crossed the Po. First British troops over were Grenadier Guards and N.Z. infantry (with the 8th army).

Poaching. Term used in English law for trespass upon another's land in pursuit of game or fish. The game laws of Great Britain, which may be traced back to the forest rights exercised by Saxon monarchs, are today a tangle of statutes of various dates. They rest upon the legal doctrine that wild animals are not the absolute property of anyone until they have been "reduced into possession" by killing or capture. Thus, though ownership or occupation of land gives exclusive right to take any game upon it, an infringement of that right is not larceny of the game, but a poaching offence.

The main provisions of the various Acts of parliament directed against poaching may be summarised thus: Trespassing in pursuit of game by day, *i.e.* between an hour before sunrise and an hour after sunset, is punishable summarily by a fine of £2. This becomes £5 if the party exceeds

four in number. The penalties for night poaching are three months' hard labour for a first offence, double that term for a second, and seven years' imprisonment for any subsequent offence. Persons found on highways by night for the same purpose incur a like punishment. If violence with any offensive weapon is offered, or if any member of a party of three or more night poachers is armed with such a weapon, the offenders are liable to a heavier sentence. Persons suspected of poaching may be searched by a constable, and if any game or any instrument of poaching is found on them, they become liable to a fine, and the property may be forfeited.

Private fishery rights are protected. No one may knowingly take or attempt to take or expose for sale any immature fresh-water fish, or use or have in his possession for the purpose of catching fresh-water fish any illegal implement, which includes lights, wires, spears, or gaffs. It is an offence to take fish in private waters.

The game laws of the mother country have not been applied to any of its oversea possessions; but many of these have passed less stringent Acts for the protection of wild animals. See Game Laws.

Pocahontas (c. 1595-1617). North American Indian princess, sometimes known as Matoaka. She

Pocahontas,
Indian princess

was a daughter of Powhatan, overking of the Indian tribes of Virginia. About the age of 12 she is said to have saved the life of Captain John Smith, who had been captured by the Indians, though the story of her doing so has been doubted. In 1612 she was lured upon an English vessel by Samuel Argall (*q.v.*), and taken to Jamestown as hostage for the good behaviour of the Indian tribes. Converted to Christianity, she was baptized Rebecca, and in 1613 married John Rolfe (1585-1622), a leading Virginian settler. In 1616 she accompanied her husband to England, and in March, 1617, died at Gravesend, leaving one son who went to America, and from whom many prominent Virginian families claim descent. Her story has inspired several works of fiction. Consult P. and her Companions, E. D. Neill, 1869; P. and her Descendants, W. Robertson, 1887.

Pochard (*Nyroca ferina*). Diving duck of the sub-family Anatidae. An expert diver, the male has a reddish-brown head, black breast and back, and grey sides. The female has greyish brown plumage. It is common as a migrant to Great Britain in the winter; but a few pairs are resident and breed in marshy places. The red-crested pochard is a very occasional visitor. The bird is found over a wide range in Europe, Asia, and N. America. Pron. pokard.

Pochard, a wild diving duck
which visits Great Britain

Pocket. Literally, a little pouch. It is used for the receptacles which are part of many articles of clothing; also for the net receptacles at the sides and corners of a billiard table. In mining a pocket is a cavity which is filled with metaliferous ores.

The term pocket is used in aeronautics to describe a condition of flying where the flow of wind over the earth's surface is not entirely horizontal, but tends to produce a vertical component in the movement of the air, due to natural obstructions such as ridges of hills. When the ridges are at right angles to the direction of the wind, the air passes over the summit to produce an upward current on the windward side and a downward current on the lee. Where a number of ridges exist, a series of eddies is induced. An aircraft experiences sudden increases and decreases of lift and a bumping effect in the pocket between the two eddies.

Pocket of resistance is a military term for a heavily defended point which holds out after it has been passed by the main tide of an advance. Notable examples in the Second Great War were the Channel and Atlantic ports retained by the Germans after the liberation of most of France.

Pocket Battleship. Popular name for the Panzerschiff (armoured ship) developed by the German navy after the First Great War. By the Versailles treaty, Germany was forbidden to build warships exceeding 10,000 tons displacement, which restricted her fleet to cruisers. To mount heavy armament on minimum tonnage, three vessels, the Admiral Graf Spee, Deutschland (later renamed Lützow), and Admiral Scheer, were designed with a paper tonnage of 10,000. Each mounted a

main battery of six 11-in. guns, a secondary battery of eight 5.9-in. guns, six of 4.1 ins., eight A.A. guns, and eight torpedo tubes. The ships were welded instead of riveted, and were driven by eight Diesel engines each developing 6,750 h.p. to give a maximum speed of 26 knots. Most notorious of these pocket battleships was the Admiral

Graf Spee (*q.v.*), scuttled in the River Plate, Dec. 17, 1939. Documents captured later proved that the Germans had infringed the Versailles treaty, as these ships displaced nearly 15,000 tons.

Pocket Borough. Formerly a borough of the U.K. in which the political representation was controlled by a single man, or a small group, who could dictate to the electors how they should vote. These boroughs were abolished by the Reform Act of 1832.

Pocket-Gopher (*Geomys*). A family of rat-like rodents, which occur in N. and Central America. The name is derived from their very large cheek pouches. The animals are about 8 ins. long without the tail, and the body is covered with soft velvet-like fur. They burrow like moles beneath the surface of the ground and feed upon the roots of plants. Large chambers are constructed in which the animals collect great stores of potatoes, nuts, and seeds.

Pocklington. Market town of the E. Riding of Yorkshire, England. It is 13 m. E. of York by rly. The chief buildings are the church of All Saints, mainly Early English, and the grammar school, founded in 1515 by the Rev. John Dolman, and now a large public school with scholarships and exhibitions. The industries are all connected with agriculture, as the town is in an agricultural area. A canal, now used only for fishing, connects the town with the Derwent. Market day, Sat. Pop. est. 3,000.

Sir George Pockock,
British admiral

Pockock, SIR GEORGE (1706-92). British admiral. Born March 6, 1706, he entered the navy in 1718 and saw extensive service in both the West and the East Indies, where

he was appointed commander-in-chief in 1757. He became famous by his remarkable series of actions, 1758-59, against the French in the E. Indies, as a result of which the French never recovered their position. He retired in 1766 and died April 3, 1792.

Pococke, RICHARD (1704-65). British traveller. Born at Southampton, he graduated at Corpus Christi College, Oxford, and travelled in Greece, Egypt, Palestine, and Mesopotamia, 1733-42. On his return he published *A Description of the East and Some Other Countries*, 1743-45. He also made several journeys through England, Ireland, and Scotland as far as the Orkneys. In 1756 he became bishop of Ossory and in 1765 was translated to Meath. He died at Charleville, Ireland. His *Tours in Scotland*, 1747, 1750, 1760, were edited by D. W. Kemp, 1887.

Pod. Popular name for certain types of dry fruits, of which the legume and the silique are the chief. The legume, familiar in the pods of peas, beans, and furze, is characteristic of the entire family Leguminosae. It develops from a single carpel and opens by splitting along both edges. The silique has well-known examples in the seed-vessels of the wallflower, the cabbage, and all through the great family Cruciferae. The silique originates in two carpels, and when the seeds are ripe the two sides or valves split away from a central frame across which is spread the replum or partition which separates two layers of seeds. *See* Fruit; Manila Tamarind; Mezquit; Pea.

Podestà (Lat. *potestas*, power). Italian municipal officer. The podestà was originally appointed by the emperor and afterwards by the citizens, usually for a year. He was the supreme administrative and military official in the commune. The office was instituted in the 12th century, and lasted, though latterly shorn of much power, into the 16th century. The title was restored by Mussolini, in place of that of sindaco (mayor).

Podgoric or **TRIGRAD**. Town of Yugoslavia. It is situated on the Moracha, about 16 m. E. of Cetinje. It has a transit trade, and the industries concern tobacco and sawmilling. Here was Diocleia, birthplace of the emperor Diocletian. The town, with a mixed Turkish and Albanian pop., became the commercial capital of Montenegro soon after that state achieved independence. In the First Great War it was held by Austrians from Jan., 1916.

Podiebrad, GEORG BOCKZKOV, or **GEORGE** OF PODEBRADY (1420-71). King of Bohemia. Born at Podiebrad, April 6, 1420,

Georg von Podiebrad, King of Bohemia

he gained a name in the Hussite wars against the Austrians, and brought about the election of Ladislaus as king of Bohemia in 1453, himself acting as regent for the young king. On the death of Ladislaus in 1457 he was elected, early in 1458, to succeed. His efforts at religious conciliation failed, and in 1466 he was excommunicated, and attacked by the Catholic nobles of Bohemia and Silesia and by Matthias, king of Hungary. Matthias was defeated and had to sue for peace, but Podiebrad died, March 22, 1471, before the treaty was concluded.

Podocarpus. Genus of evergreen coniferous trees of the family Taxaceae. They are chiefly natives of the extratropical regions of the S. hemisphere, but with representatives in E. Asia and tropical America. They are closely related to the yews (*Taxus*), which some of the species resemble in their two-

Podocarpus. Leaves and, inset, fruit of *P. ferrugineus*

ranked leaves and pulpy fruit. Several species afford valuable timber, e.g. the miro (*P. ferrugineus*) of New Zealand, with close-grained reddish wood; the Totara pine (*P. totara*), also of New Zealand; and the Illawarra pine or kidney-wallum (*P. elatus*) of Queensland and New South Wales, with light yellow, durable wood, useful for piles, masts, and spars.

Podolsk. Town of Moscow region, R.S.F.S.R., about 25 m. S.S.W. of Moscow, on the main Moscow-Tula rly. A town of small importance until after the 1917

Revolution, it greatly increased in size during the 1920s, many factories being established here. Pop. 72,422.

Podophyllum (*P. peltatum*) or **MAY APPLE**. Perennial herb of the family Berberidaceae, native of N. America. It has a creeping rootstock and thick fibrous roots. Barren stems end in a large round leaf with lobed margins, attached by the middle; flowering stems with two one-sided, lobed leaves, and between them a solitary, nodding, white flower, which is

Podophyllum or May Apple. Leaves and flower; inset, fruit

succeeded by a large yellow oval fruit with edible pulp, sweet and slightly acid. From the rootstocks, collected in autumn, the resinous extract known as podophyllin is obtained, and used as a cathartic medicine. Indian podophyllum rhizome comes from *P. emodi*, a plant growing on the lower slopes of the Himalayas.

Podsol (Russ., ash). Type of soil. It is found in temperate and cold regions where there is considerable rainfall and the soil has been extensively leached by the downward movement of water through it. Below a surface layer of humus or peat the soil is usually ashy grey as a result of the removal of bases by the rain water which has become acid. The soil may, however, be stained brown by decomposing vegetable material. Below this soil layer iron oxides form a brown hard-pan which grades downward into broken and unweathered rock. Podsoles are impoverished soils forming heathery moorland or pine forests. Porous rocks such as sandstones form podsoles more easily than less permeable ones, because of the ease with which rain water can percolate through them. The formation of a podsol type of soil is known as podsolisation.

Poe, EDGAR ALLAN (1809-49). American writer. He was born at Boston, Mass., Jan. 19, 1809, the

son of an actor of Irish descent who had married an English actress, Elizabeth Arnold. Both his parents had died by the time he was three years old, and he was adopted by John Allan, a tobacco merchant of Virginia, who sent him, during a visit to England, to the Manor School, Stoke Newington. In 1820 Poe returned to the U.S.A., and, after attending school at Richmond, Va., went to the university of Virginia, where he matriculated with distinction in 1826. He had, however, contracted debts, mainly through gambling, which Allan refused to pay, insisting that Poe should take up a position in his office. He left this after a brief time, joining the U.S. army, becoming a sergeant-major, and, in 1830, entering West Point to train as an officer. Within a year, however, he was dismissed for insubordination, and was thenceforth dependent on his own resources, assisted only by Mrs. Clemm, his father's widowed sister, whose daughter, Virginia, he married in 1836, when she was not quite 14.

Poe had been writing verses since he was 15, and published volumes of juvenilia in 1827 and 1829, a third, more mature, volume following in 1831. In 1833, the Baltimore Saturday Visitor having offered prizes for fiction and poetry, Poe won the fiction prize with the tale, *A MS. Found in a Bottle*, and was recommended for the poetry prize also, the judges deciding that one competitor should have both.

Poe held various editorial positions, though none for long, mainly because of his intemperate habits. But in the Southern Literary Messenger of Richmond, and in other periodicals, he soon acquired a triple reputation, as a writer of skilful verse, an author of short stories of brilliantly fantastic plot and striking style, and a critic of unusual penetration.

His stories, though for the most part fantastic and showing the effects of his drinking and opium-taking, included *The Murders of the Rue Morgue*, the *Mystery of Marie Roget*, and *The Purloined Letter*, in which he laid down the main principles of the modern detective story in its most in-

Edgar A. Poe

tellectual form. It was, however, with the publication of *The Raven* in 1845 that he leapt into real fame, but he was already on the verge of the personal tragedies which led to his death. He was living at a cottage at Fordham, near New York, and his wife died there, Jan. 30, 1847, amid depressing surroundings. He wrote little more, though *The Bells* and *Annabel Lee* (the latter written in memory of his dead wife) soon established themselves in the affection of a wide public. His health grew worse, partly because of his grief, and partly because of drink and opium, and on Oct. 3, 1849, he was found in Baltimore in a state bordering on collapse, having apparently been taken around by a group of political fanatics, and forced to vote, impersonating various electors, at polling places in the city. He was admitted to hospital, and died Oct. 7.

Poe fits into no scheme of literary history. He was a solitary craftsman, whose work at its best shows a brilliance of conception and execution excelled only by the greatest. His verse is masterly in technique, though in some respects superficial. But his stories will always remain as monuments to his special type of fantastic imagination. Through his influence on Conan Doyle he must be regarded as the originator of the detective story. And his tales of horror and grotesquerie have influenced authors as different as R. L. Stevenson, Arthur Machen, M. P. Shiel, and E. H. Visiak. In France he has been even more widely influential than in Great Britain and the U.S.A. In 1922 there was opened, in an old house at Richmond, Va., the Poe Foundation, which now possesses an unrivalled collection of Poe manuscripts and other rarities, as well as an assembly of objects associated with Poe and a model of Richmond as it was in his day.

John Rowland

Bibliography. *Tales and Poems*, ed. J. H. Ingram, 4 vols., 1884; *Life, Letters, and Opinions*, ed. J. H. Ingram, 2 vols., 1886; *Complete Works*, ed. J. A. Harrison, 1902-03; *Life*, G. E. Woodberry, 2 vols., 1909; *Critical Study*, A. Ransome, 1910; *The Murder of E. A. Poe*, J. A. T. Lloyd, 1931; *Israfel*, H. Allen, 1935; *Life*, A. H. Quinn, 1942.

Poe, WILLIAM (1852-1934). British actor-manager. A Londoner, he was born July 22, 1852. Making his first stage appearance in 1876, he was the first modern producer to revive *Hamlet* without

scenery, at St. George's Hall, London, 1881. He ran the Old Vic, 1881-83, and became stage manager for Benson. In 1895 he founded the Elizabethan Stage Society, reviving plays by Marlowe, Jonson, Beaumont and Fletcher, etc. Poe was the first to point out that, in characterisation and in the delivery of verse, modern actors adopt the traditions of the 18th century as distinct from those of the Elizabethan open platform period. He dramatised Baring-Gould's *Mehalah*, 1886, and wrote *Shakespeare and the Theatre*, 1913. He lived until Dec. 13, 1934.

Poerio, CARLO (1803-67). Italian patriot. Born at Naples, Dec. 10, 1803, he supported every popular agitation for constitutional government, and was in exile, 1821-35. In 1835 he went back to Naples, and practised law until the rising of 1848, when the threat of revolution caused Ferdinand II to appoint him to the cabinet. But on the collapse of the national cause in 1849, Poerio was sentenced to 19 years in the galleys. Gladstone's exposure of the Bourbon atrocities, and his special reference to Poerio, had the tardy effect of releasing him in 1858, and he was elected to the Italian parliament of 1860. He died April 28, 1867. His brother Alessandro (1802-48), an eminent poet, shared his fortunes until wounded in battle against the Austrians. He died Nov. 3, 1848.

Poet Laureate. A poet crowned with bays or wreath of laurel. The custom originated in Greece, and was perpetuated in Rome, where Domitian gave the bays to Statius. Petrarch was similarly honoured in Rome in 1341. The custom was followed in Germany in the 15th and 16th centuries, and in 16th century Spain.

In England the title poet laureate was first applied to a poet attached to the court; known earlier as *Versificator Regis*, he was styled poet laureate in the time of Edward IV, the first holder being John Kaye, author of *The Siege of Rhodes*, a work printed by Caxton. John Skelton called himself both poet laureate and regius orator; he was crowned at Oxford and wore the laurel at Cambridge. Though Chaucer was a recipient of gifts from Edward III and Richard II, and Spenser was pensioned by Elizabeth, the English laureateship is usually dated from Daniel or from Jonson, to whom James I by letters patent gave a pension of 100 marks (about £67), a sum increased by Charles I to £100 and a tierce of canary

wine. In Southey's time the sum of £27 was substituted for the wine.

POETS LAUREATE FROM 1599

Samuel Daniel	1599-1619
Ben Jonson	1619-1637
Sir William Davenant	1637-1668
John Dryden	1670-1688
Thomas Shadwell	1688-1692
Nahum Tate	1692-1715
Nicholas Rowe	1715-1718
Rev. Laurence Eusden	1718-1730
Colley Cibber	1730-1757
William Whitehead	1757-1785
Rev. Thomas Warton	1785-1790
Henry Pye	1790-1813
Robert Southey	1813-1843
William Wordsworth	1843-1850
Lord Tennyson	1850-1892
Alfred Austin	1892-1913
Robert Bridges	1913-1930
John Masefield	1930-

Poetry (Gr. *poëtes*, maker, poet). When we speak of poetry we imply two main conditions. The first is a creative feat of the imagination, unlike the fact-finding concern of science. The essential idea that poetry is creative is contained in the word itself. The old Scottish poets were actually called the makaris. Aristotle stressed the inventive and ingenious aspect of poetic drama as a standard of judgement, though on such a formal principle alone, as Newman pointed out, "the inferior poem might be the better tragedy." The object of poetry is to create—for intellectual pleasure. The nearest that science can get to creation is in imaginative exploration, which must fall back inexorably if it steps outside the realm of demonstrable truth. But the unbridled eye of the poet seeks the unlimited truths of the imagination. Wordsworth says: "Poetry's object is truth, not individual and local, but general, and operative; not standing upon external testimony, but carried alive into the heart by passion; truth which is its own testimony."

Metre and Music

But this creative definition takes in much that is not, speaking literally, poetry. It would include imaginative prose and that quality, for instance, in a novel which is inventive or which might enable one to say that it was poetically written. A second condition is therefore needed to describe what poetry has meant, at any rate in European literature, for the last six hundred years. Since the beginning of the Renaissance the word poetry has presupposed a metrical form, also that the art of poetry is akin to that of music. When Dante defined poetry in his treatise *De Vulgari Eloquentia*, he called it *fictio*

retorica musice—a rhetorical fiction made musically. Chaucer linked it with music, and his contemporary, the French poet Deschamps, called it a branch of music. The submission to metre, and where suitable to rhyme, is likewise the poet's sign that imagination in its farthest flights still willingly disciplines itself to harmony and order.

"Poetry," said Shelley, "may be defined to be the expression of the imagination," but no such generalisation—nor Wordsworth's "emotion recollected in tranquillity"—can help to identify poetry; it can only describe or analyse what must first have been felt. It is unlikely that any definition could cover the inspirations of the ancient and the modern world, of epic, lyric, and drama. Shelley spoke of different inspirations as "episodes to that great poem, which all poets, like the cooperating thoughts of one great mind, have built up since the beginning of the world." What all these episodes of poetry have in common is heightened emotion, expressed rhythmically in heightened language—possibly to the point of grandeur, but if simply, then with heightened simplicity. Hazlitt said: "Poetry is the most emphatical language that can be found for the creations of the mind"; Leigh Hunt that "Poetry is a passion because it seeks the deepest impressions."

The Use of Imagery

This quality of emphasis is reinforced by poetry's abundant use of imagery, with which it loads its truth with cognate instances. To quote Hazlitt again: "The poetical impression of any object is that uneasy, exquisite sense of beauty or power that cannot be contained within itself; that is impatient of all limit; that (as flame bends to flame) strives to link itself to some other image of kindred beauty or grandeur; to enshrine itself, as it were, in the highest forms of fancy, and to relieve the aching sense of pleasure by expressing it in the boldest manner, and by the most striking examples of the same quality in other instances."

It is only, then, "by the consent and delight of poetic readers" that true poetry can be known. And it is by a consensus of opinion in regard to such delight over a period of time that a poem or poet is established. (An extreme statement of this delay is contained in Emerson's striking remark that "it was not until the 19th century, whose speculative

genius is a sort of living Hamlet, that the tragedy of Hamlet could find such wondering readers.") In our immediate centuries it may still be generally uncertain how much Pope was a poet, for instance, or what was the stature of Byron. But individual certainty operates immediately on the reader according to his own time and taste; the excitement of poetry is unmistakably either there for him as he reads, or not.

Eternal Idea of Beauty

One must not conclude from this that man is the measure of all worth, and that beauty is purely relative to his taste and judgement. There is, as Plato said, the eternal idea of beauty, which is something absolute, like certain moral truths—as that kindness is better than cruelty, absolutely, beyond opinion. True poetry, in this eternal sense, may sometimes be difficult to discern in the contingency of time, though rarely poetry of the very highest quality; in regard to this the verdicts of one century and of all centuries speak unanimously.

The place of poetry in the experience of mankind cannot be considered only in what it has to show in the printed word, and wholly apart from the more inchoate poetic emotion of men who are not poets. Someone said that every lover is a poet, and Shakespeare linked poets with lovers and lunatics. Much unconscious poetry in people has gone into place names, for example and into the naming of flowers. The origins of poetry, at any rate, are wherever there are stirred perceptions of that beauty which man's moral nature allies with greatness. In this general sense, poetic emotion is the high light in the life of everyone, and the actual reading of poetry the deliberate turning to that light. The habit of poetry reading, as physical exercises strengthen the body, undoubtedly fosters in those who form it a development of that general sensitiveness to beauty which made Hazlitt say: "All that is worth remembering in life is the poetry of it." See Verse.

Viola Meynell

Bibliography. Poetics, Aristotle, ed. S. H. Butler, 1902, ed. W. H. Fyfe, 1940; An Apologie for Poetrie, Sir Philip Sidney, 1595, ed. E. Arber, 1869; Discoveries upon Men and Matter, Ben Jonson, 1641; Lyrical Ballads, preface, W. Wordsworth, 1800; Lectures on the English Poets, W. Hazlitt, 1818; A Defence of Poetry, P. B. Shelley, 1821; Essays in Criticism, M.

Arnold, 1865-88; Theory of Poetry, 1924, and Idea of Great Poetry, 1925, L. Abercrombie; Poetry and the Modern World, Daiches, 1941; Critical History of English Poetry, H. Grierson and J. C. Smith, 1944; Poetic Image, C. D. Lewis, 1947.

Poetry Society, THE. Founded in London in 1909 and incorporated in 1923, to promote, in the words of Matthew Arnold adopted as its motto, "a clearer, deeper sense of the best in poetry and of the strength and joy to be drawn from it." The society conducts examinations in reading and speaking verse, organizes meetings and festivals, provides a headquarters for teachers of English and elocution, and publishes periodicals containing new poetry and critical articles. Its offices are at 33, Portman Square, W.1, and there are affiliated centres in Great Britain and the Americas.

Poets' Corner. Name given to part of the S. transept of Westminster Abbey, London. Here are honoured, and in many instances

Pogradets. Town of Albania. Situated 20 m. N.N.W. of Koritza on Lake Ochrida, it was captured by the Greeks on Dec. 1, 1940, during their defensive campaign against the Italians. At the German attack on Greece and Yugoslavia in April, 1941, the town passed into German-Italian occupation, during which it became a centre of the Albanian resistance movement. See Albania.

Pogrom (Russian, devastation). Deliberate massacre in Russia aimed at the destruction of a particular class, and especially applied to organized attacks upon Jews. Pogroms were introduced into Germany by the Nazi party. The most savage was on Nov. 10, 1938, following the assassination of Vom Rath, an official of the German embassy in Paris, by a Polish Jew. Synagogues were burnt down and Jewish shops, homes, hospitals, and orphanages destroyed. The Germans instigated similar pogroms in Poland after they occupied it.

Poilu (Fr., hairy or bearded). Popular name given to the French soldier. It was first used for the recruits as distinct from the older men and implied affectionate respect, not devoid of humour. Later the word came to signify the common soldier of France, particularly under the conditions of trench war in the First Great War.

Poincaré, JULES HENRI (1854-1912). French scientist, born April 29, 1854, at Nancy. A qualified engineer, he was in 1886 appointed professor of mathematical physics in the faculty of sciences, Paris, and in 1896 he became professor of celestial mechanics. A cousin of Raymond Poincaré (*v.i.*), he died July 17, 1912.

Poincaré was one of the most brilliant mathematicians of the 19th century, not only carrying out investigations into the problem of three bodies (cubes, cones, cylinders), and the theory of functions, in which he introduced an entirely new mathematical weapon, but also investigating the theory of non-Euclidean geometry, the higher algebraic functions, etc. He was awarded the gold medal of the Royal Astronomical Society, and the Sylvester medal of the Royal Society, and the gold medal of the French Association for the Advancement of Science. His chief books are *Leçons sur la Théorie Mathématique de la Lumière*, 2 vols., 1889-92; *Cours de Physique*, 13 vols., 1890; *Électricité et Optique*, 2 vols., 1890-91; *Méthodes Nouvelles de la Mécanique Celeste*, 3 vols., 1892-99; *Calcul des Probabilités*, 1896.

Poincaré, RAYMOND NICOLAS LANDRY (1860-1934). French statesman. Born Aug. 20, 1860, at Bar-le-Duc, he studied law at Nancy and Paris and was called to the bar. He started a political career by writing and acting as secretary for deputies of the moderate Right. Elected to the Chamber in 1887, for Commercy, Meuse, he held office as minister of education, 1893, and of finance, 1894, and was vice-president of the chamber, 1895-98. A senator from 1903, he succeeded Caillaux

in 1912 as premier and foreign minister, and improved Franco-Italian relations.

On Jan. 17, 1913, Poincaré was chosen president. He systematically prepared for the war he had long foreseen. With Barthou as premier to re-establish the three years' conscript service, with Delcassé as ambassador to St. Petersburg, with a budget that pro-

buried, celebrated British poets and men of letters and the arts, among them Chaucer, Spenser, Jonson, Dryden, Addison, Handel, Garrick, Macaulay, Thackeray, Dickens, Browning, Tennyson, Hardy, and Kipling. In front of Dryden's tomb is a blue slab believed to commemorate Robert Hawke, murdered in the choir of the Abbey in 1378 by followers of John of Gaunt.

Poets' Corner, Westminster Abbey. Shakespeare's memorial, and busts of Southey, left, and Burns, right. Upper picture, some of the other memorials, with Thomas Hardy's grave in the foreground

vided for strengthened military and naval defence, and with his own visits to England and

Raymond Poincaré,
French statesman

Russia, he secured the Entente against Germany. In July, 1914, he sent an appeal to George V for Anglo-French solidarity. During the First Great War, in 1917, he called upon his personal adversary Clemenceau in order to have the strongest personality available as head of the cabinet.

He had proved his valour as president, but he relinquished office in 1920. He resigned the chairmanship of the reparations commission after a few months; overthrew Briand, whom he thought insufficiently nationalist during the Cannes conference in 1922, and became again premier and foreign minister; favoured the Rhenish separatists in Germany, occupied the Ruhr against British objections in 1923, and secretly supported Mustapha Kemal against the Greeks. Ousted in 1924 by an electoral victory of the Left, he was recalled to save the franc in 1926, and his stabilisation plan succeeded. Briand was now allowed to pursue the policy of Locarno, and Poincaré himself in 1928 received Stresemann with a view to improving Franco-German relations. In 1929 he retired from political life. He died Oct. 15, 1934.

Poincaré was one of the most straightforward and strong-minded statesmen of modern France. His brilliance was recognized in 1909 by his election to the Academy, and in 1914 he was rector of Glasgow university. His memoirs, *Au Service de la France*, 7 vols., 1925-31, and other political and historical writings are classics in style. *Consult* Lives, by H. Girard, 1913; S. Huddleston, 1924; Raymond Poincaré and the French Presidency, G. Wright, 1943.

Poinding (A.S. *pyndam*, to pound). In Scots law, the taking of goods in execution or by way of distress. It is either real, called pointing of the ground, meaning removal of effects on the land for payment of a debt attaching to the land, *debitum fundi*; or personal, seizure of movables for rent or debt. The word is also applied to the impounding of stray cattle.

Poinsettia (*Euphorbia pulcherrima*). Shrub of the family Euphor-

biaceae, native of Mexico. It has oval-elliptical leaves and small greenish-yellow flowers. There are a number of large leaf-like bracts around the flowers, coloured a brilliant vermillion.

Point. In geometry, an indicator of position, having no magnitude. Any point satisfies certain geometrical conditions. Many problems involve either the discovery of the position (or successive positions) of a point satisfying stated conditions, or the elucidation of conditions pertaining to points in stated positions. The boundaries of lines are points; lines intersect at points. A line can be regarded as an assemblage of points (i.e. successive positions) or as the path of a moving point. The line which a point describes if it moves so as to satisfy given geometrical conditions is called the locus of the point. In analytical geometry the position of a point is indicated by its coordinates. *See* Geometry.

Point. Term in ballistics. There are a point in the trajectory of a projectile where the curve begins to decline towards the ground; a second point at which the lowest horizontal line of sight cuts the trajectory; and a point at which a horizontally-fired projectile strikes the horizontal plane containing the base of the gun mounting.

Point. In heraldry, part of the shield, as in the terms honour point, fesse point, etc. All points are described under Heraldry.

Point. In music, a dot employed in medieval notation and placed either after a note or above the staff, in order to affect the value of certain notes. The principal dots were known as points of (a) augmentation; (b) perfection; (c) alteration; (d) division. Point was also an old term for a note.

Point. Unit of scoring in many sports and pastimes. The application of the term falls really into two distinct categories. Points may be registered as an essential feature throughout the game, e.g. every rally at lawn tennis; every hand at bridge, every move in attack or defence at boxing, will result in so many points being credited to one side or the other; at Rugby football a try counts 3 points and conversion to a goal 2 extra points. Or points may be awarded on the result of the match alone; e.g. in a chess tournament a win is worth one point and a draw half a point to each player; in League football tables two points are awarded for a win and one to

each side for a draw; while in county cricket various points are given according to the outcome of the match.

Point. At cricket, a position in the field square to the batsman on his off-side and about 10-15 yds. away. This old-fashioned position is now less commonly seen than either backward point, which is deeper and behind the wicket, or silly point, only a few yards from the bat and in front of it.

Point Duty. That part of a policeman's work concerned with the directing of traffic by signals. Until the introduction of traffic lights, important road crossings and junctions in large cities throughout the world were controlled by one or more police officers or traffic marshals. Where unlighted points still exist in London, point-duty policemen perform an 8-hour tour of duty with 3 half-hour breaks for meals. The officer on duty may leave his point only if required for more essential police duties. In Great Britain, point-duty police direct traffic from ground level and give signals by hand, but in many U.S. and Continental cities they are accommodated in towers or on pedestals. In some cities, e.g. Paris, they give the right of way by blowing a whistle.

Pointe-à-Pitre. Town of Guadeloupe, French West Indies. The chief commercial centre of the colony, on Grande Terre, it has a good harbour with a trade in sugar, vanilla, and cacao. The town was almost destroyed by earthquake in 1843 and by fire in 1871. Pop. 43,551.

Pointe-des-Galets. Chief port of Réunion. It is connected by a coast rly. of about 80 m. with St. Benoit and St. Pierre, and has a trade in sugar, rum, and tapioca. It is administered according to French municipal law.

Ponter. Old breed of sporting dog of Spanish origin, which in its British type has been crossed with the foxhound and the greyhound. It is characterised by the habit of pointing, or stopping dead and remaining rigid when it finds game at close quarters. This dog,

Ponter. Prize-winning specimen of this breed of sporting dog

which belongs to the hound group, hunts by scent, but follows the body-scent, not the foot-scent, of the game, wherefore it should carry its head high when working, and not low as the foxhound does. A large specimen stands about 24 ins. high at the shoulder and weighs nearly 60 lb. In general appearance it is not unlike a foxhound, but is always parti-coloured, liver and white being the favourite combination. *See Dog colour plate*; Kennel.

Pointillism. In painting, the representation of vibrating light and atmosphere by means of pure colours laid on in juxtaposed points or dots. This technique was an offshoot of the Impressionist doctrine of the division of tones, and was exploited by Seurat, Signac, (*qq.v.*), and others. *See Neo-Impressionism.*

Pointing. In music, the method of marking the prose Psalms so as to ensure correct accentuation and unanimity in singing them to the Anglican chant. At one time the rendering seems to have been empirical, and was probably not unsatisfactory with singers constantly rehearsing together, but when it became more general to chant the prose Psalms in place of the metrical versions, it was necessary to devise some way more useful to the average choir. The method now in vogue is based upon the application to the words of the bar-lines in the music, so that in mediation and cadence the syllables may coincide with the notes, all redundant syllables being sung to the receding note.

Pointing. In brickwork and masonry, the ornamental finishing of joints on the face of a wall, etc. The general principle is that the joints are raked out to a shallow recess, and then new material is filled in. Thus, when a wall is to be pointed, after raking out the joints it is cleaned down and given a colour wash. Next a stopping of the same colour as the wash is filled in, made from lime mortar and a little cement. On top of this goes the pointing material which, for white joints, is composed of lime-putty and silver sand. The narrow vertical and horizontal lines of the pointing are cut cleanly by means of a knife and straight-edge. The various patterns used comprise the recessed vee-joint, grooved joint, and beaded joint, for which a tool called a jointer, shaped to the counterpart of the desired pattern, is worked over the filled brickwork joint.

In the pointing of masonry, the joints may be left flush, or be

raked out to leave recesses. Weathered and struck joints are also used, and projecting forms of pointing are employed, much as in brickwork. Another meaning of the term pointing is for the use of the mason's tool known as a point, for roughing out carving and figure work. *See Bricklaying.*

Point Lace. Light embroidery employing a foundation usually of hexagonal net, and handworked with the point of a needle, whence its name. Seen under a magnifying-glass the more solid portions of the design are found to consist of looped (not of twisted or plaited) threads. Certain patterns of pillow lace (*q.v.*) are also, though incorrectly, called point, *e.g.* Bucks point and point d'Angleterre. *See Lace and colour plate.*

Points. Device by means of which a railway track branches into two or three separate tracks, or by which a train is enabled to pass from one track to another.

Points. Crossings and points at York station, England. A. Single junction. B. Diamond crossing. C. Single slip. D. Double slip. E. Cross-over road. F. Scissors crossing. G. Special scissors crossing. Top, diagram showing disposition of rails for a single junction

Points are also known as switches and turnouts. At a given point in the track the two outer rails are laid so as to diverge, one or both of the rails being curved outwards for the purpose. From the same point, in a single turnout, an additional rail tapering to a knife-edge and known as a tongue-rail is laid on the inside of each of the main rails, one being arranged tangentially to one outer rail and the other tangentially to the other outer rail, so that these tongue rails converge to a crossing point; they are rigidly cross-connected by bars or rods, and rest upon metal chairs.

Two tongue rails with their connexions are known as a switch and are connected by rodding to switch levers in a signal cabin at the side of the track, by means of which the knife-edge of one may be drawn tightly against the inner edge of one of the outer rails, leaving a space between the other knife-edge and the other outer rail

or vice versa. By this means the knife-edge guides the wheel flanges of vehicles on to one of the tracks, the space on the opposite side allowing the opposite wheel flanges to pass. At the point where the tongue rails, continued as ordinary rails, would otherwise cross, their ends are splayed apart, and the pointed end of two other rails spliced together is inserted between them, leaving a clear space for wheel flanges.

The spliced rails in turn diverge and, continued, form the two extra rails required for two separate tracks. The pointed end of the spliced rails is called a frog, and, with the splayed ends, constitutes what is known as the crossing. On either side of the crossing, on the inner edges of the two outer rails, a short length of guard rail is fixed, to prevent flanges

from fouling and mounting the frog. In cases where the track branches into three it is termed a three-throw switch; the arrangement is more complicated as additional tongue rails are introduced. When a frog points in the direction from which trains approach, the switch is a facing switch; when in the opposite direction, a trailing switch.

The curvature of rails at a turnout is determined by the angle of crossing, *i.e.* the angle at which the switch-rails would cross, measured on the gauge line, if not played at their ends. The greater the angle the sharper the curvature; both are determined by the gauge of the railway, the speed at which trains have to be diverted, and other reasons. See Railways.

Points Rationing. Scheme introduced in the U.K., Dec. 1, 1941, and maintained until May 19, 1950. It was akin to that governing clothes rationing, and allowed the consumer a choice among a range of foodstuffs. At first it comprised rationed distribution of tinned meats, fish, and beans, with special ration books allowing 16 points monthly. It was extended to include biscuits, tinned fruits and milk, macaroni, spaghetti, cereals, porridge oats, foreign cheeses, and dried fruits, with an increased monthly allowance of points. See Ration.

Point System. In printing, the adoption of type-sizes according to a standard of 72 points to the inch (one point = 0.0138 in.). Each increasing type size gives an exact multiple of points. The usual sizes range from 5 pt. to 12 pt. for text type, and from 14 pt. upwards (18, 22, 24, 30, 36, 48, 60, and 72 pt.) for headings and display type. The text of this Encyclopedia (except for bibliographies, tables, etc., in 7 pt.) is set in 8 pt. The point system originated in the U.S.A. See Type.

Point to Point. Name given to a type of race for hunters. Such races are held under the auspices of a hunt, and are usually divided into two classes: for welterweights, over 13 stone, and for light-weights under that figure. Women also participate. Usual conditions are that the horses entering must have been regularly hunted, and must be ridden by their owners. The course is generally one of three or four miles, over fair hunting country. See Steeplechasing.

Poiré, EMMANUEL. Real name of the French caricaturist better known as Caran d'Ache (*q.v.*).

Poise. The C. G. S. unit of viscosity. The viscosity of water at 20° C. is approximately equal to $\frac{1}{100}$ poise, *i.e.* one centipoise.

Poison (Lat. *potio*, draught). Substance which, when taken into the mouth or stomach or absorbed by the blood, is capable of seriously affecting health or destroying life. Some poisons have a local action only, *e.g.* strong mineral acids which injure the tissues with which they come directly in contact. When well diluted they are not poisons. Other poisons, *e.g.* morphia, have no local action, and produce symptoms only after absorption into the system.

A poison inhaled in the form of a gas, or injected hypodermically straight into the blood stream, acts with great rapidity. When swallowed, absorption is much less rapid, and as the process of elimination acts concurrently, an amount taken by the mouth may be less dangerous than a smaller amount injected subcutaneously. Poisons can also be absorbed through the skin. Some poisons, *e.g.* alcohol, morphia, cocaine, when taken for a long period, gradually confer a degree of tolerance which enables the taker to swallow quantities that would otherwise be fatal.

In the treatment of poisoning, the first object aimed at is removal of the poison from the system. Vomiting may be produced by tickling the back of the throat with a feather, or by the administration of an emetic—a tablespoonful of mustard, or one or two tablespoonfuls of salt in a tumbler of warm water. This treatment is suitable in all cases of poisoning, except those due to the alkalis, in which straining the damaged or corroded tissues may lead to perforation of the stomach. The treatment for strong acid poisoning is to administer an alkali, calcined magnesias being the best; but in an emergency sodium bicarbonate, chalk, or even plaster from the ceiling may be given, and, failing these, the poison should be diluted by administering large draughts of water.

In poisoning by caustic potash or other alkalis, water with vinegar or lemon juice should be given to neutralise the acid. Another method of removing poison is by means of the stomach-tube. A long, flexible indiarubber tube is passed by the physician into the stomach, and the tube and stomach are then filled with water through a glass funnel. By lowering the funnel, the fluid is drawn off from

the stomach by syphonage. Thus the stomach can be washed out as frequently as necessary, and antidotes introduced. With such poisons as fungi, in which the onset of the symptoms is delayed for several hours, much of the poison is apt to have passed on from the stomach into the intestines, and in these cases administration of a brisk purge is recommended.

Antidotes to poisons act in various ways. The object in some cases is to convert the poison into an insoluble substance. Thus, in oxalic acid poisoning, soluble calcium salts are given to precipitate the insoluble calcium oxalate. In poisoning by metallic salts, such as the corrosive sublimate or mercuric chloride, albuminous substances like white of egg are useful, as they convert the poison into albuminates, which are much less soluble. These, however, are slowly digested, so it is still necessary that they should be removed from the system by emesis or washing out. Other antidotes act as physiological antagonists, *i.e.* they produce the opposite effect of the poison. With signs of heart failure, ether, strychnine, or caffeine may be administered. Respiratory failure may need treatment by artificial respiration. In any form of poisoning prolonged vomiting and severe pain may make administration of morphia advisable.

Poisoning by vegetable food, with the exception of fungi, is rare, occurring almost exclusively as a result of accidental contamination of the food, as, for example, when lead is dissolved out of the vessel containing preserved fruit by the action of the fruit juices.

MEAT. Poisoning by meat is nearly always the result of acute infection by bacteria, following the eating of diseased or putrefying meat. Usually the animal from which the meat has been prepared has been found to be suffering from infection with the *Bacillus enteritidis* of Gärtner, an organism which belongs to the paratyphoid group. The disease has been found in cows after septic poisoning following calving, the bacillus occurs less frequently in sheep and pigs.

Botulism is a rare form of poisoning due to the presence of a micro-organism, which has been found in infected meat that has been potted, or otherwise preserved so as to exclude air.

The symptoms of poisoning from meat usually begin from 6

to 12 hours after the food has been eaten. Sometimes there is a delay of from 12 to 48 hours. They may begin suddenly with acute onset, or more gradually with nausea, loss of appetite, and feelings of ill-health. The most marked symptoms are vomiting, pain, or colic in the abdomen, headache, profuse diarrhoea, pain in the back, and rise of temperature. Rashes on the skin sometimes occur, and, in severe cases, delirium. The great majority of people recover, but in severe cases there may be failure of the action of the heart, collapse, and death. When the symptoms begin early, some relief may be obtained by inducing the patient to vomit; but usually the food has passed on from the stomach before the condition is recognized.

Any decomposing fish may give rise to poisoning. Mackerel is especially liable to become rapidly unfit for food. Crabs, lobsters, and other shellfish are equally dangerous if not fresh. Oysters and mussels, if grown in sewage-polluted waters, may convey typhoid. The symptoms are those of irritation of the stomach and intestines. Milk may be responsible for epidemic poisoning, if infected by organisms; it may also convey bacterial diseases.

The Law on Poisons

The sale of poisons in the U.K., according to the Pharmacy and Poisons Act, 1933, is under the control of the poisons board, a committee representing government departments. This board prepares the poisons list, which is approved by the Home secretary. This list is in two parts. Poisons in the first may be sold only by authorised sellers; those in the second may be sold by a wider class of persons called listed sellers (because their names are on the local authority's list). The poisons in the second part are those normally used for purposes other than the treatment of human ailments. No one may be an authorised seller unless he carries on the business of selling drugs by retail and unless (subject to some relaxations where the business is carried on at two or more premises) the sale of all retail drugs is under the personal supervision of a registered pharmacist. Poisons in the first part of the list may not be sold unless the purchaser is known to the seller or is vouched for by a householder. The seller must enter the sale in a book and the entry must be signed by the purchaser.

There are some relaxations of these rules, e.g. in the sale of animal medicines. The container of any poison sold must be labelled with the word Poison and the name and address of the seller.

Control under the above Act is complementary to that imposed by any other enactments, e.g. the Dangerous Drugs Acts, which bring under special control a number of substances, including opium, cocaine, morphine, and Indian hemp. It is unlawful for a person to be in possession of a dangerous drug unless he is a pharmacist, medical practitioner, veterinary surgeon, etc. Authority to possess dangerous drugs may be withdrawn.

Poison Gas. Term used for chemical agents which may be used in warfare to incapacitate or kill. Gases, together with smokes and incendiary substances, constitute the materials of Chemical Warfare (*q.v.*).

Poison Ivy (*Rhus toxicodendron*). Bushy shrub of the family Anacardiaceae. It is a native of N. America, where it is abundant in woods, thickets, and hedgerows, often climbing to considerable heights by means of rootlets, after the manner of ivy. The leaves are divided into three oval or rhombic leaflets, paler and downy beneath. It has minute, whitish flowers in panicles, succeeded by small cream-coloured berries. The whole plant is highly poisonous, and many persons are so susceptible to its influence that even brushing the plant with the dress may cause serious trouble. Smoke from fires containing it has been known to produce this effect.

Poison elder (*Rh. vernix*), which has from 7 to 13 leaflets, is a more erect shrub and is also extremely poisonous. The poison oak is a similar plant, which may be distinguished by the more serrated leaves.

Poissy. Town of France, in the dept. of Seine-et-Oise, it is 17 m. by rly. N.W. of Paris. It stands on the left bank of the Seine on the edge of the forest of St. Germain. The church of Notre Dame is a fine example of the Transition style. There are iron and steel works. Here, in 1561, was held the abortive conference between the Roman Catholics and Protestants known as the Colloquy of Poissy. Pop. 13,375.

Poitiers. Town of France, capital of the department of Vienne and formerly of the province of Poitou. It is built on a plateau encircled by the Clair and Boivre, 60 m. S.S.W. of Tours, on the Bordeaux rly. It is famed for steep, tortuous streets and ancient houses. Numerous ecclesiastical buildings include the Romanesque-Gothic cathedral of S. Pierre, 1162-1379; the Temple S. Jean, a baptistery dating from Merovingian times; the Romanesque church of Notre Dame la Grande, dating from the 11th century; the church of Montierneuf, begun in 1077 by William VI, duke of Aquitaine and count of Poitiers, who is buried within its walls; and S. Radegonde (11th century), erected on the site of an ancient edifice which contains the tomb of the town's patron saint, who founded the abbey of the Holy Cross. Secular buildings include the palais de justice, and the university in the former Hotel-Dieu. Among bridges, the Pont Joubert dates from the 12th century. There are ruins of a Roman amphitheatre and baths. Near the tombs of a number of Christian martyrs (discovered in 1879) is a large dolmen, around which was formerly held the fair of S. Luke.

Poitiers arms

Industries include brewing and the manufacture of leather, hosiery, and cloth. Pop. 48,546.

Its situation has given Poitiers a peculiar importance in military and political history. The capital of the Gallic tribe of the Pictones (or Pictavi), it was known as Limonum at the time

Poitiers, France. West front of the cathedral of S. Pierre

of the Roman conquest. Christianity was introduced in the 3rd century; the first bishop was S. Hilarius. Alaric II was defeated by Clovis at Vouillé near by in 507, and the town became part of the Frankish dominion. In 732 Charles Martel vanquished the Mohammedans somewhere between Poitiers and Tours. The battle between French and English in 1356 is described below.

Poitiers, BATTLE OF. English victory over the French during the Hundred Years' War, Sept. 19, 1356. Edward, the Black Prince, in command of some 8,000 men, was marching up from Guienne, where he had landed the previous year, when, near Poitiers, he found his way barred by a French army of 15,000 under King John. Attempts at peace having failed, the battle opened with a French attack made by the dismounted knights of one of four divisions. The English archers, skilfully placed behind hedges, met them with a flight of arrows, and they failed utterly. The next assault made more impression, but these knights, too, had to give way after a stout exchange of blows. The third division thereupon fled from the field, but the fourth, under the king himself, advanced, and the English were hard pressed when the Black Prince sent a small body to the rear of this force; this move decided the day. The French knights fought to the last, but by night the army was routed. John, his son Philip, and some 2,000 knights were made prisoners, while about 3,000 were killed. The English losses were slight. The actual site of the battle is said to be some 6 m. S.E. of Poitiers, at Maupertuis. It is described by the English chronicler, Geoffrey le Baker, and by Froissart.

Poitou. Prov. of France before the Revolution. It lay between the Loire and the Garonne, around Poitiers, its capital. From the 9th century it was ruled by the counts of Poitiers, who later became dukes of Aquitaine (*q.v.*), of which it formed part. It was divided into lower and upper Poitou. Apart from Poitiers its chief towns were Mirebeau, Loudun, Niort, Luçon, Maillezais, Thouars, and Roche-sur-Yon. Since the Revolution it has been divided into the departments of Vendée, Deux-Sèvres, and Vienne, stretching also into Charente and Charente-Inférieure.

Poke. Scots word for a home-made bag of paper. It is formed from a square sheet folded in the

form of a cone and twisted at the end to prevent unrolling. Pokes are mostly used for holding small quantities of tea or sweets. A poke bonnet, a woman's hat popular in the 19th century, took its name from its resemblance to the paper bag; with a deep projecting brim, it is sometimes called a scuttle bonnet. Poke means bag in the phrase, a pig in a poke.

Poker. Card game. Various sources of origin have been claimed for it, the most authentic being that a species of poker played with 20 cards made its appearance in America on the Mississippi steamboats about 1830. This was superseded from 1860 by the now prevalent draw poker, described here. Another variety is stud poker.

In the usual game a full pack of cards is used; some players like to include the joker, which may stand for any card the holder chooses. Cards bear their usual face value, except that the ace may count as either highest or lowest. Five or six players make the best number. The dealer shuffles and makes up the pack, which is cut by the player on his right; he then deals five cards to each person, any way he pleases except five at a time. Every player is for himself, and the object of the game is to hold the best hand when all the players remaining in expose their cards after betting.

Hands rank in this order: 1. Straight flush: a sequence of five cards all of the same suit. 2. Fours: four cards of the same denomination. 3. Full house: three cards and two cards of the same denominations. 4. Flush: five cards of the same suit. 5. Straight: five cards of different suits, but all in sequence. 6. Threes: three cards of the same denomination. 7. Two pairs. 8. One pair. If two players should each hold a sequence or pair, the one having the higher cards would win. This rule applies all the way down, so that if none of these eight combinations is held, the highest card decides the winner. Hands equal in all respects divide the pool.

Before the deal is completed the player at the dealer's left, styled the age, puts up half the stake he is willing to risk, called the blind. The next player looks at his cards, and if he considers them good enough to come in, doubles the blind; otherwise he throws down his cards and goes out. This

continues with the other players until it comes to the turn of the age, who must either double his blind and play, or drop out and lose the amount of his blind.

Any player who has staked money and remained in the game is entitled to ask for one to five cards more to replace any of his original hand. The real betting now starts, each player going above the other according to the strength of his hand and judgement of the chances, or equalling the previous highest bet. This continues until all players give way except one, in which event the cards are thrown in; or until all have paid equally to see one hand, whereupon all cards are laid upon the table, the holder of the highest taking the pool. Poker has been held to be a game of chance and so unlawful if played at a gaming house.

POKER DICE. Five dice are thrown, the sides being marked ace, king, queen, jack, ten, and nine. The player throwing first may make one, two, or three attempts, after which all other players are allowed the same number. Dice which show satisfactory numbers after the first or second throw are retained by the player as part of his "hand." Combinations to be tried for are five of a kind, four of a kind, full house, straight, threes, two pairs, pair.

POKER PATIENCE. In this card game for one, the player lays out the top 25 cards of the pack, singly as they come, in a square of five cards each way; each card must touch vertically, horizontally, or diagonally, one already placed. The aim is to make up the best possible poker hands in each direction vertically and horizontally, ten in all. A straight flush counts 30; fours, 16; straight, 12; full house, 10; threes, 6; flush, 5; two pairs, 3; pair, 1.

Poker-work. Method of decoration. An alternative name is pyrography (Gr. *pyr*, fire; *grapho*, to write). Formerly a red-hot poker with a sharp point was used, and the design, after being drawn on wood, was burnt in, but this method was later abandoned in favour of electrical and other methods. A special apparatus consists of a lamp, with a tube and hand bellows, and a metal point, held in the flame till heated. Cedar, chestnut, pear, elm, and other woods are usually chosen, and leather, velvet, and other materials can be decorated. Repeated designs are often burnt by

metal dies or brands; the designs may be embellished by carving and painting.

Pokeweed (*Phytolacca decandra*), PIGEON-BERRY OR RED-INK PLANT. Perennial herb of the family Phytolaccaceae. It is a native of the warmer parts of N. America. It has large, fleshy, poisonous roots, and tall stems. The large, oval, alternate leaves become purple in autumn. The whole plant has an unpleasant odour. The root is emetic and purging, and a tincture of the berries is used as a remedy for rheumatism.

Pokeweed, or the red-ink plant. Flower spikes and leaves; inset, single flower

Pokomo OR WAPOKOMO. Primitive negroid people of Bantu speech. In Tanaland territory, Kenya Colony, they number about 18,000. See Bantu; Negro.

Pokuna. Artificial tank for bathing or holding drinking water, in ancient Ceylon. Innumerable at Anuradhapura, many are 150 ft. by 60 ft., and 25 ft. deep, with granite tiers, balustraded marble steps, and sculptural enrichments. They were used for ablutions and general water supply.

Pola (Yugoslav, Pula). Town of Yugoslavia, in Istria. It was before the First Great War the chief naval station of Austria-Hungary. There are two harbours, commercial and naval. E. of the commercial harbour are barracks, the custom house, and the 15th

century cathedral; farther E. is the wall-encircled Castle Hill, crowned by a castle built by the Venetians. A temple of Augustus, built 19 B.C., and the amphitheatre, 435 ft. long, constructed

Pola, Yugoslavia. Ruins of the Roman Temple of Augustus. Top, left, the amphitheatre from the port

of white Istrian limestone, are monuments of the Romans. The Venetians removed the stone seats

Polacca. Three-masted square-rigged vessel employed in the Mediterranean

of the amphitheatre for building purposes. As Colonia Pietas Julia, the port was an important Roman naval station; captured by the Venetians in 1148, it was destroyed in 1379; in 1815 it became Austrian. After the First Great War it passed to Italy; but under the peace treaty with Italy, 1947, the part of Venezia Giulia which included Pola went to Yugoslavia, when nearly 25,000 Italians left the city.

Polacca. Three-masted ship seen in the Mediterranean. Though square-rigged and carrying a jib-boom, the main and fore masts are single spars, without top or crossrees. The name is Italian, meaning Polish. It is also a name for the Polonaise (q.v.).

POLAND: KINGDOM AND REPUBLIC

Simon Wolf, LL.D. (Vienna)

The history of the varying area which has been called Poland is here told, followed by an account of the political conditions of the area under Polish administration after the Second Great War. See also entries under the principal towns, rivers, etc., e.g. Cracow; Tatra Mts.; Vistula; Warsaw; outstanding Polish personalities, e.g. Copernicus; John III; Paderevski; Poniatowski; Sikorski; and Russo-German Campaigns, 1941-45

HISTORY. Gniezno, oldest Polish town and cradle of the Polish nation, was, according to legend,

Poland arms

built by Lech, while his brothers, Czech and Russ, were founders of the Czech and Russian nations respectively, implying that Poles, Czechs, and Russians spring from the same stock. In old Polish the word *gniezno* meant nest. Lech so named the town because he found there a nest of white eagles, and the white eagle thus became the emblem of Poland.

Second oldest Polish town is Cracow on the Vistula. According to another legend, the ancient settlement, while ruled by Krakus, was often attacked by a dragon (more probably by a raiding enemy

tribe). Krakus killed the "dragon," and the grateful Cracovians erected a mound in his honour. Begun in prehistoric days, this mound has grown through the centuries and now dominates the city. Another mound was built in honour of Princess Wanda, daughter of Krakus. Rydygier, a German chieftain, threatened to invade Cracow unless she agreed to marry him. Wanda threw herself into the waters of the Vistula and so perished.

In the 7th century, Popiel, a descendant of the legendary Lech, ruled the third oldest Polish town,

Kruszwica. Not far from that town lived a wheelwright, Piast by name. After Popiel's death, in 842, Piast

Poland Flag; white and red

was elected his successor. This year marks the beginning of Poland's recorded history.

Mieciślaw I (Mieszko I), grandson of Piast, was christened in 966. Through him the country became Christian, and since then Poland has been in the orbit of western civilization. Mieciślaw's son, Bolesław the Valiant, was crowned first king of Poland in 1025. He extended the frontiers of the country eastwards as far as Kiev. When entering that city—then the richest in Europe—he chipped his sword in striking Kiev's golden gate. This jagged sword was used as the coronation sword of all Polish kings. Bolesław, who stopped the Teutonic advance to the E., is regarded as the real founder of the Polish state.

During the 11th century Poland grew in size and power. At the beginning of the 12th the Slav tribe of Pomeranians was converted to Christianity, and their land, stretching from Szczecin (Stettin) to Gdańsk (Danzig), was united with Poland, thus bringing her to the Baltic coast. But at the same time Poland was divided into several principalities. During that period of division the country was threatened by two great dangers. The first was the Tartar invasion. Henry the Pious, duke of Silesia and a descendant of Piast, fought the Tartars at Liegnitz (Lignice), in Silesia, and perished with all his knights in 1241. That battle saved Poland, and also her western neighbours, from the Tartars, who thereafter retreated to the E., though they kept a hold on Russia for more than 200 years.

The second peril came from the Teutonic knights of the Cross. This order, established in Palestine during the Crusades, was invited in 1226 by Conrad, duke of the Polish principality of Masovia (Masuria) in central Poland, to help convert the pagan Prussians (a non-Teutonic tribe, not identical

with the modern Prussians) to Christianity, and in order to repel their attacks on a weakened and divided Poland. In the event, however, knights of the Cross exterminated the Prussians, brought colonists from Germany, and settled

ously, union of Poland with Lithuania was arranged in 1386. The union lasted until the end of the 18th century.

After becoming king of Poland, Jagiello was provoked by the knights of the Cross into war. On the fields of Grünwald and Tannenberg, one of the most important battles in history was fought between the Polish and Lithuanian forces and the Teutonic knights, in 1410. The peace treaty of Toruń, 1466, returned to Poland all her former possessions on the Baltic coast, except E. Prussia, still held by the knights, but now under the suzerainty of the king of Poland. When the last grand master of the knights of the Cross secularised the order, he proclaimed himself hereditary duke of E. Prussia and vassal of the Polish king. East Prussia thus remained a fief of Poland until 1701.

The Jagellon dynasty ruled from 1386 to 1572, Poland's golden age, which was marked by voluntary unions not only with Lithuania, but also with Livonia, Ruthenia, and Moldavia. By the end of the 16th century, Poland was the largest state on the Continent. While religious intolerance was prevalent in nearly all Europe, in Poland there was freedom of religion; but though Protestants were given equal rights with R.C.s Protestantism never gained much influence in the country. The Polish Habeas Corpus Act, dating from 1430, stipulates that "nobody may be imprisoned before he is legally convicted." During this era science and the arts flourished.

At the extinction of the Jagellon dynasty, Poland in 1572 became a republic with kings elected for life. As in England in those days, political liberty and parliamentary government went hand in hand with weakness of the central authority. One of the ablest elected kings, the Hungarian Stefan Batory, strove in vain to strengthen the govt. He was, however, help-

Poland. Four young people of Sokolowa. Above left, peasant girls of Gosty in the district of Poznań

in what became the German prov. of E. Prussia; then they began following secular aims. They captured the Slav city of Gdańsk, 1308, and made constant raids on then pagan Lithuania.

Wladislaw the Short, one of the Piast princes, succeeded in reuniting Poland at the beginning of the 14th century, fought the knights of the Cross, and defeated them at the battle of Płowce. His son, Casimir the Great, who ascended the throne in 1333, promulgated the statute of Polish law in 1347, historically the first complete code in Europe; in 1364, he founded the university of Cracow. Jews, then persecuted in central and W. Europe, were invited by Casimir to come to Poland. They came and helped to build new cities. When Casimir the Great died, in 1370, the Piast dynasty at last came to an end.

Casimir's successor was his nephew, Louis, king of Hungary. He in turn was succeeded by Jadwiga who married the half-savage prince of Lithuania, Jagiello, who took the name of Wladislaw, and his people were voluntarily baptized. Simultan-

Poland. A meat stall in the market at Białystok

less against the *liberum veto*, the ruling by which a single member of the diet (*sejm*, in Polish) could oppose the enforcement of any law. In war, Batory was more successful: he defeated the Russian Tsar, Ivan the Terrible. Wilno university, a centre of Polish science, was founded by Batory in 1578.

In the 17th century nearly all Europe was exposed to the danger of invasion by the Turks, who besieged Vienna in 1683. The German Emperor Leopold, hard pressed by the Turks' French ally Louis XIV in the W., asked for Polish help. John III Sobieski, with 40,000 of his picked troops, defeated the Turkish army of 300,000 and saved Vienna.

This last efficient Polish king was followed by two elected rulers of the Saxon dynasty, Augustus II and Augustus III. During their reigns, Poland's strength was dim-

inishing. In 1764, the Empress Catherine of Russia imposed on Poland as a king her candidate Stanislas Augustus Poniatowski. For many years already, Russia and Prussia had been resolved to maintain a state of anarchy in Poland. To combat lawlessness and foreign intervention, Polish patriots organized a military league, the confederation of Bar, under the leadership of Casimir Pulaski, future hero of the American War of Independence. The confederation failed, and the first partition of Poland was enforced in 1772, Prussia annexing Pomorze (Pomerania) on the Baltic coast, Russia provs. in the E., Austria the S.E. section (Galicia). The shock of this partition awakened the nation in what was left of Poland. In 1773, a ministry of education—the first in the world—was created; while the constitution of May 3,

1791, which laid the foundation of a modern system of govt., while at the same time strengthening the central powers in the state, was liberal in character. May 3 became the national day of Poland.

Russia and Prussia, fearing a Polish renaissance, attacked Poland from both sides, defeated the Polish army and partitioned the country a second time in 1793. This time Prussia annexed Gdańsk and a vast tract of W. Poland, while Russia took further E. provs. Austria did not take part in the second partition.

Again a patriotic wave swept over Poland with Tadeusz Kosciuszko as its leader. Against the will of the weak puppet king, Stanislas Augustus, he summoned the nation to arms and, with his peasant fighters armed only with scythes, defeated a large Russian army at Racławice, near Cracow

In Warsaw, at the same time, the people under the leadership of the cobbler Jan Kiliński attacked the Russian garrison, and forced all the Russians out of the capital. However, on Oct. 3, 1794, Kościuszko was decisively defeated at Maciejowice, the Russians occupied Warsaw, and in 1795 occurred the third partition, which destroyed Poland as an independent country.

The Poles attempted to regain their independence during the Napoleonic wars. In Italy, Poles under Dąbrowski fought on the French side, and at that time the Polish national anthem, *Poland Is Not Yet Lost*, was written and composed. Napoleon showed his gratitude for Polish military help by creating the duchy of Warsaw, a nucleus of the Polish state, in 1807. After Napoleon's fall, the Congress of Vienna (1815) gave the major part of Poland to Russia, with the stipulation that it should be granted self-government. But the Russians treated the Poles so badly that in 1830 the November rising broke out. After its suppression, many thousands of Polish patriots emigrated—most of them to France. There Adam Mickiewicz, the greatest Polish poet, wrote his famous epic, *Pan Tadeusz*.

In 1863 the January rising occurred. It was defeated after a year of fighting, and thousands of Poles were deported to Siberia. Meanwhile, in the provs. annexed by Prussia, a process of thorough Germanisation was going on. Foreign rule in that part of Poland which had been taken by Austria was relatively liberal, Galicia eventually securing from Vienna extensive autonomy, while statesmen of Polish extraction played a role in various Austrian govts.

The Republic of 1919

It was in Galicia that a young Socialist Josef Piłsudski, after his return from Siberian prisons, founded the Polish riflemen's organization, the nucleus of the Polish legions during the First Great War, and later of the Polish army. After the war an independent Poland, one of Wilson's Fourteen Points, became a fact, recognized by the treaty of Versailles, 1919. She immediately occupied Galicia, wrested Wilno from Lithuania, and advanced into the Ukraine as far as Kiev. There her troops were held by the Red Army, which in its turn invaded Poland, to be defeated 1920 by Piłsudski. At first undisputed leader of the country, Piłsudski later had to give way to other, and more democratic, forces in the

state. In 1926, however, by a coup d'état he returned to power, introducing a semi-dictatorship which was maintained after his death in 1935.

SECOND GREAT WAR. Poland had concluded treaties of non-aggression with both Russia and Germany; but on Sept. 1, 1939, she was invaded by the Germans. That was the signal for the U.K., who had entered into a pact of military assistance with her in April, 1939, to declare war on Germany. After a gallant but short-lived resistance, the Poles were routed, and the invasion of the country from the E. by the Red army completed their defeat. Warsaw held out against the Germans until Sept. 27, but by the end of the month Poland had once more lost her independence, the country E. of a line called the Ribbentrop-Molotov line (coinciding roughly with the so-called Curzon Line, *q.v.*), being occupied by the Russians, the country W. of that line by the Germans, according to a pre-war secret treaty.

Polish Forces Abroad

A few weeks later a Polish army was being recruited in France and an exiled govt. was established in the French town of Angers. The leader of both army and govt. was Gen. Władysław Sikorski. Two Polish divs. took part in the battle of France, one in Lorraine, and the other at the Belfort gap. After the fall of Paris, June 14, 1940, Sikorski flew to London and arranged with Winston Churchill for the transfer of some 24,000 Polish troops to the U.K., where 2,300 airmen and 1,400 sailors were already serving under British command. Reconstruction of the Polish army began in Scotland, while Polish R.A.F. squadrons, particularly fighter squadrons No. 303 and No. 304, distinguished themselves in the battle of Britain. Units of the small but efficient Polish navy, after running the German gauntlet in the Baltic at the beginning of the war, became for all practical purposes a part of the Royal Navy; they participated in the Norway expedition and helped to evacuate British and French troops from Dunkirk. The Polish forces were, at that time, mostly recruited from young Poles who had fled from their country and reached the U.K. after an adventurous journey.

In Poland itself, in the meantime, the Nazi Governor Franek administered the country with an iron hand, suppressing Polish

cultural life, and conducting a policy of extermination. Worst of all was the fate of the three and a half million Polish Jews who, having been forcibly concentrated in ghettos, were condemned to death by Himmler. Not more than 100,000 escaped the gas chambers and crematoriums of the death factories at Oswiecim (Auschwitz), Tremblinka, and Belzec. Moreover, the Germans transferred Jews from all over occupied Europe to Poland, where altogether about 5 million met their death. Before the final liquidation, April 28, 1943, of the Warsaw ghetto—the largest of all—a handful of young Jews of both sexes, armed with nothing but their fists and a few machine guns and rifles smuggled in by the Polish underground movement (*v.i.*), for ten days fought their oppressors, killing 300 Germans and wounding 1,000. A few Jews escaped through the sewers; 26,000 were massacred; some 14,000 survivors were deported.

After Germany attacked Russia, the E. part of Poland was soon also occupied by the advancing Germans, and the Nazi policy of oppression and extermination extended to those territories. The Poles, unable to fight the invader openly, established a very effective underground movement, led and inspired by the Polish govt. in London. The commander of the secret army in Poland was first Gen. Rowecki and, after his arrest and execution by the Gestapo, Gen. Bor-Komorowski, who was also commander of the Warsaw rising of 1944 (*see* Warsaw). In 1944, there were 300,000 men and women in the underground army; it ran many daily and weekly papers and other publications.

Poland and the U.S.S.R.

After the invasion of E. Poland by Russia the Poles had no contact with Moscow until in July, 1941, Sikorski went to Moscow and concluded a treaty of friendship and assistance between Poland and Russia which annulled the Ribbentrop-Molotov partition of Poland and provided for the formation of a Polish army in Russia, to be recruited from the deported Poles and the Polish prisoners of war captured by the Red army during the short campaign of Sept., 1939. A corps was raised under Gen. Władysław Anders, but difficulties arising as to its arming and use, the U.K. undertook to equip it. The corps left Russia, was reorganized in

Persia, and then joined the British Middle East forces, serving eventually in Libya and Italy, where it particularly distinguished itself at Cassino (*q.v.*). A Polish armoured div., raised in the U.K., fought in Western Europe 1944-45. A total of about a quarter of a million Poles served outside Poland under British command with the Allied forces.

Sikorski's death in an aeroplane accident in July, 1943, marked the end of good relations between Russia and the Polish exiled govt., which resisted the Russian proposal, made as the Red army was approaching the pre-war Polish frontier in 1944, that Poland should revert to the E. frontier proposed in 1919 (the Curzon line), and should receive compensation in the W. at the expense of Germany. The Russians took Lublin on July 24 and there set up as a national liberation committee, to which they transferred administration of Polish territory as it was liberated, the association of Polish patriots formed earlier in Moscow. On Dec. 31 this committee declared itself the provisional govt. of Poland, and was so recognized by the U.S.S.R. on Jan. 5, 1945.

At the conference in the Crimea, held at Yalta in Feb., the U.K. and the U.S.A. agreed provisionally to withdraw recognition from the exiled govt. and to recognize the Lublin administration provided the latter were broadened by the inclusion of democratic leaders from within Poland and from abroad, and subject to the holding of free elections; accepted the Curzon line, with slight modifications, as the eastern frontier of Poland; and agreed to her acquisition of territory from Germany in the N. and W.

New Government and Boundaries

The Polish govt. in London, which had not been consulted about these decisions, refused to accept them; and inter-Allied consultation on the formation of a new and more representative govt. in Poland made little headway until in June a meeting in Moscow between Mikolajczyk, who had succeeded Sikorski as premier in London, but had resigned from the London govt. Oct., 1944, and members of the (Lublin) govt. in Poland agreed on the formation of a new govt. in Warsaw in which Mikolajczyk became vice-premier. Recognition by the U.K. and the U.S.A. followed July 5. Mikolajczyk's Peasant party was soon obliterated, however, and in 1947 he fled the country.

At the Potsdam conference, July-Aug., 1945, it was agreed that Germany between the Oder-Neisse rivers and the pre-war Polish W. frontier, as well as the S. part of E. Prussia, should be placed under Polish administration, subject to ratification in the peace treaty with Germany; while a treaty between Poland and Russia, signed Aug. 16 and ratified Jan. 3, 1946, settled Poland's E. frontier along the Curzon line with modifications in favour of Poland. For later history, see N.V.

GEOGRAPHY. The entity called Poland has had varying dimensions. Poland has a natural frontier only in the S., that formed by the Carpathian and Tatra mts. The accompanying map shows (1) her frontiers in 1939, and (2) the frontiers of the area under Polish administration in Aug., 1945. This second area, which is about one-fifth smaller than that of 1939, is 119,702 sq. m. in extent, with a pop. (1946) of 23,911,172.

The most important Polish river is the Vistula, on whose banks Warsaw, the capital, and Cracow, a former capital, are situated. The cradle of the Polish nation, however, lies in the basin of the river Warta, a trib. of the Oder. The Niemen, no longer in Poland, figures in Polish poetry.

A Peasant Population

Before the Second Great War, about two-thirds of Poland's pop. of 34 million lived in rural districts; after it, although the inclusion of industrial areas, in particular Silesia, changed the proportions of town and country dwellers, peasants still formed the majority. The post-war land reform of 1946 expropriated big landowners and distributed their land among peasants. Poland is also a country of big forests, timber being an important export.

In 1939 Poland had large minorities: 4,780,000 Ukrainians, nearly 3,500,000 Jews, 630,000 Germans, 1,500,000 White Ruthenians, 90,000 Lithuanians; and a small Czech minority in the S.W. There were hardly any minorities in the Poland of 1946; the Jews had been exterminated, the Germans expelled, and the Ukrainians, White Ruthenians, and Lithuanians absorbed in the U.S.S.R.

For administrative purposes, the country is divided into counties, called *województwa*. Warsaw, the largest Polish city (1946, 476,538), had in 1937 1,261,000 inhabitants. Other important towns are Lodz, the Polish Manchester, 496,861; Cracow, 299,565; Poznan, 267,962;

Bydgoszcz, 133,856; Katowice, 128,278; Czestochowa, 101,480; Wroclaw (Breslau), 168,466; Gdansk (Danzig), 117,616; Chorzów, 103,417.

With the inclusion of Upper Silesia in the country, Poland became an important coal producer. The salt mines at Wieliczka, near Cracow, are famous. In the Middle Ages there were silver mines at Olkusz. Other mineral deposits in Poland are: potash salts, iron ores, zinc, lead. Water power is extensively used, particularly in the S.W. Poland has, however, a low standard of living and of consumption, particularly in regard to industrial products.

CONSTITUTION. Poland was revived in 1918 as a republic. An interim constitution, adopted in 1947, divided power between the legislative chamber (*sejm*), which is elected, the executive, and the president, who is elected for seven years by the *sejm*. The *sejm* must be summoned twice a year, and controls taxation and conscription.

Through the centuries, in spite of changing rulers and forms of govt. the peasants of Poland preserved many of their traditional customs and costumes. The prov. of Lowicz was famous for the multi-coloured hand-woven dresses of the women. At weddings in the villages around Cracow young men on horseback seized the bride and carried her to church. The costumes, dances, and songs of the mountaineers in the Polish Tatra, who were never serfs and who, like the Scottish highlanders, play bagpipes, were striking. Poland is predominantly R.C., and R.C. customs were strictly observed. At Warsaw and Cracow a custom of throwing wreaths into the Vistula, dating from pagan days, continued to be celebrated.

Famous Poles of History

Poles not mentioned already who have achieved world fame include Copernicus (1473-1543), one of the founders of modern astronomy; Chopin (1810-1849), the composer; Prince Joseph Poniatowski (1762-1813), one of Napoleon's marshals; Sienkiewicz, (1846-1916) and Reymont (1868-1925), novelists and both winners of the Nobel prize for literature; Marie Curie (Skłodowska) (1867-1934), co-discoverer of radium and co-winner of the Nobel prize for physics, 1903, winner of the Nobel prize for chemistry, 1911; Conrad (Korzeniowski) (1857-1924), distinguished writer in English; Paderewski (1860-1941), pianist and politician.

Despite the geographical distance between Poland and the British Isles, certain bonds have existed between the two countries. About the middle of the 11th century Aaron, a Scotsman, was archbishop of Cracow. At the time of the English reformation, many English R.C.s found refuge in Poland. The Polish theologian, Jan Laski, founded in London, in the middle of the 16th century, the first Protestant community of foreigners in England. From the 15th century to the partitions, England imported from Poland pitch, grain, and timber, and sold in return textiles and other manufactured goods. When the first partition took place, the British govt. decided neither to recognize the aggression nor to protest against it; but Burke condemned it.

An agreement between England and Poland, 1708, provided facilities for English merchants in Gdańsk, where, by the year 1772, they owned nine warehouses; 220 ships from England reached Gdańsk every year. When Prussia annexed Gdańsk, the City of London protested, for German violence was destroying trade with Poland. The duke of York, second son of George III, was mentioned as a candidate for the throne of Poland.

LANGUAGE AND LITERATURE. Forming with Bohemian or Czech and Wendish the western group of the Slavonic languages, Polish is spoken by 20-25 million people. In flexibility, variety, and power, Polish rivals Russian. The Cyrillic alphabet, however, serves Russian better than the Roman does Polish, inasmuch as it can indicate the sounds of Slav words by combinations of appropriate letters. The disability of the Roman to do this results in that collocation of consonants which seems so intimidating in Polish, till it is explained that sz=sh, cz=ch, and rz=zh or sh; e.g. Pszybiszewski is pronounced Pshybishew(v)ski.

Polish literature is extensive, and much of it is high in quality. It has had a marked influence on Russian, Czech, Serbian, and Ruthenian literatures. The earliest extant Polish works were written in Latin, and consisted of monastic chronicles similar to those found in other European countries at the time, the principal being the Chronicle of Martin Gallus (d. c. 1140). The foundation of the university of Cracow, 1364, led to an increase in learning. The first printing press in Poland was set up in Cracow in 1475, but Latin was still used, and the first book to be written in the Polish language did not appear till 1521.

Meanwhile the Renaissance, with its humanism, had enlarged the horizon of the Poles, and in the 16th century brought about what is sometimes called the golden age of Polish literature and the growing use of the vernacular. Of the writers of this time Kochanowski was the greatest, both as poet and dramatist. Polish literature declined in the 17th century, owing to wars and internal troubles.

The rise of the romantic school of Polish authors dates from about 1820. This school produced one writer of genius, and two of remarkable talent. The first was Adam Mickiewicz (q.v.); the others were Jules Slowacki (1809-1849), poet and dramatist, his most notable work being *King Mind*, and Zygmunt Krasinski (1812-1859), poet and thinker, whose chief work, *The Undivine Comedy*, deals with the sufferings of his unfortunate land. A prolific author was Joseph Ignatius Kraszewski (1812-1887), historian, poet, dramatist, publicist, and novelist, his works actually exceeding 600 vols. in number. Of the many modern writers of merit Poland has produced, the commanding figure was that of Henryk Sienkiewicz (q.v.), a novelist of the highest rank. Other men of note were Milkowski, a vivid stylist who wrote novels about the Balkans; Korzeniowski, a dramatist of real life; Alexander Glowacki, a humorist of the type of Dickens; Pszybiszewski, a playwright of originality, whose *Homo Sapiens* made a great sensation; and Tetmajer, author of the novel, *Angel of Death*. Followers of Sienkiewicz were Stefan Zeromski (1864-1935) and Wladislaw Reymont (1867-1925), author of a fine psychological tetralogy translated into English under the title *The Peasants*. The greatest poet of the late 19th century was Jan Kas-prowicz (b. 1860).

Polar Axis. Term in astronomy relating to the mounting of a telescope so that it is directed towards the celestial pole. The term also applies in mineralogy to a crystal having different arrangements of faces at its two ends. Minerals with a polar axis are tourmaline and diopase.

Polar Bear (*Thalassarcus maritimus*). Apart from the grizzly (q.v.), this is the largest member of the bear family (*Ursidae*). It is white in colour, and sometimes over 9 ft. long. It occurs in the Arctic regions, feeding on fish and seals. *See Bear*; *Carnivora*.

Polar Day. Period of nearly six months' continuous daylight during the summer season at the N. or S. pole. As the earth travels round the sun in an elliptical orbit, it is not upright but tilted at an angle. Hence at one period the N. Pole and surrounding region are inclined towards the sun, and as the earth revolves on its axis they remain in the sun's light; simultaneously the S. Pole and surrounding region are tilted away from the sun and receive no light at all. Six months later the position is reversed.

Polar Exploration. General term for the early voyages of discovery in the Polar regions of the Arctic and Antarctic Oceans and for the later attempts to reach the North and South Poles. *See Antarctic Exploration*; *Arctic Exploration*.

Polaris. Name given to Alpha Ursae Minoris or the pole star, the nearest star to the North Pole of the heavens. *See Pole Star*.

Polarisation of Light. An ordinary ray of light may be thought of as an axis, about which very small electro-magnetic vibrations are being executed at an exceedingly rapid rate, and in every possible direction perpendicular to that of the ray. Thus, in the case of a vertical ray of ordinary light the vibrations are all horizontal, but may be directed to any point of the compass. The polarisation of light involves the reduction of these haphazard, disorderly vibrations to a more regular system.

The simplest type of polarisation is "plane polarisation," in which all the vibrations along the ray are in the same plane; in the case of a vertical ray of plane polarised light the vibrations would all be horizontal and all in a given direction, e.g. the N.-S. direction. A ray of light may also be circularly polarised, in which case the vibrations are executed in circles about the axis of the ray.

The phenomenon of polarisation may be obtained very simply by passing an ordinary ray of light through a crystal of tourmaline or Iceland spar. Plane polarised light is also obtained in the light reflected from a glass mirror at an angle of about 55° ; this is a particular instance of Brewster's law, in that the reflected beam is completely polarised when it is normal to the refracted ray. One of the most remarkable properties of light, clearly showing its electro-magnetic nature, is the fact that the plane of polarisation can be rotated by the presence of a strong magnetic field. The passage of the ray through certain substances, such as quartz and various solutions, also causes a rotation of the plane of polarisation. Instruments for measuring this rotation are called polarimeters, and they are used for determining the strength of sugar solutions, etc. In 1809 Arago found that part of the light from nearly all points in a blue sky is plane polarised. The phenomena of sky polarisation are attributed to the scattering of light by gas molecules and fine dust particles in the atmosphere. Such polarisation is most marked in the light coming in the region in the solar vertical at 90° from the sun; about two-thirds of the wave-motion is confined to the plane containing the sun, the observed point, and the observer. At three points in the solar vertical are three small regions, the light from which is unpolarised. The position of these three neutral points depends on the sun's altitude, the wavelength of the examined light, and the weather conditions. See Crystallography; Light; Optics.

Polariscope. Optical instrument for exhibiting the properties of polarised light. It consists essentially of two parts, the polariser and the analyser, of which the first isolates the polarised beam, while the second enables us to observe its properties. The instrument may take various forms, according as the light is polarised by passage through a crystal or by reflection. The figure shows diagrammatically a standard polariscope. A is the polariser, B and D quartz disks, C glass tube with brass ends, in which is placed the solution being examined. The two quartz plates, E, can slide over one another, a screw and wheel, F, making the necessary adjustment. G is a Nicol prism, H and J regulator quartz plate and prism respectively. K and L are lenses, M a small telescope to enable readings

to be taken from the vernier scale on the movable half of E. N reflects light on the scale, while O is a lamp for providing light rays into the polariscope. P is the ordinary reflected ray of light, the

Polariscope. Diagrams of a standard instrument seen in section. See text

polarised ray passing through the solution in C. A few number of parts are often used. See Polarisation of Light.

Polar Medal. British award for expeditions to the Arctic and Antarctic. The first was issued in 1857 to all personnel, or their next of kin, who had taken part in expeditions between 1818 and 1855. A second medal issued in 1876 to personnel of the Alert and Discovery Arctic expeditions was circular with the effigy of Queen Victoria on the obverse and on the reverse a ship in pack ice.

In 1904 Edward VII authorised the present Polar Medal. It is octagonal and has on the obverse the effigy of the sovereign in naval uniform and on the reverse the Discovery in winter quarters, with a sledge party. The medal is suspended from a white watered silk ribbon attached to a scroll clasp. It was first issued to members of Scott's Antarctic expedition of 1901-04, personnel of the Discovery receiving the medal in silver with a bar "Antarctic 1901-1904," and the crews of the relief ships Morning and Terra Nova the medal in bronze. The medal with appropriate bar was given for Shackleton's Antarctic expedition of 1907; Scott's, 1910-13; Mawson's, 1912; and the Shackleton trans-Antarctic expedition of 1914-16. Medals with bars, Arctic 1930-31, Antarctic 1929-31, Antarctic 1930-31, Antarctic 1935-37, were given after expeditions in those years, and in bronze to the crews of the research ships William Scoresby and Discovery II, 1925-39. The silver medal was awarded in 1943 to eight members of the Royal Canadian Mounted

Police for the voyage through the N.W. passage in the schooner St. Roch. The silver and bronze medals may be worn simultaneously.

Polarographic Analysis.

In metallurgy, the name given to a system of analysis employed in industrial and research laboratories for the rapid determination of

constituents of alloys and pure metals. It involves putting a solution of the sample to electrolysis in a cell in which the current and voltage can be measured simultaneously, during a steady increase of voltage. The cathode

of the cell is a fine column of dropping mercury; the anode may be either a pool of mercury at the bottom or an external anode of known potential. The electrolyte is a dilute solution of the sample with an added supporting electrolyte, which raises the conductivity of the solution and carries most of the current. The instrument is arranged so that the cell current may be plotted on a graph against the voltage.

The cathode is made by introducing mercury through a fine capillary tube under a constant head, so that a series of fine drops of mercury is formed, each drop eventually reaching the bottom of the cell. When the voltage is low, the current is small and the current/voltage curve nearly horizontal; but as the voltage is increased, a stage is reached at which the cations of one of the metals present start to be deposited, causing a rapid increase in the current. The current reaches a limiting value and the current/voltage curve again becomes nearly horizontal. The final curve is thus roughly S-shaped. The height of this polarographic wave is proportional to the amount present of the cation which causes it, and hence to the amount of the particular metal present. Also the voltage of the mid-point of the steep part of the wave, known as half-wave potential, is characteristic of the particular metallic cation. It is often possible to determine several elements in the same solution. See Assaying.

Polar Regions. Term used to designate the areas which surround the earth's geographical poles. They are limited by the

Arctic and Antarctic circles. At the spring equinox, in March, the North Pole begins its "day," which lasts for half a year until the autumnal equinox in Sept. On midsummer day, in June, there is no sunset visible anywhere within the Arctic circle. Between the Arctic circle and the North Pole there are periods without a single sunset between 24 hours and six months; the nearer the pole, the longer the period. Whatever is happening in the N., the exact opposite occurs at the antipodes in the South Polar regions; for when the N. is tilted towards the sun, the S. is tilted away to the same extent. See Antarctica; Arctic Circle.

Polder (Dutch). Name given to a low-lying area of the Netherlands which has been reclaimed from the sea. Used mainly for pasture, some polders have been developed for the growing of bulbs and vegetables. See Netherlands.

Poldhu. Cove and headland of Cornwall, England. It is about 6 m. N.W. of The Lizard. From Poldhu Marconi sent the first experimental trans-Atlantic radio messages in 1901; successful short-wave tests were made also between Poldhu and Sydney, N.S.W.

Pole. In geography, one of the two terminal points of the earth's axis. In astronomy the celestial poles are those points in the heavens to which the earth's axis is directed. The poles of the horizon are called the zenith and the nadir points. See Magnetism, Terrestrial.

Pole. Term used in magnetism and electrical engineering. In a bar magnet the poles are the regions near the end from which the lines of force appear to emanate. In a freely suspended magnet the end pointing to the N. pole of the earth is known as the N-seeking or N. pole. The N. and S. poles are often respectively designated the positive and negative poles.

Pole. Measure of length, also known as the rod or perch. It is $5\frac{1}{2}$ yds. long. A square pole covers $30\frac{1}{4}$ sq. yds.

Pole. Name of an English family famous for its nearness to the crown in the 15th and early 16th centuries. It was founded by a Yorkshireman, William atte Pole, who settled in Hull about 1300.

Sir William atte Pole, the younger, who lent money to the government, and was a member of Edward III's parliaments, was the father of Michael Pole, who was made chancellor of England and earl of Suffolk. He, too, was

wealthy, but had many enemies, and after an impeachment his friend, Richard II, was obliged to abandon him, and he died in France in 1389. A son, restored to the earldom, died before Harfleur in 1415, and the next earl was killed at Agincourt. William Pole, or de la Pole, as the family is often called, became the 4th earl, and was later that duke of Suffolk so prominent during the earlier part of Henry VI's reign. He, too, lost his honours and estates before he died, but the dukedom was restored to his son John in 1455. (See Suffolk, Duke of.)

This John Pole, the 2nd duke, married Elizabeth, daughter of Richard, duke of York, and sister of Edward IV, and they had several sons to whom this relationship proved fatal. The eldest, John, earl of Lincoln, regarded at one time by Edward as heir to the throne, rebelled with Simnel against Henry VII, and was killed at Stoke. The second, Edmund, who succeeded his father in the earldom but not in the dukedom of Suffolk, handed over to Henry VII by Philip, the archduke, was put to death in 1513. Another son, Richard, killed at Pavia in 1525, was the last male of the house.

Pole, REGINALD (1500-58). English cardinal. He was born in March, 1500, at Stourton Castle,

Reginald Pole

Titian

Staffs, son of Sir Richard Pole and Margaret, countess of Salisbury. Reginald entered the Church, retired from England to Italy in 1532, definitely broke with Henry VIII in 1535 on the question of his divorce, and was made a cardinal in 1536. During the reign of Henry and the Protestant government under his successor, Edward VI, Pole could not venture to England; but on the accession of Mary (1553) he was sent to England as papal legate to effect the formal reconciliation of England with Rome. Arriving Nov. 25, 1554, he immediately became Mary's most trusted confidant, and was elevated to the vacant see of Canterbury. He died Nov. 17, 1558, the same day as the queen. Consult Life, by F. A. Gasquet, 1927.

Pole-axe. Military weapon used up to the 16th century by mounted soldiers. It consisted of

a hatchet blade, and serrated hammer, on a short handle, and was a later form of the battle-axe (*q.v.*). A more modern form of pole-axe was used for slaughtering cattle, but during the 20th century it gave way to more humane methods. See Armour.

Polecat (*Mustela putorius*). British carnivorous mammal, belonging to the weasel tribe. It is

Polecat, small savage mammal found in parts of Britain
W. S. Berridge, F.Z.S.

about 17 ins. in length and has a short bushy tail. The general colour of the fur is blackish brown, the under-fur being yellowish brown; the legs are black, the rims of the ears and the lips white, and there is a bluish-grey band across the forehead. The animal makes its home in deserted rabbit holes, old buildings, and crevices in rocks; preys upon small mammals and birds, frogs, reptiles, and eggs; and is very ferocious in disposition, often killing for mere sport. The polecat breeds in May. See Ferret.

Pole-Finder. In electricity, an apparatus indicating the positive and negative poles of a chemical cell, dynamo, or other source of D.C. Any kind of moving-coil volt meter will act as a pole-finder, as the pointer will be deflected over the scale of the instrument only when the terminals are correctly connected. A galvanometer can be used similarly. Polarity can also be determined electrolytically. When leads from a source of D.C. are brought into contact with moistened pole-finding paper a change in colour is produced at one or other of the poles according to the chemical used in the paper.

Polemoniaceae. A family of annual and perennial herbs (a few shrubs), natives of cold and temperate regions. They have tubular, or bell-shaped, showy flowers. The order includes the genera *Polemonium* (Jacob's ladder), *Phlox*, *Gilia* and *Collomia*.

Polenta (Ital.). Favourite food in Italy. It is maize meal made into porridge, and when served hot eaten with milk and salt or sugar. When cold, it is cut into slices, powdered with grated cheese, and

fried. This dish is a favourite with Americans as well as Italians.

Polesden Lacey. Estate of about 1,000 acres near Ranmore Common, Surrey, England. It belonged to R. B. Sheridan, and as the home of Mrs. Ronald Greville became famous during the Edwardian period for social entertainments. King George VI and Queen Elizabeth when duke and duchess of York spent part of their honeymoon here in 1923. Mrs. Greville, who died 1942, left

house and estate to the National Trust.

Pole Star. Nearest conspicuous star to the N. Pole in the sky. It is at present a second magnitude star forming alpha in the constellation of Ursa Minor. It is easily found by following up the line joining the stars alpha and beta, or the pointers of the Great Bear. Owing to precession (*q.v.*) the pole star was Alpha Draconis about 4,500 years ago, and will be Vega in 12,000 years' time.

POLICE: PRESERVERS OF LAW & ORDER

David Le Roi and a Legal Authority

Here is an account of the origin and development of police forces in Great Britain, together with some account of their duties and training, and particularly of similar forces in other countries. See illus. facing p. 6549. See also Scotland Yard

The police (*Fr.*, from *Lat. politia*, civil government or condition of a state) of a country form its system of judicial and executive administration, especially the enforcing of that country's system or policy for the maintenance of social order and the security of life and property. Originally the term was restricted to its judicial meaning, but is now more generally applied to a civil force organized and maintained for the prevention and detection of crime, the preservation of public peace and order, and the general enforcement of national laws and the by-laws and regulations of a city, borough, or district.

From the earliest times most countries have had police forces, but at first their functions were more concerned with the maintenance of political power.

Such police forces were, in effect, internal secret services, and in that sphere reached high efficiency in the 17th, 18th, and early 19th centuries, notably in Russia, Spain, and France. On the other hand, there was little organized deterrence to common crime, and those countries with efficient political police were generally the most lawless. A political police remains essential to a dictatorship; Nazi Germany had its Gestapo (*q.v.*) and Soviet Russia its OGPU (*q.v.*) to detect and prevent opposition to its regime.

Early English Police

Except under the Elizabethan and Commonwealth administrations, political police were seldom employed in England, but neither was there any organized force specifically charged with the enforcement of the common law until the 19th century. Anglo-Saxon police arrangements were based primarily on the principle of mutual responsibility. When a man committed a crime, his rela-

tives were responsible for his apprehension; this was later extended into the Frankpledge system of Alfred the Great. Each county was divided into hundreds and each hundred into tithings. A tithing consisted of ten freemen mutually responsible for the good behaviour of each other. This system continued under the Normans, though the actual arrest of criminals was delegated to the king's troops.

Statute of Winchester

By the Statute of Winchester, 1285, security of life and property was made dependent upon three regulations: Assize at Arms, Watch and Ward, and Hue and Cry. Assize at Arms required every able-bodied man between 16 and 60 to be armed and at the disposal of the judicial power. In all towns and populous districts between sunset and sunrise twelve armed citizens patrolled the streets and apprehended any suspicious character. This was Watch and Ward. Hue and Cry was raised if a suspect attempted to escape the patrol, to chase him to the district boundaries, where the chase was taken up by other districts until he was arrested or driven to sanctuary. The crown appointed to each town and parish a constable, to ensure that patrols were properly armed and organized.

After some centuries the custom arose of employing full-time substitutes for Watch and Ward obligations. As few citizens were prepared to pay the wages of able-bodied deputies, the office of watch-and-ward-man, or watchman, was often filled by men too old and feeble for their task.

At the end of the 18th century, high constables and parish constables in rural districts and provincial towns were authorised, at

the discretion of local justices of the peace, to appoint what officers were necessary to maintain law and order. Many of those appointed were unpaid. The rest received grossly inadequate wages. In London there was a host of parochial police administrations, all badly managed; a number of parishes were entirely unpoliced, while in others the watchmen were in league with the criminals. The only really active police were the Bow Street Runners, whose duties were confined to apprehending major criminals in the City of London.

Peel's Metropolitan Police

In 1829, Peel's Act "for improving the police in and near the metropolis" instituted the first properly organized police force in the U.K. The Act brought London police, with the exception of the City police, under the jurisdiction of the Home secretary, defined the metropolitan police district, and appointed two justices of the peace, afterwards called commissioners, to frame regulations for the administration of the new force.

Remembering that in other countries an organized police force had invariably been used for political oppression, the public was at first hostile to the new force, and agitation against it led to riots. Within a year of the passing of the Act, however, virtually the whole of London was policed under a single authority, and gradually the force won recognition and respect through its superiority over the old watchmen. Before long, provincial authorities were petitioning the Home secretary for the loan of metropolitan police officers to organize their local police forces.

Under the Municipal Corporations Act of 1835, watch committees were established in the provinces and made responsible for the appointment of head constables and the recruitment of police forces. Such committees were required to make quarterly returns of their police to the Home secretary. In 1839 a further Act authorised justices at quarter sessions to raise police forces for the protection of their counties, so introducing the county police, as distinct from the borough police established in 1835. A police Act of 1856 made the existence of an adequate police force compulsory throughout England and Wales, while the Police Act (Scotland) of 1857 and the Burgh Police Act (Scotland) of 1892 provided and regulated sufficient police forces throughout the counties and burghs

of Scotland. By an Act of 1888, no borough in England or Wales or burgh in Scotland with fewer than 20,000 inhabitants could have a borough police force.

Consequent upon these various Acts, all the police forces in the U.K., except for those of London and N. Ireland, are under the partial control of local authorities: recruitment, pay, and conditions are the responsibility of the local authority, but the Home secretary's approval is required for increases in establishment, for promotion to higher grades, and appointment of chief constables. In a county the local authority is the standing joint committee of the county council and of the justices at quarter sessions, the disciplinary authority being the chief constable; in a county borough the administration and disciplinary authority is the watch committee. Cost of administration is borne partly by a charge on the local rates and partly by a grant from the Exchequer. Since 1947 non-county boroughs ceased to have police forces separate from the county forces unless their 1939 population exceeded half the population of the county. In 1947 the cost of the police in England and Wales was £55,312,548, of which £33,977,000 was met from local rates. Police in Scotland are administered partly from the Scottish office and partly by county and burgh authorities; in 1947, their cost was £23,503,235, of which £21,335,515 was contributed by the Scottish office. The police forces of Glasgow, Aberdeen, Edinburgh, Dundee, and Greenock were established by special Acts of parliament. The City of London force is controlled by the City corporation, its commissioner being appointed by the court of common council.

Under the Act of 1856, inspectors of constabulary, appointed by the Home office, report annually upon the police forces in England and Wales. Upon their reports depends the granting of a force's certificate of efficiency and the consequent Treasury contribution of half the cost of pay and clothing.

Police Act of 1919

After the First Great War some discontent existed amongst police forces in the U.K., culminating in police strikes in London and Liverpool. In March, 1919, the Home secretary appointed a committee of inquiry to cover some 250 forces. This recommended that the general police system be retained on existing lines, but with a greater degree of standardisation in regard

to pay, allowances, pensions, and conditions of service. It further recommended that a police federation be established, with membership open to the personnel of all forces below the rank of superintendent, to look after the interests of policemen and to act as an official negotiating body with the Home secretary. All these recommendations became law under the Police Act of 1919. Every police officer is now an officer of the crown within the meaning of the Official Secrets Act. He may not be a member of a trade union.

Enlistment and Training

Throughout the U.K., police forces are generally organized and maintained on the lines of the London Metropolitan Police. Candidates must be between 21 and 30, and are required to pass stringent medical, educational, and character tests. Enlistment is for a minimum of ten years, with the option of extending to 20-25 years to qualify for pension, which is usually at the rate of two-thirds of salary. Uniform is provided free, with the exception of boots, for which a special weekly payment is made. Officers not living in section houses are paid a rent allowance. Metropolitan police recruits are trained at Peel House, Westminster (established 1907). Mounted police are trained at Imber Court, Surrey, damaged by bombs during the Second Great War but later reopened; and those for the mobile section at the driving school at Hendon, Middlesex.

In 1934 a Metropolitan Police College was established at Hendon by Lord Trenchard, then commissioner for the Metropolitan police, for the training of candidates for the higher ranks of the force. The college was open to students without previous police experience and was designed to attract men of the university graduate type to a police career. Students who successfully completed the course were appointed to the rank of station inspector. This innovation aroused considerable resentment within the force, and the college was closed in the Second Great War.

After the war, a national police college was established at Ryton, near Coventry, to serve all police forces in England and Wales. Unlike the Hendon college, it is a staff and not a cadet college, the entrants being men who have served at least five years in a police force. No sergeant or constable is eligible for promotion to inspector until he has passed through a six weeks' residential course. There are a senior

residential course of three months to provide training for the higher ranks, and short subsidiary courses for senior and junior officers, and for dominion, colonial, and other overseas police officers.

All policemen start their careers as constables, and if in the foot branch, which constitutes the largest section of a force, are given a beat, the length of which depends upon the size and population of the town or district. While on his beat the policeman must not smoke or frequent licensed premises, and must not engage in conversation with the public except to answer questions or in the course of duty. When on duty in uniform constables and sergeants wear a blue and white striped brassard above the right cuff of the tunic or greatcoat, except in the City of London, where the brassard is red and white.

Each police division is subdivided into districts, with a police station in charge of a station sergeant. In country districts a policeman's beat may cover an area of several square miles and include one or more villages. Larger villages have a policeman permanently stationed in them, his house serving as the local station.

Plain-clothes policemen normally serve a probationary period in uniform, and if they show particular aptitude may be transferred to the Criminal Investigation Department (*q.v.*), which is concerned with the detection of crime; or to the Special Branch, which is responsible for protecting royalty and other prominent persons and for inquiries concerning the security of the realm. The closest cooperation exists between the uniformed police and the C.I.D.

Control of Traffic

Police are responsible for traffic control and the general safety of the road and vehicles. Until the introduction of traffic lights a constable was on point duty at the intersections of all busy thoroughfares and crossings. In 1934 successful experiments were made with autogiros for the controlling of heavy traffic streams at the Derby race meeting. The traffic branch is the authority for licensing taxicabs, buses, and other public service vehicles, and has the power to close any thoroughfare to all vehicles or any type of vehicle. Mounted police are responsible for controlling crowds at processions, sports meetings, etc. Seaports and river towns have marine or river police to regulate water-borne traffic and prevent the

pilfering of cargoes. In London the river police, equipped with fast motor launches and recruited mainly from ex-naval personnel, patrol 36 m. of the Thames.

After the First Great War the Metropolitan police were rapidly modernised and equipped to meet the changed conditions brought about by the development of the motor vehicle and the emergence of the more technically minded criminal. Police motor-cycle patrols were organized in 1921 to assist in the control of traffic, and a "flying squad" (*q.v.*) equipped with fast cars was formed, to enable members of the C.I.D. to reach quickly the scene of a crime. In 1927 mobile patrols were established on a large scale, their cars being in two-way radio communication with the operations room at Metropolitan police h.q., New Scotland Yard. In 1947 mobile police in the metropolitan area travelled some 13,000,000 car miles.

Police boxes, enabling the public to establish telephone communication with the nearest police station, had been set up throughout London and in most provincial centres by 1930. They contain a small cell for the holding of a prisoner until the arrival of a police car, and first aid equipment for dealing with accidents. On the roof is an electric lamp which can be illuminated from the police station to call a policeman on the beat. A further development was an arrangement with the G.P.O. whereby the dialling of 999 on any automatic telephone immediately brought a mobile police patrol to any person requiring police service. All large police forces now have forensic laboratories to provide every scientific aid in the detection of crime (*see* Criminology).

Women Police

In 1920 the first women police went on duty and proved invaluable in large cities for such duties as child welfare and the protection of girls against immoral influences. Later, women police in plain clothes were employed with the C.I.D. in general investigation work. In 1947 there were 1,283 women police in England and Wales and 97 in Scotland. During the Second Great War large numbers of women were recruited into the Women's Auxiliary Police Corps as motor drivers and clerks, and on communications; they wore uniform but were not attested and did not enjoy constabulary authority.

Supplementing the regular police forces are the Special Constabularies (*q.v.*). The Second Great War necessitated further reinforcement from three types of auxiliary police: the 1st reserve, consisting of re-engaged pensioners who volunteered to rejoin for the duration; the 2nd reserve, special constables accepting engagement on a full-time paid basis; and the 3rd reserve, the War Reserve (*q.v.*), men recruited for service during the war only. The maximum numbers in the police forces in England and Wales during the war was 91,025 in 1941, and the minimum, 63,331 in 1945. Enemy action caused the death while on duty of 278 officers, including auxiliaries, women police, and civilian employees.

Regular police officers were reserved from the fighting services until 1941, when men under a certain age were permitted to volunteer as pilots and observers with the R.A.F. and Fleet Air Arm. The following year regulars under 35 were "de-reserved." A number of police officers were temporarily commissioned in the security and investigation branches of the Royal Navy, R.A.F., and Army. Altogether 16,700 police officers from forces in England and Wales served in the fighting services; 1,275 were killed, 219 permanently disabled.

Post-War Strength

After the war the regular police forces found themselves considerably undermanned, the Metropolitan police, for example, being some 6,000 below establishment. Lack of man-power was due in large measure to the retirement of time-expired officers who had remained on duty until war ended, while the shortage of housing made it difficult for recruits to find living accommodation in districts where their services were most needed. In 1947 the total police strength of England and Wales was 66,935, and of Scotland 6,643.

Since the Police Acts of 1829, the constable's uniform has undergone few changes. In 1867 the cut-away coat and top hat worn by the original "Peelers" was replaced by a tunic and helmet. The whistle was introduced in 1884. Certain provincial forces have a distinctive helmet, *e.g.* the Devon County Constabulary, who wear spiked ones. City of London police wear a helmet with a crest or spine similar to that worn by the Roman centurions.

With the exception of the Royal Ulster Constabulary, all

police forces in the British Isles are unarmed, except for a truncheon, and are administered on a strictly civil basis. Recruits to the Royal Ulster Constabulary undergo an intensive course of semi-military training, and when accepted for duty are subject to military discipline. They live in barracks and no man is permitted out in plain clothes unless detailed to do so or on leave. Officers are not allowed to serve in their home town, and one who marries a local woman is immediately transferred to another district. They are always armed on duty.

Dominions and Other Countries

Certain of the British dominion, colonial, and other overseas police forces are also organized on semi-military lines, and where there are large coloured populations there is usually an armed European police and an unarmed native police, the latter's authority being restricted to the coloured population. Foreign police forces are in general of a military character, but in certain countries, notably France, there are two types of force: the *gendarmerie*, which corresponds approximately to the London Metropolitan Police, and the *Garde Mobile*, a military force concerned with the maintenance of order during strikes, etc.

In the U.S.A. each state administers its own police force, or grants powers to certain municipalities. Generally speaking, the public attitude towards the police in American cities differs from that in the U.K. The policeman is not so commonly regarded as a friend of the community, and an American is less likely than an Englishman to turn to him for help in an emergency. Exposures made from time to time of the exercise of political patronage in police appointments, and of police complicity with the racketeers, have led to considerable lack of confidence in his integrity. The frequent use of the "third degree" (*q.v.*) for extorting confession is another notable difference from British practice. In rural areas of the U.S. the officers mainly entrusted with the duty of preserving law and order are the sheriffs. For an account of the U.S. federal organization corresponding to the C.I.D., *see* G-men. Some depts. of the federal govt. also maintain special police for the prevention and punishment of specific offences, *e.g.* the treasury dept.'s secret service for suppressing counterfeiting and that of the post office for dealing with fraudu-

lent use of the U.S. mails. See Canadian Mounted Police; Criminology; Metropolitan Police; Military Police; Palestine Police; Scotland Yard. Consult The King's Peace, F. Inderwick, 1900; Scotland Yard, Sir J. Moylan, 1934; The English Police, H. Glover, 1934; The English Policeman, A. Holmes, 1935.

Police Court. Name until 1944 of magistrate's court, a court of the first instance or court of summary jurisdiction. In London and some other towns such courts are presided over by stipendiary magistrates, and they are dealt with in this work under Metropolitan Police. The judges of others are unpaid justices of the peace. In 1944 the Home office changed the name from police court to magistrate's court.

Police Staff College. Former British police training school established in 1934 at Hendon, Middlesex, for the instruction of candidates for the higher ranks of the London Metropolitan Police. It was closed in 1940. See Police.

Polignac, AUGUSTE JULES ARMAND MARIE, PRINCE DE (1780-1847). French politician. Son of Jules, duc de Polignac (1745-1817), he was born May 14, 1780, and spent his early years in exile in Russia and England. He was imprisoned for participation in the Pichegru conspiracy, 1804, but returned at the restoration of 1814. Made peer of France, 1815, he was ambassador in London, 1823-29, when he became minister of foreign affairs under Charles X. His policy gave dissatisfaction to the country, and his ordinances of St. Cloud precipitated the revolution of 1830. Condemned to life imprisonment, Polignac was pardoned, 1836; published, 1845, *Études Historiques, Politiques, et Morales*; died March 2, 1847. *Pron.* Polinyak.

Polignac, MELCHIOR DE (1661-1742). French cardinal and diplomatist. Born at Puy-en-Velay, Oct. 11, 1661, he showed brilliant scholarship at the Collège de Clermont and was present at the papal elections in 1689 and 1692. Ambassador to Poland from 1693, and from 1710 plenipotentiary in Holland, he negotiated the treaty of Utrecht, and became cardinal in 1713. Forced into retirement during the regency, he was diplomatic representative

M. de Polignac,
French cardinal

in Rome, 1725-32, and was made archbishop of Auch, 1726. A man of considerable literary ability, he was elected to the Académie Française, 1704, and his Latin poem, *Anti-Lucretius*, appeared in 1745. He died in Paris, April 3, 1742.

Poligny. Town of France. In the dept. of Jura, it is picturesquely situated at the foot of the Jura Mts., 38 m. S.W. of Besançon. It contains the ruins of a château, and the early Gothic church of S. Hippolyte. Trade is carried on in wine and agricultural products, and there are oil refineries.

Poliomyelitis. Notifiable disease which occurs in two forms. Acute anterior poliomyelitis is an infectious disease which, attacking certain nerve cells, may cause paralysis. Chronic poliomyelitis is a complaint of adults characterised by increasing atrophy of the muscles. See Infantile Paralysis.

Polish. Substance for improving the surface appearance of wood, metal, leather, etc. The essential condition for a satisfactory polish is that the surface shall be uniform and highly reflective. This is attained by removing blemishes and irregularities, filling pores and cavities, and applying a thin and highly reflective transparent coating. Apart from decorative considerations, a high polish is often necessary for metallic components of machinery. The materials used for polishing metals are abrasive in action (see Abrasives), and usually consist of fine quartz, emery, crushed pumice, and chert, often mixed with a soap solution, so that there is also a cleansing action. In the cleaning and polishing of such metals as aluminium, steel wool, together with soap and an abrasive powder, is often used.

To polish wood, apart from the special process of French polishing (*q.v.*), it is usual to apply a material which is partly cleansing and slightly solvent as well as leaving a wax coating. The normal constituents of such polishes are wax, soap, oil, water, and turpentine, mixed so as to produce an emulsion. For leather polish, especially boot polish, a similar emulsion is used, with the addition of a pigment, such as carbon black, and sometimes with shellac and borax, which increases the waterproofing qualities. Fine abrasives are also used to polish such materials as stone, ivory, and various plastics.

Polish Corridor. Stretch of land ceded to Poland by the treaty of Versailles in 1919 to provide that country with an outlet to the Baltic Sea. The corridor, called in

Polish Corridor. Map showing the Corridor, formerly Poland's only outlet to the sea

Poland the province of Pomorze, passed through former German territory, cutting off E. Prussia from the rest of Germany. Its existence was a constant source of contention. Germany complained that an arrangement cutting the Reich in two was intolerable; Poland declared that the territory had been Polish for centuries until the first partition of the country, and that 80 p.c. of her foreign trade was seaborne. The Germans felt that they did not receive adequate transport facilities between E. Prussia and the Reich; the Poles that they were not properly paid for hauling German trains. In 1934 Hitler concluded a ten-year non-aggression pact with Poland and the problem of the corridor was thought to be settled. But the holding of a plebiscite in the corridor was one of the 16 demands he made Aug. 31, 1939, 9 hrs. before invading Poland. See Danzig.

Polish Resettlement Corps. Civilian body existing in the U.K. from 1946 to 1949, to provide a transition stage between military and civil life for men of the Polish forces who, during the Second Great War, had served under British command outside Poland, and did not wish to return to Poland. Members could (1) enlist in the British army; (2) emigrate overseas; (3) take up civilian work in the U.K. The cost of the corps was borne by the British Treasury under the Polish Resettlement Act, 1947.

Politbureau. Contraction for the political bureau of the Communist party in the U.S.S.R. There

are similar organizations in the party in other countries; but the supreme executive of the U.S.S.R., consisting of some 14 members with headquarters in the Kremlin, Moscow, formulates the so-called "party line" which Communists in every part of the world are required to follow.

Political Economy. Term formerly used for economics (*q.v.*). It was apparently first used by the French writer, Montchrétien, in

1615, and came into general use chiefly as a result of the wide influence of Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations*, 1776. Probably the last influential book containing the term in its title was W. S. Jevons's *Theory of Political Economy*, 1871. Within a few years (as exemplified by A. Marshall's *Principles of Economics*, 1890) the term was falling into disuse.

tance from the royal seat tended to abuse of power, and able kings like Henry II invented expedients to curtail their dangerous local greatness. In the 20th century, however, political practice has swung over to the opposite extreme, and in all states, even federations (of which the U.S.A. is an outstanding example), there has been a steady movement towards the centralisation of all administration.

Church and State

The problem of the relation between church and state, though decided in most contemporary societies in favour of the predominance of the state, has from time to time been even more important than that of central and local government. Broadly speaking, four rival theories have contested the field. The first theory was one of dualism. Each of the great entities known respectively as church and state had its own distinct province and need never encroach on that of the other. The civil arm must leave conscience free; ecclesiastics might persuade but never coerce the temporal powers. Collision was thus assumed to be impossible, where each side loyally observed the terms of the pact. This was the theory upon which the relations of Papacy and Holy Roman Empire were supposed to depend throughout the Middle Ages.

Unhappily, this theory proved impracticable. The history of the Middle Ages is one long, sad record of strife between pope and emperor, Guelph and Ghibelline, church and state. Philosophers and men of common-sense came to ridicule the possibility of a hard-and-fast division between two spheres labelled respectively as temporal and spiritual.

A second theory presented all Christendom as forming one commonwealth, one spiritual and material whole, over which Rome was supreme, while the various kingdoms of Europe formed its members. In reaction against this doctrine, the Tudor sovereigns of England, particularly Henry VIII and Elizabeth, were the protagonists of a third, very different view. Papal interference in England was rudely shaken off, and the church in England became one administrative department among many, falling into line with the chancery, the exchequer, and the admiralty. Henry, as head of the state, claimed the right to regulate the religious thoughts and observances of his subjects.

The fourth theory was the voluntary principle, in virtue of which

POLITICS: SCIENCE OF GOVERNMENT

* G. W. Keeton, LL.D., and others

This Encyclopedia contains articles on the various forms of government, e.g. Democracy; also on the political parties, Conservative; Labour; Liberal, etc. See also Aristotle; Government; State

Politics (Greek *politeia*, from *polis*, city or state) is the art, science, and philosophy of government. Rightly considered, political theory is co-extensive with all those branches of knowledge which treat of the eternal principles on which depend the happiness, prosperity, and moral elevation of mankind grouped into kingdoms, states, or nations.

Two ideas, simple yet inexhaustible, underlie all such speculations. The two pillars on which organized society is erected are described sometimes as permanence and progress, sometimes as authority and liberty. The hard-and-fast antithesis thus drawn, however, is more apparent than substantial. Progress towards a definite goal is assured only after stability has been established, and in historical sequence, if not in logical priority, order always precedes freedom. Obedience to the law, and to the magistrates who enforce it, is essential to the rearing of constitutional progress on enduring lines. Neither of the two essentials can exist without the other. Liberty without restraint degenerates into anarchy; authority by itself is tyranny. The problem of political science is how to combine the two in such a manner as will bring out fully what is best in both.

The inhabitants of all countries tend to fall into two groups, those who wish above all things to perpetuate the institutions that have maintained an orderly society in the past; and those who favour change, ranging from liberals who advocate amendments of existing institutions to revolutionaries who desire to replace an existing system by an entirely new one.

It is the duty of the constitutional theorist to consider the claims of all, and in this endeavour two main problems face him: (1)

What is the ideal form of constitution? (2) What are the proper limits to government intervention, and what spheres of human activity should be left to individual initiative? From Plato and Aristotle to near the end of the 19th century, the first of these two problems received major attention: the rival merits of democracies, aristocracies, and monarchies, the conflicts between kings and parliaments. The second group of questions was thrust upon public attention in the 20th century, with the discussion of the rival merits of state action and *laissez-faire*, of socialism, communism, collectivism, individualism, anarchism, syndicalism, fascism, etc.

There is, perhaps, no question vitally affecting individual or national life that has not, at some period of history, formed the subject of keen political controversy. Three important groups of problems are, or have been; (1) the distribution of power between central and local authorities; (2) the relations of church and state; (3) the protection of minorities.

Local Government in England

The entire history of England forms a dissertation on local government. Anglo-Saxon kings, like Alfred or Edgar, ruling the mixed races of the North and Midlands from distant Winchester, were, in the absence of railways and good roads, dependent on their provincial rulers; and a dilemma thus arose. A weakling placed over Mercia or East Anglia failed to enforce order at home and to provide against Danish invasions; a strong local ruler, on the contrary, might grow so strong as to defy his king. Under the Norman sovereigns the problem took new forms. Each county, or group of two counties, was administered by a sheriff, whose tenure of authority and dis-

many churches may exist under the protection of one state. The civil government, while refusing to set limits to its own absolute sovereignty, disclaims direct interference in matters of religion.

What is, perhaps, the most crucial problem of all is that of protecting effectively individual rights and liberties from the tyranny, whether of the one, the many, or the few. In ancient Greece and Rome this problem assumed the form of how best to reconcile a sufficiently powerful executive with constitutional liberty. In Athens and in Sparta the kingly power proved dangerous and was deliberately weakened by division. This principle was carried further in Rome, as a reaction from the tyrannies of Tarquinius the Proud. One king, enjoying a monopoly of kingship, gave place to a number of magistrates known respectively as censors, consuls, praetors, aediles, and tribunes of the plebs.

In England of the Middle Ages a similar menace was met by a new expedient, parliament and parliamentary control. The English monarchy which, for a century after the Norman Conquest, had stood for order as against the barons' wild and lawless anarchy, seemed to change its policy under John. The crown then claimed the widest licence in breaking its own rules, while the barons seemed to stand for law and order in compelling the grant of Magna Carta; the chief problem of English politics from 1215 for many centuries was how to restrain the executive government when despotically inclined. The answer may be found in one word, parliament; the great council of the nation learned how to control the king. This process, begun perhaps in the 13th century, was not completed, even in theory, till the settlement of 1689.

Theory of Political Association

The classical theory of political association, particularly as it found expression in the works of 19th century writers, was that there were certain essential branches of governmental activity, e.g. the preservation of internal order, the protection of the country from external attack, the administration of justice. Beyond these, it was the duty of the state to intervene as little as possible. This is, in essence, a reflection of the individualist, liberal, and *laissez-faire* theories which had developed steadily in the 18th and first half of the 19th centuries. Thus, Sidgwick, writing at the end of the 19th century, says: "The legislation of

modern civilized communities then, is, in the main, framed on the individualistic basis; and an important school of political thinkers are of opinion that the coercive interference of government should be strictly limited to the application of this principle." Already in Sidgwick's day, however, another principle of political activity was making itself felt, and later editions of Sidgwick's classic *Politics* gave increasing attention to what he called "socialistic interference."

Problems of a Planned Society

After his day, political speculation went very much further, and all fashionable theories in the mid-20th century started from the assumption that the community as a whole is more capable of planning the individual's life for the promotion of his health and happiness than the individual could do if left to his own devices. Thus, the increasing centralisation, noticed above, directed by an increasingly powerful executive, in all modern communities, is employed for the purpose of creating a planned society, or social service state. For the time being, therefore, collectivism appeared to have won a complete victory over the individualism which prevailed until the second half of the 19th century.

This is one of the most difficult problems of current political science, for it has often been said that the triumph of democracy has seen the replacement of the divine right of kings by the divine right of majorities. The 19th century found no final answer to this problem, beyond laying down general principles that the majority should not use its power tyrannically, or alternatively, that it should so use it as to secure the assent of the greatest number of the governed. In a homogeneous community such as 19th century Great Britain, such restraints were generally observed, although even there they worked imperfectly where the rights of a racial minority such as the Irish were concerned. At the conclusion of the First Great War, when several new national states were created in Europe, an attempt was made to safeguard the rights of minorities in these states by clauses in the peace treaties, giving the racial minorities the right to appeal to the League of Nations in cases of racial discrimination. These rights were never really effective, and they became obsolete with the declining influence of the League. The Nazi persecution of the Jews in Germany from 1933 onwards, and the mass extermina-

tion of Jews and other groups, in the occupied countries as well as Germany, by the Germans during the Second Great War, showed how terrifyingly ruthless oppression by an intolerant governing clique can be.

The period between the two Great Wars also saw the growth of another dangerous threat to minority rights—the cult of the one-party state in which deviation from the party line, equally with opposition to the party whose interests are identified with those of the state, is regarded as a species of treason, meriting heavy punishment. Such creeds, though allegedly founded upon care for the welfare of the proletariat, are the negation of individualism and freedom of thought, which the individual is called upon to surrender in exchange for the economic security provided by state planning. Thus, the triumph of such collectivist theories, whether Nazi, Fascist, or Communist, has been accompanied by the destruction of all rival political organizations, and the subordination of all other associations to state control or supervision, as well as the death, imprisonment, or exile of all persons of significance whose views are opposed to those of the regime in power. The central political problem of the period immediately following the Second Great War is the issue of the struggle between such intolerant collectivism and the modified and tolerant collectivism of the western world, in which freedom of thought of the individual still retains a place.

Bibliography: Lectures on the Principles of Political Obligation, T. H. Green, 1895; *Political Theories of the Middle Ages*, O. v. Gierke, trans. F. W. Maitland, 1900; *History of Politics*, E. Jenks, 1900; *A History of Political Theories*, W. A. Dunning, 3 vols., 1902–1928; *Centralisation and the Law*, Brooks Adams, 1906; *Greek Political Theory*, E. Barker, 1908; *Elements of Politics*, H. Sidgwick, 4th ed., 1919; *Modern Democracies*, Viscount Bryce, 2 vols., 1921; *A Grammar of Politics*, H. Laski, 3rd ed. 1938.

Politis, NICOLAS SOCRATES (1872–1942). A Greek politician. He was born at Corfu and studied at Paris, becoming professor of international law there and a member of the Institut de France. He served as Greek delegate at the London Balkan Conference, 1912, and was foreign minister, 1917–20 and in 1922, being Greek minister in Paris from the latter date until his death. He was an outstanding authority on international law, publishing many

books on the subject. He died at Cannes, March 4, 1942.

Poliziano, OR **POLITIAN**, ANGELO (1454-1494). Italian poet and scholar. Born in Tuscany, at Monte Pulciano, July 14, 1454, he adopted the Latinised form of the name of his birthplace instead of his patronymic, Ambrogini. Distinguished by his precocity in an age of precocious youth, he won the patronage of Lorenzo de' Medici, and became tutor to his children, and the most brilliant intellectual figure at the court of "the Magnificent." The most remarkable classical scholar of the 15th century, Poliziano was as great in his Italian as in his Latin poems. His unfinished epic, *Giostra*, on a tournament in which Julian de' Medici was victor, has much inherent beauty, and is the first successful example in Italian literature of the use of the octave stanza later employed by Ariosto and Tasso. With his lyrical play *Orfeo* (the story of Orpheus and Eurydice), he originated pastoral drama and opera in Italy. Poliziano died Sept. 24, 1494, two years after Lorenzo.

Polk, JAMES KNOX (1795-1849). President of the U.S.A. Born in Mecklenburg county, N. Carolina,

James A. Polk

Nov. 2, 1795, of Scottish-Irish descent, his original name being Pollock, he was called to the bar in 1820. Hesoonturned to politics, and in 1823 he was elected to the legislature of Tennessee, and in 1825 became a member of congress. For eight years he was speaker of the house of representatives, and during 1839-41 governor of Tennessee. In 1844, Polk, as the Democratic candidate, was elected president, his opponent being Henry Clay. During his term the Mexican war took place, and the Oregon boundary dispute with Great Britain was settled. A reduced tariff system was introduced in 1846, and a bill passed for setting up an independent United States treasury. A bill to sanction the expenditure of large sums on internal improvements was vetoed by him. Polk died at Nashville, Tennessee, June 15, 1849.

Polk, LEONIDAS (1806-64). American soldier. Born at Raleigh, N. Carolina, April 10, 1806, he was educated at West Point and entered the army. In 1831, however, he

was ordained in the Episcopal Church, and in 1838 became a bishop in charge of an immense tract of country in the south of the U.S.A. On the outbreak of the Civil War in 1861 he returned to military life and was soon a major-general in the Confederate army. He held various commands with success, including that of a corps in the army of the Tennessee, until charged by Bragg with delay in attacking at Chickamauga. Jefferson Davis, however, exonerated him, and he was still in the field when he was killed, June 14, 1864.

Polka. Round dance said to have been invented about 1830 by a Bohemian servant girl. The name is probably derived from *pulka* (half), referring to the very short steps necessitated by the small dimensions of the room in which the inventor usually danced. In a few years the polka overran Europe, and its extraordinary popularity attained such a height as to become almost a mania, streets and public-houses being named after it. Its lively character and the simplicity of its steps no doubt conduced to this. It has virtually disappeared from the ballroom, except as a kind of reminiscent romp, usually to the tune, *See Me Dance the Polka*. The music is in 2-4 time, the characteristic feature being the rest on the second beat.

The man begins with the left foot, his partner with the right. Three steps are danced forward, three back again, and then six turning round, after which the same order is resumed.

Poll (Mid. Eng. *pol*, back of the head). Taking of votes in order to ascertain the wishes of the people qualified to vote. The polling booth is the place where electors go to record their votes, and the polling day the day fixed for the voting. The announcement of the result is called the declaration of the poll. (See Election; Hustings; Vote.)

The poll plays a part in English company law. Every company, by its charter or articles of association, provides a mode whereby shareholders may vote at company meetings. It is a common provision that votes shall be taken by show of hands, but that if a fixed number of shareholders should be dissatisfied with the result of such a vote as announced by the chairman, a poll may be demanded. See Company Law; Gallup Poll.

Pollack (*Gadus pollachius*). Common British fish, belonging to the cod family and nearly related to the coal fish. It is usually about

Pollack, a British fish belonging to the cod family

20 ins. long and is of a greenish colour, with a dark spot near the pectoral fin and no barbels. It occurs off the coasts of Cornwall and Devon, Norway, N. America, etc., and is valuable as a food fish and as a source of oil.

Pollaiuolo, ANTONIO (1429-98). Born at Florence, he studied under

A. Pollaiuolo, Italian painter

Bartoluccio, the goldsmith, and founded a prosperous school of painting, engraving, sculpture, and enamelling. In painting he was the foremost of the Florentine realists, insisting on anatomical truth at the expense of poetic sentiment; he often collaborated with his brother Piero. During 1489-96 he was in Rome, but died at Florence. His Martyrdom of S. Sebastian and Apollo and Daphne are in the National Gallery, London.

Pollanarua. Former name of an ancient capital of Ceylon, Topare (*g.v.*).

Pollard, ALBERT FREDERICK (1869-1948). British historian. Born at Ryde, Dec. 16, 1869, he was educated at Felsted and Jesus College, Oxford. Settling in London, he began to work as an assistant editor of *The Dictionary of National Biography*, was recognized as an authority on Tudor times, and during 1903-31 was professor of history at London University. In 1908 he was elected a fellow of All Souls College, Oxford, a position he held until 1936. During the First Great War his lectures and writings thereon were the most careful and dispassionate utterances produced by the crisis. He founded the Historical Association in 1906, editing its journal, *History*, from 1916 to 1922. He lived until Aug. 3, 1948. Pollard wrote widely on historical subjects, among his books being *Henry VIII*, 1902; *Life of Thomas Cranmer*, 1904; *The British Empire*, 1909; *A History of England*, 1912; *The Evolution of Parliament*, 1920 (4th ed., 1938). He wrote the article *Parliament* for this Encyclopaedia.

Pollarding. Removal of all the branches at the head or poll of a tree, in order to induce the stem to throw out fresh branches. Willows and elms are the trees most usually pollarded, the latter for reasons of safety. See Forestry.

Pollen (Lat., fine flour, mill-dust). Mealy substance, usually yellow, formed in the anthers of flowering plants and comparable organs of conifers. The grains of which it is composed contain the male nuclei, which fuse with the female initiates in the ovules to bring about the formation of an embryo and other changes through which the ovule becomes a seed.

In plants that are pollinated by the wind the pollen grains are dry and light. Most forest trees are so pollinated, and the pollen may be carried a long distance by the wind. In other cases the pollen-grain is variously roughened that it may the more easily catch upon the hairy bodies of the insects that act as pollen-carriers. In the orchids the pollen-grains have long threads which are united to form a stalk to the pollen-mass (pollinium), and this may be carried away bodily by attachment to the head of a visiting insect, thus reaching the stigma of the next orchid visited. See Bee; Flower.

Pollentia. Town of ancient Italy, on the Tanaro, 30 m. S. of Turin. Here, in 403, Stilicho defeated Alaric and the Goths. Remains of an aqueduct amphitheatre, temples, etc., still exist. The modern town is called Pollenzo.

Pollination. Process antecedent to the fertilisation of the ovules of a seed-bearing plant. Pollen grains are brought to the stigma (angiosperms) or the micropyle (gymnosperms), where they are stimulated into activity and produce pollen tubes which ultimately penetrate into the ovules, thus facilitating fertilisation by introducing the male gametes.

In the simplest form of pollination, known as autogamy or self-pollination, and found in many of

the commonest weeds, the anthers are so situated in relation to the stigma that the pollen fertilises the ovules of the same flower. In the majority of plants, however, means, often elaborate, are taken to prevent self-pollination, and to obtain the aid of external agents in effecting cross-pollination. The pollen may be impotent as regards the ovules of the same flower; or the male organs (stamens) may be in separate flowers or on separate plants from those that bear the female organs (pistil). Or a species may bear on different individuals two or more forms of flowers (long-styled, short-styled, etc.), and the pollen of one form can be transferred only to those of the other form. This is known as heterostylism, and is familiar in the flowers of the primrose and cowslip (pin-eyed, long-styled, and thrum-eyed, short-styled).

In a few conifers and many British forest trees the sexes are on distinct trees (dioecious), and the pollen is carried from one to the other by the wind. This is a wasteful method, and many plants have improved upon it by enlisting the service of insects as carriers, attracting them to the flowers by conspicuous colouring, which is usually accompanied by the pro-

Pollen. Highly magnified specimens from British trees and plants. 1. Cedar of Lebanon, *Cedrus libani*, showing air sacs. 2. Willow Herb, *Epilobium angustifolium*. 3. Lupin, *Lupinus*. 4. Thistle species. 5. Sage, *Salvia officinalis*. 6. Evening Primrose, *Oenothera biennis*. 7. Sweet Pea, *Lathyrus odoratus*. All are magnified 66 times except 3 and 5, which are magnified 100 times

vision of nectar and often by seductive odours. Many flowers are suited by their shape and colour to particular insects; thus we can recognize bee-flowers, butterfly and moth-flowers, wasp-flowers, beetle and fly-flowers, and so forth. Fly-flowers are often noticeable from their dull purple-brown tints or their odour of carrion. With a few plants small birds, such as the humming birds, are the pollinating agents, and more rarely snails discharge this office. *See Botany; Clover; Flower; Plant.*

Pollino, MONTE. Peak of the S. Apennines, Italy. It is situated on the borders of the provs. of Potenza and Calabria, 10 m. N.W. of Castro Villari, and reaches an alt. of 7,325 ft.

Pollio, GAIUS ASINIUS (75 B.C.-A.D. 6). Roman soldier and man of letters. He first became prominent by attacking Cato for his violent action on behalf of the senate, and attached himself to Julius Caesar, with whom he served in Gaul and crossed the Rubicon. Pollio fought in Epirus, was present at Pharsalus, and held military appointments in Africa and Spain. He espoused the cause of Antony, negotiated the terms between Antony and Augustus, and finally became a friend of the latter. In 40 B.C. he was consul. Even during his active career he achieved distinction as an orator and poet, and later devoted himself to literary pursuits, writing a history of the civil war, unfortunately lost. Pollio was the first to set up a public library at Rome, where he was a friend of Horace and of Virgil, who dedicated his fourth and eighth Eclogues to him.

Pollitt, HARRY (b. 1890). British political organizer, born Nov. 22, 1890. He was a weaver's helper in a Lancashire cotton mill at 12, later a boilermaker. He was secretary of the Communist party of Great Britain, 1929-39 and 1941-46. In 1925 Pollitt was sentenced to 12 months' imprisonment for sedition. During the Spanish Civil War he helped to organize the British battalion of the International Brigade. He published books and pamphlets about the Communist point of view.

Pollock, SIR DAVID (1780-1847). British judge. Son of David Pollock, saddler to George III, he was born Sept. 2, 1780, and educated at S. Paul's and Edinburgh university. Called to the bar in 1803, he practised as a special pleader on the home circuit and in the insolvent debtors' court. Appointed recorder of Maidstone

in 1838, and commissioner of the insolvent debtors' court in 1842, he was knighted in 1846 on becoming chief justice of the supreme court of Bombay. He died May 22, 1847.

Pollock, SIR FREDERICK (1845-1937). British jurist. Eldest son of Sir W. F. Pollock, Bart., he was born in London, Dec. 10, 1845. Educated at Eton and Trinity College, Cambridge, he became a barrister in 1871. In 1882 he was appointed professor of jurisprudence at University College, London, and during 1884-1903 was Corpus professor in the same subject at Oxford. Also, 1884-90, he was professor of common law to the Inns of Court, and he edited *The Law Quarterly Review* and *The Law Reports*. He succeeded to the baronetcy in 1888, and in 1911 was made a privy councillor. His many honours include a fellowship of the British Academy. He died Jan. 18, 1937. Besides writing *Essays in Jurisprudence and Ethics*, 1882; *Principles of Contract*, 1911; *For My Grandson (reminiscences)*, 1933, Pollock produced with F. W. Maitland the standard *History of English Law*, 1895.

Pollock, SIR GEORGE (1786-1872). British soldier. Born June 4, 1786, son of David Pollock, saddler to George III, he entered the army of the East India Company in 1803, and served in the campaign against Holkar, 1804-05, in Nepal, 1814, and the first Burmese War, 1824-26. In the expedition for the relief of Jalalabad he fought his way through the Khyber Pass, relieved Sir Robert Sale, and reached Kabul, and was rewarded with the G.C.B. Returning to England, 1846, he became a director of the East India Co., was made a F.M. in 1870, a baronet in 1872. He died Oct. 6 that year.

Pollokshaws. District of Glasgow, formerly a separate burgh. It stands on the White Cart, and is connected with the city proper by rly., tram, and bus. To the S.W. of Glasgow, it is mainly an industrial area. There is a town hall, and other public buildings include churches and schools. Having become an industrial centre, Pollokshaws was made a burgh in 1813. The name means the shaws or woods of Pollok, which is the name of a Glasgow constituency.

In 1912, pop. about 13,000, it was absorbed into Glasgow (*q.v.*).

Pollokshields. District of Glasgow. It is S.W. of the city proper, and is served by rly., tram, and bus. Chiefly a residential quarter, it was absorbed into Glasgow in 1891. Here is Maxwell Park.

Poll Tax. Impost levied on every poll or head; sometimes called a capitation tax or charge or fee. It was applied in ancient Greece, and on various occasions in the U.K.; it is still levied as a means of financing services in certain African colonies; and in the states of Alabama, Arkansas, Mississippi, S. Carolina, Tennessee, Texas, and Virginia a poll tax is imposed as a condition of eligibility to vote.

In 1377 a poll tax of 4d. was levied on every man and woman in England above the age of 14, except beggars. In 1379 an attempt was made to graduate the amount of the tax according to the position and wealth of the individual, the charges varying from £6 13s. 4d. for a duke to 4d. for a married man and his wife. Poll taxes were commonly imposed on aliens during the 15th century; but no general one was levied between 1380 and 1513. It was then graduated according to means. The idea of the poll tax was revived by the Stuarts, and the last was in 1698; it was steeply graduated from a payment of nothing to one of 20s. Income tax is the successor of the graduated poll tax, though it draws a clearer distinction between income and capital.

Pollution. As applied to the atmosphere, term denoting the presence of smoke and, to a lesser extent, dust particles. Atmospheric pollution is derived chiefly from burning coal under conditions which render combustion incomplete. When the temperature of industrial furnaces or domestic fires is not sufficiently high, some of the carbon present in the fuel as hydrocarbons fails to combine with oxygen to produce carbon dioxide, and instead is carried by rising air up the chimney, from which it escapes as coagulated particles of soot. Coal also contains sulphur, the burning of which results in sulphur oxides and sulphuric acid, the agent largely responsible for corrosion of objects and damage to buildings. Smaller quantities of other polluting substances such as nitrous acid, chlorine, and ammonia are likewise projected into the air of towns. In industrial processes the introduction of more efficient furnaces and the washing

Sir George Pollock,
British soldier

of flue gases before emission, and in homes the replacement of coal ranges by gas and electric cookers, have contributed greatly to the abatement of smoke. Despite these measures, it has been estimated that pollution in Great Britain causes damage to the extent of £40,000,000 annually.

Atmospheric pollution may be regarded as composed of gases, large particles which are deposited fairly quickly close to their place of origin (e.g. ash and coal dust), and smaller particles (including smoke) which remain in suspension in the air. If the particles in a volume of town air are collected and analysed, about 85 p.c. of their weight will be found to be combustible matter and 15 p.c. ash. The principal distributor of pollution is turbulence rather than wind; the latter merely spreads smoke from the cities to neighbouring districts, while eddy motion lifts smoke from the surface into the upper layers of the air.

The movement for official investigation of pollution in Great Britain dates from 1912, systematic records beginning two years later. With the assistance of local authorities, the department of industrial and scientific research has established a network of observing stations and regularly publishes the measurements. Estimates of the amount of solid matter in suspension in the atmosphere are obtained with automatic filters; such records indicate that on a foggy winter day in London the suspended solids may amount to 4 milligrams per cubic metre. Normally, pollution is least during early morning and afternoon, and greatest about breakfast time and in the evening. It is more convenient, however, to

study the geographical distribution of pollution by collecting the fraction deposited by rain. In the great industrial and manufacturing areas of central Scotland, Yorkshire, Lancs, and London the annual amount exceeds 100 tons per sq. m.

A. J. Drummond, F.R.Met.S.

For the sources and control of river pollution, see Drainage; Filtration; Sewage; Water Supply, etc.

Pollux. In Greek mythology, the twin brother of Castor. See Castor and Pollux.

Pollux. In astronomy, popular name of the star Beta Geminorum, in the constellation of the Twins. It is of 1.2 magnitude. See Castor.

Polly. Ballad opera by John Gay. A sequel to *The Beggar's Opera* (q.v.), with scenes in the West Indies, it was completed in 1728, but its performance was forbidden by the lord chamberlain at the alleged instigation of Sir Robert Walpole (satirised in *The Beggar's Opera*). In 1729 it was published with the tunes of the songs. Its first performance was at the Haymarket Theatre, London, in 1777, with alterations by the elder Colman, but it was withdrawn after a few performances. It was revived at the same theatre in 1782, and at Drury Lane in 1813. A revised version by Clifford Bax, with music arranged by Frederick Austin, produced at the Kingsway Theatre Dec. 30, 1922, ran for 327 performances.

Polly, ALFRED. Central figure of H. G. Wells's story *The History of Mr. Polly*, 1910. A dyspeptic small shopkeeper, suffering the economic and social tribulations of his kind, he is genially and humorously presented as a frustrated romantic, with a natural love of literature and of words (which

he misuses effectively) and visions of a fuller kind of life. After failing to commit suicide, he breaks through his limitations, deserts his nagging, discontented wife and finds adventure and final contentment at an English country inn. A film version, with John Mills as Mr. Polly, was made in 1948.

Polo (Tibetan, *pulu*, ball). Polo is one of the most ancient games in the world. Cradled in Persia, it spread to India, and in slightly varying forms is found in China and Japan. A favourite sport of the Byzantine emperors, later it was revived in India, where it was taken up by British officers, and so spread over the world.

In 1874 the Hurlingham club ground was made, a code of rules laid down, and regular matches and tournaments instituted. Clubs were established at Ranelagh, Rugby, Roehampton, and elsewhere.

Polo grounds are of turf, carefully rolled and tended. The standard size is 300 yards by 160 yards. The long sides are guarded by planks 1 in. thick and 11 ins. high, 2 ins. being in the ground, so that the fence is 9 ins. on the outside. On the inside the turf should be raised and sloped along the boards, so that the ball striking the boards may not lodge under them. The ends are unboarded, and in the centre of each end are the goal posts, 24 ft. apart.

Polo balls are made of willow root in England, and are 3½ ins. in diameter. The weight must not exceed 5 ounces. In India the polo grounds are as a rule unboarded, and the balls made of bamboo root. The polo stick is everywhere of Singapore cane fixed at a slight angle into heads, which in England are of willow or ash, and in India

Polo. An international polo match in progress on the ground of the Hurlingham club, London, seat of the game's governing committee

of bamboo. In India the heads of the sticks are round, and much the shape of a manila cheroot, but in England a square mallet head is preferred. The handle should be shaped like the handle of a racquet, but with a rubber grip and tape wrist-loop. Length and weight vary, but a 53 in. cane with 8 in. head is suitable for beginners.

Polo ponies are bred for the game. The best are those which on a foundation of native British pony stock have grafted thoroughbred or Arab blood. There are also Argentine ponies, Walers or New Zealand ponies, pure Arabs, and American ponies.

The game is played with four players a side. No. 1 and No. 2 are forwards. No. 3 is generally the best player in the team, and plays forward or back as the game requires. No. 4 is back, his primary duty being to defend his goal, and to pass the ball to No. 3, who in his turn tries to serve the ball up to his forwards in attack. In defence it is the duty of every man to ride the corresponding man on the other side off the ball. Thus No. 1 tries to hinder or take the ball from No. 4 on the opposite side, No. 2 from No. 3, and so on. There is no offside. The game is divided into short periods called chukkas. Goals are scored, and the players are handicapped on their goal records.

The governing body of polo is the Hurlingham club polo committee, including representatives of army and county polo and of the leading polo clubs. It selects teams to meet American teams for the Westchester Cup (*q.v.*). No "senior" polo was played in England in 1946 or 1947, and the Hurlingham club was threatened with the loss of its ground.

Bibliography. Hints to Polo Players in India, Gen. Sir H. de Lisle, 1897; Riding and Polo, J. M. Brown, revised T. F. Dale, 1899; Tournament Polo, G. T. Young-husband, 1894; Polo, Past and Present, T. F. Dale, 1905; Polo, T. B. Drybrough, 1906; Modern Polo, E. D. Miller, 3rd ed. 1911; Polo at Home and Abroad, ed. T. F. Dale, 1915.

Polo, MARCO (c. 1254-1324). Venetian traveller. Born of noble parentage, he accompanied his father and uncle in 1271 to China, which the two elders had already visited about 1260. Crossing Persia, Western Asia, and Tartary, through districts unknown to Europeans until modern times, the three Italians crossed the Gobi desert, and eventually reached the city of Shang-tu in

1275. Here they saw the Great Khan, who conceived a liking for Marco, conferred dignities upon him, and even appointed him to an administrative post.

For three years Marco was governor of the city of Yangchow; he was employed on various political missions to India and to other parts of China. The khan was loth to let his visitors go when they expressed a wish to return to Europe, but in 1292 he permitted them to accompany an embassy to Persia, to conduct a Mongol princess as a bride to the shah. During the two years occupied in reaching their destination, many of the retinue perished. Largely owing to the care of the Venetians the girl survived, and was duly handed to her bridegroom. The Polos did not reach Venice until 1295. Three years later Marco, while fighting the Genoese, was taken prisoner, and during his confinement dictated an account in French to one of his fellow captives, Rusticiano of Pisa, who eventually published it as *The Book of Marco Polo*, ed. L. F. Benedetto, Eng. trans., 1931.

Polonaise (Fr., Polish). Stately Polish national dance in three-four time. It has a strong accent on the first beat of the bar, whereas the Mazurka has the accent on the second beat. Its closing cadence represents the final courtly bow. It was idealised by Chopin, whose Polonaises are, however, too complex to convey the impression of the real dance. *See* Dancing.

Polonium. One of the radio-active elements, discovered by P. and M. Curie during their researches on radium. They found that the insoluble residue from pitchblende, after roasting with sodium carbonate and extraction with sulphuric acid, contained another radio-active element, apart from radium. It was precipitated with bismuth by sulphurated hydrogen and

separated chemically. It has since been identified with radium F, the last recognized of the transformation products of radium. The radiation from polonium consists entirely of alpha-rays, identical with those of radium. A substance, called by Giesel beta-polonium, has been shown to be radium E. The element, chemical symbol Po, has atomic number 84. *See* Radium.

Polonius. In Shakespeare's *Hamlet*, a counsellor of King Claudius, and the father of Laertes and Ophelia. Chiefly famous for the rules of conduct which he gives to the former, Polonius is a well-intentioned busybody, against whom Hamlet scores verbal points. But he persuades the king to spy on Hamlet and Ophelia, and, during the prince's conversation with his mother, hides behind the arras, where Hamlet stabs him fatally in mistake for Claudius. A fine interpreter of the part was George Howe, and Felix Aylmer took it on the screen.

Polotsk. Town of White Russia S.S.R. It is in the region of Polotsk, and is 60 m. N.W. of Vitebsk, at the confluence of the Dvina and Polota, and a rly. junction half way between Dvinsk and Vitebsk. A very old town, it was once the capital of an independent principality. The old Kremlin encloses the Greek Catholic cathedral of S. Sophia. At the first partition of Poland in 1772 it was allotted to Russia. The town was captured by the Germans in March, 1918. Taken by the Germans during their drive on Smolensk in 1941, it became an important strongpoint covering the road to Dvinsk, and was recaptured by the Russians July 4, 1944, only after severe fighting through three powerful lines of fortifications and large minefields. Pop. 21,000.

Polperro. Fishing village of Cornwall, England. On the S. coast, 13 m. S.E. of Bodmin, it

Marco Polo,
Venetian traveller
Titian

Polperro, Cornwall. The village and harbour from the west cliff

occupies a picturesque position in a valley and is of special interest to geologists. The chief industry is the pilchard fishery. Polperro has a small harbour, and there is a coastguard station. Formerly it was a market town.

Poltava OR **PULTAVA**. Town of Ukraine S.S.R. It is 70 m. S.W. of Kharkov and stands at the junction of the Poltava and the Vorskla, and is a rly. junction on the Kharkov-Nikolaiev rly. Its chief industries are the making of tobacco, candles, soap, and leather. Pop. 130,305. Peter the Great's signal victory over the Swedes in 1709 is commemorated by a memorial stone set up in the town in 1849 and tumuli on the battlefield, 3 m. to the N.W.

Poltava was captured by the Germans in March, 1918, and was prominent in the anti-Bolshevist campaigns of 1919, being captured by Denikin (*q.v.*) in that year. During the Second Great War the Germans captured Poltava in Sept., 1941. The Russians, recaptured it Sept. 23, 1943.

Poltava. Memorial church built near the battlefield of 1709

Poltava, BATTLE

OF. Fought July 8 (N.S.), 1709, between the Swedish army of Charles XII and the Russians under Peter the Great. In spite of unbroken success, Charles's army was reduced to an efficient force of 20,000 men, chiefly cavalry, the powder had deteriorated, and communications with Sweden were cut off. Poland being as yet unable to help, the king could only rely upon the Tartars, Zaporogian Cossacks, and Wallachians, and while awaiting their arrival laid siege to Poltava in May. A Russian relief force captured the Zaporogian camp and entrenched itself behind the river Vorskla. Charles having been incapacitated by a wound, Marshal Rehmskjöld succeeded in the command of the Swedes, and on July 8 (N.S.) attacked the lines of the Russians, who outnumbered the Swedes by four to one. At first the Swedes were victorious on both wings, but Peter counter-attacked and enveloped them. With the help of a new gun he annihilated the Swedish infantry. This was ranked by Cressy as one of the world's decisive battles. See Charles XII.

Poltergeist (Ger., noisy ghost). In spiritualism, name given to the supposed agent of inexplicable

occurrences in a house, *e.g.* the rattling of crockery, moving of furniture, etc. The phenomena referred to have been common since ancient times in most parts of the world. In a number of cases—*e.g.* at Woodstock in 1649, described in H. More's *Continuation of Glanvil's Collection of Relations in*

Proof of Witchcraft; at Tedworth, dealt with in Joseph Glanvil's *Sadducismus Triumphatus*; and the Cock Lane Ghost, successfully laid by Dr. Johnson and his friends—the apparent mystery has been proved to be the result of human agency, a cleverly managed trick. But, as the inquiries of the Psychological Research Society seem to show, some occurrences permit, if they do not compel, even the frankly sceptical to keep an open mind on the subject of the doings of the poltergeist. The most celebrated case of poltergeist activity in the 20th century was at Borley rectory. See Cock Lane; Demonology; Haunted House; Witchcraft. Consult *Poltergeist* over England, H. Price, 1945.

Poltortsik. An older name of Ashkhabad (*q.v.*), the capital of Turkmen S.S.R.

Polyaenus (2nd century A.D.). Greek rhetorician and advocate. A native of Macedonia, he settled at Rome during the reign of Marcus Aurelius, for whose benefit he compiled a work called *Strategemata* (military stratagems) at the beginning of the campaign against the Parthians (162–165). Originally consisting of eight books, six of which are extant complete, it contains examples not only of military strategy, but of astuteness in other branches of life. He also wrote on Thebes and Macedonia.

Polyandry (Gr. *polys*, many; *andres*, males). Plurality of husbands. Usually deemed to arise from a paucity of women, especially in mountainous, insular, or sterile regions, it is often associated with food-scarcity and girl-infanticide. Its antithesis is polygyny. In the fraternal form, a man's brothers share his marital rights, as among the agricultural Tibetans

Polyanthus. Flowers and leaves of this hybrid

and Todas. The non-fraternal form among the Nayars of India, and in the Marquesas islands, is scarcely distinguishable from communal marriage. See Marriage; Polygamy; Society.

Polyanthus (Gr. *polys*, many; *anthos*, flower). Garden hybrid originally derived from crossing the cowslip (*Primula*

veris) and the primrose (*P. acaulis*). By selection and further crossing an almost endless variety of form and colour has been raised.

Polybius (c. 210–120 B.C.). Greek historian. He was born in Megalopolis in Arcadia, and his father was one of the leaders of the Achaean League in its resistance to the dominion of Rome. Deported to Italy after the conquest of Macedonia, Polybius had the good fortune to be received in the household of Aemilius Paulus, with whose son, the younger Scipio, he formed a life-long friendship. Polybius was with Scipio at the destruction of Carthage in 146 B.C. The same year saw him in Greece, and when the inevitable defeat took place Polybius succeeded in securing the most favourable terms for his countrymen. Statues were erected in his honour in several of the cities of Greece. Already Polybius had begun to collect material for his great work, a history of Rome from 221–146.

Of the 40 books of the history, only the first five survive, but these and fragments of the lost books make it clear that the general thesis of the work was to show that the passing of dominion into the hands of the Romans was inevitable, because they were more fitted to rule than the nations they conquered. Polybius is no stylist, yet he ranks high as an historian. See Greek Literature; consult Ancient Greek Historians, J. B. Bury, 1909.

Polycarp (c. 69–155). Apostolic father and saint. Born about A.D. 69, he is said to have become a Christian about the year 80. According to Irenaeus, he was a disciple and friend of S. John, who is said to have consecrated him bishop of Smyrna about the year 96. It is supposed that he was the angel of the Church in Smyrna (Rev. 2, v. 8). One of his pupils was Irenaeus. Polycarp was the author of an Epistle to the Philippians, and about 155 he went to Rome to confer with Anicetus on the question of the date of the Easter festival

and other matters of Church observance. Soon after his return to Smyrna he was apprehended in a local persecution of the Christians, and burnt at the stake.

Polyclitus (5th century B.C.). Greek sculptor. He was probably a native of Sicyon, but was identified with the school of Argos, where he lived. One of the greatest artists of his time, his Doryphorus (spearman), of which there are copies at Rome, Florence, Naples, and Berlin, was, according to Pliny, the last word in perfect sculpture. Among his other works are the Diadumenus and the famous chryselephantine statue of the goddess Hera, once in the temple at Argos. Portraits, etc., by him have been discovered at Olympia, Delos, and Samos. There was also a younger Polyclitus, architect and sculptor, who flourished in the 4th century. *Pron.* Polly-cly-tus.

Polycrates (d. 522 B.C.). Tyrant of Samos. By creating a fleet, he extended his dominion to other islands and the coast of Asia Minor, and became exceedingly powerful and wealthy. His good fortune was so constant that Amasis, king of Egypt, who had entered into an alliance with him, became uneasy, thinking that such unvarying prosperity would eventually provoke the anger of the gods. According to Herodotus, Amasis asked his ally to throw away one of the most valued of his possessions. Polycrates threw a beautiful ring into the sea, but the next day it was brought back to him by a fisherman, who had found it inside a fish which he had caught. Amasis was now certain that such luck could not possibly last, and broke off the alliance. Polycrates repelled the attacks of various enemies, but was finally decoyed to the Asiatic mainland by a Persian governor, and crucified. The ring of Polycrates is the subject of one of Schiller's ballads.

Polygalaceae. A family of herbs and shrubs, natives of temperate and tropical regions. They have chiefly alternate leaves (rarely opposite), and irregular flowers. The roots have diuretic, emetic, and purgative properties, and *Polygala senega* and *Krameria triandra* are employed in medicine. *See* Milkwort; Rhatany.

Polygamy (Gr. *polys*, many; *gamos*, marriage). Term commonly used for a plurality of wives. Strictly speaking, however, this is polygyny, from Greek words meaning many women, and its converse is polyandry, having many husbands. Polygamy really includes

the two, and its antithesis is monogamy. Highly developed in negro Africa, polygamy was well established among the Australian aborigines, and in parts of Melanesia. It is of high antiquity among the Semites, by whom it was regulated in early times. It passed into Aryan India and was retained in Mahomedanism. Among many peoples, whose powerful and wealthy classes practise polygamy, marriage is normally monogamous for economic reasons. *See* Marriage; Society.

Polygenism (Gr. *polys*, many; *genos*, kind). Theory attributing to mankind descent from more than one original stock or pair. In one form it claims a separate ancestry for the main human races now extant, on the ground that their physical and mental differences are so fixed as not to be accounted for by the alternative view, called monogenism, of the unity of the human species. *See* Anthropology; Monogenism.

Polyglot (Gr. *polys*, many; *glōtta*, a tongue). Term applied to any book containing, in addition to the original text, various translations of this text, arranged in parallel columns. The term, also used in reference to dictionaries in various languages, is especially applied to particular editions of the Bible.

Among polyglot Bibles are (1) The Complutensian, printed at Alcalá de Henares, Spain (the Roman *Complutum*), for Cardinal Ximenes, 1502-17, published in 6 vols., 1520, and containing Hebrew, Chaldee, Greek, and Latin. (2) The Antwerp, or Biblia Regia, printed by C. Plantin, 8 vols., 1569-72, for Philip II under the supervision of B. A. Montanus and based largely on the Complutensian. (3) Paris, 10 vols., 1628-45. (4) London, or Walton's, 6 vols., 1654-57, ed. by Brian Walton, afterwards bishop of Ches-

ter, one set of which, 1657, was dedicated to Oliver Cromwell and known as the Republican; and the other to Charles II, 1660, called the Loyal. It contains Hebrew, Samaritan, Aramaic, Greek, Arabic, Chaldee, Ethiopic, Syriac, Persian, and Latin texts, all except the last named with literal Latin translations, and a Prolegomena by the editor. (5) Bagster's, in Hebrew, Greek, Latin, Syriac, German, Italian, French, Spanish, and English, ed. S. Lee, with Prolegomena. 2nd ed. 1831. Among others is Bielefeld's, ed. R. Stier and C. G.W. Theile, 4 vols., 4th ed. 1875. In 1819 a Polyglot English Prayer Book was published by Bagster.

Polygnotus (5th century B.C.). Greek painter. Born in Thasos, he was the son and pupil of the elder Aglaophon. He decorated the temples of the chief Greek cities with paintings of mythological subjects chosen from Homer's epics, and his idealistic and expressive style greatly raised the status of painting, hitherto subordinate to other arts. When Winston Churchill received his honorary doctorate of Cambridge university in 1948, the public orator described him as *Polygnoti discipulus*. The Athenians gave Polygnotus citizenship, and the Amphictyonic council decreed his maintenance, in Athens and other Hellenic cities, at public expense. *Pron.* Polly-gno-tus.

Polygon (Gr. *polys*, many; *gonia*, angle. In geometry, a closed figure bounded by straight lines. The triangle is the only polygon which is necessarily in one plane. Polygons which do not lie in one plane are called *gauche*; those in which all the angles are equal and all sides equal are said to be regular.

Polygonaceae. A family of herbs, shrubs, and a few trees, chiefly natives of temperate regions. Forming the buckwheat family, they have alternate undivided leaves, whose margins are at first rolled back. The flowers are mostly small and inconspicuous, though sometimes rendered showy by association, as in rhubarb (*Rheum*). They have hard fruits with floury seeds, which in the case of the buckwheat (*Fagopyrum esculentum*) has caused them to be used as food for farm animals. The order includes the docks and sorrels (*Rumex*) and rhubarb (*Rheum*). *See* Rhubarb.

Polygon Wood. Wood of Belgium in the prov. of W. Flanders. It is 4 m. E. of Ypres, and is so named because in its centre was

Polygalaceae. Leaves and flower-spike and, right, root of *P. senega*

once the racecourse (*polygone*) of Ypres. In the First Great War its possession was fiercely contested by the British and Germans in Oct., 1914, but it remained in the possession of the former until May, 1915. It was stormed by Australians, Sept. 26, 1917: retaken by the Germans in April, 1918, and finally cleared of the enemy by the Allies in Oct. An obelisk marks the Australian victory. See Ypres, Battles of.

Polyhedron (Gr. *polys*, many; *hedra*, base). In solid geometry, a solid completely bounded by plane surfaces. The bounding surfaces are polygons and are called faces, where they meet edges, and the points where the edges meet vertices. When all the faces are equal, regular figures, the polyhedron is said to be regular. There are only five regular convex polyhedra, the tetrahedron, hexahedron, octahedron, dodecahedron, and icosahedron.

Polymhymnia. One of the nine Muses (*q.v.*) in Greek legend. Her department was sacred song, and she was represented as pensive, and wrapped in a mantle.

Polymerisation. Chemical change involving two or more molecules of the same substance, resulting in the formation of a new compound with molecular weight a multiple of that of the original. The new compound is called a polymer. Polymerisation has an important practical bearing in the rubber, petroleum, resin, plastics, and paint industries. See Chemistry; Plastics.

Polymorphism (Gr. *polys*, many; *morphe*, form). Occurrence of different forms of individuals in one species of animals. These may occur at different times during the life history of any individual, or as a number of different types for the whole of their lives. See Evolution.

Polyneicēs. In Greek legend, the son of Oedipus, king of Thebes. When Oedipus went into voluntary exile, it was agreed between his two sons, Polyneicēs and Eteoclē, that each should rule by turn for terms of a year. Eteoclē had the first term, but at the end of it refused to give up the throne. Polyneicēs took refuge in Argos, whence he organized and led the first expedition of the Seven against Thebes, in which the two brothers met in single combat and were both killed. Antigōnē (*q.v.*) had Polyneicēs' body buried with honour, in defiance of the orders of the king of Thebes, and was put to death.

Polynesia (Gr. *polys*, many; *nēsos*, island). Term applied to the most easterly of the islands of the Pacific Ocean. Their limits are approximately the tropics of Cancer and Capricorn on the N. and S. and meridian 180° on the W. Hawaii is in the track of the N.E. trade winds in summer and the S.W. winds in the winter; the islands S. of the equator are crossed by the S.E. trade winds. Except Hawaii, which comprised large volcanic islands fringed by coral reefs, they are small in size and, in many cases, coralline in formation. The volcanic islands are forested, but the others are rather bare. Coconuts are produced, and copra forms the chief article of island trade, which largely centres in Auckland and Sydney. Sugar and fruit are grown on the larger islands. Politically, the Hawaiian islands, S. Samoa, and the Baker and Howland islands belong to the U.S.A.; the Society, Gambier, Austral, and Rapa groups, and the E. Marquesas are French; N.W. Samoa, formerly German, has been, since the First Great War, under the mandate of New Zealand; Fiji, the Phoenix, and the Tonga groups are British; and the Hervey or Cook and the Manahiki islands are dependencies of New Zealand, which also assumed control of the formerly British Tokelau or Union group in 1926. See Pacific Ocean.

Polynesian. Term denoting the aboriginal population of the Pacific islands S. and E. of the Micronesian and Melanesian groups. Estimated at 200,000, their ambit lies within a triangle whose corners are New Zealand, Hawaii, and Easter Island, including the Tonga, Samoa, Cook, Tahiti, Paumotu, and Marquesas archipelagos.

Native traditions point to a migration from the Ganges basin, after 450 B.C., of a Caucasoid people who, reaching Java shortly before the Christian era, acquired seamanship, and replaced rice by bread fruit in their dietary. By A.D. 450 they were established in Samoa, two centuries later in Hawaii and the Marquesas, and by 850 in Tahiti and New Zealand, although the present Maoris did not arrive until 1350. These migrations occurred in double canoes and single outriggers, with triangular mat-sails. Melanesian and other elements, ancient and recent, are discernible, the result of ethnic and cultural admixture with previous comers. These predominate in Fiji, which subsequently experienced Polynesian influence from the Tonga or Friendly Islands.

Polynesians are usually lithe and active, averaging 5 ft. 8 ins. in height; olive-brown and longish-headed, they have oval faces and wavy hair, and are cheerful and dignified. Megalithic monuments here and there denote independent streams of influence. Hunting and the bow-and-arrow necessarily fell into disuse, but fishing was highly developed. Cannibalism and infanticide formerly prevailed. The staple foods are taro root, sweet potato, yam, coconut, bread fruit, and banana. Pottery, unknown except through Fijian contact in Tonga, was replaced by gourds and carved wood bowls, cooking being effected by hot stones. In the absence of metals, implements were of shell, wood, or stone. Bark-cloth, tapa, was made from the paper-mulberry, and mats from plaited strips of pandanus and other leaves. Featherwork excelled in Hawaii. Tattooing of the limbs of both sexes was formerly effected by bone implements with serrated edges. In the Tonga group nose-flattening was practised.

Society was based upon noble, free, and servile classes, the last representing the indigenous populations. The prerogatives of the nobles were guarded by a taboo system, maintained by a priesthood, which also practised divination and ordeals. Pantomimic dancing survives in such forms as the Samoan siwa, or sitting dance, and the Hawaiian hula. The copious mythology includes tales of cosmic deities and culture-heroes, with creation legends emanating from the Indian cradleland. The Polynesian dialects form a sub-family of the Austronesian division of the Austro family of languages. See Areois; Ethnology; Kanaka; Maori; Taboo.

Bibliography. Maori and Polynesian, G. M. Brown, 1907; Hawaii, S. P. Smith, 3rd ed. 1910; Islanders of the Pacific, T. R. St. Johnston, 1921; Savage Civilization, T. Harrison, 1936; Religion and Social Organization in Central Polynesia, 1937; The Pacific Basin, G. L. Wood, 1942.

Polyp (Fr. *polype*, octopus). Name applied to a certain type of animal of the phylum Coelenterata (*q.v.*). It takes the form of a hollow tube-like bag containing only one internal body cavity or set of cavities, which communicates with the exterior only by the mouth. The common hydra (*q.v.*) of British ponds is a familiar example. But a more widely quoted example is the coral, details of which are given under the headings Coral; Coral Reef.

Polyperchon OR **POLYSPERCHON**. One of the generals of Philip of Macedon and Alexander the Great. Nominated governor of the Macedonian empire by Antipater, 319, he found himself opposed by the latter's son Cassander, and others. Twice obliged to leave Macedonia, Polyperchon attempted to form an independent kingdom in Peloponnesus. Having espoused the cause of Heracles, the son of Alexander, he afterwards put him to death at the instigation of Cassander, who entered into negotiations with him. Cassander afterwards failed to carry out the terms of the agreement, and Polyperchon, his reputation ruined by the murder of Heracles, spent the remainder of his life in Locris.

Polypase. In electricity, term describing the generation, transmission, or utilisation of alternating currents in more than one circuit or phase, each current rising and falling in potential at regular intervals, one after the other. A single-phase alternator with a single winding produces a rapidly oscillating current which rises and falls, reversing in polarity many times in a second. Graphically the current takes the form of a sine-wave moving above and below a central zero line. A three-phase alternator has three windings spaced 120° apart, in each of which an A.C. is induced in turn. These can be shown graphically by three sine-wave curves, the crests of each following the other one-third of a period apart. Three times more power can be transmitted over three conductors in the form of three-phase A.C. than over two conductors in the form of single-phase. Also three-phase A.C. motors are self-starting, whereas single-phase A.C. motors need special windings. Two-phase A.C. is used to only a limited extent. Six- and twelve-phase A.C. is used for rectification to D.C.

Polyphemus. In Greek mythology, one of the Cyclopes, a race of giants. The son of Poseidon and Thoösa, daughter of the sea-deity Phorcyas, he dwelt on the coast of Trinacria (Sicily), where he kept his flocks. In the course of his wanderings, Odysseus and his comrades sought refuge in the cave of Polyphemus, who killed and ate some of the companions of the hero. When the giant had gone to sleep, however, Odysseus destroyed the sight of his one eye by piercing it with a burning pole, and escaped from the cave with the remainder of his comrades. See Cyclopes.

Polyphony (Gr. *polys*, many; *phōnē*, sound). Style of music in which the constituent voices or instruments pursue their own individual courses and preserve a distinct melodic interest. It thus differs from the monodic or homophonic style, in which most of the parts are simply accompanimental to the principal melody. A fugue or a canon is necessarily polyphonic; other forms of music may or may not be so, according to the desire of the composer. See Harmony; Music.

Polyploidy. Term used in cytology and genetics to describe the condition in nuclei which contain more than the normal pair of sets of chromosomes. Triploids contain three sets, tetraploids four, and so on. Various causes lead to the condition, among them the failure of meiosis so that diploid gametes are produced. Fusion of one of these with a normal haploid gamete would result in a triploid individual; with another diploid gamete, in a tetraploid one.

Polypodiaceae. Large family of Pteridophytes. It includes the greater number of fern genera, and is of world-wide representation. With few exceptions they are perennial herbs with leaves or fronds of a tough texture, simple, or more or less divided. The spores are borne in minute stalked capsules, partially girt by a vertical ring. These are clustered in dots or lines on the back of the frond. The frond before expansion is rolled up with the tip in the centre of the coil.

Polypterus, the African mud-fish, showing dorsal fin broken into small finlets

Polypody (*Polypodium vulgare*). Fern of the above family Polypodiaceae. A native of Europe and the N. temperate zone, it has a fleshy rootstock, with a furry coat of pale brown lance-shaped scales, which creeps on the surface of tree-trunks, walls, and hedge-bottoms. The leathery fronds are cut into lobes from the sides, and their stalks are jointed to the rootstock in such a way that they can be thrown off when old. They are produced singly at short intervals along the rootstock, and remain fresh and green throughout the winter. The golden-orange clusters of spore-cases are produced in double rows on the back of the lobes. The rootstock was formerly

employed as a purgative and for whooping cough. See Fern.

Polyporus. Large genus of fungi of the family Hymenomycetaceae. It has spores borne in mi-

Polyporus. *P. squamosus*, a bracket-shaped species on a tree trunk

nute tubes which are sunk into the underside of the cap or pileus. The substance of the pileus is corky or woody. They mostly grow upon living or dead wood—trunks, branches, or roots of standing trees or worked wood. Those that grow from the trunks usually take the form of brackets. These are only one phase of the plant's growth. The vegetative phase takes the form of delicate threads (mycelium) permeating the tissues of the wood and destroying them. Many of the species are highly destructive to growing timber. See Forestry.

Polypterus. Genus of mud-fishes, found in the rivers of Africa. The dorsal fin is broken up into a series of small finlets arranged in a row along the back, and the body is covered with large plate-like scales. It grows to about four

ft. long, is carnivorous in diet and nocturnal in habit. See Fish.

Polypus. Tumour growing from mucous membrane, usu-

ally more or less pear-shaped, and attached by a stalk to the surface from which it grows. It consists of fibrous tissue covered with epithelium, and is inflammatory in origin. Polypi are most frequently met with in the nose, bladder, rectum, or uterus. They rarely become malignant, i.e. cancerous in nature. If the growth is accessible, it is as a rule easily removed by surgical means.

Polytechnic (Gr. *polys*, many; *technē*, art). Term applied to any institution affording practical training in the arts and sciences. Such institutions are known also as technical high schools. The term was first used in connexion with the École Centrale des Travaux Pub-

lics, established in Paris by the National Convention in 1794, and known since Sept., 1795, as L'École Polytechnique. Frequently reorganized, it has been ever since devoted to engineering. The first London polytechnic, the Royal Polytechnic Institution, 309, Regent Street, and 5, Cavendish Square, opened Aug. 6, 1839, was devoted to the exhibition of new inventions and lectures, a popular feature being a diving-bell. In 1881 the premises became the home of the Polytechnic Young Men's Christian Institute, founded by Quintin Hogg (*q.v.*). Now known as the Regent Street Polytechnic, its educational courses and equipment receive material aid from the L.C.C. technical education board and the city parochial charities. Other London polytechnics include Battersea, Borough, Chelsea, and Woolwich.

The work carried on by means of day as well as evening classes at these polytechnics embraces both theoretical and practical training in class-rooms and laboratories, while at most of them is a department for the teaching of domestic economy to girls and women. Similar institutions exist in other cities of the United Kingdom, in Germany, Austria, Switzerland, and the U.S.A., where the parent foundations, the Rensselaer Polytechnic Institute, Troy, and Franklin Institute, Philadelphia, date from 1824. *Consult* Histoire de L'École Polytechnique, G. Pinet, 1886.

Polytheism (Gr. *polys*, many; *theos*, god). Belief in, and worship of, many gods. Opinion is divided on the question whether polytheism preceded, or was a degradation of, monotheism. It figured in the ancient history of the Hebrews, characterised the religions of Assyria, Babylonia, Egypt, Greece, and Rome, and affected the pantheism of India. *See* Anthropomorphism; Deism; Monotheism; Pantheism; Religion.

Polyuria. Increase in the amount of urine passed. It may be due to natural physiological processes, *e.g.* increase in the amount of food and liquid taken; to exposure to cold, which reduces transpiration by the skin; or to disease, most frequently diabetes and Bright's disease.

Polyxena. In Greek legend, the daughter of Priam, king of Troy, and beloved of Achilles. After the taking of Troy, Polyxena was taken captive by Neoptolemus, the son of Achilles, and when on the return journey, on the Thracian coast, the shade of Achilles ap-

peared, and demanded that Polyxena should be sacrificed to him, Neoptolemus immolated the unfortunate maiden. The incident is dramatically treated in the Hecuba of Euripides.

Polyzoa (Gr. *polys*, many; *zōon*, animal). Name applied to a zoological phylum of minute animals, mostly marine, which live in colonies. The sea-mats, *e.g.* *Flustra*, common on sandy shores, and often mistaken for sea-weeds, are familiar examples. The colonies assume many forms, some being tree-like, others leaf-like, while others form incrustations on rocks and sea-weeds. The animal is of simple structure, consisting mainly of a U-shaped alimentary canal, terminating in a mouth and an anus placed near together. The mouth is surrounded by a ring or horseshoe of tentacles, covered with minute cilia, the waving of which causes currents in the water and so sweeps particles of food into the mouth. In these colonies the individuals are specialised to perform various functions for the common benefit, some being feeding agents, some reproductive, and others being armed.

Pomade (Lat. *pomum*, apple) or **POMATUM**. Name given to any scented grease or ointment used for the hair or skin. It was formerly made from the juice of apples.

Pomander (Fr. *pomme d'ambre*, amber apple). Scented ball or box hung at the end of the girdle, round the neck, or carried in the pocket. Pomanders became obsolete at the end of the 17th century.

Pombal, SEBASTIÃO JOSÉ DE CARVALHO E MELLO, MARQUESS OF (1699-1782). Portuguese states-

man. Born at Lisbon, May 13, 1699, of good family, he became Portuguese ambassador in London, 1739-45, and Vienna, 1745-49. Recalled to Portugal, he became principal minister of Joseph I, Aug., 1750, carrying out many internal reforms, and strengthening the position of Portugal abroad. He crushed a revolutionary plot among the nobles and Jesuits in 1759, and in the same year expelled the Jesuits from Portugal and her colonies.

On the accession, in 1777, of Queen Maria, he resigned his offices. Much of his action was reversed, and he was severely censured and banished from the court. He died at Pombal, May 8, 1782. *Consult* Dictator of Portugal, M. Cheke, 1938.

Pome (Lat. *pomum*, apple). In botany, a succulent fruit with a fleshy body, such as that of the apple, pear, etc., the seeds of which are enclosed in carpels forming the core. *See* Fruit.

Pomegranate (*Punica granatum*). Tree of the family Punicaceae, native of W. Asia. The leaves are oblong or lance-shaped, and the red flowers are in small clusters at the ends of the branches. The large fruits, golden tinged with red, are remarkable in their structure, there being two series of carpels, one above the other. The seeds are coated with sweet, juicy pulp. The rind is used for tanning morocco leather, to which it gives its rich red colour.

Pomegranate. Flower, leaves, pulp. The rind is used for tanning morocco leather, to which it gives its rich red colour.

Pomerania. Former province of Prussia, Germany, between Brandenburg and the Baltic. Its area was 11,680 sq. m., and its pop. almost 2,000,000. It was divided into two parts by the Oder and included the islands of Ruegen, Usedom, and Wollin. It was remarkable for its many lakes, and was important to German economy as a centre of agriculture and fishing.

Pomerania was inhabited about the 8th century by people of Slavonic race, and about 1200 their rulers called themselves dukes. It became part of the German kingdom, and at one time included Pomerellen, a province of the former West Prussia. This, however, was separated from Pomerania proper about 1300. The dukes of Pomerania divided and subdivided their lands to provide for various branches of the ducal family. In 1625, however, it was united under a single duke, and in 1637, on his death without sons, it was claimed by Brandenburg, in accordance with a treaty made some years before. The Swedes, however, were in possession, for the Thirty Years' War was raging, so in 1648 it was divided; Brandenburg secured eastern, and Sweden western, Pomerania.

The rulers of Brandenburg lost no chance of claiming the whole province, and in 1720 most of Western

Pomerania was handed over by Sweden. In 1815 the rest also became part of Prussia. After the Second Great War, the part W. of the Oder lay in the Russian zone of occupation in Germany; the part E. of the Oder was placed by the Potsdam agreement, Aug. 1945, under Polish administration, the bulk of the German pop. being expelled.

Pomeranian Dog. Breed of pet dog. It is bred largely in Germany, where it is known as the Spitz and

Pomeranian Dog. A champion specimen of the breed

is claimed as one of the national breeds. In general appearance the Pomeranian recalls a diminutive chow or Eskimo dog, and is doubtless descended from one or more of the Arctic breeds. In its original and large form, a breed now little known, the Pomeranian was used as a wolf dog. It has been used abroad as a sheep dog, but in Great Britain the diminutive type only, bred by special selection, is seen, still sometimes kept as a lady's pet in spite of its rather uncertain temper and uselessness as a house dog. Specimens of these once-fashionable dogs weighed 8 lb. and less; the favourite colour was black, but white and fawn, sometimes mixed, were frequently seen; the ears should be erect, with no tendency to curl at the tips. See Dog, colour plate.

Pommel Cheese. One of the most popular cream cheeses, made in France and largely used in

England in normal times. It is unsalted, does not keep long, and is made from cream and milk thickened by souring.

Pommer, ERICH (b. 1889). German film director. One of the cinema's pioneers, he entered the film industry before the First Great War when he worked for the French Gaumont Co. in Berlin during 1907-14. During the 1920s he worked as a director for U.F.A., achieving world-wide fame by such pictures as *Nibelungen*, *Vaudeville*, and *Waltz Dream*. With Charles Laughton in the U.S.A. he founded the film company Mayflower Pictures, Ltd., and directed *Vessel of Wrath*, 1938; *They Knew What They Wanted*, 1940. His best-known British film was *Fire Over England*, 1936.

Pomona. In Roman mythology, a nymph or goddess who was the patroness of gardens and fruit.

Pomona OR **MAINLAND.** Largest of the Orkney Islands, Scotland. Its area is 150 sq. m. It is divided into two unequal portions by Kirkwall Bay and Scapa Flow (*q.v.*), and has a steep rocky W. coast, with a few good harbours. The surface is mainly moorland and heath, with some fertile valleys. Kirkwall and Stromness are the only towns. "Maes Howe," a chambered barrow, and the Standing Stones of Stenness, a group of stone circles, are interesting antiquities. Pop. 14,083.

Pomona. City of California, U.S.A., in Los Angeles co. Situated 34 m. by rly. E. of Los Angeles, and served by the S. Pacific rly., it lies in an important fruit and vegetable district, and carries on a large trade in oranges. Pomona was settled in 1875 and incorporated 1887. Pop. 20,804.

Pompadour, JEANNE ANTOINETTE POISSON, MARQUISE DE (1721-64). Mistress of Louis XV. Born in Paris, Dec. 29, 1721, she was the illegitimate daughter, by Madeleine Poisson, of Le Normant de Tournemont, whose

nephew, Le Normant d'Étiolles, she married in 1741. She became mistress of Louis XV in 1745, and

thenceforth, a woman of high talents and with great ambition, exercised much political influence. She accumulated a large fortune for herself and her relatives, became a duchess, 1752, and lady-in-waiting to the queen, 1756. She personally carried out many of the king's state duties, and her patronage of writers and artists such as Voltaire, Crébillon, Quenay, Helvétius, Van Loo, and Boucher enhanced her influence. The French alliance with Austria, 1756, was due to her personal spite against Frederick II. She died at Versailles, April 15, 1764. *Consul* Mme. de Pompadour, E. and J. de Goncourt, new ed. 1896; Mme. de Pompadour, H. N. Williams, 1902.

Pomp and Circumstance. Title of five marches composed by Elgar: Nos. 1 and 2 in 1901; No. 3 in 1905; No. 4 in 1907; No. 5 in 1930. In 1902 the trio portion of No. 1 was adapted by the composer as a setting for A. C. Benson's words, *Land of Hope and Glory* (*q.v.*), as the official Coronation Ode.

Pompeia. Name of a Roman plebeian gens, or clan, the most important member of which was:

GNÆUS POMPEIUS (106-48 B.C.). Roman general and triumvir. Commonly known as Pompey the Great, he received from Sulla, as the reward of his military achievements, the surname of Magnus, a title which descended to his sons. He was born Sept. 30, 106 B.C., of a family which in the great strife between the democratic and the aristocratic parties in Rome, took the senatorial side. In 89 young Pompey was already serving with the army under the command of his father. He became so popular with the soldiers that, when Sulla landed in Italy in 84, determined to overthrow the dominant democratic faction, Pompey was able to lead a considerable force to support him. Sulla gave him responsible employment, and during the next three years he rendered brilliant services, especially in the overthrow of the Marian, or democratic, party in Africa. These were the triumphs which caused Sulla to hail him as Magnus, the Great. After Sulla's death in 78, Pompey remained a recognized leader

Marquise de Pompadour, mistress of Louis XV

From the portrait by Boucher in the Wallace Collection, London

Pompey the Great, Roman general
From a bust

of the senatorial party, whose armies he commanded in Spain 76-71.

Returning to Rome, he broke with his former allies, and in 67 was appointed with extraordinary powers for the suppression of the pirates in the Mediterranean. In this task he was completely successful, and in 66 he was sent to the E., again with extraordinary powers, primarily to overthrow Mithradates (*q.v.*). Again he was successful, and brought the entire east under the Roman sway.

After the year 62 his hitherto brilliant record became one of failure. Since now he would neither give way to the senate nor seize absolute power, he formed an alliance, known as the first triumvirate, with Crassus and Julius Caesar. In 58 Caesar took up the proconsulship or governorship of Gaul, an office which, by means of the armies at his disposal, he was able to use as a step towards making an ultimate bid for supreme power. Pompey, remaining in Rome, rapidly lost influence. In 52 the government broke down altogether, and again Pompey had his chance. He again hesitated, lost his opportunity, and threw himself upon the support of the senatorial faction. The result was the invasion of Italy by Caesar at the head of his preconsular army in 49, the decisive defeat of Pompey at Pharsalus, Aug. 9, 48, and his flight to Egypt, where he was assassinated, Sept. 29. *Consul's Life*, Plutarch; *Seven Roman Statesmen*, C. W. C. Oman, 1902

Pompey's younger son, Sextus Pompeius Magnus (d. 35 B.C.), escaped from the battle of Munda (45 B.C.), and for some time lived in retirement in Spain. In the second civil war he emerged from retirement and, collecting a powerful

fleet, seized Sicily and seriously interfered with the supply of grain to Rome. In 36 the fleet of Pompeius was severely defeated. Its leader fled, but eventually was captured in Asia and put to death.

Pompeia. Wife of Julius Caesar, by whom she was divorced in 61 B.C. While the mysteries of the Bona Dea were being celebrated in her house, the profligate Clodius succeeded in gaining entrance disguised in woman's clothes. There

Pompeii. Plan of the ruins of the ancient Roman city

was no real evidence of any intrigue between Pompeia and Clodius, but Caesar divorced Pompeia on the grounds that "Caesar's wife must be above suspicion."

Pompeii. Ancient city of Campania, Italy. Its ruins lie $1\frac{1}{2}$ m. from the sea, at the S.E. foot of

to leave paintings, household goods, etc., in their original setting. In the Second Great War the R.A.F. dropped 156 bombs on the amphitheatre, which was used by the Germans as an encampment. The damage caused to the antique remains was not serious.

Pompeii A room showing Pompeian decoration in the form of mural paintings suggesting open windows and raised columns

Mt. Vesuvius, 15 m. by rly. E.S.E. of Naples. Founded by the Oscans, it was partially Hellenised, conquered by the Samnites, and taken from them by the Romans in 290 B.C. Having joined the Italian revolt in 90, it was made a Roman colony in 80 B.C. A small but flourishing town and seaport, it became a pleasure resort of wealthy Romans. Wrecked by an earthquake, A.D. 63, it was hastily rebuilt, though many of its buildings were still ruinous when it was overwhelmed by the great eruption of Vesuvius, Aug. 24, 79. A hail of small pieces of pumice-stone covered the town to a depth of 8 to 10 ft. and was followed by a fall of ash. Sulphurous fumes suffocated many of about 20,000

The city, built on a low hill of lava, stood at the mouth of the river Sarnus. The walls, with towers and eight gates, enclosing an irregular oval, are nearly two miles long, but had been pulled down on the sea side. The streets are narrow, generally straight, and paved with lava. Of the two *fora* or market-places, the larger is surrounded on three sides by a colonnade, and facing it are the principal temples, the municipal buildings, the *maxellum* or provision market, and other public edifices. The smaller, or triangular forum, contains scanty remains of a Greek temple. Near it are two theatres and the gladiators' barracks. At the E. end of the city is an amphitheatre.

Sextus Pompeius
From a statue in the
Louvre, Paris

inhabitants some 2,000 perished.

In 1748 the discovery of some statues led to the exploration of the site. Desultory search gave place to systematic excavation, but only since 1861 has this been scientifically prosecuted.

Recent excavators have tried

1. Sepulchres in the Street of Tombs. 2 The Street of Abundance, so called as the centre of the jewellers. Note the stepping stones across the roadway, and the square public fountain beyond. 3. An oil merchant's shop,

with earthenware jars for storing the oil 4 A room in the baths, showing niches for depositing clothes. 5. Peristyle and inner court of Pompeian house. 6. Temple of Isis. 7. Inner shrine of the Temple of Venus or of Apollo

POPULATION : DIAGRAMS ILLUSTRATING DISTRIBUTION, DENSITY, RACES, AND RELIGIONS

Pom-pom Anti-aircraft gun used against dive bombers

There are three *thermae*, or public baths, and without the city walls are two streets of tombs. The most interesting remains are private houses, which illustrate with extraordinary vividness the life of all classes. Their outer walls are generally blank or faced by shops, but within the larger houses are courts and gardens, and avishly decorated rooms.

Pompeian decoration is a term applied chiefly to paintings discovered in the ruins of Herculaneum and Pompeii, but also to decorations in the same style and period unearthed in Rome. The style is derived from Alexandrian art, its principal characteristics being gaiety of colour and a Greek gracefulness in design. Bright reds, blues, and yellows predominated. The paintings were on stuccoed walls, and represented mythological beings, landscapes, and studies from bird or plant life. Fantastical architectural motives were often woven into the design. See Io; Iphigenia; Issus; Lytton. 1st Baron.

Bibliography. Pompeii, T. H. Dyer, 1867; Buried Cities of Vesuvius: Herculaneum and Pompeii, J. F. Horne, 1895; Pompeii Its Life and Art, A. Mau, Eng. trans. 1902; Pompeii R. C. Carrington, 1936

Pompey. English form of the Latin name Pompeius, specially applied to Gnaeus Pompeius, called Pompey the Great. See Pompeia.

Pompey's Pillar. Monument at Alexandria, Egypt. It was set up in 302 in honour of the emperor Diocletian. A red granite column with a Corinthian capital, it is 99 ft. in height. The name is due to a mistaken idea that it marked the site of Pompey's tomb. See Alexandria illus.

Pom-pom. Small calibre cannon in which the shells are loaded and fired, and the empty cases ejected, by automatically operated mechanism. These guns were used

by the Boers in the South African War, and in the later stages by the British troops. The shells weigh about 1½ lb., the smallest explosive projectile permitted under the Geneva convention. Usually the shells are fed in belts of 25 for the Maxim and clips of 8 for the Hotchkiss. In 1936 the Royal Navy introduced a multiple pom-pom for defence against torpedo-dropping aircraft. It consists of a nest of 4-8 barrels mounted and fired as one gun; the eight have a total rate of fire of 1,200 2-lb. H.E. shells per minute, and the effective range is 400 yds. Popularly known as the Chicago piano, the multiple pom-pom was mounted on all warships and many merchantmen in the Second Great War. The name is derived from the noise caused by projectiles bursting in rapid succession. See Gun; Machine-Gun.

Ponapé. Chief of the Caroline Islands, Pacific Ocean, formerly under the mandate of Japan. Off the shore, beyond an islet-dotted lagoon about 1½ m. across, is a barrier reef. The soil is very fertile. Its area is 340 sq. m. Turned into a base by the Japanese during the Second Great War, Ponapé was frequently bombed by both carrier- and land-based U.S. bombers during Feb.-May, 1945, and was bombarded by U.S. warships May 1. No landing was made, however, the Japanese troops here surrendering Sept. 2. Pop. 11,467. See Caroline Islands.

Ponce. Town of Puerto Rico The second largest town of the island, it lies 3 m. from its harbour, Playa de Ponce on the S. coast, and 81 m. S.W. of San Juan, with which it has rly. connexion. It manufactures lace cigars, and hats, and exports copra, coffee, sugar, tobacco, and fruits. Pop. 105,116. Pron Pon-say.

Ponce de Leon, JUAN (c. 1460-1521) Spanish explorer. Born at San Servas Leon, he accompanied Columbus to America

1493, in 1510 was appointed governor of Porto Rico, and in 1513, voyaging N., discovered Florida. After cruising along the coast he visited the Bahamas and then made his way to Spain, where he procured a grant for the colonisation of Florida. He was killed whilst attempting to establish his colony there in 1521.

Ponce de Leon, Luis (1527-91) Spanish poet. After studying at Salamanca he became professor of theology in the university, 1561. Charged with heresy by the Inquisition in 1572, he was imprisoned for four years, being then reinstated as a professor. He died Aug. 23, 1591, within a few days of becoming vicar-general of his order. His most famous work was the mystical Of the

Poncho, as worn in the Argentine

Names of Christ, published 1583-85. His poems were issued by Quevedo in 1631.

Poncho. Cloak worn by men in Peru, Chile, Argentina, and other parts of S. America. It is a wide strip of cloth with a slit in the middle through which the head is passed, so that while it protects back and front it leaves the arms free.

Pondharpur OR PANDHARPUR. Town of India, in Sholapur dist., Bombay state. It is on the Bhima, a tributary of the Kistna, 84 m. E. of Satara. Thousands of pilgrims visit the temple of Vithoba. Pop. 33,329.

Pondicherry OR PONDICHÉRY. Seaport and town of India, belonging to France, capital of the province of the same name. It stands

Pondicherry General view showing, on the left, the Roadstead and Marina

on the E. coast, 85 m. S. of Madras, and is divided by a canal into a European and a native town. There is a considerable trade with France and elsewhere, and the town has some manufactures, three cotton mills being situated there. The capital of a district, 115 sq. m. in extent, which belongs to France, Pondicherry was founded by a Frenchman in 1674. The buildings include government house, the hôtel de ville, and the cathedral. Taken by the Dutch, it was restored in 1697. The British captured it in 1761, 1778, 1793, and 1803, but each time it was restored when peace came. On Sept. 9, 1940, Pondicherry rejected the Vichy govt. and declared for Gen. de Gaulle. The port was developed into a base for Allied naval craft operating against Japan. Pop. 53,101, the largest French town in India. Pop. of prov., 204,653.

Pondoland. Country forming one of the Transkeian Territories of the Cape Province, British S. Africa. It stretches along the coast, S.W. of Natal. British sovereignty was proclaimed in 1878 over the tidal estuary of the St. John's river and the country was annexed to Cape Colony in 1894. The inhabitants, the Pondos, number about 234,000. The area is 3,906 sq. m.

Pondweed (*Potamogeton*). Genus of aquatic herbs of the family Potamogetonaceae. They are na-

Pondweed. Frond of curled variety, *Potamogeton crispus*

tives chiefly of temperate regions. They have submerged, translucent or floating, opaque leaves, and simple flowers in spikes.

Poniard (Lat. *pugnus*, fist). Term used for a small dagger. It usually refers to a slender weapon of this kind, introduced from France, having a triangular or square blade, and used for stabbing at close quarters. See Dagger.

Poniatowski. Name of a famous Polish family. Stanislas Poniatowski (1677-1762) was in

Count Stanislas Poniatowski

the service of Charles XII of Sweden, and afterwards held high positions in Lithuania and Poland. One of his sons, Stanislas, became king of Poland; another, Michael, became archbishop of Gnesen. The family became extinct when Stanislas, a grandson of the earlier Stanislas, died in 1833, but a natural son, Joseph (1816-73), carried on the name. He became a prince in Tuscany and in Austria, and was for many years the envoy of Tuscany in Paris. He passed his last years in England, where he shared the exile of his friend, Napoleon III.

Poniatowski, JOSEPH ANTON, PRINCE (1762-1813). Polish soldier. Born May 7, 1762, he entered the Austrian army. In 1789 he became a general in the Polish army, and in 1791 was commander-in-chief of the operations against Russia. Disgusted at the terms of the treaty which concluded the war, he went into retirement. War minister of the duchy of Warsaw, he resisted the Austrian invasion of 1809, in 1812 commanded a corps in Napoleon's Russian campaign, and remained in the emperor's service until his death after the battle of Leipzig, Oct. 16-19, 1813. He had just been made a marshal.

Ponnani. Harbour of Madras province, India, on the Malabar coast. It is situated at the mouth of the Ponnani river. A road joins it to Tirur on the rly., and continues to Mysore. Pop. 18,000.

Ponsard, FRANÇOIS (1814-67). French dramatist and academician. Born at Vienne, June 1, 1814, he abandoned law for literature, publishing a translation of Byron's Manfred in 1837, and specialising in the drama. Aided by the consummate acting of Mme. Rachel, his Lucrèce, 1843, scored an immense success, but Ponsard is remembered chiefly for his admirable comedy of manners, L'Honneur et l'Argent. He died in Paris, July 7, 1867.

Pons Asinorum (Lat., asses' bridge). In geometry, name popularly given to the fifth proposition

of the first book of Euclid, from the supposed difficulty of beginners in understanding it. The proposition states that the angles at the base of an isosceles triangle are equal. See Geometry.

Ponsford, WILLIAM HAROLD (b. 1900). Australian cricketer, born at N. Calton, Melbourne. Oct. 19, 1900. When he played an innings of 429 for Victoria

W. H. Ponsford, Australian cricketer

against Tasmania, 1922, and one of 437 against Queensland, 1927, each was at the time a record for first-class cricket. This opening batsman made more runs for Victoria than any other player. He played against England from 1924, achieving, with D. G. Bradman, a world record partnership of 451 for the second wicket, at the Oval, 1934, in his last test match.

Ponsonby, ARTHUR AUGUSTUS WILLIAM HARRY PONSONBY, 1ST BARON (1871-1946). A British politician. Son of Sir Henry Ponsonby, private secretary to Queen Victoria, he was born Feb. 16, 1871, and went from Eton to Balliol College, Oxford. He was chosen after twelve years in the diplomatic service to be principal private secretary to Campbell-Bannerman during the latter's premiership, 1906-08, and succeeded him as Liberal M.P. for Stirling Burghs. He joined the Labour party in 1918, and represented it as M.P. for Brightside, Sheffield, 1922-30, being under-secretary for foreign affairs in 1924. Raised to the peerage in 1930, he was chancellor of the duchy of Lancaster next year, after which he led his party in the house of lords until 1935. He resigned from it in 1940, and died March 24, 1946. His son Matthew (b. July 28, 1904) succeeded to the title.

Ponsonby wrote The Camel and the Needle's Eye, 1909; English Diaries, 1923; Samuel Pepys, 1928; John Evelyn, 1934.

Pons Winnecke. Name of a periodical comet. First discovered by J. L. Pons in 1819, and re-

Lord Ponsonby, British politician

discovered by Winnecke in 1858, it has been seen at approximately six-year intervals since. One of the lesser sized comets, it belongs to the Jupiter family of comets, and its irregular appearances and change of orbit have been due to the gravitational pull of the planet. See Comet.

Ponta Delgada. Capital of St. Michael's, Azores Islands. It is a winter resort, and its harbour is protected by a breakwater nearly 3,000 ft. long. The commercial centre of the Azores, it manufactures cotton fabrics, pottery, straw hats, and spirits. Pop. of district, 156,045.

Ponta Grossa. Town of Brazil, in the state of Parana, 200 m. S.W. of São Paulo. It exports large quantities of yerba maté and timber through the port of Paranaguá and also produces beef, bananas, cattle, rice, and tobacco. It is the centre of a network of good motor roads. The Parana rly. connects it with Curitiba and the seaports of Antonina and Paranaguá. Another rly. runs to Rio Grande do Sul and São Paulo. Altitude 2,930 ft. Pop. est. 40,000.

Pont-à-Mousson. Town of France. In the dept. of Meurthe-et-Moselle, it stands on the Moselle at the foot of the Mousson Mt., 18 m. N.W. of Nancy. On a height to the E. are the ruins of the château. The Late Gothic church has interesting vaulting and a 16th century altar-piece. Needles, matches, plush, and velvets are made. The town, which once belonged to the counts of Bar, became a municipality in 1444 and the seat of a university in 1571. In the Franco-Prussian War it was important, as guarding a passage over the Moselle. It was shelled by the Germans intermittently during the First Great War. During the Second, the U.S. 3rd army advancing to the Moselle found the Germans in strength here Sept. 4, 1944. They withdrew, however, across the river, shelling the town as the Americans moved into it, and it was against fierce opposition by troops including fanatical S.S. and Hitler Youth detachments that the Americans forced a crossing below Pont-à-Mousson, Sept. 7. Heavy fighting continued in the area until Sept. 19. Pop. 10,239.

Pontarlier. Town of France. In the dept. of Doubs, it stands on the Doubs, in the midst of the Jura Mts., and on the Dijon-Neuchâtel-Lausanne rly., 26 m. S.E. of Besançon. It manufactures paper and clocks and trades in cattle,

cheese, and agricultural produce. In the fort de Joux, near the town, Mirabeau was imprisoned, 1775, and Toussaint l'Ouverture died a prisoner in 1803. Pontarlier was burned by the Swedes in 1639. Pop. 12,722.

Pontchartrain. Salt-water lake in Louisiana, U.S.A. It is situated in the S.E. part of the state, about 6 m. N. of New Orleans, and measures about 37 m. by 23 m.

Pont du Gard. Aqueduct of France. Spanning the Gard above Remoulins, it is one of the finest Roman structures in existence. It was built over the valley to conduct the waters of the Eure and Airon to Nîmes. The bridge is 880 ft. long and 160 ft. high, and consists of three tiers of arches composed of massive stones without cement. Damaged in the 5th century, it was restored between 1855 and 1858. See Aqueduct, illus.; Nîmes.

Pontecorvo. City of Italy, in the prov. of Frosinore. It stands on the left bank of the Garigliano, 39 m. N.W. of Capua and 5 m. from Aquino station. It has a cathedral, several churches and convents, a castle, and a triumphal arch with a statue of Pope Pius IX. One of its churches was completely destroyed in the Second Great War. The city was included in the Papal States down to 1860. Napoleon gave the principality (scarcely 40 sq. m. in area) of Pontecorvo to Bernadotte in 1806.

Pontefract. Mun. bor. and market town of the W. Riding of Yorkshire, England. It is 8 m. E. of Wakefield, by rly. and is near the junction of the Aire and the Calder. The ruins of the Norman castle show it to have been one of unusual strength

Pontefract arms

and size. Part of it is now used as a museum, and the adjoining grounds have been made into a public recreation ground. The churches are St. Giles and All Saints. Two old foundations are Trinity Hospital and St. Nicholas's almshouses. The grammar school is a modern building, but the school itself is old. There is a town hall, court house,

market hall, and assembly rooms. Features of the town are an old hermitage cut out of the rock, and the windmill on St. Thomas's Hill, the eminence where Earl Thomas of Lancaster was executed. The industries include tanning, brewing, iron-founding, and corn-milling. Pontefract cakes (usually pronounced Pomfret cakes) made here are lozenges of liquorice. Much coal is mined near.

The original name of Pontefract was Kirkby, where a castle was built by the Normans. Soon the name was changed, and the town

Pontefract, Yorkshire. Ruins of the Norman castle, a part of which is still used as a museum

became important owing to its geographical position, and the fact that it was a stronghold of the dukes of Lancaster. In 1399 Richard II was murdered here. The castle was taken and retaken during the Civil War, after which it was destroyed. The borough rights began early, and soon the borough had a merchant guild, markets, and a mayor. The first charter was granted by Robert de Lacy in 1194, he being a descendant of the Lacy who received from William the Conqueror the honour of Pontefract. From 1621 to 1918 Pontefract had its own M.P.s, first two and then one. In 1948 it was again allotted a member. Race and other sports meetings are held in the town park. Market day, Sat. Pop. est. 23,796.

Pontevedra. Maritime prov. of N.W. Spain, facing the Atlantic ocean. It is bounded N. by Coruña, E. by Lugo and Orense, and S. by the Portuguese prov. of Minho. Densely populated, and largely mountainous, it yields timber and agricultural produce. The capital is Pontevedra, other towns being Vigo and Redondela. Area, 1,695 sq. m. Pop. 686,333.

Pontevedra. City of Spain. Capital of the prov. of Pontevedra, it stands near the mouth of the river Lerez, in the Bay of Pontevedra, 13 m. N.N.E. of Vigo, with

Pontevedra, Spain. Ruins of the church of the 13th century convent of Santo Domingo

a station on the Santiago-Tuy Rly. The river is here spanned by a twelve-arched Roman bridge, the Pons Vetus. Santa Maria la Grande is a Gothic edifice with a 16th century façade, while the church of San Francisco contains many beautiful tombs. To the west of the town, near to the road from Carril, are the ivy-clad ruins of the 13th century conventual church of Santo Domingo, including fine apses, beautiful arcades, and some interesting tombs. The town has a trade in agricultural produce and some small manufactures. The name is a corruption of the Latin *pons vetus*, old bridge. Pop. 29,500.

Ponthierville. River port on the Congo. It is 78 m. above Stanleyville (q.v.) by rail. S. of Ponthierville the Congo again becomes navigable as far as Kindu.

Pontiac. City of Michigan, U.S.A., the co. seat of Oakland co. It stands on Clinton river, 25 m. N.W. of Detroit, and is served by the Grand Trunk and other rlys. Chief industries are concerned with the production of motor cars. Settled in 1818, Pontiac was incorporated in 1837, and became a city in 1861. Pop. 66,626.

Pontiac (c. 1712-69). North American Indian chief. As chief of the Ottawas he assisted the French commander, Montcalm, against the British, and took part in the annihilation of Braddock's force in 1755. In 1763 he was leader in a conspiracy against the British garrisons in N. America, and unsuccessfully besieged Detroit for five months. He was murdered by an Indian of the Kaskaskian tribe in 1769. His story is treated in Sir

Gilbert Parker's novel, *When Valmond came to Pontiac*, 1895. *Consult* History of the Conspiracy of Pontiac, F. Parkman, 10th ed. 1896.

Pontifex (Lat., bridgemaker). Member of the most important college of priests in ancient Rome. The college was charged with the maintenance of the law in so far as it was bound up with religion, a special function being the supervision of the calendar. In the last period of the republic the *pontifices* were 15 in number, holding office for life; at their head was the *pontifex maximus*, whose office, of great dignity, was held under the empire by the emperor himself. When Christianity became the state religion the title was assumed by the popes.

Pontifical OR **ORDINARIUM.** Roman Catholic service book for the use of bishops or of priests specially empowered by bishops. Books of this kind originated in the 8th century; that in the national library of Paris is attributed to the 8th-10th centuries. They were compiled by bishops from old sacramentaries, etc., in the Middle Ages. The Roman pontifical was first printed in 1485; that in use was revised by order of Leo XIII. The Greek Church has its own pontifical. A bishop's vestments are called pontificals. See Hungary. *Consult* Pontificale Romanum, G. Catalani, 1738; Bibliotheca Ritualis, F. A. Zaccaria, 1776-81; Monumenta Ritualia, W. Maskell, 2nd ed. 1882.

Pontigny. Village of France. It stands on an island, formed by the Serain, in the dept. of Yonne, 11 m. N.E. of Auxerre. It is famous for its Cistercian abbey. Founded

in the 12th century, by Count Thibaud of Champagne, this was a refuge for both Becket and Langton, while here S. Edmund Rich was buried. Its Gothic church has been restored as a national monument, and there are other monastic remains.

Pontine Marshes. Reclaimed marshland tract of W. Italy. In Roman times it bore the name of Pomptinae Paludes. Now roughly coterminous with the prov. of Littoria (Littoria), it borders the Mediterranean coast between Cisterna on the N. and Terracina on the S. About 25 m. in length, its breadth varies between 6 m. and 11 m. In ancient times the district was well drained, with prosperous villages and farms, and was inhabited by the Volsci. After the subjugation of that people by the Romans, the drainage works fell into disrepair and it became a malarious waste. Appius Claudius tried to drain it when in 312 B.C. he drove the Apennine Way through it.

Various attempts have since been made to reclaim it, Pope Pius VI in the 18th century constructing huge drainage works. In 1899 a large sum of money was allotted by the Italian government for reclamation purposes, but little work was done until 1926. Then the fascist govt., with a view to making Italian food supplies independent of imports, initiated a vast scheme to turn the marshes into agricultural land. Canals were built and mountain streams diverted to prevent the land from again becoming waterlogged. By 1931 the land had been drained; swamps where the malaria-carrying mosquito had bred were filled in; work had begun on clearing woods and undergrowth. In 1934, when the scheme was more than half completed, the reclaimed Pontine Marshes became the new province of Littoria. Four towns, Littoria (Littoria), Pontina, Sabaudia, and Aprilia were established in what developed into one of the richest wheat-growing districts of Italy.

Ponting, HERBERT GEORGE (d. 1935.) British photographer. Educated at Preston grammar school and Wellington College, he went to California in 1900 and entered journalism, being correspondent for American newspapers in the Philippine campaign in 1901 and the Russo-

H. G. Ponting, British photographer

Japanese War. After making world tours with his camera, he was appointed photographic officer to Scott's Antarctic expedition of 1910 and obtained a remarkable collection of pictures. In 1918 he joined the Spitsbergen expedition as photographer. He published in 1921 an account of his experiences under the title *Great White South*, and in 1933 his record of Scott's expedition was made into a film, *90° South*, with running commentary by Ponting. Awarded the Polar Medal and the Royal Geographical Medal, he died Feb. 7, 1935. His photographs are used in Great Britain and the U.S.A. for educational purposes.

Pontivy. Town of France. In the dept. of Morbihan, Brittany, it stands on the Blavet, and the canal from Nantes to Brest, 30 m. N.N.W. of Vannes. The chief buildings are the church and the château, now a museum. Linen and paper are made; there is a trade in agricultural produce. The newer part of the town is known as *Napoléonville*; it was built by Napoleon to accommodate a great number of soldiers, because he wished to make the place a military centre. During the Second Great War it was in German occupation following the Franco-German armistice of June, 1940, until captured by the U.S. 3rd army Aug. 5, 1944, against little opposition. Pop. 10,878.

Pont l'Évêque Cheese. Product of Normandy. It comes to the market in the 4-inch squares, with a golden crust round a semi-hard substance. The curd is produced by rennet only, and is salted more than once during preparation. Made throughout the year, the cheese varies according to the seasonal richness of the milk.

Pont-Neuf. Oldest bridge over the Seine, Paris. Built 1568-1603, remodelled 1843-53, and again partly restored in 1886, it is 360 yds. long and 25 yds. in width. The equestrian statue of Henry IV dates from 1818, when it re-

Pontresina, Switzerland. General view of the village, with Roseg Valley and glacier in the distance. See page 6614

placed an earlier work of 1635, converted into cannon in 1792. The bridge was famous in the 17th and 18th centuries as a gathering place for showmen. See Paris.

Pontoise. Town of France. In the dept. of Seine-et-Oise, it stands at the junction of the Oise and the Viosne, 17 m. N.W. of Paris. The chief buildings are the churches of S. Maclou and Notre Dame. There are manufactures of chemicals, an agricultural trade, and some shipping on the Oise. Pontoise was founded by the Gauls, and was a fortified town under the kings of France. It became the capital of

the Vexin, and was taken and retaken several times. In the Second Great War, after being in German occupation from June, 1940, it was liberated in the rapid Allied advance from Paris to the frontier during the last days of August, 1944. Pop. 11,009.

Pontoon (Lat. *ponto*, punt, floating bridge). Flat-bottomed boat, particularly one of special design employed for military bridge-building. This type of bridge utilises the boats as piers, the superstructure forming the roadway being thrown across from boat to boat. It can be speedily erected and is particularly useful for crossing wide streams, as no foundations for the piers are required. Boat bridges have been used since the earliest times. Modern pontoons are usually made in two or three sections for convenience of transport. Boats about 21 ft. long carry a roadway ten ft. wide, the distance between boats being proportioned to the load the bridge is to carry. In the Second Great War, rubber pontoons were used by the German armies for bridging rivers during the invasion of France and the Netherlands in 1940. Pontoons later were generally replaced by the British-invented Bailey bridge (*q.v.*). See Bridge.

Pontoon. Popular English name for the card game more accurately called *Vingt-et-un* (*q.v.*).

Pontoppidan, HENRIK (1857-1943). Danish novelist and poet. Born at Fredericia, July 24, 1857, he was the son of a pastor, and was trained at Copenhagen polytechnic as an engineer. After a walking tour in Switzerland he published in 1881 *Clipped Wings*, a collection of

Pontoon. German troops of the Second Great War constructing a rubber pontoon to replace a bridge destroyed by Russians in their endeavour to obstruct the enemy's advance in the neighbourhood of Kiev

short stories; its immediate success decided him to adopt a literary career. His novels include

H. Pontoppidan,
Danish novelist

The Promised Land, 1892; Lucky Peter, 8 vols., 1898-1904; The Kingdom of the Dead, 1916, for which he was awarded the Nobel prize next year; A Winter's Journey, 1920. A play, Storeholt, was produced in 1913. Pontoppidan's work is characterised by a ruthless seeking after truth and has a background of almost morbid pessimism in its vivid portrayal of the peasants' sombre life. He died at Copenhagen, Aug. 22, 1943.

Pontremoli. City of Italy, in the prov. of Massa e Carrara. Situated on the river Magra, at the foot of the Apennines, it is 25 m. by rly. N.E. of Spezia. It contains a 17th century cathedral. There is trade in wine and olive oil. A republic in the 12th and 13th centuries, Pontremoli was captured by the French in 1495.

Pontresina. Village in the Bernina Valley at the foot of the Pis Languard, Upper Engadine, Switzerland, in the canton of Grisons. Situated at an alt. of 5,915 ft., 5 m. by rly. S. of Samaden and 4 m. E. of St. Moritz, it is a favourite tourist resort in summer and winter. The church of S. Maria has a wooden roof dating from 1497. Pop. 1,000. See illus. p. 6613.

Pontus. Ancient dist. of Asia Minor. Lying along the Black Sea, it was a monarchy about 400 B.C., and was a prosperous country, strong and independent, until its king, Mithradates the Great, was conquered by Pompey, 63 B.C. Part of it then became a Roman province, and the rest survived as a state under a native ruler until A.D. 63, when this, too, was taken by Rome. Amasia was the capital, and afterwards Pharnacia.

Pontypool. Urban dist. and market town of Monmouthshire, England. It is 8 m. N. of Newport, being served by rly. and by a canal which connects it with Newport. The buildings include S. James's church and the town hall. It stands on the border of the S. Wales coalfield, and the chief industries are coal mining, works for making iron and tin plate, and the manufacture of rayon yarn and glass. In the 17th century Thomas Allgood made

japanned wares here, and sheet iron was manufactured a little later. Market days, Wed. and Sat. Pontypool gives its name to a Welsh co. constituency. Pop. 42,000.

Pontypridd. Market town and urban dist. of Glamorganshire, Wales. It stands at the junction of the rivers Rhondda and Taff, 12 m. by rly. N.N.W. of Cardiff, and is the gateway to the Merthyr, Aberdare, and Rhondda valleys. The principal buildings in the town include S. Catherine's church, the municipal buildings, town hall, and free library. In the neighbourhood there are large coal and ironstone mines, and the chief industries are the manufacture of tin plate and iron goods, and the founding of iron and brass. An old bridge, dating from 1755, which crosses the Taff here is a single arch with a height of 35 ft. and a span 140 ft. Pontnewydd, the English equivalent of which is Newbridge, is

Pontypridd arms

several miles distant. Pontypridd's industry dates only from the 19th century. It gives its name to a co. constituency. Pop. 38,020.

Pontypridd, Glamorganshire. General view of this Welsh town and river Taff

several miles distant. Pontypridd's industry dates only from the 19th century. It gives its name to a co. constituency. Pop. 38,020.

Pony (Old Fr. *poulenet*, from Lat. *pullus*, young animal). Small type of horse, ranging in height from 8 to 14 hands. There is little doubt it is the oldest breed of domesticated horse. In many details the small, half-wild ponies of the Shetland Islands and Connemara show points of resemblance to Przevalsky's wild horse of Mongolia, and also with the sketches of horses found in cave dwellings.

Prehistoric remains have been found in Ireland, and it was abundant in Britain in the Bronze Age. The horses used by the ancient Britons for their war chariots ap-

pear to have been Celtic ponies. This Celtic breed is now found in its purest form in Iceland, but the ponies of the Faroë and Shetland Islands have undergone but slight modification. In their pure form these ponies lack the chestnuts on the hind limbs and the ergots on the fetlocks. They develop a heavy rough coat, and the mane and fore lock are remarkably luxuriant. Another peculiarity is that the hairs at the base of the tail are very stiff and stand out protectively on either side.

The ponies of Dartmoor and the New Forest have undergone considerable modification, and this also applies to the ponies of the Welsh hills. The various native strains have been greatly improved by the introduction of thoroughbred blood and by selection in breeding. The great aim of all breeders is to combine smallness and compactness with general usefulness. See illus. p. 6615; Horse, and colour plate; Polo.

Pony Express. Postal service operated in isolated districts of the U.S.A. It was introduced early in the 19th century to serve settle-

ments in the Far West, the letters being carried by riders using relays of small but hardy horses. Buffalo Bill was one of the chief pony express riders in California. The service still operates in some parts where neither rlys. nor motor roads are available.

Ponza (anc. *Pontiae*). Chief island of a small group, sometimes called the Pontine islands, in the Tyrrhenian Sea, belonging to Italy. It is 70 m. W. of Naples, and has a spacious harbour. The islands were used in Roman times as a place of banishment, and continued to be penal settlements in the 20th cent.

Pood or **PUD** (Norse, *pund*, pound). Russian measure of weight, equal to 40 Russian or 36 English lb. About 62 poods make a ton.

Pony. Some varieties of the animal. 1. New Forest pony, domesticated. 2. Mongolian, or Przewalsky's horse. 3. Welsh mountain pony. 4. Shetland stallion. See page 6614

Poodle. Breed of dog commonly supposed to be of French origin, but also found in Russia and Germany. In France and Russia the poodles are black, but in Germany a white breed is found.

The poodle is often considered to be the most intelligent of all dogs; it learns tricks very readily. Essentially a water dog, it makes one of the best retrievers known, and in Germany and France has been much employed in the chase. In its natural state the poodle has a very long coat, which often hangs in cords and drags the ground; but the popular fashion is to clip the hinder half of the body and the legs and tail, leaving the hair in tufts. See Dog colour plate.

Pooh-Bah. Character in the Gilbert and Sullivan comic opera, *The Mikado*. He is described as Lord High Everything Else, because he holds simultaneously every important salaried office in the town of Titipu, except that of Lord High Executioner. He is the embodiment of family pride, being able to trace his ancestry back to a "protoplasmic primordial atomic globule," but was open to cash bribery. His most quoted

phrase is: "Merely corroborative detail intended to give artistic verisimilitude to an otherwise bald and unconvincing narrative." His name has become synonymous with any holding of multiple and multifarious office.

Pool. Body of fresh water smaller than a lake (*q.v.*). The word is also used for the monetary stake contributed by the various players in card and other games, and indeed for any common fund. During the Second Great War, indus-

petrol was replaced by pooled petrol of a standard quality distributed by a single organization of refiners. Stores and multiple shops pooled their transport for the delivery of bulky objects. Butter and tea were sold as National butter and tea, trade brands being abolished. Rly. companies established pools of material at strategic points for the repair of lines damaged by enemy action. Fire-fighting services were thrown together under the N.F.S., while shipping pools were set up for the most efficient employment of vessels and crews. The fighting services maintained personnel pools to keep men available for dispatch to any ship or unit requiring immediate reinforcements. The ministry of Supply had a pool of scientists. See Football Pool.

Pool. Game played on a billiard table. It is played by any number of players from two to twelve, each having a different coloured ball dealt out to him by the marker, and playing in turn according to the sequence of the colours on the scoring-board. The object of the game throughout is to pocket the ball played on. The game begins by the white ball being placed upon the billiard spot, and the red ball is played by its owner, from the D, upon the white, the yellow on red, green on yellow, and so on, by their

Poodle. Champion corded poodle; upper picture, white miniature poodle

trial and commodity pools were established in Great Britain to economise in man-power, transport, and costs of distribution. Branded

respective owners. When a player pockets the ball which has come to him in proper rotation, he plays upon the ball nearest to the position where his own has stopped, continuing the process until he fails to score. Each person contributes an equal share to the pool, and starts with three lives, losing a life and paying forfeit each time his ball is pocketed by another player. A player who loses all three lives may under certain conditions "star," i.e. purchase another life or lives. The last player left in takes the pool. *See Billiards.*

Poole. Mun. borough, seaport, and largest town of Dorset, England. It stands on a peninsula, 5 m. W. of Bournemouth, and includes Branksome, Broadstone,

Pool of London. This part of the Thames seen from London Bridge

and $4\frac{1}{2}$ m. broad. It is known to yachtsmen, has a power station, and has been a base for flying boats. Here is Brownsea or Branksea I.

Pool of London. Name given to that part of the Thames between Limehouse Point and London Bridge, in which navigation is

of Ancient Usage drawn up by Edward I for the regulation of London's river-borne trade.

Pools. For this form of betting, see Football Pool; Sweepstake; Totalisator, etc.

Poona. Town of Bombay, India. The capital of a district, it stands at the union of the rivers Mutha and Mula, 120 m. S.E. of Bombay, and is an important rly. and road junction. It consists of a native town and a European quarter, and during British rule in India it had a residence for the governor of Bombay during the rainy season. It was also the

Poole, Dorset. Air view of the town and harbour
Aerofilms, Ltd.

Canford Cliffs, Hamworthy, Parkstone, Sandbanks, and Wallisdown. There is a rly. station. Old buildings are the town house, customs house, and guildhall. Municipal buildings were opened in 1932, and there are a public library and museum, school of art, nautical school, and churches of many denominations. Of 27 public open spaces the chief is Poole Park. Poole was a seaport in the Middle Ages and still has a coastal trade. Manufactures include a noted pottery, rope, bricks, tiles, chemicals, and agricultural implements. A borough from 1248, Poole was made a county of itself in 1569, having its own M.P. until 1885 and again from 1950. Pop. est. 80,000.

Poole arms

Poole Harbour is an inlet of the English Channel, about 7 m. long

strictly supervised. It is divided into the Upper and Lower Pools; the former extending from London Bridge to King's Head Stairs, Rotherhithe, the latter thence to Cuckold's Point, Limehouse. The term first appeared in the Articles

Poona, Bombay, India. The main street, and (upper picture), the Temple

headquarters of the Southern military command. An educational centre, here are the Deccan and Fergusson colleges. In 1928 a meteorological observatory was opened here to receive the Indian meteorological department, transferred from Simla.

The industries include the making of fine wares of gold, silver, brass, etc., and of cotton, paper, and flour. The buildings included temples and others erected by the Mahrattas, who made Poona one of the centres of their power, and more modern ones built by Europeans. The district of Poona has an area of 5,347 sq. m. Pop. dist., 1,359,408; town, 258,197.

Poon-wood (*Calophyllum inophyllum*). A tree of the family Guttiferae. A native of India and

Poon-wood. Flowers, leaves, and fruit

Malaya, it has large oblong leaves and sweet-scented flowers in loose sprays. The reddish fruit is the size of a walnut, and its seeds yield a thick, green oil, used medicinally. Poon-wood is used for building purposes, and for making masts and spars.

Poop (Fr. *poupe*, from Lat. *puppis*, hind part of a ship). Aftermost or highest part of a ship's hull, and, in sailing ships, the after spar deck abaft the mizzen. On the galleons of the 16th and 17th centuries, the poop was of towering proportions and was called the poop royal; it carried the mast supporting the lateen sail (*q.v.*), and at its end the taffrail to which one or more lanterns were fixed. Until the introduction of steam, the captain's living accommodation on warships was in the space below the poop deck. See Ship.

Poopo, LAKE OR. Situated 185 m. S.E. of Lake Titicaca in the dept. of Oruro, Bolivia. On old maps it is called Pampa Aullagas. It has an area of about 400 sq. m. and gives its name to the nearby town of Poopo.

Poor Clares OR CLARISSSES. Order of nuns founded in 1212 by S. Clare with the advice of

S. Francis of Assisi. They formed the Second Order of Franciscans. Having received no definite rule from S. Francis during his missionary journey in the E., they were brought under the Benedictine rule, which was repeatedly modified, and no uniform system was accepted, the Urbanists following the milder rule instituted in

1264 by Pope Urban IV, and the Coletines observing the reforms made by S. Colette in 1436. The Poor Clares devote themselves to the education of poor girls. They are under the authority of the Minorites, and the Minorities in London preserves the memory of one of their former nunneries. See Clare; Francis of Assisi. Consult S. Clare and Her Order, anon., 1912.

Poor Law. The first parliamentary attempt to provide for the poor of England was an Act of 1601, the original basis of the poor law. Its area was the parish, in each of which the churchwardens and some householders were made overseers, being charged with relieving the poor and raising the required money. Poor persons able to work were to do so, children were put out as apprentices, and relief was to be given to poor persons unable to work. The first workhouse was opened at Bristol in 1697.

In 1834 a union of parishes replaced the parish as the area; and boards of guardians took over the duties of the overseers, the necessary money still being raised by overseers by means of rates until in 1925 their functions were transferred to the rating authority. The poor law was consolidated by the Poor Law Act, 1927, and again by the Poor Law Act, 1930, made necessary by changes brought about by the Local Government Act, 1929. The Act of 1930 abolished boards of guardians and transferred their functions to county and county borough councils. Poor relief was then under

Poor Clares. Dress of the order of nuns founded in 1212

the general control of the minister of Health. In each area there was a public assistance committee with a local sub-committee called the guardians committee.

Poor relief might be either outdoor or in an institution. The functions of the council in relieving those between 16 and 65 were taken over by unemployment assistance boards. When the National Insurance Act, 1946, was passed, it was announced that the poor law would be abolished. An Act passed in 1948 provided for the setting up of a national assistance board under the minister of national insurance; its duty being to assist persons whose resources required to be supplemented, or who were totally without resources. Local authorities have to provide certain accommodation and services. The Act provided for (1) money grants and assistance in kind; (2) re-establishment centres for instruction and training; (3) reception centres to provide temporary board and lodging for vagrants; (4) residential accommodation for persons who by reason of age or infirmity were in need of care; (5) temporary accommodation for persons in urgent need; (6) welfare services for blind, deaf, dumb, or disabled persons. The accommodation and services under the last three headings have to be provided by county and county borough councils.

Poor Man's Lawyer. Voluntary organization for giving free legal advice to poor persons. The first was set up at Mansfield House settlement in Canning Town in 1890. See Poor Persons' Procedure.

Poor Persons' Procedure. Procedure in the high court for enabling persons of small means to obtain assistance of barristers and solicitors in litigation free of charge. From 1700 or earlier a system of legal aid has existed in England under which persons who could show that they were not worth more than £5 (later £25) could bring or defend legal proceedings, free of legal charges or court fees, in the house of lords, court of appeal, high court, etc. For the two last a more regular system was introduced in 1914, and extended in 1919, to extend the aid to those with incomes below £2 a week (in special circumstances £4). During the Second Great War it was again extended to include, in matrimonial cases, any person in the services up to the rank of sergeant. From 1926 the Law Society administered the system through

poor persons' committees, assisted from 1942 by the services divorce department. Outside the official scheme, good work was done by various poor man's lawyer societies, by the Bentham committee, by trade unions and approved societies, and by charitable associations.

The Legal Aid and Advice Act, 1949, provided for free legal aid or assistance in civil proceedings in England and Wales for persons with incomes not exceeding £420 a year and with disposable capital of not over £500. Administration of the scheme was placed in the hands of the Law Society. These measures were in implementation of the Rushcliffe report of 1945, and were put into operation in 1950. A similar act was passed for Scotland. For procedure in criminal courts see Poor Prisoners' Defence Acts.

Poor Prisoners' Defence Acts. Acts of parliament, 1903 and 1930, governing the provision of legal aid for accused persons in criminal cases. An accused person on trial at quarter sessions, the assizes, or the Old Bailey, has long been entitled to choose from the dock any barrister present in court to defend him, and the barrister is bound to accept the "dock brief" unless he has special grounds for refusing, e.g. is engaged to prosecute. But there was never adequate opportunity of preparing a defence until the passing of the 1903 Act. This enabled the magistrates, after committing the accused for trial, or the judge at the trial, to grant a certificate entitling the accused to be represented by a solicitor and barrister paid out of public funds. But the certificate was granted only if the magistrates or judge were satisfied that it was desirable "having regard to the evidence given or statements made" by the accused, who, therefore, was under the disadvantage of having to disclose to those about to try him what his defence was going to be. Nor was any legal aid provided for the accused at the magistrates' court. The 1930 Act gave an accused person the right to free legal aid at the magistrates' court, the cost falling on the rates. It also enabled a certificate to be granted where the accused had insufficient means to pay for legal aid and where the magistrates considered that "by reason of the gravity of the charge or of exceptional circumstances," it was desirable, in the interests of justice, that he should be legally represented. This certificate entitled him to the services of a solicitor and, in murder cases, a barrister

also. If a magistrate failed to grant a certificate, the judge might do so. A certificate was bound to be supplied in a case of murder. Other clauses enabled an accused person of small means to be granted legal aid on an appeal to quarter sessions, or to the court of criminal appeal, or to the house of lords.

The Rushcliffe committee of 1944-45 recommended that any doubt in the minds of magistrates or judge as to the granting of a certificate should be resolved in favour of the accused.

Poor Richard's Almanac. Almanac compiled by Benjamin Franklin. He began it in 1733 under the pseudonym Richard Saunders and continued to issue it annually for 25 years from his printing office in Philadelphia. Besides containing astronomical and tide tables, each issue was distinguished by pithy and proverbial sayings, e.g. "Early to bed, and early to rise, makes a man healthy, wealthy, and wise."; "For want of a nail the shoe was lost; for want of a shoe the horse was lost; for want of a horse the rider was lost; being overtaken and slain by the enemy, all for want of care about a horse-shoe nail." Until publication ceased in 1758, this was for many Americans the only book regularly bought and read. See Almanac.

Poor's Roll. In Scots law, a register of persons who, on the ground of poverty, have obtained leave of the court to bring or defend actions *in forma pauperis*. They are exempt from payment of court fees, and if the court is satisfied that they have reasonable ground of action, it appoints agents and counsel who represent them gratuitously.

Popayán. City of Colombia, capital of the dept. of Cauca. It stands near the river Cauca, at the foot of the Purao volcano, at 5,800 ft. alt. It has a cathedral, bishop's palace, government buildings, and a university, and is celebrated for the beauty of its classic Spanish architecture. A commercial highway runs S. from the city by Quito to Trujillo in Peru. Popayán is connected with Buenaventura by the Pacific rly. and with Bogotá by the Girardot-Tolima and Pacific rlys. The manufacture of blankets is the chief industry. Founded in 1537, Popayán was a gold mining centre in the 18th century, was nearly wrecked by an earthquake in 1834, and suffered severely in the civil wars. Pop. 30,038.

Popcorn. Variety of maize or Indian corn. Its large oil content causes the grain to expand and pop or explode when roasted. In this condition it is favoured as a breakfast cereal in the U.S.A. Popped corn coated with sugar is a popular sweetmeat.

Pope. THE (Gr. *pappas* or *papas*, Lat. *papa*, father). Name specifically applied to the bishop of Rome since 1073. The full title of the pope is bishop of Rome and vicar of Jesus Christ, successor of S. Peter, prince of the apostles, supreme pontiff of the Universal Church, patriarch of the West, primate of Italy, archbishop and metropolitan of the Roman province, and sovereign of the temporal dominions of the Holy Roman Church.

Known also as Pontifex Maximus, he claims supreme authority in all matters of faith. Elected by the college of Cardinals, who must agree by a majority of two-thirds plus one, he is crowned in S. Peter's

THE POPES OF ROME FROM URBAN VI TO PIUS XII

Urban VI, April, 1378–Oct., 1389	Clement VIII, Jan. 1592–March, 1605
Boniface IX, Nov., 1389–Oct., 1404	Leo XI, April, 1605

by the dean of the Sacred College. His ordinary dress includes a white silk cassock and rochet and a scarlet mantle; his insignia, the straight crosier, or *pedum rectum*, pall or *pallium*, and tiara or triple crown. He is addressed as Your Holiness, *Beatissime Pater*, etc., and refers to himself as *Servus Servorum Dei*, servant of the servants of God.

The more important are referred to separately under their official names. The term Black Pope is sometimes humorously applied to the general of the Society of Jesus, in allusion to his black cassock. See Anti-Pope; Infallibility; Papa; Papacy; Rome.

Pope, ALEXANDER (1688-1744). English poet and satirist. He was born May 21, 1688, in Lombard

of a translation of The Thebaid of Statius and the Pastorals.

By the time he was 24 he had come to be regarded as the leading poet of his time. His reputation was made first by his Essay on Criticism, 1711, a didactic poem on the canons of literary taste and style, and secondly by The Rape of the Lock (*q.v.*), 1712, a brilliant satire on the fashionable life of his time. The poem brought great fame, with a circle of literary friends, which included Gay, Addison, and Swift. Pope became a member of the Scriblerus literary club, formed under the presidency of Swift.

The task of translating Homer into rhyming pentameters now became the main occupation of Pope's life, the first part of the Iliad appearing in 1715, the last part of the Odyssey in 1725. The translations were most favourably received, but the real spirit of Homer is lacking. Pope received some £10,000 for the work, and the money thus earned enabled him in 1718 to establish himself comfortably with his mother in a villa on the banks of the Thames at Twickenham, where he lived until the end of his life, May 30, 1744. At the Twickenham villa Pope's chief diversions were landscape gardening, and the visits of friends.

During the period in which he was occupied with Homer he published two powerful poems, Elegy to the Memory of an Unfortunate Lady, and Epistle of Eloisa to Abelard; he was also engaged on an edition of Shakespeare. This last work came in for unfavourable criticism from Lewis Theobald, an indifferent man of letters, but possessed of a sounder knowledge of Shakespeare than Pope. This so annoyed Pope that he made Theobald the hero of his great satirical poem, The Dunciad, 1728. The scheme of The Dunciad, namely the castigation of all literary pretenders of the day, had long been in Pope's mind. A fourth book was added 14 years later, Colley Cibber being substituted for Theobald as the hero. About 100 contemporary writers are impaled in The Dunciad, but some like Bentley were men of real eminence.

The concluding period of Pope's life was occupied with philosophical and critical poems, of which the most notable is his Essay on Man, 1733. This exposition of the philosophy of Bolingbroke contains passages of great eloquence that are perhaps more quoted than anything outside Shakespeare. The influence of Bolingbroke, with whom

he had become friendly, is also to be traced in Imitations of Horace and Moral Essays.

It cannot be gainsaid that Pope was of an irascible disposition. He quarrelled with Addison when the latter pronounced Tickell the best translator of Homer; also with Lady Mary Wortley Montagu, who called him "the wicked wasp of Twickenham." Much may be forgiven him, however, on account of his health, and to the credit side must be placed his uninterrupted friendship with Swift and others. His position as a poet has been the subject of much controversy. His technique is beyond praise; he handled the heroic couplet inherited from Dryden as no other poet has done; but he lacks warmth of emotion, shows no real feeling for nature, and his finest passages are often rhetorical rather than spiritual. He excelled in condensing into an epigram "what oft was felt, but ne'er so well expressed." He is one of the first in delighting the intellect: one of the last to stir the soul.

Bibliography. Works and Correspondence, ed. W. Elwin and W. J. Courthope, 10 vols., 1871-89; Lives, O. Ruffhead, 1769; L. Stephen, 1888; E. M. Symonds, 1909; E. Sitwell, 1932; The Age of Pope, J. Dennis, 1894; Mr. P., His Life and Times, G. Paston, 1909; Early Career of Pope, G. Sherburn, 1934.

Pope, JOHN (1822-92). American soldier. Born March 16, 1822, at Louisville, Ky., he was educated at West Point. He served with distinction in the Mexican War, and was also engaged at different times on surveying and engineering work. After the outbreak of the Civil War he was appointed brigadier-general in 1861, and was mostly successful, until defeated by Lee and Jackson at the second battle of Bull Run, 1862. Pope blamed McClellan and Fitz-John Porter for his defeat, but at his own request was relieved of his command, and was transferred to the North-West department where his task was to keep the Indians in subjection. He retired in 1886 and died Sept. 23, 1892.

Pope Joan. Card game. It is played with a full pack, by any number of persons from three to twelve. A small round board, divided into special compartments, is also required. The eight of diamonds is removed from the pack. The dealer having been determined he dresses the board (providing the stakes himself or each player contributing a share) by placing counters upon the different divi-

After H. Hudson

A. Pope

Street, London, where his father was a prosperous linen draper. Bred in the R.C. faith, Pope was denied the privileges of education at a first-class school, but his bent was studious, and he more than made up for imperfect schooling by reading at home. Religion also made it impossible for him to enter any of the professions, while a business life was out of the question for one who was not only weak in health, but actually deformed. His own predilection was for literature, and the fact that his father was financially independent, having retired to a small estate on the borders of Windsor Forest, made it possible for the lad to follow his own inclinations. It is said that a brief interview with Dryden at the age of 12 determined his career. He displayed remarkable precocity in verse writing, many thousands of lines having been written before he was 16. All these he is said to have destroyed with the exception

sions—one each to ace, king, queen, knave, and game; two to Matrimony, two to Intrigue, six to the nine of diamonds, known as Pope.

The cards are then dealt round, with an extra hand left in the middle of the table which forms stops; the last card being turned for trumps. Also the four kings and the seven of diamonds are always stops. If either ace, king, queen, or knave is turned up for trumps, the dealer is entitled to whatever stake is contained in either of those compartments upon the board; if Pope is the card turned, the dealer appropriates all these and game, including a stake from each player for every card he has had dealt him.

Otherwise, the game begins by the player on the left of the dealer leading any card he chooses, generally his lowest card of any suit, at the same time naming it, and playing out a sequence, each player following on until a stop occurs, the player of the card forming the stop having the next lead. This continues until some player has succeeded in getting rid of all his cards.

The first person to accomplish this is entitled to all the stakes in the compartment marked game, and also receives from the other players a counter or stake for each card left in their hands; only the holder of Pope, if this card has not been previously played, being exempt from payment. Whenever the ace, king, queen, or knave of the trump suit is played during a hand, the holder appropriates the counters contained in the corresponding compartments on the board. Knave and queen of trumps in one hand give the player of these cards a right to all counters in the Intrigue division; and he who plays queen and king takes all counters in the division marked Matrimony. The player of Pope profits similarly. See Joan.

Poperinghe. Town of Belgium, in the prov. of W. Flanders. It stands on the Vleirbeck, a tributary of the Yser, 6 m. W. of Ypres. The town is a hop growing centre and trades also in locally grown tobacco. Brewing, tanning, pottery, lace and woollens are industries. The Romanesque church of S. Jean, 13th cent. and the 15th cent. church of S. Bertin, with a conspicuous square tower surmounted by a cupola, are noteworthy.

During the First Great War Poperinghe was a centre of the British forces on the Flanders front; town and neighbourhood contained numerous camps, supply services, casualty clearing stations,

etc. Held by German troops at the beginning of the war, it was occupied by Allied forces on Oct. 15, 1914. It suffered sporadic bombardment, but no serious damage until the German advance in April, 1918, brought it within closer range. "Toc H" or Talbot House (q.v.) was established here in 1915. Pop. 11,500.

Popeye. Film cartoon character. Popeye the Sailor, famous for raucous voice and sardonic sayings, was devised by Dave Fleischer (q.v.) and first appeared in a series of one-reel American films exhibited during 1933-34. The Popeye cartoons were perhaps second only in popularity to those of Walt Disney.

Popeye. The famous film cartoon character

Popham, Sir Home Riggs (1762-1820). British sailor. Born at Tetuan, Oct. 12, 1762, the 21st child of his parents, he entered the navy in 1778, but soon transferred temporarily to the merchant service and did useful hydrographic work in the East Indies. He was attached to the army in Flanders, returned to organize a system of sea-fencibles or coast guard volunteers, and in 1799 went to Kronstadt in charge of the convoy of Russian troops to Hol-

Sir Home Popham, British sailor

land. Popham introduced a new system of signalling at sea, and this was used at Trafalgar. He commanded the fleet conveying the army which retook Cape Town in 1806, but was court-martialled and reprimanded for undertaking against Brazil an expedition which miscarried. After much sea service, he was appointed in 1817 commander-in-chief on the Jamaica

station. A knight from 1815, he died Sept. 10, 1820.

Popinjay. Old English word for parrot. It is still used in heraldic language to describe a parrot as a bearing or charge. The name was given to a dummy bird used as a target in early times.

Popish Plot, THE. Name given to an imaginary R.C. conspiracy in 1678. Taking advantage of popular feeling against the duke of York and all Roman Catholics, Titus Oates (q.v.) swore an information, Sept. 6, 1678, before Sir Edmund Berry Godfrey (q.v.) to the effect that a Popish plot was afoot to kill the king and carry out a general massacre of Protestants. Five weeks later Godfrey was found murdered; popular panic ensued.

Oates then for two years earned the £900 pension which had been granted him, by a series of astounding revelations compromising Catholics in all stations of life, many of whom were imprisoned or executed on the mere word of Oates or his accomplices. The commons tried to exclude the duke of York from the succession, but by its very enormity the execution of Lord Strafford in 1680 induced a saner atmosphere, and on the dissolution of parliament, 1681, Charles II was able to allay the public frenzy. One of Oates's informers, Colledge, was found guilty of perjury, and in 1685 Oates was himself convicted. See Dangerfield; Toleration.

Poplar (*Populus*). Genus of trees of the family Salicaceae. They are natives of Europe, Asia, and N. America. They have alternate leaves, and the small flowers (without sepals or petals) are crowded in hanging catkins, which usually appear before the leaves. The sexes are on different trees. The

Poplar. 1. The white poplar. 2. Leaves of the black poplar. 3. Male catkins and fruit

females are succeeded by dry fruits containing numerous seeds, each of which has a tuft of cottony hairs at its base. The trees are of rapid growth, and require much light. The timber is not valuable. Familiar examples are white poplar (*P. alba*), black poplar (*P. nigra*), and the aspen (*P. tremula*). See also Lombardy Poplar.

Poplar. Met. bor. of the co. of London. It lies N. of the Thames, opposite Greenwich, combines the parishes of Poplar, Bow, and Bromley, and contains the East and West India docks, Millwall docks, and the Isle of Dogs. It has an area of 2,728 acres and a pop. (1947) of 73,000, and is served by London Transport and by trains from Broad Street and Fenchurch Street. The church of S. Matthias, 1776, much restored, was once the chapel of the East India Co.; that of All Saints dates from 1823. Public buildings include the modern town hall (1937), libraries, and baths. Among other prominent buildings are the L.C.C. school of engineering and navigation, Poplar hospital, and S. Andrew's hospital, Bow.

In addition to Victoria Park, which covers an area of 73½ acres, the bor. has several small open spaces, including Island Gardens, 3 acres, with a river front of 700 ft., opened in 1895 largely through the instrumentality of Will Crooks, M.P. In Island Gardens is the entrance to the tunnel to Greenwich, opened in 1902. An institute was erected as a memorial to men who fell in the First Great War.

The bor. has a large pop. of dock workers. For refusing to levy rates to meet the precepts of the L.C.C. and the Metropolitan Asylums Board, certain members of the borough council, including George Lansbury (q.v.), were imprisoned in 1921. As an industrial area, Poplar was subjected to heavy and continuous air attack during the Second Great War, and severe damage was done. Schemes for rebuilding were put in hand during 1945-46. Poplar, until 1817, was just a hamlet of the village of Stepney.

Up to 1950 the bor. elected two M.P.s, being divided into two divisions, Bow and Bromley, and South Poplar; in 1950 it was made one bor. constituency.

Poplin. Term originally applied to a ribbed fabric with a silk warp and worsted weft, made mainly in France and used for dress material and upholstery. Nowadays the term usually means a fine-ribbed cotton fabric, widely used for

shirtings, blouses, tropical suits, etc. They may be plain, or have woven or printed stripes.

Popocatepetl (Aztec, smoking mountain). Conical volcano of Mexico. Situated about 40 m. S.E. of Mexico City, it is an active volcano reaching 17,520 ft. There were big eruptions in 1802 and 1921. The crater, 2,700 ft. across, produces a large quantity of pure sulphur. The peak was first scaled by Diego Ordez in 1522.

Popolo d'Italia, Il. Daily newspaper of Milan, founded and edited in 1914

by Benito Mussolini, when he left the editorship of the official socialist Italian newspaper *Avanti!* and was expelled from the Socialist party for having sponsored Italian intervention in the First Great War. It carried at the beginning the sub-title *Socialist Daily*, which disappeared when Mussolini founded the Fascist movement. When Mussolini became prime minister in 1922 the editorship of *Popolo d'Italia* passed to his brother Arnaldo, and, at the latter's death, to Arnaldo's son. The paper ceased to appear when the Fascist regime collapsed in 1943.

Poppaea Sabina. Mistress and eventually the wife of the Roman emperor Nero. She was a woman of infamous character, according to Tacitus possessing "everything save honour." Nero divorced Octavia to marry her.

Poppy (*Papaver*). Genus of about 110 erect annual or perennial herbs of the family *Papaveraceae*. They are natives of Europe, Asia, Africa, and Australia. The five British species have become partially naturalised in the

U.S.A. They have erect stems with variously lobed or cut alternate leaves, and large, showy flowers on long stalks. The two concave sepals are thrown off usually by the expansion of the four petals.

Popocatepetl. The great Mexican cone-shaped volcano in an active state

The stamens are very numerous, surrounding the conspicuous ovary whose four to 20 stigmas are united into a disk, which later forms a roof with eaves to the large seed-capsule. The numerous small oily seeds can escape from openings under the eaves of the ripe capsule only when the latter is jerked.

The larger opium p. (*P. somniferum*) of Europe, Asia, W. Africa, with white or purple flowers, has become naturalised in parts of Kent and Surrey. This and the Oriental p. (*P. orientale*) are frequently grown in gardens, where, however, the Shirley p. is the more general favourite. All poppies are easily grown from spring-sown seed in any garden soil. All the species have a milky sap with narcotic properties, and the seeds under pressure yield a valuable oil which is not narcotic. See Fruit illus.; Opium.

Poppy Day. Name sometimes given to Armistice Day (q.v.) because artificial poppies, commemorating the poppies that bloomed in no-man's-land in Flanders during the First Great War, were sold on that day to help ex-service men.

Poppy. Three well-known varieties. Left, the Oriental; centre, the scarlet field poppy (*Papaver rhoeas*); right, Shirley poppies, favourite garden species

Popular Front. Term used for a left-wing coalition in politics. The idea is said to have been originated by the Bulgarian politician Georgi Dimitrov (q.v.), and first came into prominence during 1935-36, especially in France and Spain. The popular front included mainly Socialists and Communists, and also other left-wing groups, such as Radicals in France and Liberals and Anarchists in Spain. Especially in France this cooperation had some initial success, en-

forcing the 40-hour week and a modicum of state control of industry; but the flight of capital followed, and many industries were disorganized by large-scale strikes, among them the then new form of "sit-down" strike. Daladier in France and Azana in Spain failed to make a genuine success. In France the Nazi menace proved too strong a diversion from merely domestic politics, and in Spain the civil war of 1936-39 ended popular front government.

of England and Wales was in 1940 "projected" to 1970, under the auspices of the League of Nations, by the bureau of population research of Princeton university, U.S.A. (see Table 1).

By 1940 the youngest age-group had been declining for some time; the age-group of enterprise and reproduction had already passed its zenith; and the groups of maturity and old age were growing rapidly. The projection for 1970 is based on pre-1939 tendencies, and it is uncertain whether any lasting change in child-bearing habits is likely following the Second Great War; but no action or event — short of pestilence, mass-bombing, or mass-migration — can materially affect the numbers of the population in England and Wales which will be adult in 1970. The potential mothers of England and Wales are not reproducing themselves and the indications are that the population will consolidate itself in the higher age-groups and, after 1970, decline rapidly. This applies also to Scotland, Northern Ireland, and Eire, though none of these would, it was estimated, reach the peak of its population by 1945; in Eire the projection anticipated no decline before 1970.

The question arises whether, in view of the difficulty experienced in Great Britain during and after

POPULATION: FACTS & PROBABILITIES

T. J. Hickey, Editor, *The Statist*, and G. A. Gordon, F.S.S.

This explanation of the effect of the changing numbers and age-composition of world populations is amplified by articles on Birth Rate and Death Rate. See also plate facing p. 6609.

The population (Lat. *populatio*) of any territory rises or falls with the natural increase or decrease (excess or otherwise of births over deaths) and the balance of migration (excess or otherwise of immigrants over emigrants).

It can be argued that a territory should not have a larger population than it can feed and maintain from its own resources. This was the theory advocated in Great Britain by Malthus (q.v.) at the beginning of the 19th century. The population of England and Wales, however, rose from 9 million in 1801 to 22.7 million in 1871, and it was found that the extra labour which thus became available more than sufficed, thanks to the working of the industrial revolution, to maintain the nation's internal well-being and external expansion. The home population exceeded 30 million by the end of the century despite a large excess of emigration over immigration, this phase of high fertility coinciding in fact with the great period of British imperial development.

British fertility began to decline in the 1870s. The population still included, however, a large proportion of women of child-bearing age, so that the number of births continued to increase till about the end of the century. At the same time, and this extended into the 20th century, there was an important decline both in infant mortality and in general mortality rates, so that births still exceeded deaths and the population continued to grow until at the end of the Second Great War it was about 43 million. Throughout this period there was a natural increase which offset an outward migration balance until about 1930, after which immigration exceeded emigration, chiefly as a result of the unsettled

conditions in Europe during 1930-39, and of the restrictions imposed upon immigration into the U.S.A. and the British dominions as an effect of the world depression of 1929 onwards.

Reduced mortality was very important, both statistically and in social development. In the 18th century, it was still common enough for a woman to have "borne twelve and buried ten"; and the large families of the mid-Victorian age resulted from increased survivors of the perils of infancy. Smaller families were induced, in part, by the economic depression of the 1880s, which lasted into the 1890s. They became general thereafter because the scope for emigration was diminishing and because, with better health conditions increasing the number

of older men in the home labour market, young men had smaller prospects of prosperity, and therefore tended to postpone marriage, while young married couples felt less sure of their economic future.

In the result, the British population grew older as it grew larger, and the natural turning-point is the time when the reduced number of potential mothers (women aged 15-45), with the child-bearing habits of the time, fail to produce babies enough to replace the number of persons dying. This event, it was anticipated, would happen about 1945, but was postponed at any rate beyond that year by an increase in births during and just after the Second Great War. On the basis of tendencies noted during 1919-39, the probable population

Population, Table 1. Pop. of England and Wales by Age Groups (in thousands), with 1970 Projection

AGE	1881	1911	1940	1970
0-14	9,458	11,051	8,610	4,880
15-44	11,600	17,315	19,250	14,910
45-64	3,708	5,826	9,330	11,450
65+	1,209	1,878	3,680	5,840
TOTAL	25,975	36,070	40,870	37,080

the Second Great War in feeding a large population, some decrease in the total may not be desirable. In fact, the growth of population in the 19th and early 20th centuries was associated with improved living standards only because of the growing industrial productivity of the growing labour force in the first country to become highly industrialised. Great Britain, in this period, produced a diminishing proportion of her own food; but she produced manufactured goods for which there was a demand overseas, whence the food required at home could be imported. As increasing industrialisation in countries which formerly devoted themselves primarily to the production of food and raw materials reduces the

relative demand for British manufactured goods, it is arguable that Great Britain could live better with a smaller population which would require less imported food. If the same standards of living were to be maintained, however, decrease in population would have to be accompanied by an increase, or at least by the absence of any decline, in the industrial productivity, and a positive increase in the home food productivity, per head of population. With a growing proportion of the people in the pensioner age-group, and therefore unproductive or at best much less productive, it would require an important rise in the output per worker to maintain the output per unit of population. However much a man may save to provide for his declining years, or whatever pension he may collect from the state, the food he eats after his retirement is produced or bought by the current labour of his juniors. With a growth in the proportion of unproductive consumers, there must be either a decline in living standards or a growth in the output of the workers who are still productive. That is to say, if the old age pensioners of the 1970s are to be supported in comfort, more babies than the actual reproduction trends make likely must be born in the 1950s, or those who are born must work very much harder than those born in, say, 1900.

The tendencies observed in Great Britain are at work, though at different stages, in many other countries. Broadly speaking, the industrial and developed peoples of W. Europe and N. America had by 1945, on known fertility trends, either passed or come within sight of the zenith of their population growth. On the other hand the populations of Russia, eastern and southern Europe, and S. America were entering on the phase in which birth rates were still high and mortality rates were beginning to decline. Spain, it is estimated, will not reach its zenith before 1965; Portugal and the Balkan states can hardly reach the peak before 1970; and the Russian population is likely to continue increasing till considerably later.

The effect of these movements, so far as Europe is concerned, is shown in Table 2, also taken from the projections already quoted. The figures are, of course, simply estimates based on pre-1940 tendencies; and what, if any, enduring effects the Second Great War may have had on demographic

tendencies cannot be apparent until the 1950s or later. It remains probable that the basic tendencies supported by the table are close to the truth.

The increase in population projected for Russia and the E. of Europe will, of course, arise from longer life in these regions as well as from a higher birth rate than is now normal in W. Europe. The size of the population under 20 years of age is expected to reach its peak by about 1955; the older age-groups will, at that time, still be increasing rapidly, but the proportion of youth to age will still be impressive. In 1970, according to this projection, there will be 112 males under 20 years of age, as compared with about 200 in 1945, for every hundred who are over 40 years old. The number of males under 20 for every 100 over 40 both in the British Isles and in France in 1945 was about 82; by 1970 it is likely to be about 46½ for France and 40 for the British Isles.

"Demographic Balance"

Apart altogether from the potential problems which arise through the population of some territories increasing while that of others is decreasing, the basic problem is that of demographic balance. High birth rates originated in times of high infant mortality and high general mortality; and medical science has lowered and is lowering both classes of mortality. In N.W. Europe and in N. America, economic and social conditions produced a rough corrective in the form of lower fertility. In E. Europe and S. America, areas with high mortality, if through increasing spread of medical knowledge the death rate is reduced, growth of population may be very rapid.

If population could be made a matter of policy, each nation would aim at stabilising its own population at the optimum size and the optimum age structure economically; and the subject would also be made a matter of international policy. It has, however, proved impossible for an individual nation to pursue a population policy even when it has defined one; and the world is some way from being able to consider the matter internationally. Consult Population of Britain, E. M. Hubbard, 1947.

Populist. Name of a political party in the U.S.A., 1891-1900. Chiefly drawn from agricultural and industrial groups, it nominated

Population. Table 2. European and U.S.S.R. Population Projection. 1940-70 (Princeton Bureau estimates; in millions)

a presidential candidate in 1896 and 1900.

Porbandar. Indian state and town in Kathiawar peninsula. Formerly in the Western India states agency, the state is now part of the Saurashtra union. It lies along the Arabian Sea in the S.W. of the peninsula. The town, which was Gandhi's birthplace, has a harbour and a rly. terminus. Only small vessels can use the port. The state covered 642 sq. m. and had a pop. of 146,648. Pop. of town, 23,699.

Porcelain. Fine pottery distinguished from earthenware by being a vitreous translucent substance coated with a hard transparent glaze. It was discovered by the Chinese, wherefore it is often called china, and attained great perfection during the Ming dynasty, 1368-1644. The Japanese also have made porcelain for many centuries. It was not introduced to Europe until the late 17th and 18th centuries, France preceding Germany, and England following quickly. In each country it has been a new invention dependent upon the discovery of the correct material at hand. See Chinaware; Pottery.

Porcelain Tower. Pagoda which formerly stood on West Hill, Peking, China. Built early in the 15th century, it was entirely of coloured porcelain, octagonal in shape, 261 ft. high, and had eight storeys. It was destroyed in 1853.

Porch (Lat. *porticus*). In building, an enclosed space of entrance and exit projecting from the main mass, sometimes as the lower part of a pavilion the whole height of the structure. The church porch originated in the narthex (*q.v.*). The Gothic porch of parish churches was frequently constructed of timber. In civil and domestic architecture, the term includes the gabled cottage porch, and the verandah screening the entrance to a house in the "colonial" style,

Porch. Examples of the porch in principal styles of architecture. 1. Culver Homestead, New York, U.S.A., Colonial style. 2. Parish church, Clay-next-the-Sea, Norfolk, Late Perpendicular Gothic. 3. Old School House, Woolley, Herefordshire, English half-timber. 4. Church of S. Mary-le-Strand, London, Classic designed by Gibbs. 5. Woolwich Town Hall, modern Classic. 6. Cranbourne Manor House, Dorset, English Renaissance

and has also come to be loosely used for the outer lobby of a house, between outer and inner entrances. See Basilica.

Porch, THZ. Name given to the Stoics and their philosophy. The school was founded about 310 B.C. by Zeno of Citium, in Cyprus, who lectured in the market place at Athens in the Stoa Poikilē, the painted porch (or, rather, colonnade), adorned with paintings by Polygnotus. See Stoicism.

Portchester OR PORTCHESTER. Village of Hampshire, England. It stands on Portsmouth Harbour, 7 m. by rly. N. by W. of Portsmouth. Its interest is mainly historical. An important Roman station, and later a prosperous seaport, it was one of the chief stations of the navy until the receding of the sea made it useless as a port. Of the Norman castle built in the 12th century, there are remains, including the keep. In 1926 these became the property

of the nation. S. Mary's church, also of the 12th century, has been largely restored. Pop. 2,267.

Porcupine (Fr. *porc*, pig; *épine*, prickle). Rodent mammal of the family Hystriidae, distinguished by the possession of a defensive armour of hollow quills and spines. Porcupines are distributed over large areas of S. Europe, S. Asia, Africa, and America. The common porcupine (*Hystrix cristata*) found in both Europe and Africa, is a bulky animal about 27 inches in length, and has black hair with a white crest on the head and band of the neck. The quills are ringed with black and white, and are of great length. The shorter open quills on the tail seem to serve the purpose of rattles to warn any animal that proposes to molest the porcupine. These animals generally occur in hilly districts, and spend the day in burrows or in clefts in the rocks, feeding at

night upon roots and vegetables, and often greatly damage gardens. If attacked, they rush backwards at their foe, and can inflict severe wounds with their quills.

The porcupines of America are different in appearance, having short quills and long tails, which in the tree porcupines of S. America are prehensile. As the quills are barbed at the tips and are loosely attached to the skin, they make serious wounds by working their way into the flesh of the animal attacked, and are difficult to extract. The Canadian species (*Erethizon dorsatus*) makes effective use of its thickly quilled tail as a weapon. These porcupines climb well and spend much of their time in the trees, where they strip off the foliage and eat the bark. They make their home in hollow trees and in rock crevices.

Porcupine Grass (*Triodia*). Small genus of grasses of the tribe Festuceae, three species natives of

Australia, and one native of tropical Asia. The leaves are in the form of spines, which inflict severe wounds on man or beast venturing among the grass.

Pordenone, IL (1483-1539). Italian painter. Born near Pordenone, Venetia, whence the name by which he is generally known, Giovanni Antonio de Sacci, or Licinio, developed under the influence of Bellini, Giorgione, and Titian. In the cathedral of Cremona he painted colossal dramatic frescoes of the Passion, 1521-22, and an altarpiece representing the Virgin between Saints. For the cathedral of Pordenone he executed a Madonna of Misericordia, 1515; S. Erasmus and S. Roch, 1525; and Glorification of S. Mark. In Venice from 1535 he did fine work, e.g. frescoes in the courtyard of the convent of San Stefano; and Legend of S. Catherine. He died at Ferrara.

Pori. Seaport of Finland. The Swedish name is Björneborg. It stands on the Kumo R., on the Gulf of Bothnia, 18 m. S.E. of its harbour Mäntyluoto, and about 85 m. by rly. W. of Tampere. A municipality since 1558, it has ship repairing yards, and exports

timber, fish, and tar. The harbour of Mäntyluoto is ice-free until Jan., and that of Räfsö also serves Pori. Pop. 31,885.

Porifera. Phylum of the subkingdom Parazoa, consisting of the various forms of sponges. In this phylum are simple cellular organisms, such as constitute the Protozoa, being aggregated to form tissues. See Sponge.

Porism (Gr. *porizein*, to bring about, deduce as a corollary). In ancient mathematics, one of the divisions into which propositions in geometry were divided, the other two being theorems and problems. In a porism it was required to find something, e.g. the centre of a given circle. See Problem; Theorem.

Pork (Lat. *porcus*, hog). Uncured flesh of the hog. In Great Britain, though normally far the greater part of the consumption of pig's flesh is in the form of bacon, there is a steady demand for fresh and salted pork, which has in the past been met to a large extent from home supplies, and partly from Holland and Belgium as well as from America. In the U.S.A. and Canada, pork is a standard and favourite article of diet, while pork and beans is a staple food.

Pork is a forbidden food both to the Mahomedan and to the Jew, perhaps originally because it deteriorates rapidly in hot weather, and is therefore unsuited for use in the climate of the Mediterranean countries. Hutchison (Food and Principles of Dietetics) states that the comparative indigestibility of pork is shown by the fact that

3½ oz. required 3 hours for their digestion, as compared with 2 hours for beef. The difficulty is said to be due to the large accumulation of fat between the fibres. The fat of bacon, on the other hand, is digestible because of its granular composition. Medium fat pork contains 60.9 p.c. water, 12.3 p.c. protein and gelatine, 26.2 p.c. fat, and 0.6 p.c. ash. In very fat pork the percentage of protein and gelatine may be as low as 9.7 p.c., and the fat content reach 45.5 p.c.

Porlock. Village of Somerset, England. It is 6 m. W. of Minehead, on the edge of Exmoor, about a mile from the coast. The church of S. Dubritius is an old building restored. Porlock Bay is an opening of the Bristol Channel, about 4½ m. across, and before the sea receded this was a flourishing seaport and a market town. The old main road into Devon went up an exceptionally steep and sharp-bending hill (with gradient of 1 in 4), which is now used for motor trials. It was a person from Porlock who interrupted Coleridge in the writing of Kubla Khan. Pop. 1,351.

Porosity. Term used to describe the presence, in the body of a solid material, of pockets or pores of gas. Porosity may be inherent in the structure of a material, e.g. earthenware, blotting-paper, and sponge, or it may be localised and undesirable, as in defective cast metal. In water and petroleum engineering, the porosity of a reservoir rock is a measure of its fluid capacity, but it is also necessary to know the permeability (*g.v.*) which determines resistance to flow. A porous rock is not necessarily permeable, e.g. pumice. Crystalline rocks and well-cemented sedimentary rocks vary in porosity from one to 10 p.c., but cracks may considerably increase the porosity of the rock mass. Less coherent rocks may have porosities higher than 50 p.c.

Porphyrites. In geology, name given to certain types of igneous rocks. They are intrusive rocks of porphyritic texture, occurring as dikes and sills. These rocks are usually grey in colour with phenocrysts of plagioclase feldspar, hornblende, biotite, or augite, and are found in Scotland, Wales, N. America, the Swiss Alps, etc.

Porphyritic Structure. In geology, name given to a particular rock texture in an igneous rock. It is characterised by the occurrence of two distinct series of

Porcupine Grass. Spiny leaves and flower

Porcupine. 1. Brush-tailed African variety, *Atherura africana*. 2. Crested, and, 3. Long-tailed porcupines, European varieties. 4. Brazilian tree porcupine, *Syntheres prehensilis*. See page 6624

W. S. Berridge, F.Z.S.

crystals. One series forms a ground mass of extremely fine crystals, in which the other series of large well-formed crystals is embedded. These latter crystals are called phenocrysts. Rocks of this class often make beautiful ornamental stones.

Porphyrius or **Porphyry** (233-c.304). Neo-Platonist whose real name was Malchus (king). Born at Batanea in Syria, he spent most of his life in Rome and died there. Though a pupil of Plotinus, whose literary remains he edited with a biography, Porphyrius was a vigorous champion of paganism against Christianity. In one of his works he discusses the problem of the nature of universals, much debated during the Middle Ages.

Porphyry (Gr. *porphyra*, purple, fish). Name given to igneous rocks of varying composition but with porphyritic texture. The famous red porphyry used by the Romans for an ornamental stone is obtained from quarries at Jebel Dukhan, in Egypt, near the Red Sea, the site of which was long lost. Cut and polished, the rock shows bright red or white spots on a deep red background, and black or dark brown patches of hornblende, etc. The colour of the rock is due to the part conversion of the plagioclase feldspar into thulite and manganese epidote. Granite porphyries contain orthoclase, quartz, and mica, and are generally pink to grey; while syenite porphyries are almost lacking in quartz. A green variety of porphyry has a large proportion of epidote and chlorite in its composition, and was often used with the red porphyry as a contrasting ornamental stone, especially for objects of art and interior decorations. The green variety is found in Peloponnesus, and at Lambay Island, near Dublin.

Porpoise (Lat. *porcus*, hog; *pietis*, fish). Genus of aquatic mammals belonging to the order

a miniature whale, but has a more aloping head. It is found in herds or schools off the British, Scandinavian, and American coasts, frequently sporting on the surface of the water, and occasionally ascends the larger rivers. It lives on fish, and does damage at times to the herring and mackerel fishery, besides occasionally killing salmon. Formerly a popular article of food, esteemed a royal dish down to the days of Queen Elizabeth, its flesh being said to resemble pork, it is now killed mainly for its oil, a fine specimen yielding about three gallons. The so-called porpoise hide used for making boots and laces is the product of the white whale. See Mammal; Narwhal.

Porpora, NICCOLO ANTONIO (1686-c. 1767). Italian composer and music master. Born in Naples, Aug. 19, 1686, he there produced his first opera, *Basilio*. For a time director of the conservatoire at Vienna and master of the music to the king of Poland, he composed many operas, some oratorios, cantatas, masses, etc., and, in opposition to Handel, conducted the opera in London. His greatest successes were gained as a teacher.

Porsanger. Fjord penetrating the N. coast of Finnmark, Norway. It runs S. from the island of Magerö, S.E. of the North Cape. Its length is about 80 m. and its average width 10 m.

Porsena or **Porseenna**, LARS. King of Clusium in Etruria. According to the Roman legend, he led his army against Rome to restore to his throne the exiled Tarquin. An attempt to storm the city was defeated by the valour of Horatius Coclès (q.v.). Porsena now establishing a blockade of the city, a young Roman, C. Mucius Scaevola, entered his camp and attempted to murder him. Seized and tortured, Scaevola (q.v.) displayed such astonishing fortitude that Porsena abandoned the siege and made terms with the Romans.

Historical research has pronounced this legend a fabrication to conceal the complete defeat of the Romans by the Etruscans. Porsena's name, however, remains familiar to English readers because it occurs in Macaulay's *Lays of Ancient Rome*.

Porson, RICHARD (1759-1808). English scholar. Born at East Ruston, Norfolk, Dec. 25, 1759,

he went to Eton, whence he proceeded to Trinity College, Cambridge, where he had a brilliant career ending with election to a fellowship. Declining to take orders within the specified time, Porson lost his fellowship in 1792, but friends provided a fund to enable him to continue his studies in the Temple. In the same year, however, he was elected regius professor of Greek at Cambridge, but continued to live in the Temple, and in 1806 he was made librarian of the London Institution. He died Sept. 25, 1808. Porson did comparatively little, owing to his indolent disposition and intemperate habits. Among his works are editions of Aeschylus and of some of the plays of Euripides. He also restored the last 28 lines of the Greek inscription on the Rosetta stone. Consult *Life*, J. S. Watson, 1861; *Biographical Essay*, M. L. Clarke, 1937.

Porson Prize. Annual prize awarded to undergraduates of Cambridge university for the best translation of a passage of English poetry into Greek verse. Founded in honour of Richard Porson, and first awarded in 1817, it can be won more than once by the same person.

Port (from Lat. *portus*, an entry or harbour). Place where passengers and goods are landed. There are two kinds, seaports and airports; the latter, an aerodrome or flying boat base provided with customs and other facilities, where passengers are landed or taken up, is described under *Airport*.

A seaport is a harbour, natural or artificial, in which ships can lie to load or discharge. The term dates from Anglo-Saxon times and survives in many English place names, e.g. Portsmouth, Bridport. Ports are not necessarily on the coast, for that of London is some miles inland up the Thames, and large rivers like the Amazon, Mississippi, and Danube have many ports along their banks. Although London, Liverpool, Amsterdam, and other large seaports are referred to as ports, the term strictly applies only to that part of the place devoted to ships and shipping, and is usually under a separate authority, e.g. Port of London Authority, Mersey Docks and Harbour Board.

Richard Porson,
English scholar

Porpoise. Common species, *Phocaena phocaena*, found off the coasts of Britain

Cetacea or whale-like animals. The common porpoise (*Phocaena phocaena*) is about 5 to 8 ft. long, is blackish on the upper parts and white below, and in form resembles

Ports are maintained by a levy, or port dues, on all vessels using their facilities, and while ships are in port they come under the control of the authority. In most ports ships such as tankers carrying dangerous cargo are refused entry and must discharge at installations some distance away. All ports have a representative of Lloyd's, and every ship has a port of registry: the place where her particulars are kept and where she generally signs on or pays off her crew. Manning ports are naval bases where warships muster their crews. *See Dock; Harbour.*

Port, or PORT WINE. Red, rich, strong wine made near the mouth of the Douro, Portugal, and named from Oporto, where it is shipped. The vine-growing region, Alto Douro, lies mainly on the S. bank of the river, 60 m. E. of Oporto. Though cold in winter, the climate is very hot in summer, and the wine is naturally strong. The grapes, carefully gathered, are foot-pressed, usually repeated at a secondary stage in order to extract the full colour from the skins.

Before fermentation is complete, about five parts of alcohol are added to 100 of wine; after the first racking, more spirit, generally brandy, is put in the wine, and this is again repeated before shipping. Port wine thus contains from 17 to 25 p.c. of alcohol, the average amount varying from 18 to 21 p.c. Some natural, specially good, vintage port is shipped unsophisticated, soon after making, but the bulk is manufactured as described, and almost always blended.

Port is stored for a long time, being matured both in cask and in bottle. Some is kept in cask up to 20 years; always it is so kept for two years, and generally for three, or even six, before bottling. The former is a mistaken policy, as the valuable esters escape through the wood, but long rest in bottle improves the wine. Nevertheless, port should not be kept too long, as it loses its essential qualities as well as its red colour, owing to the escape of the esters. Possibly the best vintage years of the 19th and early 20th centuries were 1847 and 1927. Wine 100 years old is still to be met with in the cellars of Great Britain, but after 40 or 50 years port becomes of a sherry colour, and though often a delectable drink, it is not characteristically port wine. It may happen that the produce of a particular year, when sampled, is found to be of relatively poor quality, and therefore not worth the ageing. Port

contains from 7 to 15 p.c. of sugar, and a fair amount of tannin, much of which last is deposited as a crust in the bottle. Some white port is made, chiefly for the German market, though there is a steady sale for some brands in England. By a treaty with Portugal and two English Acts of parliament in 1914 and 1916, the description port may not be applied to any wine not the produce of Portugal; and all wine brought in as port must be certified by Portuguese authorities. *See Wine.*

Port Adelaide. Seaport of Adelaide, S. Australia. It stands on an estuary of the Gulf of St. Vincent, 8 m. N.W. of the capital, and has an excellent harbour and docks accommodating ocean liners. It is a port of call for mail steamers for Europe and Asia by both Suez and S. African routes. Wheat and other agricultural products are exported. Pop. 33,404.

Portadown. Market town and borough of co. Armagh, N. Ireland. It stands 25 m. S.W. of Belfast, on the Bann, a navigable waterway leading to Loch Neagh. The Newry Canal leads S. to communicate with Carlingford Loch. Portadown is also a rly. junction and manufactures boots, linens, and other textiles. Market days, Mon., Wed., and Sat. Pop. 13,000.

Portage (Fr. *porter*, to carry). Act of carrying something, also the charge made for the carriage of goods. In N. America a break in the chain of water communications is called a portage because here the goods have to be transferred from the canoes and carried. Portages are often caused by rapids and waterfalls. Many places in N. America bear the name of Portage, e.g. Portage la Prairie, but this is but a relic of their past, as the cutting of canals and the building of railways have done away with these obstacles to transport.

One of the most important of these portages was in Wisconsin over the tract of land between the rivers Fox and Wisconsin, which here are only 2 m. from each other. The best route from Lake Michigan to the Mississippi lay along these rivers, and the portage between them was regularly used by Indians and later by Europeans.

Portage. City of Wisconsin, U.S.A., capital of Columbia co. It is at the head of navigation on the Wisconsin river, 30 m. N. of Madison, and is served by the Wisconsin Central and other rlys. and by the ship canal between the Wisconsin and Fox rivers. Early in the 19th century a fur-trading

post, the city now has diversified small industry. There is steamboat communication with Green Bay. Pop. 7,016.

Portage La Prairie. City of Manitoba, Canada. Situated 56 m. W. of Winnipeg, it is served by the C.P.R. and C.N.R. It is the centre of a famous farming district, and its manufactures include flour, bricks, and agricultural machinery. Pop. 7,625.

Portal, WYNDHAM RAYMOND PORTAL, VISCOUNT, OF LAVERSTOKE (1885-1949). British industrialist and politician.

Lord Portal,
British industrialist

Son of Sir W. Portal, he was born April 9, 1885, and educated at Eton and at Christ Church, Oxford, becoming managing director of the firm which bore his name. Regional commissioner for Wales under the civil defence scheme in 1939, he was chairman of the coal production council from 1940, minister of works and planning, 1942-44, and deviser of the Portal prefabricated house. He succeeded his father as 3rd baronet 1931, was raised to the peerage 1935, and created viscount 1945. He died May 6, 1949.

Port Alberni. Town of British Columbia, Canada. At the head of Alberni canal, on the W. coast of Vancouver I., it is a rly. terminus. In the centre of a district rich in timber, coal, and minerals, it is the site of a huge pulp mill erected in 1947. Pop. 4,584.

Portalegre. Dist. of E. Portugal. Bounded E. by Spain and N. by the Tagus, its area is 2,405 sq. m. Mountainous in the N.E. and S., it is elsewhere level and contains the Campo de Benavilla in the S.W. It is traversed by two rly. lines from Lisbon to Spain. Wheat, coal, oil, and wine are produced; pigs are reared and textiles are manufactured. Pop. 186,373.

Portalegre. City of E. Portugal. The capital of Portalegre dist., it is 8 m. N. of its station on the Lisbon-Badajoz rly. The cathedral, founded 1556, contains fine wood sculptures. There are many prehistoric and Roman remains. Woollens are manufactured and cork is obtained locally. It is the ancient Ammaia. Pop. 12,300.

Portal of Hungerford, CHARLES FREDERICK ALGERNON PORTAL, 1ST VISCOUNT (b. 1893). British air officer. After being

educated at Winchester and Christ Church, Oxford, he was awarded the D.S.O. and bar and the M.C.

Lord Portal
of Hungerford,
British airman

during the First Great War. He commanded British forces at Aden, 1934-35, and was instructor at the Imperial Defence College, 1936-37. He then became director of organization at the Air Ministry, and shortly before the Second Great War was air member for personnel on the Air Council. In 1940 he was appointed A.O.C.-in-C., Bomber Command. Chief of the air staff, 1940-45, he reached the rank of marshal of the R.A.F. He was created K.C.B. in 1940; was raised to the peerage in 1945, and in 1946 received a viscounty and the O.M. He then became head of a dept. in the ministry of Supply dealing with work on atomic energy.

Portal System. Circulatory system formed by veins from the intestine and other main abdominal organs, which unite to form a trunk, the portal vein. This passes

Port Antonio. Seaport town of Jamaica. Situated on the N.E. coast, 28 m. N.E. of Kingston, with which it is connected by rly., it has two good harbours, and is the chief exporting centre for the Jamaica banana trade. Pop. 5,482.

Portarlington. Market town of Eire. It is partly in Offaly and partly in Laoighis, and stands on the Barrow and a branch of the Grand Canal. It is 42 m. S.W. of Dublin, with a station of the Eire State rlys. Near the town are Emo Park and the ruins of Lea Castle. The name was given when the town became the property of the earl of Arlington in the 17th century. Until 1885 the town returned one M.P. Its representation in the Dail is now merged in the co's. In 1685 a body of Protestant exiles from France settled here. Market day, Fri. Pop. 2,094.

Port Arthur. City and town of Ontario, Canada. It stands at the

there included Lieut. Arthur. The port is a terminus of the Siberian rly. system, and has a secure harbour ice-free throughout the year.

The fortress was captured twice by the Japanese; in 1894 from China; and from the Russians in 1904-05. After the 1894 episode, it was ceded to the Japanese, but European pressure compelled them

Port Arthur, Manchuria. The waterfront and hill-top memorial to Japan's victory over the Russians, 1904-05

to restore the town to China. In 1898 Port Arthur was leased to Russia with the neighbouring port of Talienwan. It was gradually converted into a Russian stronghold, and the principal base of the Russian eastern fleet.

From the outbreak of the Russo-Japanese War, which began with a successful Japanese torpedo attack on the Russian fleet in the outer harbour, the Japanese admiral Togo blockaded the harbour. The battle of Nanshan on May 26 cut off communications with the north, and Gen. Stössel was left in command with a garrison of some 47,000 men. Japanese troops began to land under Nogi on June 1.

After seven months of stubborn defence and fierce attack, Stössel surrendered on Jan. 2, 1905, having only 24,000 effectives and 15,000 wounded and sick left out of his 47,000. The Japanese lost 92,000 men, 58,000 killed and wounded, as well as 34,000 sick.

By the treaty of Portsmouth, New Hampshire, 1905, Port Arthur was ceded by the Russians to Japan, and in 1915 the Chinese extended the lease for a further period of 99 years. After Japan's defeat in the Second Great War, Russian airborne troops landed at Port Arthur, Aug. 22, 1945. By a clause in the 1945 treaty of alliance between the U.S.S.R. and China, Port Arthur was to be used jointly as a naval base by the U.S.S.R. and China for a period of 30 years; but under the Russo-Chinese pact of 1950 it was to be handed over to China by 1952 or on the signing of peace with Japan.

Port Arthur, Ontario. An air view of this Canadian city on Lake Superior, showing the docks

into the liver, where it again subdivides into smaller vessels, breaking up into a capillary network, as it does not carry the blood directly to the heart.

Portamento (Ital., carrying). Musical term for a vocal effect obtained by sliding from one note to another. Used with restraint it is a legitimate means of expression, but it may easily be vulgarised, and as frequently employed by untrained singers it is a fruitful source of faulty intonation.

head of Lake Superior, 991 m. W. of Montreal and 423 m. E. of Winnipeg, and is served by C.P.R. and C.N.R. It has a fine harbour, ships quantities of grain to Montreal and elsewhere, and in addition to large grain elevators, has shipbuilding yards, sawmills, blast furnaces, foundries, etc. Pop. 24,426.

Port Arthur or LUSHUN. Fortified seaport at the S.W. end of the Liao-tung peninsula, Manchuria. The English name dates from 1860, when a naval surveying party

Port Augusta. Seaport of S. Australia. It stands at the head of Spencer Gulf, 190 m. N.N.W. of Adelaide by rly., and is the starting point for both transcontinental rly. routes, one to Kalgoorlie, 1,000 m. away, and the other to the Northern Territory. Repair work to rly. rolling stock is carried out at Port Augusta, which is the outlet of a district of gold, silver, copper, iron, and coal mines, and of a pastoral area producing wheat and wool. Ostrich farming is carried on. Pop. 4,350.

Port-au-Prince. Capital and chief seaport of Haiti, West Indies. Situated on the W. coast, at the head of the Gulf of Gonaïves, it has a secure harbour which ships coffee, hides, and logwood. Sugar is treated in the neighbourhood. There are a cathedral, schools, and up-to-date cable and telephone services. A light rly. runs to Lake Assuei, a motor road to Cap Haitien, and there is a weekly air service to the U.S.A. In the palace, on Aug. 7, 1912, President Lecomte was burned to death. Pop. est. 115,000. See Haiti.

Port Bannatyne. Watering-place of Buteshire, Scotland. It stands on Kames Bay, 2 m. from Rothesay. The chief industry is fishing. John Sterling was born here. Near by is Kames Castle, which mainly dates from the 14th century. Pop. 695.

Port Chalmers. Port of South Island, New Zealand, 8 m. N.W. of Dunedin, for which it is the deep water port. Distant 190 m. from Lyttleton and 1,343 m. from Melbourne, it has wharves, warehouses, graving docks, etc. Pop. 2,165.

Portcullis (Fr. *porte*, gate; *coulisse*, a groove). In military architecture, a strong, timber-framed grating like a harrow, made

Portcullis. Defensive grating of medieval castles

to slide up and down in stone grooves in the portals of fortified castles. The vertical spikes were pointed with iron at the bottom, so as to strike into the earth or to pierce the bodies of those attempting to force an entrance. The portcullis was a feature of early Norman and later medieval strongholds. A long entrance passage frequently had a succession of them. See Castle; Fortification.

Port de la Paix. Town and seaport of Haiti, West Indies. It stands at the mouth of the Trois

Port Bannatyne, Buteshire. The town and bay from the west

Rivières, on Tortuga Channel, and carries on a trade in coffee, cocoa, etc. Pop. 5,000.

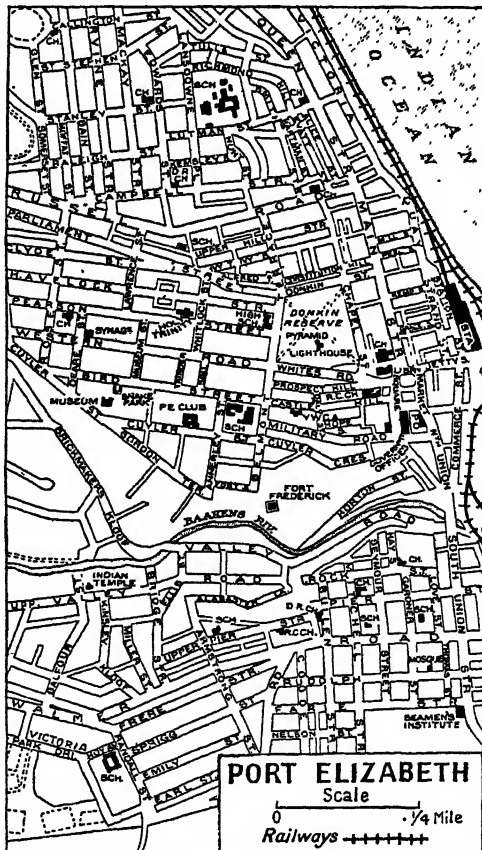

Porte or **SUBLIME PORTE.** Term formerly used for the government of Turkey. It comes from an Arabic word for gate which was translated into French as *porte*, and thus passed into general use in Great Britain. This special use of the word bears relation to the Eastern custom of administering justice at the gates of cities and royal palaces. The term went out with the end of the Ottoman Empire.

Port Edgar. Harbour of the British crown colony of the Falkland Islands. It is situated on the S.E. coast of W. Falkland I.

Port Elizabeth. Seaport of Cape Province, S. Africa. It stands on Algoa Bay, 714 m. S. by W. of Johannesburg and 841 E. of Cape Town, with both of which it is connected by rly. The Baakens river runs through the town. The chief buildings are the city hall, public library, museum, post office, and hospital. The churches include the R.C. cathedral and S. Mary's, Anglican. The market buildings contain large halls, one called the feather market hall.

The town has a theatre, opera house, and drill hall. There are three public parks, S. t.

George's, Victoria, and Prince Alfred. To the N. of St. George's Park is an old Scottish cemetery. The town is a shipping and distributing centre. The breakwater was removed in 1869, but a new harbour scheme, put into effect early in the 20th century, and completed by 1941, gave the port an enclosed harbour 314 acres in area. This scheme involved the building of a new breakwater, 4,850 ft. long. The industries include the manufacture of boots, flour, and jam. It is important, too, as a market for the sale of wool and ostrich feathers.

Port Elizabeth, S. Africa. Plan of the city and its railways

Port Elizabeth, S. Africa. Main street of this flourishing town in Cape Province

Port Elizabeth, frequently called Algoa Bay, was originally Fort Frederick, a fort erected to guard the roadstead, and named after Frederick, duke of York. In 1820 it was settled by a number of British immigrants. The town was laid out and named after Elizabeth, wife of Sir Rufane Donkin, then governor of the Cape. Pop. 146,231 (64,745 white).

Porteous Riots. Two affrays between the Edinburgh populace and the city guard in 1736. At the execution on April 14 of a smuggler named Wilson, who had robbed the Pittenweem custom house, the crowd assaulted the guard, which, led by its captain, John Porteous, opened fire, killing five or six persons. Porteous was convicted of murder but respited, and the citizens dragged him from the Tolbooth prison and hanged him in the Grass Market on Sept. 7. None of the rioters, who were protected by influential people, was arrested. The house of lords demanded for the disaffected city severe penalties, which were reduced by the commons to the dismissal of the provost and a payment to Porteous's widow. Scott described the affair in *The Heart of Midlothian*.

Porter. Dark, bitter beer, brewed from browned malt, containing from four to six p.c. of alcohol. It was largely drunk by market porters in the 18th century, and was so named about 1750. It is less in demand in the U.K. than formerly, but is still popular in Eire. See *Brewing*.

Porter, COLE (b. 1892). American song writer, born at Peru, Ind., June 9, 1892. He was educated at Yale and Harvard, and studied composition under d'Indy. His scores for revues and musical plays were popular in New York and in London, where Wake Up

Kern could be compared with him.

Porter, DAVID DIXON (1813-91). American sailor. Born at Chester, Pa., June 8, 1813, he first served under his father, an admiral in the Mexican navy, but in 1829 entered the U.S. service, in which he became lieutenant in 1841. At the outbreak of the Civil War he was sent to relieve Pensacola. By a daring and well-executed action he opened the Mississippi for Farragut to capture New Orleans, 1862. In command of the Mississippi squadron, Porter took part in the operations at Arkansas Post and Vicksburg, and in 1863 was promoted rear-admiral, receiving the thanks of congress. Next year he commanded the N. Atlantic blockading squadron, concluding his war services with the capture of Port Fisher, Jan. 15, 1865. In 1870 he was promoted admiral. He died in Washington, Feb. 13, 1891.

Porter, ENDYMION (1587-1649). English royalist. Member of a Gloucestershire family with Spanish connexions, he was brought up in Spain. After returning to England he became groom of the bed-chamber to Charles, prince of Wales. From 1622 he was sent to Spain on various diplomatic missions. A loyal servant of King Charles, he voted against Strafford's attainder, and was expelled

and Dream brought him to the fore in 1929. Best remembered are *The Gay Divorce*, *Nymph Errant*, and *Anything Goes*. He also wrote for films. Some of Porter's tunes—*Night and Day*, *In the Still of the Night*, *Begin the Beguine*—remain as classics of sophisticated dance music, in which idiom only Gershwin and

from parliament. He left England in 1645, and lived in France and the Netherlands until 1649, when he returned to London to die, being buried in S. Martin-in-the-Fields, Aug. 20. He acquired a fortune and was a patron of art and letters. *Consult* *Life and Letters*, D. Townshend, 1897.

Porter, GENE STRATTON (1868-1924). American author. A native of Indiana, she became the wife of Charles Darwin Porter in 1886. She was a keen naturalist and an able photographer of animal and bird life. She is remembered for her "best-selling" novels, most of which deal with out-of-door life in a pleasantly sentimental and cheerful tone. Among them were *Song of the Cardinal*, 1902; *Freckles*, 1904; *A Girl of the Limberlost*, 1909; *Laddie*, 1913. She died Dec. 7, 1924. *Consult* *Life and Letters*, J. Stratton-Porter, 1928.

Porter, JANE (1776-1850). British novelist. Born in Durham and brought up in Edinburgh, she achieved great success in 1803 with her first novel, *Thaddeus of Warsaw*, a story of Polish exile. This was followed in 1810 by *The Scottish Chiefs*, the hero of which is Wallace. Among other works are *The Pastor's Fireside*, 1815, and *Sir Edward Seaward's Narrative*, 1831. She died at Bristol, May 24, 1850.

Jane Porter
After G. Harlowe

Porter, WILLIAM SYDNEY. Real name of the American short-story writer, O. Henry (*q.v.*).

Port Erin. Watering-place of the Isle of Man. It stands on the S.W. coast, 15 m. by rly. S.W. of Douglas at the head of a land-locked inlet, Port Erin Bay. There is a harbour, but the breakwater is now a ruin. The place has golf links and good bathing, while the

Port Erin, Isle of Man. Town and bay from the S., looking towards Bradda Head
The Times

scenery around is an attraction. Here are a fish hatchery and a marine biological station. Pop. 3,200.

Port Fairy. Town and harbour of Victoria, Australia, 186 m. by rail W.S.W. of Melbourne. It is a centre of trade in wool, grain, and dairy produce; also a tourist resort. Pop. 2,000.

Portfolio (Lat. *portare*, to carry; *folium*, leaf). Flat case for carrying papers. The word is also applied to the office of a minister of state, presumably because the minister is responsible for all the documents appertaining to his department. Minister without portfolio is a term used to describe a cabinet minister who has no departmental duties. Such functionaries were not uncommon in France and other countries before they were appointed in the U.K. during the First Great War.

Port Glasgow. Mun. bor. of Renfrewshire, Scotland. It stands on the left bank of the Clyde,

Port Glasgow arms

20 m. N.W. of Glasgow, and has a rly. station. The chief edifices are the town hall, town buildings, and library. Birkmyre Park is a public recreation ground, and near are the ruins of Newark Castle. The industries are chiefly connected with shipbuilding, and the burgh has wet and dry docks, shipbuilding yards, iron foundries, and works for making rope and sailcloth. Port Glasgow arose from the village of Newark. In 1668 the baillies of Glasgow bought the land from the Maxwells and built a harbour, making it the seaport of Glasgow, hence its name. In 1710 it was made the chief custom house port for the Clyde, and in 1775 was created a burgh. During the 19th century Glasgow gradually absorbed the trade of the Clyde owing to the deepening of the river, which permitted liners to reach the Broomielaw at Glasgow; at Port Glasgow, however, shipbuilding developed into a great industry, and a trade with Canada and the West Indies was maintained. Pop. 20,063.

Port Harcourt. Seaport of Nigeria. It stands on one of the largest creeks entering the Bonny and New Calabar rivers, about 30 m. from the mouth of them, in Nigeria. A precipitous cliff rises to a height of 45 ft., and there is a depth of 50 ft. alongside, conditions unknown elsewhere in this part of Africa. It is the

terminus of the rly. which crosses the Benue at Makurdi, joining the western rly. at Kaduna Junction. It was named after the 1st Viscount Harcourt when, as Lewis Harcourt, he was Colonial sec.

Porthcawl. Seaside resort and urban dist. of Glamorgan, Wales. It is 30 m. by rly. W. of Cardiff. The chief building is the church of St. John the Baptist. The town is visited for all kinds of holiday recreation. Pop. 10,000.

Port Herald. Town and river port of the Nyasaland Protectorate, S. Africa. Situated on the Shire river, it is 214 m. by water N.W. of Chinde, at the mouth of the Zambezi, and 61 m. by rly. N. of Chindio, the terminus of the rly. from Blantyre to the Zambezi. It is a port of shipment for coffee, cotton, and groundnuts.

Port Hope. Port and town of Ontario, Canada, in Durham co. Situated on Lake Ontario, 63 m. E.N.E. of Toronto, and served by the C.P.R. and the C.N.R., it has a good harbour, and is a watering-place as well as a market for the local produce, mainly fruit. Here is the only radium plant in Canada. Pop. 5,006.

Porthos. Character in Dumas's romances, *The Three Musketeers*, *Twenty Years After*, and *Le Vicomte de Bragelonne*. He is one of the famous trio of musketeers; a vain, titanic hero who dies magnificently at bay in the third of the romances. See *Aramis*; *Athos*.

Port Huron. City and port of entry of Michigan, U.S.A., the co. seat of St. Clair co. A popular summer resort, it stands at the mouth of St. Clair river, on Lake Huron, 61 m. N.E. of Detroit, and is served by rlys. and by lake and river steamers. Industry began with the discovery of a salt deposit in 1882; now a shipping trade is carried on, and among manufacturing establishments are boiler and engine works, rly. workshops, plants for machinery, motor vehicles, and agricultural implements. The river separates Port Huron from Sarnia, Ont., but a tunnel and bridge connect the cities. Stretching along the lake are some 100 m. of beaches. The village of Port Huron was laid out in 1849 and became a city in 1857. Pop. 32,759.

Portia. Leading female character in Shakespeare's *Merchant of Venice*. A wealthy heiress, wooed by Bassanio, she learns that Antonio stands in danger of forfeiting his life by his inability to repay money he has borrowed from Shylock, the Jew, to equip

her lover for his wooing. Portia disguises herself as a doctor of law and outwits the Jew in the trial scene, during which she delivers the speech, "The quality of mercy is not strained." Ellen Terry excelled in this part.

Portici. Town of Italy, in the prov. of Naples. It stands on the Bay of Naples at the W. base of Mt. Vesuvius, 5 m. by rly. S.E. of Naples. In 1631 it was destroyed by an eruption of Vesuvius. It has an 18th century palace and a museum of antiquities. Fishing, silk-worm rearing, and the manufacture of silk are the most important industries. Adjoining the town is Resina (*q.v.*). Pop. 14,500.

Portion. In English law, that which a parent gives to a child in order to set him up in life; or, in other words, his share of the parental inheritance. Equity leans against double portions, and therefore if a parent has, by his will, left a share of his estate to a child, and, after making his will, but before his death, has given the child the same amount or something equivalent, a court of equity will presume that he meant the gift to be in satisfaction of the legacy; and the child will not be allowed to have both, to the impoverishment of other children.

Portioner. In Scots law, a female heir at law, corresponding to a coparcener in English law. All portioners inherit equally the inheritable estate of a common ancestor dying without male issue. In ecclesiastical usage the term portioner is applied to a minister who serves a benefice jointly with others, and receives only a portion of the tithes or benefits of the living, and also to the portion commonly allotted to a vicar out of a rectory or impropriation.

Portishead. Urban dist. and watering-place of Somerset, England. It stands on the estuary of the Severn, 11 m. W. of Bristol, with a rly. station. For details of the docks here, see Bristol, Port of. S. Peter's is an old church, and near the town are traces of an ancient camp. Pop. 3,908.

Port Jackson. Harbour of New South Wales, Australia. Formed by the estuary of the Parramatta river, it was discovered and charted in 1770 by Capt. Cook, who named it after Sir George Jackson (1725-1822), then secretary to the Admiralty. In 1778 Capt. Arthur Phillip established on the S. shore a convict settlement which developed into the city of Sydney. The entrance to Port Jackson is a

mile wide, and the harbour has a total area of 21 sq. m., the largest vessels in the world being able to enter at any state of the tide. The island of Cockatoo has a naval dockyard. In 1932 a 2½-m.-long bridge spanning the W. end of Port Jackson was completed. (See Sydney.) Port Jackson is the chief port of Australia, and in the Second Great War was an important Allied base.

Port Jervis. City of New York, U.S.A., in Orange co. It stands at the junction of the rivers Navesink and Delaware, 87 m. by rly. N.W. of New York City, and is served by the Erie and the New York, Ontario and Western Rlys. It is a popular summer resort, and has rly. repair shops, iron foundries, and silk, glove, stove, and glass factories. Pop. 9,749.

Port Kembla. Port of New South Wales, Australia. It is situated 50 m. S.W. of Sydney, and grew, during the 20th century, into an important industrial centre, with iron and steel works prominent among its factories. With neighbouring Wollongong it utilises to the full the resources of the nearby coalfields, and its harbour, with an area of 330 acres and a depth of 20 to 50 ft., has wharfage accommodation for large vessels.

Portland. Peninsula of Dorset, England, known as the Isle of Portland. Connected with the mainland by part of Chesil Bank, it is 4½ m. long, with an average breadth of one mile. A rly. line runs down the pen. from Weymouth. Portland can also be reached by steamer from Weymouth.

Portland is noted for its building stone, the quarries being crown property. On the E. side is the prison; opened in 1848, this has accommodation for 800 men, and was used for convicts, many of whom worked in the quarries, until the First Great War. In 1921 it was made into a Borstal institution. There is a castle, built in the 16th century, and still used officially; also remains of a much older one. Pennsylvania Castle

was built about 1800 by a member of the Penn family.

Portland has a harbour of refuge, used by the navy. Known as Portland Roads, it covers 2,200 acres, and is protected by gigantic breakwaters built by convict labour. The largest of them cost over £1,000,000. The harbour is strongly fortified. The inhabitants, who live by fishing and pasturing sheep, retain some old customs. As the Isle of Slingers, Portland is the scene of Hardy's story, *The Well-Beloved*. It forms an urban district. Pop. est. 17,000.

Portland. Name of three towns in Australia. One is in New South Wales, in Roxburgh co., 12 m. N.W. of Lithgow on the rly. to Mudgee. The second is in Victoria, in Normanby co., on the coast of the W. side of Portland Bay; it is an agricultural centre

by coasting steamers. Among its chief buildings are the city hall, the Federal building, the co. court house, the observatory, the Masonic building, and a public library containing well over 100,000 volumes. The capacious harbour (frontage 8.5 m.), across which is a fine bridge connecting the city with South Portland, is defended by several forts. The public parks cover over 100 acres.

It carries on a considerable export trade. Among its manufacturing establishments are lumber mills, machinery and marine engine works, and boot and shoe, hat, furniture, paint, stove, and boiler factories. The city has ship-building yards, large grain warehouses, and is a fishing centre.

The first settlement here was made in 1633, the place being first known by its Indian name of

Portland. Air view of the chief commercial city of the state of Maine, U.S.A.

and rly. terminus 200 m. W.S.W. of Melbourne. The third is in S. Australia, in Adelaide co.

Portland. A city of Maine, U.S.A., the co. seat of Cumberland co. The largest and chief commercial city of the state, it stands on Casco Bay, 106 m. N.N.E. of Boston, and is served by the Grand Trunk and other rlys., and

Machigonne. Its early inhabitants were troubled by Indian attacks, and in 1690, in conjunction with the French, these foes destroyed the settlement. In 1718, after peace had been made with France, settlers again made their homes here, calling the place Falmouth. The townsfolk took the side of the colonists in the struggle for independence, for which a British fleet damaged their town in 1775. In 1786 the name Portland was given to part of Falmouth, and the present municipality arose. It was the capital of Maine in 1820-32. Longfellow was born here and the city has several mementoes of the Longfellow and Wadsworth families, some of them housed in the poet's early home. In 1866 damage estimated at £2,000,000 was done by a fire that broke out during the celebration of July 4. Pop. 73,643.

Portland, Dorset. View of the town and railway track over part of the Chesil Bank which forms the approach from the mainland

Portland, Oregon, U.S.A. Air view of the town, showing the Willamette river

Portland. Largest city of Oregon, U.S.A., the co. seat of Multnomah co. It stands at the confluence of the Columbia and Willamette rivers, 53 m. N. by E. of Salem, and is served by the Great Northern and other rlys., and by ocean-going and coasting steamers. The buildings include the city hall, court house, art museum, and public library. The Episcopal cathedral is one of many churches. Here is the medical department of the state university. The city has a zoological garden and about 350 acres of public parks.

Portland has an extensive harbour, accessible by the largest vessels, and carries on an important export trade in flour, grain, and lumber. Its industrial establishments include lumber and flour mills, foundries and machine shops, iron-works, and furniture, saddlery, soap, candle, and paint factories. There are also canning and meat-packing houses. During the Second Great War Portland was the point of departure for goods sent to Russia under lease-lend; war activity caused a great and sudden increase in its pop. Shipbuilding became an important industry during the war years.

Portland was founded in 1845, and as its founders came from Maine they called it after Portland there. In 1873 it was damaged by fire, but it soon recovered. It had been made a city in 1851, and in 1891 East Portland and Albina were added to it. In 1905 a great exhibition was held here, in honour of the visit of two explorers, Meriwether Lewis and William Clark, to this district a century before. At the head of a small party, they were the first white men to cross the continent from south to north. Pop. (1940) 305,394.

Portland, BATTLE OF. Fought between the English and the Dutch, Feb. 13-20, 1653. Tromp

was sailing home along the Channel, convoying a merchant fleet, and the English ships were watching for him. Off Portland he attacked some of them under Blake and Deane, and the battle continued all day, the rest of the English ships coming up one by one to the fight. Neither side secured any advantage, but, owing to lack of ammunition, Tromp was unable to renew the fight on the following morning. He therefore made haste home and the battle resolved itself into a pursuit by the English. In this, although many of his ships left him, Tromp showed great skill in keeping the pursuers at a distance. The Dutch, however, lost heavily in both warships and merchantmen during the retreat.

Portland, EARL AND DUKE OF. English titles, the former held by the family of Weston and both by that of Bentinck. Sir Jerome Weston, an Essex landowner, had a son Richard, who entered parliament and was sent abroad on business by Charles I. In 1628, being in high favour with the king, he was made lord high treasurer and created Baron Weston. In 1633 he was made earl of Portland, and he held the office of treasurer until his death, March 13, 1635. His three successors were all loyal to the Stuarts, and the title became extinct when, in 1688, the 4th earl died abroad.

The earldom was revived in 1689 by William III for his Dutch favourite, William Bentinck, and his son Henry was made duke of Portland in 1716. The 3rd duke, separately noticed, was twice prime minister of England, and the 5th was the eccentric recluse wrongly asserted to have lived a double life, masquerading also as T. C. Druce, a tradesman in Baker Street, London. On his death, in 1879, a nephew became the 6th

duke, being succeeded as 7th duke in 1943 by his son William Arthur Henry Cavendish-Bentinck (b. March, 16, 1893). An eldest son is called the marquess of Titchfield. The chief residence of the family is Welbeck Abbey, Notts. The valuable London property around Welbeck Street, Portland Place, and Baker Street owned by the 5th duke was left by him to his sisters, one of whom was Lady Howard de Walden. The Portland Town estate, London, was sold by Lord Howard de Walden for £500,000 in 1920.

Portland, HANS WILLIAM BENTINCK, EARL OF (1649-1709). English politician. He was born of a

Earl of Portland, English politician
After Simon de Bois

noble Dutch family, July 20, 1649, and came to England first as a confidant to William, prince of Orange. On his master's accession to the crown, Bentinck was created earl of Portland, and sworn of the privy council, April 9, 1689. Henceforth he was William's confidential adviser, and conducted several diplomatic missions with skill. In command of a regiment of Dutch horse, he rendered distinguished service at the battle of the Boyne, July 1, 1690, and received the Garter seven years later for work on the treaty of Ryswick. His death took place Nov. 23, 1709.

Portland, WILLIAM HENRY CAVENDISH-BENTINCK, 3RD DUKE OF (1738-1809). British statesman.

3rd Duke of Portland, British statesman
After Stothard

The eldest son of William, 2nd duke, he was born April 14, 1738. He entered parliament in 1761, succeeded to the dukedom next year, and in 1765 became a member of Rockingham's cabinet. In 1766 he married the daughter of the duke of Devonshire, whose surname of Cavendish he assumed by royal licence in 1801. During the ministry of North, Portland was in opposition, but held office again in 1782, when he was appointed lord lieutenant of Ireland. In April, 1783, he became nominal head of the Fox-North coalition government, resigning in Dec. He was Home secretary 1794-1801,

and again became premier in 1807, resigning just before his death, which occurred on Oct. 30, 1809.

Portland Vase. The Roman cameo-glass vase now in the British Museum

Portland Beds. In geology, name given to a sub-division of the upper Jurassic system of rocks. The strata of the Portland Beds lie above the Kimmeridge Clay and below the Purbeck Beds, and are typically developed at Portland, Dorset. The beds consist of limestones and sands, contain many fossil shells, and are used for building stones. See Jurassic.

Portland Bill. Cape of the English Channel. It forms the bold and rocky extremity of the Isle of Portland, Dorset. Between it and the Shambles Sandbank is a dangerous stretch of water, the race of Portland. Near by is a lighthouse, with a light visible for 18 m. See Portland.

Portland Cement. A full description of this material will be found under Cement.

Portland Channel OR CANAL. Fjord on the Pacific Coast of N. America. It stretches almost due N. for 100 m., and separates the S. end of the Alaskan mainland from British Columbia.

Portland Club. London social club. Named after the duke of Portland, it was founded in 1816. The house is at 18B, Charles Street, W.1. This is recognized as the chief English card-playing club, hence the phrase, Portland Club rules.

Portland Stone. Oolitic limestone of upper Jurassic age quarried on Portland Bill. Of this cream-coloured building stone many of the great London buildings are composed, or partly so, e.g. St. Paul's Cathedral. Its even texture is such that it can be cut and worked

in any direction without fear of later disfigurement by weathering. See Portland Beds; Oolite.

Portland Vase. Fine example of cameo-glass of the early Roman empire. An amphora, 9½ ins. high, its blue glass body has an opaque white overlay cut in relief, illustrating the Peleus and Thetis story. Formerly in the Barberini palace, Rome, it passed into the Portland family, who deposited it on loan in 1810 in the British Museum. Shattered by a madman in 1845, it was skillfully restored. Josiah Wedgwood made 50 earthenware reproductions. In 1929 the vase was sent by the duke of Portland to Christie's, but was withdrawn at 29,000 guineas. In 1945 it was sold to the British Museum at a figure not disclosed.

Portlaoighise OR **PORT LEIX** OR **MARYBOROUGH.** Market town and co. town of Laoighis, Eire. It stands on a tributary of the Barrow, 51 m. by rly. S.W. of Dublin. There was a castle here in the Middle Ages, some slight remains being extant, but the town really dates from 1560. It was then named Maryborough and made the capital of the new Queen's co. It was incorporated in 1570, and sent two members to the Irish parliament from 1585 to 1800. There are a market hall, court house, and infirmary, and the industries are connected with agriculture. Near the town is a rock with ruins of a castle where the kings of Leinster lived. Market day, Thurs. Pop. 12,000. *Proz.* Portleesh.

Port Louis OR **ISLE OF FRANCE.** Capital and seaport of Mauritius, on the N.W. coast. There are Anglican and R.C. cathedrals, botanical gardens, astronomical and meteorological observatories. Subject to hurricanes, the town has special shelters, and high kerbs and deep gutters. Exports include sugar, aloe fibre, and coconut oil. Many of the traders are Indians and Chinese. Pop. 66,805.

Port Macquarie. Inlet on the coast of New South Wales, Australia, at the mouth of the Hastings river. The township of the same name is a seaside resort, 174 m. N.N.E. of Sydney by sea, and exports cobalt.

Portmadoc. Market town, seaport, and holiday resort of Carnarvonshire, Wales. It stands on

Tremadoc Bay, 16 m. S. by E. of Carnarvon, and has a rly. station. The commodious harbour exports slates, which come by a narrow-gauge rly. from Blaenau Festiniog. Portmadoc stands upon land reclaimed by a man named Madocks. Market day, Fri. Pop. 4,200.

Port Mahon. Spanish naval station and seaport. It is the capital of Minorca, Balearic Isles, and is the ancient Portus Magonis. At the head of an inlet on the E. coast, its harbour is one of the best in the Mediterranean, and is fortified. It was occupied by the British, 1708-56 and 1762-82, and was ceded to Spain in 1802. The church of Santa Maria has a remarkably fine organ. There are few traces of the ancient walls of the town; most of the buildings are of stone. It has an arsenal. Pop. 17,500.

Portman Square. London square. At the S.W. end of Baker Street, Marylebone, W., it is named after William Henry Portman (d. 1796), owner of a large estate in Marylebone. Begun about 1764 and completed about 1784, it has always been a fashionable quarter. Earl Nelson, elder brother of the sailor, lived here, and Lord Nelson himself is said to have resided at No. 9. Mrs. Montagu held her salons at Montagu House (q.v.), at its N.W. angle. At No. 32 Caroline of Brunswick stayed with Lady Anne Hamilton, author of *The Secret History of the Court of England*. No. 15, once No. 12, was occupied by the 10th duke of Hamilton, and became the town residence of Princess Louise, wife of the 1st duke of Fife. No. 33 is h.q. of the Poetry Society.

Port Melbourne. Seaside suburb of Melbourne, Australia. Situated at the head of Hobson Bay, the N. portion of Port Phillip, it has numerous docks and wharves. It was formerly known as Sand Ridge.

Port Moresby. Capital, the seat of government, and the chief seaport of Papua. Dating from 1873, it is on the S. coast, on

Port Moresby, Papua. General view of this Pacific seaport, showing the bay

the sheltered and picturesque Fairfax Harbour, and is in communication with Sydney by steamer. When Japan attacked New Guinea in the Second Great War, Port Moresby was heavily attacked from the air on Jan. 23, 1942, but preparations for an amphibious assault on the town and port were upset by the U.S. naval victory of the Coral Sea (*q.v.*). An overland advance against the port from Buna and Gona was held in Sept. by Australian troops when the Japanese were only 32 m. from the town. As Allied strength mounted, the town became the advance base of Australian forces in New Guinea. Copper deposits occur near.

Port Natal. Harbour of Natal, S. Africa. On it developed the chief port of the colony, Durban, and the name is sometimes used as a synonym for that city, although strictly applying only to its harbour.

Port Nolloth. Seaport of Namaqualand, S. Africa. It is on the N.W. coast of the Cape Province, and is chiefly interested in the shipping of copper, being the terminus of the rly. line that runs to the mines at Ookiep. It is also visited by pleasure seekers, for whom there is fishing. The climate is very dry, water being brought in tanks by the rly. from 5 m. inland. Sea fogs are frequent. There is regular steamer communication with Cape Town.

Porto. Dist. of Portugal, in the prov. of Entre Minho-e-Douro. Named from its chief town, Oporto, it is hilly in the E., level by the coast, and is well served by rlys. Area, 880 sq. m. Pop. 938,288.

Porto Alegre. City of Brazil, capital of the state of Rio Grande do Sul. Situated at the convergence of the Jacuhy and other navigable rivers, near the N. end of Lagoa dos Patos, 160 m. N.N.E. of Rio Grande, its harbour is commodious and provided with docks. A large area of reclaimed land has been used as a site for modern buildings, both business and residential. It has a cathedral, technical schools, and government buildings, manufactures food products, chemicals, furniture, and textiles, and exports cattle, salted beef and pork, hides, tobacco, Paraguayan maté, beans, and cereals. It is the terminus of several lines of rlys. to the interior. An active river trade is carried on by steamers with the agricultural colonies in the N. part of the state. It has two civil airports and a military one. Ocean liners make it a port of call. Pop. 321,628.

Porto Amelia. Settlement on the shores of Pemba Bay, Mozambique, about 120 m. N. of the port of Mozambique. It was under the administration of the Nyasa Company, and became in 1907 the capital of the district. The town was laid out by the Spilsbury expedition in 1900. In 1915-16 Pemba Bay formed the base for the operations of the Portuguese against the Germans in German East Africa.

Portobello. Watering-place of Midlothian, Scotland, part of the city of Edinburgh. It stands on the Firth of Forth, 3 m. from Edinburgh proper, with a rly. station. It is a popular seaside resort, and has some manufactures. Portobello was a separate burgh, with its own provost and council, until 1896, when it was included in Edinburgh. The name is supposed to have been taken from a cottage built here in 1742 by a sailor who had taken part in the capture of Porto Bello in 1739. See Edinburgh. Pop. 9,900.

Porto Bello. Seaport of Panama, on the N. side of the isthmus. It stands on the Caribbean Sea, 24 m. N.E. of Colón. Once commercially important, its prosperity has declined. Drake, having died at sea, was buried in the bay. The port was taken by the British under Vernon in 1739, when the fortifications were demolished. There are many famous ruins of its earlier greatness, including those of the fort, the cathedral, and the treasury.

Porto Empedocle (formerly Molo di Girgenti). Seaport of Sicily, in the prov. of Agrigento. It stands on the S. coast, 5 m. by rly. S.W. of Girgenti, for which it is the port. Here are large warehouses of the Girgenti sulphur and corn merchants, who export great quantities of these commodities. Pop. 11,400.

Porto Ferrajo or PORTOFERRAIO. Town of Italy, in the prov. of Leghorn. It is the capital of the

island of Elba, and is on the S. slopes of a citadel-crowned hill on the N. coast of the island. Here are two residences used by Napoleon when in exile. W. of the town is a large foundry. The lighthouse on the hill is a well-known landmark. There are good sea-bathing establishments, and here is maintained one of the few maritime commands left to the Italian navy after the Second Great War. Pop. 5,000. See Elba, *illus.*

Port of London Authority. Corporate body, established by Act of parliament in 1908 to con-

Port of London Authority. Headquarters of the corporation at Trinity Square, London

trol the tidal portion of the Thames, from Teddington Lock to the estuary, 70 m. in length. It controls the five dock systems between London Bridge and Tilbury, accommodating ships up to 35,000 tons, and covering over 4,000 acres. The members are partly nominated by the government and the L.C.C. and partly elected by shipowners and merchants. Revenue is derived from dues and charges on ships entering and leaving the port. The offices are at Trinity Square, London, E.C.3.

Port of Spain. Seaport of Trinidad, British W. Indies, and capital of the island. Situated on the E. coast, facing the Gulf of

Port of Spain, Trinidad. The government building known as the Red House

Paria, its harbour is a port of call for many lines of steamers. A finely built town, with wide streets, it has Protestant and R.C. churches, botanical gardens, in which is the governor's residence, a royal college, etc. Commercially it has supplanted St. Thomas, and exports cocoa, sugar, asphalt, coconuts, copra, rum, and petroleum, besides re-shipping produce from Venezuela. It is also known as Spanish Town. Pop. 107,499.

Porto Grande OR **MINDELLO**. Seaport of St. Vincent, Cape Verde Islands. A coaling station and the commercial centre of the archipelago, it stands on the N.W. coast of the island and has an excellent harbour.

Portogruaro. Town of N. Italy, in the prov. of Venice. It stands on the small river Lemene, $1\frac{1}{2}$ m. above the site of the ancient Roman military station of Concordia. It is a rly. junction 42 m. N.E. of Venice and is the seat of a bishop. Pop. est. 3,000.

Porto Maggiore. Town of N. Italy, in the prov. of Ferrara. It is close to the W. shore of the lagoon, Valle del Mezzano, at the N.W. corner of the Adriatic Sea, and is 15 m. S.E. of Ferrara and a rly. junction on the route between Ferrara and Ravenna. During the Second Great War the parish church, containing the Pietà by Mazzoni, was destroyed. Pop. (commune) est. 20,000.

Porto Maurizio OR **IMPERIA**. City of Italy, capital of the prov. of Imperia. It is a seaport and health resort on the Italian Riviera, 70 m. by rly. S.W. of Genoa. Picturesquely placed on a promontory, the old part of the town is on a hill, while modern villas, hotels, etc., line the shore. Surrounded by olive groves, it exports an excellent oil, as well as wine, fruit, and flowers. It has a fine domed church (1799). Included in the commune since 1928, when its name was changed to Imperia, is Oneglia, 2 m. N.E. Both towns are frequented for sea-bathing. The port and industrial area were damaged during the Second Great War. Pop. 28,540.

Porto Novo. Harbour of Madras state, India, on the Coromandel coast, in S. Arcot dist. It is at the mouth of the small Vellar river on the Madras-Tuticorin main rly. The settlement was originally made by the Portuguese in the latter part of the 16th century. The Dutch maintained a factory until 1678. Here Sir Eyre Coote defeated Haidar Ali in 1781. Pop. 19,000.

Porto Novo. Seaport and the capital of Dahomé, French W. Africa. The residence of the lieutenant-governor, it is situated at the E. end of a lagoon which is in communication with the other coastal lagoons. A narrow-gauge rly. goes 50 m. N. to Ipobe. Pop. 27,483.

Porto Praia OR **VILLA DA PRAIA**. Portuguese port, capital of the island of São Thiago, Cape Verde Islands. Situated on the S. coast of the island, with a good harbour, it contains a palace of the governor-general, an observatory, museum, and a cable station. In the bay, Porto da Praia, an English fleet defeated a French one, April 16, 1781. Pop. 28,000.

Porto Rico. This U.S. possession in the W. Indies is now usually spelt Puerto Rico (*q.v.*).

Portoviejo. Town in Manabí prov., Ecuador. About 110 m. N. of Guayaquil, it is on the river Portoviejo and connected by rly. with Manta on the Pacific. Wool, carpets, and capes are manufactured, and the weekly fair is celebrated. Pop. 15,000.

Portpatrick. Seaport and watering-place of Wigtownshire, Scotland. It is 7 m. S.W. of Stranraer on the rly., and 21 m. from the coast of N. Ireland. About 1600 it was made a station for the packet service to Ireland, but this ceased in 1849. In 1821-43 large harbour works were constructed at a cost of £500,000, but these were allowed to fall into ruin, as the expected trade did not develop. The place has a little trade, and is visited as a seaside resort. Pop. 1,100.

Port Phillip. Harbour of Victoria, Australia. The largest indentation on the Victorian coast, it is 30 m. from N. to S., and 30 m. across at its widest part. Melbourne and its suburbs are on the N., and Geelong on the W. Discovered in 1802, and used as a penal settlement in 1803, it was first colonised in 1835, and gave its name to Port Phillip dist., which in 1851 became Victoria. It was named after Arthur Phillip, first governor of N.S.W. See Melbourne.

Port Pirie. Seaport of S. Australia. It stands on Spencer Gulf, 136 m. by rly. N.W. of Adelaide, being a junction. It has smelting works for Broken Hill mines, one of the largest silver-lead works in the world. It exports ore and wheat. There are high and technical schools. Pop. 11,677.

Portraiture. In a general sense all representational art is portraiture, but the term is particu-

larly applied to the art of drawing, painting, carving, or modelling likenesses of human individuals—also, latterly, to their mechanical representation by means of the photographic camera. The history of portraiture is inseparable from the general history of art, for almost the earliest known manifestations of human art abound with idealised portraits of individual human beings, *e.g.* the Egyptian statues of their kings. At its highest rating it is a means by which men may be honoured; at its lowest it is a concession to human vanity. Yet it may well be neither of these when the artist chooses his own subject, but simply his solution of an artistic problem which has engaged his interest, in which the importance of the sitter's personality is of little concern to him. Whistler, for example, claimed no more than this even for his famous portrait of his mother, which professed to be only an exercise in tone values. Orpen's painting of the Chef at the Chatham (*see* Orpen *illus.*) was primarily the result of the painter's desire to produce a fine picture rather than of any desire to immortalise the chef; and the same may be said of many of Rembrandt's magnificent portraits. This kind of portrait may, in a way, reveal as much of the painter as of his subject. Nevertheless a tradition has been evolved through the ages of portraiture as a special branch of art, the purpose of which is to preserve for posterity the semblance of the outer physical features of a man or woman and as much of the inner character as those features can express. Many great artists have taken portraiture in their stride, *e.g.* Raphael, Titian, Rubens. Others have been pre-eminent in the art, *e.g.* Holbein, Lely, Van Dyck, Rembrandt, Hals, Velasquez, Reynolds, Gainsborough, Romney, Ingres, and in more recent times, Sargent, Orpen, Augustus John, Sir William Rothenstein, and (in sculpture) Jacob Epstein. As may be gathered from this list, the British contribution to portraiture, as to landscape, has been notable. The British genius seems to be as well suited to the delineation of individual human character as of the varying moods of nature. Perhaps the British love of tradition and the homage they pay to the record of what is past and gone has also helped to foster the art. These characteristics are demonstrated in the many private collections of family portraits, and on a wider scale in the unique collection of "national family por-

traits" contained in the National Portrait Gallery (*q.v.*). See Caricature; Miniature Painting.

Portree. Seaport of Inverness-shire, Scotland. It stands on Portree Bay, on the E. side of the Isle of Skye, 120 m. N.W. of Oban. The capital of Skye, it is the chief business centre of that island, and is also visited by tourists. From the harbour there is steamer communication with the mainland. The name is said to come from Port à roi, given because James V once landed here. Pop. 2,100.

Portreeve (Lat. *porta*, gate). English municipal officer. Until the 11th century the chief civil officer of a mercantile town was called the portreeve. The equivalent later title was mayor. See Sheriff.

Port Royal. Seaport and naval station of Jamaica. Situated at the end of a long, sandy tongue of land enclosing the harbour, 4 m. direct S.W. of Kingston, the capital, it is strongly fortified, has a royal naval dockyard, arsenal, barracks, military hospital, etc., and is the headquarters of the British naval forces in the West Indies. The town was destroyed by earthquake in 1692, by fire in 1702, by hurricane in 1722.

Port-Royal. Name of a famous Cistercian convent in France and of a school of theological thought to which it gave rise. Founded in 1204 by Mathilde de Garlande, the convent stood between Versailles and Chevreuse, in the valley of the Yvette. Early in the 17th century it underwent a great revival under Jacqueline Arnauld and members of her family, who had the sympathetic support of S. Francis de Sales, Pascal, and others, and, removing to Paris in 1626, in 1633 began a new life in the Faubourg St. Jacques. The convent there was known as Port-Royal de Paris.

A male community of recluses being formed, the old building, Port-Royal des Champs, was restored for their accommodation, and became a centre of Jansenism, educational activity, in which the Paris house joined, and anti-Jesuit propaganda. In the intervals of their devotional exercises, the recluses of Port-Royal devoted themselves to literary, agricultural, and mechanical labours. The system of teaching the young the

elements of learning, and at the same time imbuing their minds with a sense of piety, was inspired by the Abbé de St. Cyran, one of the most notable of Jansen's colleagues. Among the many distinguished students was Racine. The teaching, a modified form of Cartesianism, aimed more at moral than at intellectual results, but special attention was paid to the

ings were destroyed, by order of Louis XIV, Jan. 22, 1710. Though the inmates had been accused of plotting the ruin of the R.C. church, it was proved against them in this connexion only that while they held the pope infallible in matters of faith, they thought he might be deceived as to fact. See Arnauld; Jansenism; Pascal.

Sainte-Beuve, 6th ed. 1901; The Nuns of P.-R., M. E. Lowndes, 1909; Little Schools of P.-R., H. C. Barnard, 1913; Strangers and Sojourners at P.-R., R. Clark, 1932.

Portrush. Urban dist., seaport, and watering-place of co. Antrim, N. Ireland. It stands on Ramore Head, 67 m. N.W.

of Belfast, and has a rly station. An electric line connects it with Giant's Causeway, 7 m. away, and near also are the ruins of Dunluce Castle. The buildings include a town hall.

Portrush has a harbour whence steamers go regularly to Liverpool and Glasgow. For visitors there are golf links, recreation grounds, and good bathing. Pop. 2,953.

Port Said. Town in Egypt, at the N. entrance of the Suez Canal. It stands on land reclaimed from the sea, and was founded in 1859, when the first surveys for the canal were made. Here are the offices of the Suez Canal Co. and various mercantile and steamship offices. Port Said, named after Said Pasha, the promoter of the canal, is of great importance as a coaling station and a shipping centre for Suez traffic. Pop. 124,749. See Suez Canal. *Pron.* Sigh-id.

Portrush, N. Ireland. Ruins of Dunluce Castle, formerly a stronghold of the earls of Antrim

study of the French language. In addition to Greek, Latin, and Italian grammars, the works issued included the influential Art du Penser, or Logique de Port-Royal, 1659, in which Arnauld and Nicole were chief collaborators.

Political jealousy of its success and ecclesiastical opposition to the teaching of Port-Royal attracted many powerful enemies, and though Pascal and Anne of Bourbon, duchesse de Longueville, succeeded in saving it for a time, the recluses were eventually forced to vacate Port-Royal des Champs for Les Granges, a farm near by. St. Cyran was accused of heresy and imprisoned for five years at Vincennes, surviving his release only by a few months (1643).

Finally, the remaining members of Port-Royal having been expelled without mercy in 1709, the build-

Portsea. Peninsula of Hampshire, England, known as the island of Portsea. It lies between Portsmouth and Langstone Harbours, and is about 6 m. from N. to S. On it stands Portsmouth, part of which is known as Portsea.

Port Side. In nautical language, the left-hand side of a ship when looking forward. In fairways or crowded waters, ships must always pass each other port to port. (See Navigation.) A ship is said to be on the port tack when she is sailing with the wind blowing on the port beam. The opposite of port is starboard. The old term for port side was larboard. The port wing of an aeroplane is that on the left-hand side when looking towards the nose of the fuselage. A ship or plane carries a red light to port at night.

Portslade. Urban district and industrial and residential town of Sussex, England. Situated 4 m. W. of Brighton, on the E. arm of Shoreham Harbour canal, it has a rly. station. Pop. 13,000.

Portsmouth. Co. bor., city, and seaport of Hampshire, England. It covers Portsea I. and

Portsmouth arms

extends for a considerable area on to the mainland. It lies 74 m. S.W. of London and is served by rly. On the opposite side of the harbour is Gosport (q.v.). The harbour has a narrow entrance, but afterwards expands into a basin 4 m. by 2 m., spacious enough to accommodate a large part of the Royal Navy. The old Victory, Nelson's flagship,

was moored in the harbour until 1920; in 1923 she underwent a thorough restoration and was berthed here in the oldest dry-dock in the world. A system of fortifications surrounds Portsmouth, the chief naval arsenal of Great Britain, known to sailors as "Pompey." The forts on the Isle of Wight and Portsdown hill, and those standing in Spithead complete the perimeter. The dockyard covers nearly 300 acres, has twelve docks ranging in depth from 21 to 36 ft., dry-docks, building slips, a school of naval architecture, and many establishments connected with the production of the requirements of the navy. In 1923 the torpedo school (H.M.S. Vernon) was transferred from old ships to new buildings on the Gun wharf. At Whale I. (H.M.S. Excellent) there is a great

Portsmouth. Pre-war buildings and scenes in Great Britain's chief naval depot. 1. Cathedral church of S. Thomas & Becket. 2. honour attended Henrietta, duchess of Orléans, who visited her brother Charles at Dover in 1670. Louise was later sent as a secret French emissary to London, and before 1672 was recognized as the king's

borough Pool. The estate, laid out in 1888 by Messrs. Lever Bros., Ltd., covers an area of 235 acres, and the 1,300 attractive cottages, well spread out, are let to workers in the great soap factory at fav-

roadway was laid across a swamp, searchlights and signal towers were installed, and camps and jetties sited. The port was ready to operate when Japan entered the war, and provided a refuelling and defence base for convoys, the first of which put in on Jan. 3, 1942. The existence of Port T was kept secret until July 15, 1945.

Port Talbot. Seaport and borough of Glamorganshire, Wales. It stands on Swansea Bay, 11 m. E.S.E. of Swansea, and has rly. stations. It has large docks and employs many in collieries, steel

mistress. In July she bore him a son, who was created duke of Richmond, and next year she was created duchess of Portsmouth. Her insatiable avarice made "Madam Carwell" extremely unpopular in England, and after Charles's death she returned to France, dying in Paris, Nov. 14, 1734. *Consult* Life, H. Forneron, Eng. trans. 1887.

Portsmouth, TREATY OF. Peace that in 1905 ended the war between Russia and Japan. After the defeat of Russia at Mukden, the U.S. President T. Roosevelt in June, 1905, suggested that peace negotiations should be begun. Both sides accepted the invitation, and on Aug. 10, Kamura and Takahira met de Witte and Rosen at Portsmouth, N.H. The treaty signed on Sept. 5 recognized Japan's dominant position in Korea, while Russia ceded the southern half of Sakhalin and the leased territory of Liaotung. Both parties agreed to evacuate Manchuria, which, excepting the leased territory, was restored to China. There were other minor provisions. *See* Russo-Japanese War.

Port Stanley. Seaport and capital of the Falkland Islands (*q.v.*). It stands on Port William Inlet, on the N.E. coast of East Falkland. Whale products, wool, hides, and seal fur are the chief exports. Pop. 1,246.

Port Sudan. Seaport of the Anglo-Egyptian Sudan, on the Red Sea. It is the terminus of a rly. from Atbara. The port is the centre of a considerable traffic with the Sudan in gum, cotton, sesame, senna, and ivory. The harbour is well equipped for handling coal. Salt pans provide a local industry.

Port Sunlight. Industrial model village of Cheshire, England. It lies 3 m. S. by E. of Birkenhead, in the bor. of Bebington, has a rly. station, and is reached from the river Mersey by a tributary, Brom-

Port Sunlight, Cheshire. Estate comprising 1,300 cottages let to workers in the Lever soap factory. Top, entrance to the art gallery

ourable rents. There are a church, school, hospital, library, gymnasium, theatre, recreation grounds, and welfare institutions. The Gladstone hall, opened 1891, Hulme hall, 1901, and art gallery, 1922, are among public buildings. *See* Leverhulme, Viscount.

Port Swettenham. Seaport on the Strait of Malacca in Selangor, Malaya. It dates from 1901, when the rubber of the Federated Malay States required a port for export; much earth was dumped on a tidal flat, mangrove-covered, at the mouth of the Klang and Langat rivers, a passenger jetty and three wharves were built, the rly. was extended from Klang, and the port came into existence. Bombed by the Japanese in Dec., 1941, it was overrun by them in early Jan., 1942, and remained in their hands until they surrendered in Malaya, Sept. 12, 1945.

Port T. Secret British naval base of the Second Great War. It was established on Addu Atoll, a waterless coral islet 500 m. from Colombo and 3,000 m. from Australia. Construction began in Sept., 1941, and was accomplished under difficult conditions, 25 p.c. of the workers falling sick. A four-mile

and tinplate works, and rly. works. Port Talbot was founded in the 19th century on land owned by the Talbot family. In 1921 it was created a borough, absorbing the existing borough of Aberavon, the urban dist. of Margam, and some rural areas. Pop. 38,440.

Port Tewfik. Town of Egypt. Situated at the Red Sea entrance to the Suez Canal, it stands on the W. bank, a residential quarter of the town of Suez. In the Second Great War it was a centre for landing and distribution of men and supplies for Imperial troops operating in the Western Desert.

Port Townsend. City of Washington, U.S.A., the co. seat of Jefferson co. It stands on Puget Sound, 40 m. N.N.W. of Seattle, and is served by the Northern Pacific Rly. and by steamers. Its harbour is one of the finest and most commodious in the world. The export trade is chiefly in lumber, grain, dairy produce, livestock, and oil; and among industrial establishments are foundries and machine shops, sawmills, boiler works, paper and pulp works, and fish canneries.

Port Transport Worker. This is the official style of a docker (*q.v.*).

PORTUGAL: THE LAND AND THE PEOPLE

Alfonso Lopez, A. D. Innes, and others

See the articles on the cities and towns, statesmen, navigators, and men of letters of Portugal; also those on Goa, Mozambique, and other Portuguese colonial possessions. See also Europe

Portugal is a republic of S.W. Europe, lying between lat. 37° and 42°N. The ancient Lusitania, it is bounded N. and E. by Spain, and S. and W. by the Atlantic Ocean. It is a maritime country. Its greatest length, from N. to S., is 358 m., and its greatest breadth 141 m.

Portugal Arms of the Republic

Its area is 34,254 sq. m., or, with the Azores and Madeira Islands, officially included with continental Portugal, 35,490 sq. m. Pop. (est.) 7,950,000 and 8,484,700 respectively.

Portugal possesses colonies in Africa and Asia as follows: Cape Verde Islands, Guinea, Principe and St. Thomas Islands, Angola, Mozambique, Goa, Din, Timor, Macao, etc.; total area, 803,835 sq. m.; total pop. 10,954,500.

Physically, Portugal is an integral part of the Iberian peninsula, most of its mts. and rivers being prolongations of those of Spain. The longest river rising in Portugal is the Mondego, in Beira. The largest mt. range is the Serra da Estrella, 6,540 ft. Farther S. is the Serra d' Ossa, a continuation of the Sierra Morena, and, still farther S., the Serra de Monchique. The chief rivers are the Minho, which forms part of the N. boundary; the Guadiana, which forms part of the S.E. frontier: the Douro, and the Tagus (Port. Tejo). The coast, some 500 m. in length, is generally low and flat, except near the Tagus and Cape St. Vincent. Apart from the estuaries of rivers, the only deep indentations are the bay of Setubal and the Ria de Aveiro or Aveiro lagoon, S. of Oporto. The only islands are the Farilhões and Berlengas. Among the minerals found are sulphur, copper, wolfram, lead, coal, tin, silver, gold, iron, kaolin, etc. Salt is obtained from the Aveiro lagoon and other salt-marshes.

Proximity to the sea tempers Portugal's climate and, except in sheltered valleys and exposed parts of Alemtejo, the climate generally is equable and temperate.

The indigenous flora embraces the usual plants of N. Europe, but imported semi-tropical varieties also flourish, and include the

agave, eucalyptus, maple, Portugal cypress, magnolia, Barbary oak, carob-tree, myrtle, palm, aloe, and tree-fern. There are large forests of oak and cork trees, and the botanical forest garden of Busaco is one of the richest in Europe. The fauna of Portugal resembles that of Spain. In the Estrella mts. wolves are found.

The people are of mixed origin. The primitive Iberian stock has been crossed with invading Carthaginians, Romans, Celts, Jews, Arabs, and negroes. In the N. the Galician Spanish type prevails, in the centre the Arabic, and in the S. the negroid. All, however, were much influenced by the Visigothic invasion, and but little by the Spaniards. The Moorish invasion, both physically and intellectually, was the most powerful factor in determining the present type. Inter-marriage was so general that there arose a class called the Mozarabic, which was Arabic in tongue and manners, Christian in religion, and Portuguese in blood. The conquests in Africa introduced a new type, since the tolerant habits of the people interposed no racial bar against Africans, even negro slaves. The contemporary Portuguese are a kindly, hospitable, artistic, sober, and patriotic people, though somewhat shiftless, and, in the rural districts, rather superstitious. The chief towns are Lisbon, the capital (pop. (1940) 709,179), and Oporto (262,309), the

only two which have a pop. in excess of 50,000. Portugal is divided into eleven provs.: Algarve, Alto Alemtejo, Baixo Alemtejo, Beira Alta, Beira Baixa, Beira Litoral, Douro Litoral, Estremadura, Minho, Ribatejo, and Trás-os Montes e Alto Douro. (See articles under these names.)

CONSTITUTION. The constitution of 1911, adopted after the fall of the monarchy, was suspended in 1928 following the proclamation of Gen. Antonio Carmona as president, and five years later a system of government called the *Estado Novo* was established. It provides for a president elected for seven years by direct vote of the citizens, men and women; he appoints the prime minister and the other members of the cabinet on the recommendation of the prime minister. The national assembly sits for three months in the year. Origin-

Portugal. Map of the Republic

ally of 90 members, this number was increased to 120 in 1945; the only candidates put forward in 1934, 1938, 1942, and 1945 were those of the National Union, although the electoral law allows more than one list of candidates. There is another chamber, constituted on a corporative basis, and including representatives of local authorities, to which all bills introduced into the national assembly must be submitted.

Justice and Local Administration

For judicial purposes Portugal is divided into 157 *comarcas*, in each of which there is a lower court. There are three courts of appeal sitting in Lisbon, Oporto, and Coimbra, and a supreme court in Lisbon.

The antiquated and cumbersome reis currency was abolished in 1911, and the gold escudo (*g.v.*) of 100 centavos, was substituted.

For local government and administrative purposes the provs. are divided into dists. named after their chief towns, and the dists. into councils or communes (*concelhos*), governed by elected councils, including a mayor appointed by the state; *concelhos* are subdivided into *freguesias* (parishes), administered by a *junta de paroquia* and a *regedor*, nominated by the governor of the district, to represent the communal mayor.

RELIGION AND EDUCATION. The bulk of the people are R.C. There are Protestant churches and missions in some of the larger towns, but the number of Protestants is small. Portugal is divided into three ecclesiastical provs., Lisbon, Braga, and Evora, each with its own archbishop. The Azores, Madeira, and the W. African colonies, with five sees, form part of the prov. of Lisbon. The archbishop of Lisbon is called the patriarch, and of Braga the primate. Conventual establishments were formally suppressed by law in 1894, their property being confiscated by the state; this law was enforced by the provisional govt. of the republic in Oct., 1910. The R.C. Church was separated from the state, by decree, in April, 1911. In 1917 the banishment imposed on the clergy by the law of separation was annulled, and relations with the Vatican, which had been broken off in July, 1913, were resumed in 1918. Under a concordat and a missionary agreement signed with the Vatican, May 7, 1940, Church property which had come into the possession of the state was

restored, except where it was used for public services.

Primary education is free and in 1911 became in theory compulsory; but nearly 50 p.c. of the pop. above 7 years old are unable to read or write. There are three universities, at Coimbra (founded 1290), Lisbon (1911), and Oporto (1911). There are various kinds of private schools, including over 1,700 primary schools, many secondary and ecclesiastical schools and seminaries, and industrial, technical, and commercial schools. There are also colleges of art and music, and naval, military, and other special schools. Each district capital and three other towns have state lycéums.

ARMY AND NAVY. The Portuguese army is raised by conscription, and is divided into the active, the reserve, and the territorial army. The peace establishment of the active army is fixed at 35,000 men with some 4,600 officers. All adult males are liable to serve six yrs. in the active army, 16 in the reserve, and six in the territorial army. The republican guard numbers 5,500 and 220 officers, and includes a cavalry regiment, the fiscal guard 5,000 and 100 officers. A volunteer legion numbers 49,000 and 3,400 officers. The navy consists of six sloops, five destroyers, five gunboats, three submarines, and some other craft; personnel consists of some 600 officers and 5,500 men. Military aeroplanes of all types number about 100.

INDUSTRIES. The soil is very fertile, except in the mountainous parts; more than 60 p.c. of the pop. is engaged on the land, but agriculture is backward, nearly 40 p.c. of the cultivable land being still undeveloped. Forests cover 19 p.c., or over 4,000,000 acres, with pine, oak, cork trees, and chestnut. The vine is the most generally cultivated plant, and wine the most important product. In the mountainous regions rye is grown, and sheep and goats reared; in the N., maize and cattle are raised; in the S., wheat and swine, large herds of pigs fattening in the vast oak forests. Olive trees cover nearly 1,000,000 acres; figs, tomatoes, onions, oranges, lemons, nuts, etc., are grown; silkworms and bees are reared. Cork is another important vegetable product, Portugal producing more of the material than does the rest of the world.

Oxen are used for agricultural work and transport. Solid wooden

wheels for the ox-carts, and ploughs formed of branches, are relics of the Roman occupation, while the irrigation machinery and wells are reminiscent of the Moors. Fish abound; immense quantities of sardines are caught, cured, and tinned for exportation; many tunny fish are caught, and oysters are exported.

The principal manufacturing industry is the production of textiles, including linen, silk, woollen, and cotton fabrics. Metal and earthenware goods are also produced. One distinctive Portuguese industry is the manufacture of porcelain tiles (*azulejos*); the name and the industry were originally Moorish. There are large cooperages, necessitated by the wine trade, and articles manufactured of cork are largely exported. Other industries are leather, glass, paper, gold and silver filigree manufactures, lace, and the embroideries of Madeira.

A. Lopez

HISTORY. Portugal had no distinct political existence in ancient or early medieval times. In the 10th century A.D. the greater part of the Spanish or Iberian peninsula was in the hands of the Moors. In the second half of the 11th century, Ferdinand I and Alfonso VI of Castile drove the Moors to the S., and recovered for Christianity the lands as far as the river Tagus. In 1094 Alfonso bestowed the recently annexed prov. upon his son-in-law, Henry of Burgundy, as the county of Portugal or Porto Callo. Henry's son, Alfonso I, fought valiantly with the Moors, extended his dominions, captured Lisbon, and assumed the title of king instead of count in 1140, the year after the famous victory of Ourique, won against the Moors. The status of Portugal as an independent kingdom was recognized by Castile in 1143.

Growth of the Kingdom

The small Portuguese kingdom continued to wage successful war against the infidels, and to prosper under a line of efficient rulers, who, besides fighting vigorously, were not neglectful of the progress of the people. Sancho I was one of the few European monarchs who successfully resisted the claims of domination of the mightiest of the popes, Innocent III. Portugal was extended to what were virtually its permanent limits in the reign of Alfonso III (1248-79), whose predecessor, Alfonso II, had been the first to summon the *cortes*, or national council. Alfonso's successor, Diniz, is regarded as the founder of

Portugal's commercial and industrial activities, but war with the Moors and struggles to resist the dominion of Castile were the chief occupation of his son, Alfonso IV, the Brave. The struggle with Castile was finally decided by the brilliant Portuguese victory at Aljubarrota, Aug. 14, 1385, in the reign of John I (1385-1433). John's marriage to Philippa, daughter of John of Gaunt, the father of Henry IV, king of England, gave rise two centuries later to the claim to the English throne put forward by Philip of Spain, whose mother was a Portuguese princess, through whom he had already claimed the Portuguese crown.

The Maritime Empire

John's long and wise reign laid the foundations of the Portuguese maritime empire, a work of which the prime promoter was his younger son, Prince Henry, called the Navigator, under whose direction expedition after expedition sailed from the shores of Portugal, discovered the Canaries and the Azores, and crept round the great western shoulder of Africa. Other maritime states were absorbed with the traffic in the Mediterranean and the seaboard of Western Europe. The south was left to the Portuguese, who, while John II (1481-95) was engaged, like so many other monarchs of the time, in establishing the supremacy of the crown over the feudal nobility, reached the extreme south of the Dark Continent. In 1488 Bartholomew Diaz first doubled the Cape of Good Hope, and in 1497 Vasco da Gama crossed the Indian Ocean, and reached the shores of India, at Calicut. Three years later the Portuguese sailors discovered Brazil, the eastern shoulder of South America. The famous bull of Pope Alexander VI (1493) bestowed upon the Portuguese all new lands which had been, or might be, discovered E. of a line which was ultimately drawn from N. to S. 270 leagues W. of the Azores, while all territory W. of that line was to go to Spain.

For 80 years Portugal enjoyed a monopoly of the southern and eastern seas. With her tiny population, she could not acquire wide territory, and even her purely maritime empire, despite the wealth it brought her, imposed too heavy a strain on her capacities. In 1580, when the direct male line of the kings came to an end, the crown was claimed, through his mother, by Philip II of Spain, despite the better title of the House of Braganza. Philip had no difficulty in enforcing his claim, though the English tried to win the throne for

an illegitimate pretender, Don Antonio. In effect, Portugal was annexed by Spain. In the 17th century, however, the Spanish monarchy was striving to suppress all provincial rights and liberties, and the Portuguese, roused to revolt in

Portugal. Map showing distribution of natural wealth and the principal industries of the people

1640, proclaimed John of Braganza king. The rivalry between France and Spain ensured for the new claimant the support of France, though it was not till the struggle had lasted 28 years that the House of Braganza was decisively established on the independent throne of Portugal by the treaty of Lisbon. Recognition of the dynasty by the marriage of Charles II to Catherine of Braganza, 1661, confirmed the friendly association, embodied in a treaty of 1737, of Portugal and Great Britain.

Peninsular War

But Portugal, once the queen of the seas, was now no more than an insignificant European state, though she still held possession of her American colonies, of the Brazils, and of trading settlements in the Indian Ocean. Externally, her political significance lay mainly in the fact that she provided an open gateway for the British into the Spanish Peninsula. Portugal was the base of the British peninsular campaigns in the War of the Spanish Succession (1701-1713) and the Peninsular War (1808-1814).

In 1807 Napoleon resolved to sweep Portugal into the net of his continental system directed against the commerce of England; but King John, faithful to the friendship with Great Britain, chose exile in preference to submission, and withdrew to Brazil, where he established the headquarters of the Portuguese government. Napoleon's attempt to seize Portugal, and Spain also, brought about the British intervention and the Peninsular War. After the fall of Napoleon, King John remained in Brazil, leaving the Portuguese administration in the hands of the British. But in 1820 John returned to Portugal, assigning Brazil as a separate empire to his son, Pedro IV. Pedro, on his accession to the Portuguese throne in 1826, resigned it, while retaining the Brazilian empire, in favour of his daughter Maria da Gloria.

A prolonged struggle followed between the reactionaries, headed by Pedro's brother Miguel, who claimed the crown, and the constitutionalists, with the young queen as their figure-head, in which the victory of the latter was not secured until 1834, chiefly through the protection extended against foreign intervention, first by Canning and then by Palmerston. Portugal felt the general political unrest which was disturbing Europe; the party contests between the advanced democrats, known as the Septembrists, and the moderate constitutionalists, called Chartists, as supporters of the charter of 1826, were frequently acute.

Fall of the Monarchy

The crown in Portugal enjoyed prerogatives which gave it a controlling power, while the popular assembly became increasingly democratic. King Carlos, who came to the throne in 1889, was a monarch of liberal views, who was frequently forced by circumstances to adopt a repressive course of action, while the administration generally, captured by a corrupt type of politician, was the real cause of the misgovernment for which he was blamed. While discontent ran high, the king and the crown prince were assassinated at Lisbon, Feb. 1, 1908. The young prince Manoel was raised to the throne, but he was driven from the country by a revolution in Oct., 1910. Portugal was proclaimed a republic Oct. 5, 1910.

A. D. Innes

A provisional government was formed with Theophilo Braga as acting president, and he was replaced on Aug. 24, 1911, by Dr. Arriaga, who held office as full president till May 29, 1915. The

policy of the republic separated the Church from the state, and decreed the abolition of the religious orders; this played into the hands of the monarchists, and led to armed royalist incursions in 1911, 1912, and 1913, the last being the most serious; but all were defeated.

In March, 1916, Portugal declared war on the side of the Allies, Bernardino Machado being then in power. German ships in Portuguese ports were seized, and the German colony was expelled. In spite of a revolutionary movement in Dec., 1916, and later industrial unrest, Portugal sent forces numbering some 65,000 officers and men to serve in France. Some 35,000 European Portuguese troops and upwards of 100,000 native askaris took part in the war in Angola and in the fighting for German E. Africa. The peace conference of 1919 allotted to Portugal the territory, formerly German, S. of the Kuvuma.

Period of Unrest

April, 1917, saw the break up of the republican coalition Machado had formed, and in Dec. a military revolution, under the leadership of Sidonio Paes, was successful after four days' bloodshed. Paes, elected president in April, 1918, was shot in the following Dec. In Jan., 1919, a strong revolutionary effort under the royalist Couceiro failed, but unrest continued. In a new revolution in Oct., 1921, engineered by a group of republicans in the army, the premier Granjo and two colleagues were assassinated. A series of short-lived ministries followed, and abortive revolutionary attempts were frequent. In May, 1926, a successful revolution, again led by the army, resulted in the deposition and banishment of the president, Machado. Commander Cabecadas, a leader of the revolt, who represented the politicians, formed a govt., but his serious differences with the military leaders soon led to his resignation, and his minister of war, Gen. Gomes da Costa, became prime minister and acting president; a few weeks later, da Costa was deposed and banished, being succeeded by his foreign minister Gen. Antonio de Bragosa Carmona. Parliament was suspended, and the country was free of disturbance until Feb., 1927, when a revolt broke out, first at Oporto and then at Lisbon, which was quickly suppressed, though not without much bloodshed. In March, 1928, Carmona was elected president, and a new govt. was formed, with Col. José Vicente de

Freitas as premier. The minister of finance in this cabinet, Dr. Antonio de Oliveira Salazar, succeeded de Freitas as prime minister in July, 1932, and continued in office through the Second Great War, and after; from Sept. 5, 1944, until Feb. 3, 1947, he was both premier and foreign minister.

Portugal remained neutral during the Second Great War, Lisbon, the capital, being a hive of intrigue and diplomatic activity as the "listening post" of all interests on both sides of the struggle. An event of great importance to the Allied cause was the granting to the U.K. in Oct., 1943, under the treaty of 1373, of facilities in the Azores for the setting up there of air and naval bases. The bases were returned to Portugal, June 2, 1946.

LANGUAGE. Portuguese belongs to the Hispanic group of the Romance languages. Its alphabet is the same as the English alphabet, though the letters *k*, *v*, and *y* are used only in words borrowed from other languages. Each of the five vowel letters stands for two or more distinct vowel sounds, and numerous diphthongs, and even triphthongs, such as *ei*, *aão*, *o*, *oão*, *oes*, *ões*, occur.

Like Spanish, Portuguese is a direct descendant of the rustic Latin dialects spoken by the legionaries who conquered and held the Iberian peninsula, and in some respects it is nearer to classical Latin than any other of the literary languages of Europe. The Moorish occupation enriched its vocabulary with many Arabic words, but a more important influence was that of the French knights from Burgundy and Provence. By the 16th century Portuguese had become one of the great literary languages of Europe, and the changes it has since undergone are relatively slight. Modern Portuguese is thus far nearer to the speech of Camoens than is modern English to the language of Shakespeare and the Bible.

LITERATURE. For over 1,000 years the written language of Portugal was Latin. A native literature came into existence only after the establishment of the Burgundian dynasty. The French Crusaders brought with them the poems, romances, and chronicles of their own country, thus giving a new literary form to the folk-lyrics and folk-tales indigenous among the Portuguese peasantry.

Court patronage helped the growth of this new literature, especially during the reign of King Diniz or Denis (1279-1325), him-

self a poet of some merit. Historical writings began in the 15th century, during the reigns of King Duarte and Alphonso V. The best prose writers of this period were two court chroniclers, Fernão Lopes and G. E. de Azurara. Romances of chivalry were popular; the first Portuguese edition of the *Palmeirim de Inglaterra* by Francisco de Moraes (c. 1500-72) was published in 1567. Spanish models, in poetry and prose, were closely imitated, and Castilian was long the fashionable language.

Considered as a whole, Portuguese literature is chiefly remarkable for the excellence of its pastoral and lyrical poetry, its histories, and its books of travel. The Renaissance, followed by the discoveries of Prince Henry the Navigator and his successors, afforded new inspiration, and the 16th century is the golden age of Portuguese literature. To it belongs the *Lusiad* of Camoens (1524-80), one of the great epics of all time.

Other great figures of this epoch are the dramatist Gil Vicente (c. 1465-c. 1536), whose work bridges the chasm between the mysteries and moralities of the medieval stage and the true comedy of the 16th century; the poets Bernardim Ribeiro (1482-1552), Sá de Miranda (1485-1558), and Antonio Ferreira (1528-69), and the chroniclers João de Barros (c. 1496-c. 1570), Diogo do Couto (1542-1616), F. L. de Castanheda, and Gaspar Correia. F. Mendes Pinto (c. 1510-83) deserves mention as the author of a fascinating book of travel and adventure in Africa, Arabia, and the Far East.

Exaggerated Classicism

During the 17th and 18th centuries, the ecclesiastical censorship and the decadence of Portugal itself tended to give literature a more artificial character. Originality was replaced by an exaggerated classicism. Historians wrote to order and academies flourished. Nevertheless, two great prose writers, Antonio de Vieira (1608-97) and Marianna Alcoforado (1640-1723), belong to the earlier part of this period, and one distinguished poet, Barbosa du Bocage (1766-1805), to its closing years. Vieira was the prince of Catholic orators in the 17th century. The tragic letters of Marianna Alcoforado have been published in English as *The Love-letters of a Portuguese Nun*.

From the Peninsular War onwards, the more conspicuous literary names in Portugal have been those of poets, journalists, his-

torians, or novelists. The historian Herculano (1810-77) and the dramatist Almeida-Garrett (1799-1854) were instrumental in securing the triumph of the Romantic movement among their countrymen; and Herculano was also a pioneer of historical research. His *History of Portugal* is famous. J. P. Oliveira Martins (1845-94), a later worker in the same field, has been compared with Macaulay; often inaccurate in matter of detail, he wrote brilliantly, and never failed to make the past live. Among the novelists, the best known and most successful have been C. Castello Branco (1825-90), Eça de Queiroz (1843-1900), and Gomes Coelho (1839-71). But the best representatives of the modern Portuguese spirit have been the lyrical poets—João de Deus (1830-96), whose verse has the poignant quality of Heine's songs; Guerra Junqueiro (1850-1923), one of the inspirers of the revolutionary movement of 1910; Antonio Nobre (1867-1900), and others.

The political strife prevailing in Portugal throughout the first quarter of the 20th century hindered literary production. Among the few new writers who emerged were the novelists Raul Brandão (b. 1872) and Aquilino Ribeiro (b. 1885), and the poet Eugénio de Castro (b. 1869).

Bibliography. Portugal, Old and New, O. Crawford, 1880; *History of Portugal*, E. MacMurdo, 1889; *Through Portugal*, M. A. S. Hume, 1907; *Portugal, the Land and the People*, W. H. Koebel, 1909; *Portugal and the Portuguese*, A. F. G. Bell, 1915; *Portugal, Old and Young*, G. Young, 1917; *Portuguese Literature*, A. F. G. Bell, 1922; *They Went to Portugal*, Rose Macaulay, 1946; *History of Portugal*, H. V. Livermore, 1948.

Portuguesa. State of W. central Venezuela. It is situated N. of Zamora, and is named after the river Portuguesa, which traverses the state. Pop. 87,151. The capital is Guanare. The river rises in the Cordillera of Merida, flows S.E. for about 200 m., and unites with the Apure at San Fernando.

Portuguese Man-of-War. Popular name for the genus *Physalia* of the Siphonophora, a group of jelly-fish. In this group the animals occur in stocks or colonies, vitally attached to one another, but not adherent to rocks. Some members are provided with locomotive organs, which they use to draw the rest of the stock after them through the water. In *Physalia* the individual members are attached to a large float filled

Portugal. 1. Women unloading coal on the Ribeira quay, Oporto. 2. Washing clothes in the Minho river. 3. A Carcoia farmer in his straw coat. 4. A Carvalhos peasant girl. 5. Primitive ox-drawn carts still used to convey grapes from the vineyards

with air, which is supposed to bear some resemblance to an ancient man-of-war. The colony is found floating on the surface of the water in the South Seas. The dependent polyps may be divided into three classes. Some, provided with mouths, act as feeders to the colony; others are reproductive; the rest have stings which can paralyse their prey and inflict serious injury on any person who handles them. See *Jelly-fish*, colour plate.

Port-Vendres. Town of France. In the dept. of Pyrénées-Orientales, it contains one of the most commo-

dious harbours of the Mediterranean, defended by forts and batteries. It lies about 20 m. by rly. S.E. of Perpignan, and S.E. again is the lighthouse of Cap Béar. There is a trade in wine. The Roman name was *Portus Veneris*.

Port Way. Traditional name for a Roman road, incorporating an older British track, from Silchester, N. Hants, to Old Sarum, E. Wilts. Traceable through Finkley to the S. of Quarley Hill, it reaches there its greatest deviation of 1 m. from a straight line, 36 m. long, between the terminal towns.

Another road, also called Port Way, runs from Swindon to Wallingford.

Porvoo. Alternative name of the Finnish seaport entered in this work as Borga.

Posadas. City of Argentina and capital of the district of Misiones. Situated on the Alto Paraná, it is on the border of Paraguay and more of its trade is done with that country than with Buenos Aires. It is connected to both the latter and Asunción by rly. and a daily air service. Posadas is the point from which the famous Iguassu Falls can best be visited. Yerba maté and tobacco are grown in the neighbourhood. Pop. est. 38,000.

Poseidon. In Greek mythology, son of Cronos and Rhea, and god of the sea. That domain fell to him when the universe was divided among him and his brothers, Zeus king of heaven and Pluto king of the netherworld. Dissatisfied with this division, Poseidon conspired against Zeus, but was worsted, and as a punishment had to work for a period for Laomedon, king of Troy. He constructed for that king the famous walls of Troy, but when he claimed the reward promised, Laomedon refused to make good his word. Poseidon accordingly sent a sea-monster, which ravaged the country and exacted a tribute of maidens until killed by Hercules (see Hesione).

The palace of Poseidon was supposed to lie at the bottom of the sea. The symbol of his power was a trident, and he was wont to drive over the sea in a chariot with horses having brazen hoofs and golden manes. He had the power of causing not only storms, but also earthquakes. The Isthmian Games were held in his honour. His wife was Amphitrite (q.v.), and the Romans identified him with Neptuneus or Neptune. See Odysseus; Polyphemus.

Posen. This town is described under its Polish name Poznan.

Posilipo. Tufa hill, cape, and village immediately W. of Naples, Italy, and forming a part of that city. The hill is pierced by four tunnels—two ancient and two modern. The earlier ancient tunnel, the Grotto of Posilipo, was pierced in the reign of Augustus; the later, the Grotto of Sejanus, was excavated in A.D. 37 during the reign of Tiberius. In the vineyards near its entrance is a Roman columbarium, the alleged tomb of Virgil. The Grotto Nuova, constructed 1882-85, affords passage to a tram-

way, and has a lift ascending to the top of the hill, which is covered with villas and vineyards.

Position. Term with several connotations. Musically, as applied to string instruments, it implies shifting the left hand to attain the higher notes. Theoretically the violin has eleven positions, though seven mostly suffice. The hand is said to be in the first position when at the extreme end of the neck of the instrument. The index finger would then be pressed down to obtain the note next above the open string (A on the G string), and the remaining fingers in due order. In the 2nd position the same finger would obtain B, the hand being shifted a little higher, and so on for the other positions, a note higher each time. The same procedure applies to all the strings. The term is similarly applied to the use of the slide in the trombone (q.v.). In harmony, a chord is said to be in the 1st position when the root is in the bass. When the 3rd, 5th, or 7th is in the bass, it is in the 2nd, 3rd, and 4th positions respectively.

In dancing there are five fundamental positions for the feet with corresponding arm movements (see illus.). In ballet there are five basic positions of the feet, from which all movements start and in which all end (see illus.); also five conventional poses for the hands, though these are not standardised, but may be modified at the discretion of the dancer; and five positions for the head.

Position has a number of military connotations: there are the standing, kneeling, and lying positions in musketry; the positions of

foot drill positions of attention and stand-at-ease; arms drill positions of slope, order, and present; positions of files and ranks when a body of men are on parade. On military

Position. The five basic foot positions in ballet dancing, each of which has corresponding conventional positions for hands and head.

aircraft there are gun positions, or turrets; on large bombers the principal gun positions are nose, waist, upper, and rear; also the pilot, co-pilot, navigator, radio-operator, and bomb-aimer have positions. The word is also used in the military sense for any point held for defensive purposes. In marine navigation a ship has its position relative to a particular latitude and longitude.

Positive. For the use of terms positive and negative in electricity, see Electro-Negative.

Positive. In photography, the record of an object on a film, glass, or paper base, corresponding, as regards light and shade, with the original. Positives may be produced either by exposure of light-sensitive material through a negative (by contact or projection), or by direct reversal of the negative itself during processing. In optics, a positive lens is one which brings light rays to a point (focus) or renders a beam of light more convergent. See Negative; Cinematography; Colour Photography; Lens; Printing.

Positivism (Lat. *positivus*, laid down.) System of philosophy, in particular the system of Auguste Comte. Positivism recognizes only facts or laws established by strictly scientific methods and unaffected by metaphysical or theological considerations. Facts are the phenomena manifested to us by the senses, beyond which nothing exists; laws are the relations of certain facts to other facts. Philosophy investigates the relations of the general laws of each particular science; the object of its search is not the absolute, the causes and principles of things; its only concern is the relative. Regarded as a religious system, positivism is the worship of humanity regarded as a whole and single being. Comte's leading idea was that all intellectual training

Position. The five fundamental foot positions in dancing

the gun crew serving artillery weapons; the high port, *en garde*, and rest positions in bayonet drill;

should be of a synthetic kind, and serve to cultivate the whole character; and in 1851 he published a list of books of permanent value for habitual reading. This list included about 270 distinct compositions by about 140 authors, and was designed to counteract the exclusive spirit of nationality. This list was described and annotated in 1912 in *Among My Books*, by Frederic Harrison, the best-known English positivist. See Comte; Harrison, F.; *consult* What Positivism Means, H. Ellis, 1894.

Positron. Fundamental particle having the same mass as an electron. The charge of positrons, though equal in magnitude, is opposite in sign to that of electrons. They were discovered in cloud-chamber observations on the action of cosmic radiation upon matter.

Posse Comitatus. Latin phrase meaning the power of the county. In early times the sheriffs in the English counties had the power to call out all suitable males, if needed, to quell disorder or pursue felons, and this was the posse comitatus. The establishment of an efficient police in the 19th century rendered this procedure unnecessary, but the power is still retained by the sheriffs by an Act of 1887. See Police.

Possession. In law, having a thing in one's power, or in one's hands. One may possess land, for instance, without occupying it, by having it in the occupation of a tenant. Naked possession, or occupancy, without colour of title or right, is good only to the extent that anyone who seeks to oust the occupier must show that he has a better right. Occupation for 12 years of land, and for 6 years of a chattel, ousts the title of the true owner. See Right of Way.

Possession. Name given to the belief, which has always prevailed in Oriental countries, that evil spirits have the power of entering into and taking possession of the life of any individual. The effect produced by this possession is twofold: (1) physical maladies, especially madness and epilepsy; (2) moral evil, vice, and crime. The belief was very prevalent in the first century of the Christian era, and the N.T. records many miraculous cures of "men possessed by demons."

There has been much discussion in recent times as to whether the belief in demoniac possession is a superstition—the survival of "animism" which is a characteristic of every form of primitive religion—or whether it represents

an objective reality. In view of the light which has been thrown by modern psychology on "dual personality" and "the divided self," the problem cannot be summarily dismissed. If it can be proved that one personality can dominate and control another, the possibility of spirit-possession must be conceded, provided that the existence of evil spirits can be proved. See Demonology.

Posset (origin doubtful, perhaps from Fr. *pusoid*, posset; cf. Welsh *posel*, curdled milk). Beverage made of milk curdled with white wine, ale, lime-juice, or vinegar, and sweetened. It is drunk usually at bed-time as a cure for coughs or colds. The milk is brought to boiling point, and the acidulous liquor added. As treacle is used it is often called treacle-posset.

Possets, PRO DES. Peak of the central Pyrenees, in the prov. of Huesca, Spain. Height 11,046 ft.

Post, WILEY (1900-35). American airman. He came from farming in his native Texas and drilling for oil in Oklahoma to take up flying and parachute jumping in 1924, though he had lost the sight of one eye. He won the Chicago-Los Angeles air race in 1930, and next summer with Harold Gatty flew round the world in 8 days 15 hrs. 51 mins. Post cut this time in July, 1933, to 7 days 13 hrs. 49½ mins. of solo flying. He was killed in a crash in mid-Aug., 1935, while trying to fly across Alaska to Siberia. With him was the film actor Will Rogers.

Postage Stamp. Small paper label, of various face values, sold by the post office to be affixed to letters or parcels sent by post, in proof that the cost of conveyance has been paid. Adhesive postage stamps were invented by J. Chalmers, of Dundee, in 1834, and came into official use in the U.K. in 1841, in succession to the Mulready envelope. The earliest types were printed in solid sheets and had to be cut out for use; perforations were introduced later. Postage stamps vary infinitely in design, colour, and watermark. They frequently bear the effigy of the ruling sovereign, but sometimes depict historical scenes. Special issues for anniversaries, etc., are often of elaborate design, some of the best printing being done in France. Surcharges of all kinds are also used for particular reasons, e.g. when a territory changes hands. See Stamp Collecting.

Postal Censorship. This is dealt with under Censorship.

Postal District. Area circumscribed in connexion with the postal service, especially of large cities, to facilitate transmission of letter and parcels. The system of numbered districts has been successfully employed in Berlin, Paris, and other capitals for many years, but in London the postal districts until 1917 were denoted only by certain points of the compass, and the letter C for Central. In 1950 London had 118 numbered districts under the old divisions, e.g. E.C.1, N.W.3 (there is no S. or N.E.), and if these details are given on the envelope the business of sorting is much simplified. The change was made during the First Great War to assist unskilled wartime sorters. Many provincial cities also have numbered or lettered postal districts.

Postal Order. A document issued at post offices for sending money. Postal orders are available in fixed values: in sixpences up to 5s., then 6s., 7s., 7s. 6d., and 8s., and by 1s. steps up to 21s. A poundage of 1d. is charged on orders of 6d. and 1s.; 1½d. on orders from 1s. 6d. to 5s.; 2d. on orders from 6s. to 21s. The value of an order may be increased on orders between two fixed values by affixing postage stamps. Each order has a counterfoil with spaces for the name of the recipient, date of dispatch, and stamp of issuing office. A postal order may be crossed like a cheque for greater security, in which event payment will be made only through a bank. Only the rightful owner may cash a postal order, and he may take legal action to recover its face value from any other person who negotiates it. Orders are valid for six months from the last day of the month of issue.

Postal Union, UNIVERSAL. International organization desiring to facilitate world postal services. Established at Berne, July 1, 1875, after an international convention had met in Paris in 1874, the union is composed of almost all countries of the world, and was founded to reduce the confusion and cost of international postal communication. One of its first acts was to abolish the surcharge levied on mails by intervening countries during transit. The principal benefits effected by the union are the guarantee of rights of transit throughout member countries, compensation for loss in transit, and some uniformity in postal rates.

Postal Union affairs are controlled by a convention which periodically revises its regulations.

Postchaise of English construction, as used in the early 19th century

Normally, congresses are held every five years, e.g. at Stockholm (1924), London (1929), Cairo (1934), Buenos Aires (1939). At this last conference Germany, Italy, Spain, and Hungary refused to sign a new convention because Czecho-Slovakia was included as a signatory state. In 1947 a congress met in Paris to approve a relationship between the Universal Postal Union and the United Nations.

Postcard. Piece of pasteboard used for correspondence through the post office (*q.v.*). In the U.K. postcards were first issued in 1870, with the object of enabling correspondents to transmit a message or greeting in brief form. They were

originally supplied through the post office with a stamp printed thereon and cost $\frac{1}{2}$ d. When printed unofficially and sold at stationers for $\frac{1}{2}$ d., they became highly popular.

Development of the picture postcard was due to the initial popularity of the $\frac{1}{2}$ d. card. British

postal regulations stipulate that no card may exceed $5\frac{1}{2}$ ins. by $4\frac{1}{2}$ ins. or be less than 4 ins. by $2\frac{1}{2}$ ins. Material must be ordinary pasteboard not more flexible than the postcards issued by the post office. Rate of postage was raised from $\frac{1}{2}$ d. to 1d. in 1918, to $1\frac{1}{2}$ d. in 1921, and to 2d. in 1940. A reply-paid postcard, double the length and folded, is authorised for business purposes. See *Picture Postcard*.

Postchaise. A light, closed, four-wheeled vehicle for travellers, said to have been introduced into England from France in 1664. It was hired for the journey, as also were the horses that drew it from one posting-house to the next.

but theatrical announcements may have been chalked on walls or posts. It is said that, in the 17th century, the posts which protected pedestrians in the streets were used for affixing theatrical and other notices: hence the word "poster." Specimens have survived of recruiting posters of the time of Louis XIV, often illustrated by woodcuts, and sometimes coloured by hand. The broadsheets of the same period may be regarded as handbills. Troupes of acrobats made use of both handbills and posters during the early years of the 18th century; the earliest true playbill extant is dated 1737.

First Lithographic Posters

The invention of lithography early in the 19th century made the current type of poster possible, although it was not at first used for this purpose. The French publishers took the lead by producing, for display in booksellers' windows, enlargements of the cover of a book or of one of its more striking illustrations. Most posters of this kind were at first in monochrome, although attempts were made to add colour by means of processes used in production of wallpapers. The honour of introducing the true colour poster is partly French and partly English. Jules Chéret, born in Paris, 1836, served his apprenticeship as a lithographer in England, where machines had lately been introduced making use of large lithographic stones. Chéret launched out as a poster artist in 1866 and, drawing direct on to the stone, produced in his prolific career more than a thousand posters. Some of his best theatrical posters, such as those for the Moulin Rouge and the Folies-Bergère, have become collectors' pieces; they have indeed been surpassed only by his own immediate followers, the greatest of whom was Toulouse-Lautrec. French painting had just reached the point where a certain simplification of outline and flattening of planes were beginning to be accepted as artistically admissible. The discovery of the Japanese colour-print in the middle of the century had had a profound influence on the early Impressionists, in particular upon Manet, and it was his example as a painter that made it easier for lesser artists like Chéret to realize the vivid colour, simplicity of contour, and unity of design without which the poster fails in its appeal.

In spite of all the good work done later the bulk of the

POSTER: PICTORIAL PROPAGANDA

James Laver, Author of *XIX Century French Posters*, etc.

Notes on the ancestry of the poster are here followed by an account of its development in the 19th and 20th centuries, and of notable poster artists. See also Advertising

In one sense the poster is a modern invention; in another it is as old as history. Any pictorial representation publicly displayed has something of the poster in it, especially if its object is propaganda. Those who were responsible for the wall-paintings in ancient Egyptian temples had already mastered the essentials of poster-technique even to the use of firm outlines and flat surfaces of colour. The contemporary poster may claim these paintings among its ancestors. Another ancestor is the public notice, with or without pictorial representation. An Egyptian papyrus has been found dating from about 150 B.C. giving details of two escaped slaves.

The Greeks made use of white-washed walls or wooden boards on which notices could be inscribed. They also painted or engraved inscriptions on the four faces of a kind of rotating square column. Such announcements were often theatrical. The Romans for the same purpose made use of a wall divided by pilasters into panels,

and on these panels they announced in black or red paint the attractions of gladiatorial shows and other amusements. That such announcements were sometimes partly pictorial is proved by the fact that the names of some of the artists have come down to us, e.g. a certain Calludes mentioned by Pliny.

The lettered poster implies the existence of a literate public. This was lacking after the collapse of the Roman empire, and until the end of the Middle Ages publicity was achieved by means of criers. The invention of printing gradually increased the numbers of those who could read and also made it possible to multiply public announcements. Governments, in the early 16th century, were even compelled to make regulations against posters and at the same time they made use of the new invention for their own proclamations. These were sometimes adorned with wood engravings of the royal arms. So far as can be ascertained the theatre in Shakespeare's day did not use posters;

masterpieces of the poster were produced in the first 20 years of the true poster's existence. No one will ever design better posters than Toulouse-Lautrec; and before the 19th century closed France could boast in addition a galaxy of names: Ibels, Anquetin, Gerbault, Bonnard, Valloton, and Steinlen.

In the U.K. poster-art took longer to get into its stride. The famous "Bubbles" advertisement was not designed as a poster; it was a Royal Academy picture by Millais purchased by the proprietors of a brand of soap and reproduced, very skilfully, in colour lithography. This procedure had a double disadvantage: it failed to obtain the simplicity of handling inseparable from the true poster, and it failed to relate the lettering to the design. In a good poster the lettering is always part of the general conception; it is not something stuck on afterwards. One of the best of the early English posters was that designed by Frederick Walker for Wilkie Collins's *The Woman in White*. Technically, however, it was reactionary, for it was produced by woodcut and printed in monochrome. Future development did not lie that way. A more hopeful approach was that of the Beggarstaff Brothers (James Pryde and William Nicholson) who produced their posters for Henry Irving and others by cutting out shapes in different tints of brown paper and mounting them in a series of simple but immensely effective designs. Some excellent examples of their work in this technique are preserved in the Victoria and Albert Museum. The French use of colour lithography was taken up in the U.K. by Dudley Hardy, whose theatrical posters of the 'nineties could hardly be bettered. The melodrama poster of the same period has no claim to any kind of aesthetic value, amusing as some of its products—for e.g. *Uncle Tom's Cabin* and *East Lynne*—may be to the student of manners. The early years of the 20th cent., however, saw many fine artists at work on the poster: e.g. Brangwyn, Hassall, Greiffenhagen, Cecil Alden, Phil May.

The influence of Toulouse-Lautrec and his rivals spread all over Europe. In Germany such masters as Max Klinger and Franz Stuck produced posters and Ludwig Hohlwein devoted himself almost entirely to this branch of art. Austria had Emil Orlik, particularly in the sphere of theatrical publicity; Belgium had Meunier,

Poster by the Beggarstaff Brothers, advertising the production of *Don Quixote* at the Lyceum Theatre, London, in 1895. Original size of poster, 6 ft. square

Cassiers, and Toussaint. In the U.S.A. the pioneers were Louis J. Mead and W. H. Bradley, followed by Maxfield Parrish, James Montgomery Flagg, and C. Dana Gibson.

Those who produced good work later are innumerable. There was a notable decline in theatrical advertising, which dwindled once more to the playbill. Some excellent posters were produced advertising various beverages, and a very real service to poster art was performed by Frank Pick of the old London Passenger Transport Board: among the artists he employed E. McKnight Kauffer (*q.v.*) stands out as a real explorer of new possibilities. But it is doubtful if such a dazzling display of talent as was to be seen on the Paris hoardings in the 1890s will be seen again.

Poste Restante. French term, also in general use elsewhere, for the department in a post office where letters can be sent to wait until the persons to whom they are addressed call for them. Originally instituted for the convenience of

travellers, the department is not usually available for use by residents in the town itself.

Post-Impressionism. An art movement. The Impressionist theory of division of tone, which was not systematically observed, was restated in 1886 by Seurat and Signac. Chromatic theories were pushed to their limits; pure, separated tints, balanced according to a scientific method, were used to depict some visual impression. But towards the end of the 19th century painters came to depend increasingly on architectural form and perception of formal relations; compositions of the school which succeeded that of the Impressionists were judged aesthetically on the ability of the artist to dispense with representational details and to break away from the camera vision.

Cézanne, the greatest exponent of this style, introduced perspective into his work by means of colour and tone. Van Gogh, Gauguin, and Renoir are sometimes classed as Post-Impressionists, though intense individuality prevented them from adopting wholly the scientific strictness of the method. Picasso and Matisse carried the movement further by combining pieces of wood, sand, and other matter with oils, and using

fragments of actual objects like strips of newsprint or advertisements in their compositions, an innovation adopted by the surrealists.

In England the school was given the name of Post-Impressionism by Roger Fry and Desmond MacCarthy, organizers of the famous exhibition in London in 1910. English exponents included Duncan Grant and Paul Nash. The movement declined with the development of Cubism.

Posting. System of road travel. By it fixed points (posts) were established on the main road, where relays of horses, drivers, etc., were known to be available. The system is of great antiquity, is found in the ancient Roman Empire and in China, and, a government monopoly in many countries, survived in Europe until the development of rly. transport. See Postchaise; Post Office.

Postmark. An official mark stamped upon the envelopes of letters, postcards, and packages

Postmarks. Postmarks of 1680, the first to be used. Lambeth receiving office stamp, centre, and two others showing times of receipt

passing through the post. The first was introduced by William Dockwra, a London merchant who in 1680 established a penny postal system in London and stamped all packages passing through his receiving offices with the date and name of the office. When this lapsed, postmarks were not again used until 1840, when Rowland Hill's penny post was established. Primarily they consisted of a coloured cross or other mark for cancelling the adhesive stamp, but later had names and dates to indicate where and when the package was posted. In the First Great War the practice arose of including in the postmark slogans and exhortations, e.g. advertisements for war loans. Postmarks have encouraged such campaigns as fuel saving, safety first, salvage collection, national savings, etc. A postmark incorporating victory bells celebrated the end of the Second Great War. Franking machines used by industrial concerns for stamping their correspondence incorporate a postmark and, if desired, an appropriate phrase; all phrases must have post office sanction, and no political propaganda is permitted.

Postmaster-General. In the U.K., member of the government in control of all departments of the post office, and, as such, responsible to parliament for policy and efficient administration. The office dates from 1710, when a general post office for the whole of the British dominions was set up in London. The postmaster-general is sometimes a member of the cabinet. Subject to certain exceptions, he possesses, by virtue of various Post Office Acts, exclusive privilege of carrying letters from place to place, and of performing all incidental services such as collecting and delivering. He is the minister responsible to parliament for the activities of the B.B.C. See Post Office.

POST OFFICE: HISTORY AND WORK

The origins of the post office are here traced from the time of the Roman empire. See also articles on Air Mail; Money Order; Postal Order; Telegraph; Telephone, etc., and on Rowland Hill, pioneer of the British penny post

The word post (Lat. *positus*, placed or stationed) is a reminder that the Roman empire, like the Persian before it, had to establish a network of couriers posted or stationed at suitable places, so that they could receive dispatches from or to the imperial centre and convey them with all speed to the next post towards their destination. Some means of rapid communication is essential to the government of a large territory; and most medieval rulers found it necessary to expend large sums to maintain couriers and posts at which they could be furnished with fresh horses, lodging, etc., or even hand over their letters to other couriers. Usually a master of the posts was appointed to superintend the arrangements. In due course merchants and other private individuals were encouraged to utilise such postal facilities; and eventually the postal service came to be regarded as a source of revenue, and reserved as a monopoly of the state authority. Often, for convenience, it was farmed out to enterprising speculators, who guaranteed to pay a stated sum to the ruler each year, recouped themselves when and how they could, and prevented anyone else from poaching on their preserve.

Thus, the state postal service was established in France in 1464; but from 1672 until the revolution it was farmed out. Napoleon remodelled it on its present lines. The Italian postal service originated in the state couriers established by the Venetian republic in

Post Mortem (Lat., after death). Term commonly used for a post mortem examination, i.e. the examination or dissection of a body after death, usually in order to discover or verify the cause of death. See Autopsy; Coroner.

Post-obit Bond (Lat. *post*, after; *obitus*, death). Bond, or written obligation, to pay a sum of money after the death of a certain person. As a rule, such bonds are given by expectant heirs. They were formerly a favourite form of usurer's security; but they are hazardous, as a court will set such a bond aside if given by an expectant heir, unless the person in whose favour it is drawn can show that he paid a fair price for it, having regard to the risk.

the early 16th century. Somewhat larger continental cities, such as Strasbourg and Nuremberg, organized their own messenger service.

In the U.K. private letters were conveyed for centuries by common carriers or by personal servants. In the reign of Edward II the system of post-houses that had been established to provide the king's messengers with a change of horses was extended to private couriers. In 1548 a statute fixed a charge of a penny a mile as the maximum rate for the hire of post horses. A chief postmaster of England was appointed under Henry VIII, and under Elizabeth the transmission of letters to the Continent was organized.

A State Monopoly

In 1635 the first inland post for public use was proclaimed, a service of messengers conveying letters along eight routes at a minimum charge of 2d. Shortly afterwards the carrying of letters along those routes by private messengers was forbidden. The state monopoly thus established has been upheld by parliament, notwithstanding several attempts during the 17th century to break it. Thus, in 1649 the common council of London set up a local service; this was promptly suppressed by the house of commons. Only one enterprise partially succeeded: the metropolitan penny post, instituted in 1680 by William Dockwra, who actually carried and insured letters and parcels up to £10 in value and 1 lb. in weight for a penny each. After much litiga-

tion, his service was incorporated as part of the General Post Office, he himself being appointed as controller of the London office. Even officially appointed postmasters could make fortunes out of improving the postal service, a striking instance being the half million made by Ralph Allen (*q.v.*).

Postal arrangements were much improved in 1784 when royal mail coaches, escorted by armed guards, replaced postboys, and the guard was made responsible for loss of time en route. The average speed was increased from six to 10 m. per hr. In 1836 the distance from London to York, 197 m., was covered in the scheduled time of 20 hrs. But the rly. era had begun. In 1830 the first dispatch of mail by train took place (Liverpool to Manchester); and soon the mail coach was running on rails.

UNIFORM PENNY POST. The greatest revolution in the postal service, however, is associated with Rowland Hill. In a pamphlet, *Post Office Reform*, he advocated in 1837 the establishment of a uniform penny post throughout the kingdom, to replace the system of charging according to the distance a letter had to be taken. At that time the minimum charge for a letter was 4d.; the average charge, 7d.; and the cost between London and Edinburgh, 1s. 3½d. Hill argued that the real cost need be only a small fraction of a penny, that the current rates were prohibitive, that if a standard charge of 1d. throughout the kingdom were imposed the volume of correspondence would so increase that the service would more than pay its way, and the social value would be very great. Although the scheme was opposed and ridiculed, a committee of inquiry was set up, and in 1839 an Act was passed enabling the Treasury to establish a uniform penny rate for the whole of the U.K. Prepayment by means of postage stamps—another great invention—replaced the cumbrous system of collecting dues on delivery. As a result of the new plan the number of postal packets carried increased within 25 years from 5 per person to 42. In 1946 the number of postal packets was nearly 7,000 millions, or more than 140 per person. Imperial penny postage was instituted in 1898, and the penny post between the U.K. and the U.S.A. in 1908. The minimum penny charge for a letter within the U.K. remained in force until 1918; while a uniform charge irrespective of distance within a territory is almost universal.

The registration of packages containing valuables dates from 1792. In that year a system of money-letters, that is, letters of advice, was tentatively introduced as a means of avoiding the risk of sending money through the post. In 1838 the dept. officially adopted the plan, calling the letters money-orders, and extending the arrangement to other countries. This method of payment was of great service before the extensive network of branch banks and the method of paying by cheque had been developed. In 1881 the issue of postal orders for small fixed amounts began. The parcel post service was introduced in 1883; it has become almost world-wide. The Post Office savings bank was established in 1861 to encourage thrift. On Dec. 31, 1946, the bank had 24,000,000 active depositors with a total balance of nearly £2,000 million.

TELECOMMUNICATIONS. The scope of British post office activities was transformed by the discoveries and inventions connected with telegraphy, telephony, and wireless telegraph transmission. At first the transmission of telegrams was controlled by private companies; but parliament in 1868 empowered the postmaster-general to maintain electric telegraphs, and two years later gave him exclusive rights in the dispatch of telegraphic messages within the U.K. Bell's telephone instrument, invented in 1876, formed the basis of several systems evolved by rival companies, whose interests were ultimately united in the National Telephone co., whose system was transferred to the G.P.O. in 1912. The wireless stations on the coast of the U.K., with certain exceptions, were acquired by the G.P.O. during 1909-10; and in 1946 Cable and Wireless Ltd., with its world-wide network of transmitting and receiving stations, was purchased by the govt. to be operated in close association with the G.P.O. Broadcasting was similarly closely linked with the Post Office in its earliest days, and the postmaster-general remains the minister responsible for it to parliament.

SAVINGS, PENSIONS, LICENCES. The G.P.O. is the govt. agent for the sale of national savings certificates and annuities, the payment of war pensions, old age pensions, retirement pensions, and family allowances, the issue of dog, motor vehicle renewal, game, wireless receiving, etc., licences, and the distribution of many kinds of official forms, particularly forms

of application for licences. The Post Office Guide, obtainable at any post office, explains the full scope of the many services carried out through post offices.

In 1946 the G.P.O. dealt with 6,230 million letters, etc.; 257 million parcels; 339 million air-mail items; it sold 22 million money orders, and 213 million postal orders; it transmitted 75 million telegrams and handled 2,368 million telephone calls, of which 193 million were trunk calls. It issued 10.4 million wireless licences. The total transactions with the public exceeded in value £3,000 million. On Jan. 1, 1947, the G.P.O. had 351,000 employees; and owned 24,000 post offices, 5,800 telephone exchanges, 52,000 telephone call offices, 1,800,000 m. of overhead telegraph wires, 21,900,000 m. of underground cable, and 42,700 m. of submarine cable. There were more than 4,000,000 telephone subscribers.

So immense an undertaking is necessarily highly departmentalised and decentralised. Management is vested in the Post Office board, the chairman of which is the postmaster-general. He is the minister responsible to parliament for the dept., is a member of the govt., and changes with it. His powers are defined by a long series of statutes. The h.q. of the G.P.O. is at St. Martin's-le-Grand, London, E.C.4. The following are the chief depts.: personnel; postal services; telecommunications; accountant-general; contracts; engineering; factories; public relations; savings; solicitor's; stores; secretary's. London has two regional directors, one for postal and the other for telecommunications work. Outside the London area regional directors are in charge of all post office services and undertakings.

SECOND GREAT WAR. The work of the G.P.O. extended to every front and included work in association with all the services at home and abroad. It was an essential link in organizing and controlling the movement of vast forces on land and at sea, and in maintaining supplies to them and to the people at home. Its postal service sustained morale. Its telephone and telegraph services, and the efficiency with which these were maintained despite bomb damage and dangers were one of the foundations of home defence. For example, the central telegraph office in King Edward Street, E.C.1, was destroyed in the great fire raid of Dec. 29, 1940; the service was

fully restored in less than three weeks in alternative accommodation. Casualties were heavy in personnel and in material. But the powers of improvisation and the courage of Post Office workers seemed inexhaustible, and interruptions to essential services were short, even after the heaviest raids.

Bibliography. Life of Sir Rowland Hill and History of Penny Postage, Sir R. and G. B. Hill, 1880; The Royal Mail, J. W. Hyde, 1880; History of the British Post Office, H. Joyce, 1893; History of the British Post Office, J. C. Hemmison, 1912; The Post Office Went to War, Ian Hay, 1946; Post Office Guide, Nov., 1946, edition and supplements.

Post Office Savings Bank. Institution set up, primarily for small savings, by the post office under an Act of 1861. Each depositor is provided with a pass book, and sums may be paid in, or withdrawn, at any post office transacting savings bank business. Warrants can be issued on the accounts; deposits are limited to £500 by an individual in any year. The bank provides facilities for investment in and the sale of government stocks and has a department dealing with national savings certificates.

Postulate (Lat. *postulatum*, something demanded). In scientific language, the demand that the truth of a principle which has not been, or cannot be, proved should be taken for granted: e.g. in geometry, the claim for the admission of the assumption that a straight line can be drawn between any two points, or that two straight lines cannot enclose a space.

Post-war Credit. Sum representing additional income tax paid by a British taxpayer during each of the years between April, 1941, and April, 1946, as a result of reductions in earned income and personal allowances made by the Finance Act, 1941; except that those who came under the pay-as-you-earn system in April, 1944, received no post-war credit for 1943-44 as part of the tax due during it was discharged. The sum was placed to the credit of the taxpayer for repayment "so soon as may be" after the end of the war. For each year in respect of which additional tax was paid, a certificate was issued. Repayment began in 1946 to women over 60 and men over 65 years old. The credits totalled about £800 millions.

Potamogetonaceae. Botanical name for the pond-weed family. In current botanical systems it is in the family Naiadaceae (*q.v.*).

Potash. Name given to various chemical combinations of potas-

sium (*q.v.*). Potassium salts is used in the same sense. Potash manures are manures originally obtained from plant ashes, but now mostly derived from natural deposits. The chief forms are muriate or chloride of potash, sulphate of potash, and kainite, which is a mixture of sulphate and chlorides of potash with other salts. *See* Manures.

Potassium. One of the metallic elements. Its chemical symbol is K (Arabic, *Kali*); atomic number 19, which makes it a neighbour of sodium in the periodic table; atomic weight, 39.096; specific gravity, 0.87; melting point, 62°C (143.6°F.). Its colour is silver-white with a touch of violet and a brilliant metallic lustre. At normal temperatures it is soft and malleable, easily cut with a knife or moulded into any form. At 0°C. it is brittle and crystalline; while at a red heat it volatilises in a green vapour. Being lighter than water it will float, but instantly decomposes the water with which it is in contact by reason of its great affinity for oxygen. A freshly cut surface is immediately covered with a film of oxide. It is therefore necessary to keep the metal under naphtha or rock oil; though even so protected it will tarnish in time, and the only way of preserving its brilliant lustre indefinitely is to seal it in a high vacuum tube. It is the metallic base of potash (*q.v.*).

Potassium was first isolated by Davy in 1807. Mankind had long been familiar with the carbonates of potassium and sodium, but had regarded them as identical. They were called fixed alkali by the Arabian alchemist Geber to distinguish them from ammonium carbonate, which he called volatile alkali; not till 1736 did the French chemist Duhamel show that the alkali of common salt was a different thing from that of wood ashes, potash, and thereafter the latter was considered and described as vegetable alkali and soda as mineral alkali.

Later the Austrian Klaproth showed that the so-called vegetable alkali was found in various mineral substances, and the term potash was given to this alkali, and natron or soda to the mineral or common salt alkali. Both substances, however, continued to be regarded as elements until Davy's discovery, though Lavoisier had suspected their compound character. Davy obtained the metal by passing an electric current through a slightly moistened piece of caustic potash contained in a platinum dish; the metal appearing at the negative

pole, while oxygen was evolved at the positive.

Potassium does not occur native in the crust of the earth, but it is widely distributed, being found in combination with aluminium and silica. With these it forms such minerals as potash feldspar and muscovite mica. It is easily leached out of the feldspar during erosion and is taken in solution into the sea. Under favourable conditions the evaporation of brine has at various geological times given rise to thick beds of the potassium salts found in sea-water (sylvite, carnallite, and kainite). The most important deposit is at Stassfurt, Germany. Natural brines are located in the Dead Sea and in California. In the nitrate deposits of Chile the most important salt is that of sodium, but potassium nitrate (saltpetre) is also present. Other minor sources of potassium are the minerals alunite, leucite, and glauconite, of which deposits occur in Germany, France, Poland, and the U.S.A.

Potassium was once obtained by reduction of the carbonate with carbon and subsequent distillation of the metal, until Castner devised a process which involved heating potassium hydroxide with an iron carbide. The mixture was heated in retorts and the metal again distilled off and condensed into a mineral oil. Modern production is almost entirely by an adaptation of Davy's original process, the electrolysis of fused potassium hydroxide; this was also devised by Castner and is exactly analogous to the method of producing sodium (*q.v.*). Caustic potash is held in an iron pot and maintained in the molten condition by a ring of gas flames. The anode of the electrolytic cell is either iron or nickel, and the molten potassium formed at the cathode floats to the surface and is periodically removed with a ladle. In a recent process a fused mixture of potassium and calcium chlorides is electrolysed. Potassium has been used, like sodium, as a hardener for lead.

Potassium Salts. Caustic potash, or potassium hydroxide, may be made by the interaction of potassium carbonate and milk of lime, the clear solution which results being evaporated in a silver vessel until all the water is driven off. The caustic potash, still liquid, is poured into moulds to form, when cold, white sticks, which are characterised by their deliquescent properties. Potassium hydroxide is now manufactured by the electrolysis of potassium chloride

solution. The name caustic potash is derived from the fact that this substance rapidly destroys both animal and vegetable substances with which it is brought into contact. It is used to make soft soap. Potassium bromide, needed in medicine, is made by decomposing bromide of iron by potassium carbonate, the iodide of potassium, another medicinal salt, being prepared in a similar manner. Potassium chlorate is an oxidising agent in industrial chemistry, e.g. the manufacture of matches and fireworks, and in calico-printing. The method of making it is described in the article Chlorates. Potassium silicate is dealt with in the article Waterglass.

Potassium cyanide, when pure, is a white crystalline substance, which will melt without decomposing; it is often sold fused with the carbonate as "cake," the percentage figure given, from 30 to 95, indicating the amount of pure cyanide. It is soluble in water, and is a compound of potassium with cyanogen according to the chemical formula 4KCN . It is most con-

veniently prepared from common yellow prussiate of potash by heating with potassium carbonate. Potassium cyanide has long been known as a solvent of gold and other metals, and is still largely used in the art of electro-plating. The successful application in 1889-90 of the MacArthur-Forrest process of extracting gold from its ores by a weak solution of potassium cyanide led to an immensely increased demand for this chemical; production increased from under 100 tons per annum to over 6,000 tons in a few years. The substance is being superseded in the gold industry by the cheaper sodium cyanide. It is a powerful poison.

The various salts of potassium have uses in photography, e.g. the hydroxide and carbonate as accelerators in developers; bromide as a restrainer, metabisulphite as the acid constituent of fixing baths; ferriocyanide as a bleacher and reducer; iodide for the compounding of intensifiers and reducers; cyanide as a reducer and solvent of silver salts; biochromate as a bleach and a sensitiser for gum. See Carnallite; Cyanide Process; Nitrate; Saltpetre.

Potato (*Solanum tuberosum*). Tuberous rooted plant, normally grown as an annual. In its natural state it is a perennial, renewing itself by means of underground stem tubers. It belongs to the family Solanaceae. Potatoes are natives of the W. regions of N. and S. America, the greatest diversity of species occurring in Chile. From these regions they were introduced by the Spaniards into Europe in the latter half of the 16th century. The best quality of table potatoes are obtained from silt, warp, or limestone soils, and the poorest quality from peat soils, but, provided the land

is well drained, potatoes can be grown profitably on all soils except heavy clays.

Cultivation before planting should be directed to providing a loose, open condition of the soil to a depth of 6-8 ins.; after planting it should aim at keeping down weeds and earthing-up

the young tubers to prevent "greening," and to protect them from blight. The crop requires liberal manuring; 10-15 tons of farmyard manure with 5-10 cwt. of artificial to the acre is a normal dressing, although much heavier dressings are applied.

Potatoes should always be grown in rotation with other crops whether they are produced on a field or a garden scale; they should not occur on the same land more often than once in three or, preferably, five years.

In the U.K. seed (i.e. tubers) is planted from Feb. to May, depending on the district and the variety. The tubers, which are often "chitted" (i.e. have been allowed to sprout), are planted 4 ins. deep and 12 ins. to 18 ins. apart in the drills. Fifteen to twenty cwt. of seed is required to plant one acre, the quantity depending on the variety and size of seed, width of the drills, and the distance apart.

In garden culture the crop is lifted with a fork or gripe. A large-scale crop is ploughed out or raised with special implements and gathered by hand. When there is blight on the foliage, unless the produce is for immediate use, the tops should be cut and destroyed before the potatoes are lifted.

Potatoes are normally stored in a pit or clamp, covered with wheat or rye straw, and after 14 days or so, to allow for sweating, earthed over to a depth of 6 ins., holes being left along the clamp ridge for ventilation. Sods of peat 2 ins. thick can be used instead of straw.

Varieties of Potato

Varieties of potato are generally grouped according to their period of maturity, and their immunity or susceptibility to wart disease. Varieties of 1st early, 2nd early, main crop, and late main crop which are immune to wart disease are available; detailed information on varieties can be obtained from the National Institute of Agricultural Botany, Cambridge, or from the local agricultural organizers.

Potatoes are subject to many pests and diseases, most serious of which are root-eelworm, wart disease, blight, and a number of maladies caused by viruses. The chief causes of attack by root eelworm, a minute parasite worm, are cultivation of potatoes too frequently on the same land, and the use of seed carrying eelworm cysts or eggs in the soil attached to the tubers. Wart disease is caused by a primitive slime fungus. Blight (*Phytophthora infestans*) attacks

Potato. 1. Under side, and 2. upper side of affected potato leaf illustrated in healthy condition in 3. 4. Diseased tuber. 5. Highly magnified portion of under surface of diseased potato leaf: A, stomata or pores through which protrude filaments, B, of *Phytophthora*, bearing sporangia, C. 6. Highly magnified portion of diseased leaf, lettered similarly to 5, showing *Phytophthora* in tissues of leaf. 7. Tuber affected with *Spongosporium* scabies

both the leaves and the tubers. Varieties differ in susceptibility, but in districts liable to attack the crop should be sprayed with Burgundy or Bordeaux mixture as a prophylactic. Virus diseases, the effect of which is a progressive reduction of yield, are perpetuated through the tubers. They are spread from infected to healthy plants by green fly. As green fly do not thrive in wet and windswept areas, seed from Scotland, Northern Ireland, Eire, and high lying areas in Wales and England, is noted for its freedom from various diseases. See Colorado Beetle.

Potato Marketing Board.

Organization of the potato producers in England and Wales set up in Dec., 1933, at the request of the National Farmers' Union to administer the bulk purchase and distribution of potatoes. The board has statutory powers under the Agricultural Marketing Acts, 1931-33. No non-member may grow or sell potatoes; all imported potatoes are purchased and distributed by the board. It determines from time to time the minimum size of potatoes that may be sold; and in normal times, to adjust supply to demand, each producer is allotted a basic acreage and forbidden to plant in excess of his allotment. The board has h.q. at Oxford.

Potato Spirit. Ethyl alcohol made from potatoes. These are heated by steam to a temperature of 140-150° C., under a pressure of from two to three atmospheres. The mass is then removed and mashed with malt at a temperature of 57-60° C., during which process the starch of the potatoes is converted into sugar. The mash is then fermented with yeast to form ethyl alcohol, which is separated by distillation. See Distilling.

Potchefstroom. Oldest town of the Transvaal, S. Africa. It stands on the Mooi river, at an elevation of 4,000 ft., 88 m. by rly. S.W. from Johannesburg, and has an aerodrome. The buildings include a university college and an agricultural college, connected with an experimental farm. The centre of a fine agricultural country, with gold mines in the neighbourhood, Potchefstroom has a large park, fine golf links, and a lake formed from the river. It was founded by a band of wandering Boers under Potgieter in 1838, and was for some time before 1863 the capital of the little Boer republic. In 1862, during the civil war, it surrendered to

Potchefstroom, South Africa. General view of the oldest town in the Transvaal

Kruger after a comparatively harmless bombardment. In the war of 1880-81, a small British force surrendered here to the Boers after a stubborn defence. On June 11, 1900, Colonel B. T. Mahon entered the town without opposition from the Boers. Pop. est. 25,000.

Poteen or **POTHEEN** (Irish *poitin*, little pot). Whisky illicitly distilled by Irish peasantry. The making of poteen arose at the end of the 18th century owing to the government's refusal to license small stills in Ireland; and smuggling became so general that in 1815, to discourage illicit distilleries, licences were granted to stills of only 40 gallons' content. Poteen is still occasionally made in remote parts. See Pot Still.

Potemkin, GREGORY ALEXANDROVITCH, PRINCE (1739-91). Russian statesman. He was born Sept.

Prince Potemkin, Russian statesman

27, 1739, near Smolensk, of an ancient Polish family. One of the conspirators who dethroned Peter III in favour of Catherine II, he early attracted the notice of the empress, and in 1762 became a gentleman of the bedchamber. In the war against Turkey, 1771, he was made a lieutenant-gen. He was responsible for the partition of Poland, 1772, and the conquest of the Crimea, 1783, which was accompanied by the wholesale butchery of some 30,000 Tartars. In 1787 he declared war against Turkey, and as commander of the army took Ochakov, Dec. 17, 1788. He died near Jassy, Oct. 15, 1791. Potemkin owed much of his influence with Catherine to his handsome appearance, which earned him the epithet of the Russian Alcibiades. His Memoirs were trans. from the German, 1812.

Potential. Broadly, a term meaning power to do work. Whatever form a particular technical definition of potential may take, it will always include this sense. A steam boiler under pressure, an elevated body of water, a cylinder of compressed gas or air, all have potential, i.e. power to do work, whenever the necessary conditions are satisfied. The essential factor of these conditions is always a difference between the initial and final states, e.g. a difference of pressure. Two steam boilers, both at the same pressure, have no potential with regard to one another; neither can do any work against the other; but when either is connected to a condenser, or opened up to the atmosphere through a steam engine, it can do work by virtue of the difference of pressures which thus arises. Its potential is measured by these differences of pressure.

In electricity, the term is used for the work done in charging a body with a positive charge brought up from an infinite distance, or taken from a body in which the electrical potential is zero. The earth itself is regarded as being on the whole at zero potential, for its capacity is so large that the addition of any ordinary sized charges will make no difference to its potential. In measuring electric potential earth potential is the standard of reference.

Electrical potential difference (P.D.) is measured in volts. Thus, when it is said that the voltage of an incandescent electric lamp is 100, it is meant that a potential difference of 100 volts is required to force through the lamp the necessary quantity of electricity to raise the filament to the temp. needed in order that it may give out its proper measure of light. (See Electricity; Units, Electrical.)

Gravitational potential, or geopotential, at any point above the earth's surface is the potential energy of a unit quantity of

material placed there. In meteorology, potential temperature is that which a sample of air would acquire if brought to a standard pressure (usually 1,000 mb.) under adiabatic conditions, i.e. conditions in which the sample of air would neither receive heat from nor give heat to its environment.

Potential Barrier. Term used in wave-mechanics. A positively charged particle on approaching the nucleus of an atom will suffer repulsion down to distances of the order of 10^{-11} cm., but at smaller distances from the nucleus attractive forces must operate—otherwise it would fly to pieces. The nucleus is considered therefore to be surrounded by a so-called potential barrier, which means that the bombarding particle has to possess sufficient energy to overcome this barrier before it can enter the nucleus. On wave-mechanical theory it is possible for some lower energy particles to "seep" through the barrier.

Potentiometer. In electricity, an instrument for measuring or comparing the electromotive force

Potentiometer. Diagram illustrating principles of the instrument. See text

(E.M.F.) of a cell, or potential difference (P.D.) across a resistance, due to the passage of an electric current.

The principle is explained by the diagram, in which X is the cell under test, S a standard Clark or Weston cell, B a battery of greater E.M.F. than either X or S, and N P a wire of high resistance with sliders *a*, *b*. The cell positive terminals are all connected with P (those of S and X alternatively through switch R). Galvanometer G is interposed between R and P. First, assume S to be connected to slider *a* on P N, and with P through R. Current from B will flow from P to N, and, encountering resistance in P N, will tend to divide and shunt part of itself through G and S to *a*. At the same time S tends to send current in the opposite direction, namely, from S to P. Galvanometer G is deflected in one direction or the other, according

as the E.M.F. of B or S predominates. By sliding *a* along the wire the two currents may be brought into equilibrium, as will be shown by G not being deflected. Cell X is then balanced in like manner against B by slider *b*, and

$$\frac{\text{E.M.F. of X}}{\text{E.M.F. of S}} = \frac{Pb}{Pa}$$

The E.M.F. of S is known; therefore that of X can be calculated. Since at balance no current flows through X and S the series resistance included with each will not affect the balance-point.

Potenza. Province of S. Italy. With the prov. of Matera it forms the region of Lucania, and is bounded N. by Foggia, E. by Matera, S. by Cosenza, and W. by Salerno and Avellino. The province has a seaboard on the Gulf of Policastro on the W. The land slopes gently from the Apennines on the W., and is well watered. The chief products are cereals, wine, and oil. This province saw heavy fighting between Allies and Germans in 1943. Pop. 430,000.

Potenza. City of Italy, capital of the prov. of Potenza. It is picturesquely placed on the E. declivity of the Apennines, near the source of the river Basiento, 103 m. E. by S. of Naples. Surrounded by medieval walls and fortifications at an alt. of 2,700 ft., it has one of the coolest climates in Italy. The city was almost destroyed by an earthquake in 1857. During the Second Great War the fine cathedral, in the Doric style, was hit by an aerial bomb and suffered in the fire which followed; the prov. museum of Lucania was damaged beyond repair, but the more important objects were stored in safety. It was taken from the Germans by a Canadian armoured formation on Sept. 21, 1943. The old Roman town of Potentia lay some 465 ft. lower down the mountain side. Pop. 25,103.

Pot Hole. Hollow in a river bed which is deepened by the gyration of accumulated stones by the current. In soft rock these holes often attain considerable size. In limestone regions solution rather than mechanical action produces pot holes along vertical or steep planes of weakness in the

rock. These may unite with cave systems dissolved out along planes of stratification. Such limestone pot holes become shafts or swallow holes, down which rivers disappear. The exploration of the larger holes, known as pot-holing, has its attractions for the adventurous. See Gaping Ghyll; Giant's Kettle; Karst; Speleology.

Poti. Seaport of Georgia S.S.R. It is 60 m. W. of Kutais, stands in a marshy district where the Rion falls into the Black Sea, and is a junction on the Transcaucasian rly. Its exports are manganese, maize, and wheat. Poti was ceded by Turkey to Russia in 1829. It is the ancient Phasis.

Potidaea. Town in Chalcidicē, ancient Macedonia. Although a Corinthian colony, it was a member of the Athenian confederacy, and its revolt in 432 B.C. was one of the causes of the Peloponnesian War. After a two years' siege, it was taken by the Athenians. In 356 it was destroyed by Philip of Macedonia.

Potiphar. Biblical character. An Egyptian, he was captain of Pharaoh's guard and purchaser of Joseph, against whom Potiphar's wife brought a false charge after trying without success to seduce him. There is little historical evidence for the story, which is told in Gen. 39.

Potlatch (Chinook, from the Nootka *patshath*, a giving). Social custom prevalent among the American Indians on the N. Pacific coast. It consists in a ceremonial giving of presents, the acceptance and repayment of which with interest are compulsory.

Pot Metal. Name of glass that has been coloured by additions of metallic oxides. The glass is coloured in the melting-pot with the oxides, in contradistinction to that which has been only superficially coloured. See Stained Glass.

Pot Hole. Two pot holes, from above, one filled with water, the other showing the stones which formed it

Potomac. River of the U.S.A. It is formed by the junction of two branches, which rise in the N. of West Virginia, and unite about 14 m. below Cumberland in Maryland. The main river follows a general S.E. course of 365 m. and enters Chesapeake Bay by an estuary from 2 m. to 7 m. broad, and nearly 80 m. long. It forms a cataract about 35 ft. high, 15 m. above Washington, at which it becomes navigable. The Shenandoah is its largest tributary. There was much fighting around the river during the American Civil War (*q.v.*).

Potometer. Apparatus used in plant physiology for measuring the rate of absorption of water by plant organs. Since under normal conditions a healthy plant loses by transpiration approximately the same amount of water as it absorbs, the rate of transpiration may be studied. Most potometers consist of a vessel filled with water and having three apertures. In one, the lower end of a shoot cut from a plant is fixed by a perforated cork in an airtight manner so that its cut end dips into the water in the apparatus. In the other two apertures are fixed a funnel with a stop cock in its stem, and a length of capillary tube. At the start of an experiment the whole apparatus must be full of water and the stop cock closed. As the shoot transpires it absorbs water out of the apparatus, and the column of that liquid in the capillary is drawn inwards. The rate of movement of the end of this column gives a measure of the rate of transpiration.

Potosí OR CERRO RICO DE POROSÍ. Mountain, dept., and town of Bolivia. The mt. rears to an alt. of 15,500 ft., is snow-capped, and is the site of one of the richest silver mines known, which was ex-

ploited by the Spaniards in the 16th century. The Cerro is 18 m. in circumference, and the borings and shafts made in the mt. sides in search of silver exceed 5,000. It is estimated that the total yield of silver has exceeded in value £500,000,000. The dept. occupies the S.W. of the country and adjoins Chile on the W. and Argentina on the S. It is crossed in the middle by the Cordillera de los Frailes, E. of which the dist. drains to the Pilcomayo; in the W. is the extensive Salar de Uyuni. The surface is generally mountainous, but it contains the wide salt swamp known as Salinas Grandes. Potosí yields gold, silver, copper, bismuth, and tin. Its area is 45,867 sq. m. Pop. est. 754,600.

The town of Potosí, one of the highest inhabited places in the world, stands at 13,600 ft. alt. on the side of the mt.; much of it is in ruins, having been in part deserted. It contains the government mint, and a large granite-built cathedral. There is rly. connexion with Sucre and La Paz. In the 17th century the city had a pop. of 150,000; now it supports some 40,000. See Bolivia.

Pot-pourri (Fr., rotten pot). French translation of *olla podrida* (*q.v.*), the name of a Spanish dish, made up of different kinds of meat and vegetables, minced and stewed. The word has come to be used for any composition, literary or musical, put together without regard to order and with no particular connexion between the parts. The name is in common use for a mixture of dried rose petals, lavender, and spice kept for its fragrance in china jars.

Potsdam.

Town of Germany. Formerly, as capital of the Brandenburg prov. of Prussia, it was the residence of the Hohenzollern kings and emperors. It is 10 m. W. of Berlin's suburbs, on the Havel and several of the lakes formed by the river, which provide a navigable waterway to Berlin. The centre of minor industries — flour

mills, chemical and food preserving plants—and of market gardening enterprises; known also for schools, museums, and scientific institutions (including an observa-

Potsdam. The New Palace, built 1763–69, by Frederick the Great

tory), Potsdam was chiefly important for having become synonymous with the Prussian spirit.

The Wendish fishing village Poztupimi, which existed from about 993, was chosen by the Great Elector for the settlement of Huguenot refugees in 1685. He built a palace here, 1660–82. Potsdam was greatly enlarged by Frederick William I, and under Frederick the Great attained splendour of architecture and the position of a German Versailles. The chief buildings date from the 18th century: the Barberini palace, the marble palace, and, most famous of all, Frederick's rococo summer palace of Sans-Souci, where he entertained Voltaire and other writers; also the art gallery, new palace, and the triumphal arch of the Brandenburg gate. There are fine parks, and the gardens were formerly laid out in elaborate formal patterns. The garrison church, 1732, has a famous chime and a crypt containing Hohenzollern tombs. Much of the town was destroyed during the Second Great War when it was captured by the Russians April 27, 1945; but Sans-Souci and some of the minor buildings remained intact. After the surrender of Germany, Potsdam lay within the Russian zone of occupation. Pop. (1950) 116,500.

The Russian-Prussian alliance against Napoleon was signed at Potsdam, Nov. 3, 1805. William II and Nicholas II agreed to a non-aggression and friendship pact here, Nov. 5, 1910. Hitler's Third Reich was proclaimed in the garrison church, March 21, 1933. The Allied conference of 1945 is noticed separately.

Potsdam Conference. Name commonly given to a meeting of representatives of the U.K., the

Potosí, Bolivia. The Cerro Rico (rich hill), pitted with the shafts of innumerable silver mines

U.S.A., and the U.S.S.R. (officially called the Berlin conference) which met in the Cecilienhof palace, Potsdam (once the home of the crown prince), July 17-25 and July 28-Aug. 1, 1945. The delegations were headed by President Truman (U.S.A.), Generalissimo Stalin (U.S.S.R.), and, July 17-25, Winston Churchill, July 28-Aug. 1, Clement Attlee (U.K., where the July general election resulted in a change of govt. during the conference). It was called to decide on the future of Germany following its unconditional surrender on May 7, and concluded with the signing, Aug. 1, by Truman, Stalin, and Attlee of the Berlin (popularly called the Potsdam) agreement, the principal points of which were:

(1) A council composed of the foreign ministers of the U.K., the U.S.S.R., China, France, and the U.S.A. was to be established and to draw up for submission to the United Nations treaties of peace with Italy, Rumania, Bulgaria, Hungary, Finland, and Germany.

(2) Supreme authority in Germany was to be exercised, on instructions from their respective govts., by the Cs.-in-C., of the armed forces of the U.S.A., the U.K., the U.S.S.R., and France, each in his own zone of occupation, and also jointly, in matters affecting Germany as a whole, as members of the control council.

(3) The purposes of the occupation were the complete disarmament and demilitarisation of Germany and the elimination or control of all German industry that could be used for military production; to convince the German people that they had suffered a total military defeat; to destroy the National Socialist party; and to prepare for the eventual reconstruction of German political life on democratic lines. No central German govt. was to be set up for the time being, but essential central German administrative depts., headed by state secretaries, were to be established. During the occupation Germany was to be treated as an economic whole.

(4) Reparation claims by the U.S.S.R. were to be met by removals from the Russian zone of occupation and appropriate German external assets; in addition, the U.S.S.R. was to receive 10 p.c. of capital equipment in certain categories from the western zones free, and another 15 p.c. in return for an equivalent value of agreed commodities. The U.S.S.R. undertook to settle Polish reparation claims from its own share. Repar-

ation claims by the other Allies were to be met from the western zones and appropriate German external assets.

(5) The conference agreed in principle to the proposal by the U.S.S.R. for the ultimate transfer of Königsberg to the Soviet Union.

(6) The three heads of govt. reaffirmed their intention to bring major war criminals to swift and sure justice; and (7) their opinion that the final delimitation of the western frontier of Poland should await the peace settlement; they agreed, however, that pending that settlement the area of Germany E. of the Oder-Neisse rivers (see Poland: map) should be administered by Poland.

(8) The three govts. also recognized that the transfer to Germany of German populations, or elements, remaining in Poland, Czechoslovakia, and Hungary would have to be undertaken, but it should be effected in an "orderly and humane manner."

POTSDAM ULTIMATUM. While the Potsdam conference was in session, a "peace feeler" from Japan reached the representatives of the U.K. and the U.S.A. through the U.S.S.R. (not then at war with Japan). They replied, with the concurrence of Chiang Kai-shek, president of the Chinese govt., by the Potsdam ultimatum of July 26 which called upon the government of Japan to proclaim "unconditional surrender of all the Japanese armed forces, and to provide proper and adequate assurances of their good faith in such action. The alternative for Japan is complete and utter destruction." Japan rejected the ultimatum.

Potsdam Sandstone. In geology, name given to rocks of the Upper Cambrian. So called from their typical formation at Potsdam, N.Y., they consist of red or yellow sandstones, and are extensively used as building stones. They are found on the edge of the Adirondacks, in Virginia, Michigan, and Wisconsin. See Cambrian System.

Potsherd. Fragment of an earthenware pot, or any broken piece of earthenware. In archaeological exploration such sherds or

Potsherd of Egyptian glazed ware, c. 1800-1800 B.C.

shards are of great importance, often enabling the successive layers in ancient settlements to be identified. A West Asian ruin-mound may exhibit Neolithic sherds at the base and Byzantine or Arab pottery on the surface, with several civilizations between. Old foundations beneath London may prove to be Romano-British, Saxon, or Tudor. The largest heap known is Monte Testaccio, in Rome, 1,000 paces round by 115 ft. high, comprising fragments of imported jars, and proving an extensive trade with Spain and Africa. Potsherds sometimes illustrate decorative styles otherwise unknown, and in Ptolemaic and Roman Egypt were largely used for business memoranda. In Anglo-Saxon graves they were intentionally thrown upon the body, a superstition mentioned in Hamlet. See Ostraca; Pottery.

Pot Still. Simple form of intermittent still, as distinct from the patent (continuous) still. It is used for distilling malt whisky in Scotland, and for both malt and

Pot Still of common type. For explanation see text

grain whisky in Ireland. The diagram illustrates a common form of pot still. The still, A, encased in brickwork, B, is directly over the fire. The head of the still, C, is attached to the condenser, D, which enters the tub, E. There the vapour is condensed and is drawn away into a receiver at F. See Distilling; Potteen; Still; Whisky.

Potter, BEATRICE HELEN (1866-1943). British writer. She published her first book for children, *The Tale of Peter Rabbit* (q.v.), in 1902; illustrated by herself, it established her fame, and was the precursor of a series of ingenious animal stories. Much of the detail of her stories, as of her pictures, came from experiences of visits to, and later, residence in the Lake District. Other characters

Beatrix Potter, British writer

include Squirrel Nutkin, Jemima Puddleduck, Mrs. Tiggy-Winkle (hedgehog), and Tom Kitten. She married William Heelis, a Lakeland solicitor, in 1913. Dying at Ambleside, Dec. 22, 1943, she left properties in the district to the National Trust. Hill Top Farmhouse became a permanent memorial to her, and some of her original water-colour illustrations are exhibited there. Consult the biography by M. Lane, 1946.

Potter, PAUL (1625-54). Dutch painter. Born at Enkhuysen, he was a pupil of his father, Pieter, at Amsterdam, and of Jakob de Wit at Haarlem. He painted landscapes with horses or cattle, generally on rather a small scale; but his famous Bull, now at the Maurits-huis, at The Hague, is nearly life-size. He passed his life in Holland

Paul Potter,
Dutch painter
After B. van der Helst

Beatrix Potter. One of her famous characters, Mrs. Tiggy-Winkle

Trent. The Potteries cover about 9 m. in length by 3 m. in breadth on the N. Staffs coalfield, constituting the chief centre in the U.K. making china, earthenware, etc. See Bennett, E. A.; Five Towns; Stoke-on-Trent.

Potter's Bar. Urban district of Middlesex, England. Situated on the Great North Road, 3 m. N. of Barnet, it has a main line rly. station. The district is controlled by an urban district council. Here on Oct. 1, 1916, a zeppelin was brought down in flames by Lieut. W. J. Tempest, the bodies of the crew being buried in the locality. Between the two Great Wars Potter's Bar, which had previously been a quiet village, expanded rapidly into a residential suburb for London workers. Pop. 16,000.

and died at Amsterdam. See Dutch School illus. p. 2879.

Potteries, THE. District in N. Staffordshire, England. It includes the towns of Burslem, Fenton, Hanley, Longton, Stoke-upon-Trent, and Tunstall, all of which were united, March 31, 1910, to form the co. bor. of Stoke-on-

of coloured enamelware (1557). Italian influence was still notable even with the 17th century decline in Italy. Delft in Holland made a ware, that was a kind of compromise between Italian majolica and Chinese porcelain, the methods being Italian, the designs Chinese. Italian potters settled in France, at Nevers, Rouen, and Moustiers.

English potters of the 16th and 17th cents. produced ware of a homely character, porringers, bowls, "tygs" (many-handled loving-cups), etc., the Staffordshire potters rediscovering the Roman art of painting on a dark clay with one of lighter tone. Wrotham, Kent, was another important centre for this class of decorated slipware (slip being the term for thin fluid clay applied as an extra surface before baking). A later and more elaborate style was developed at Leeds. It was a Burslem potter, Astbury, who discovered the peculiar properties of calcined flint, ground to powder, when combined with an earthenware body. But Josiah Wedgwood (1730-95) did most to raise the quality of English ware.

Early Stoneware

The development of stoneware so called from its greater hardness was contemporaneous with that of earthenware. Generally it was classed as *grès de Flandres* or Cologne ware. It was finished in the natural colour of the clay and glazed with salt during the firing.

Stoneware came to England from the Low Countries and Germany, the first English factories being set up at Fulham in 1611. Mortlake followed on the same lines in 1752, but fine salt-glazed stoneware was being produced at Burslem as early as 1690.

It was porcelain that chiefly occupied the potters of the E. The Chinese invented it, and great perfection in the art was attained during the Ming dynasty, 1368-1644, when wonderful colour effects were produced. In Europe, France preceded Germany in porcelain production, but before the discovery of the true clay in 1768, it was artificially composed; the first soft paste was made at St. Cloud, 1698. In 1740 a factory was established at Vincennes, which was later removed to Sévres.

The introduction into Europe of true porcelain was a distinction left to Dresden. In England, Chelsea wares were the earliest, specimens of excellent workmanship dating back to 1745. London also made porcelain at Bow from 1744, but the whole of the plant

POTTERY: HISTORY & MANUFACTURE

* David Le Roi and Gordon Stowell, A.R.C.A.

An account of the origin and development of the potter's art is followed by a full description of the modern processes employed in manufacture, firing, decorating, and glazing. Cross-references to other entries on the subject are given at the end of the article

Pottery is the general name given to earthenware fabrics, vessels, ornaments, etc. The shapes are fashioned out of moist plastic earths (clays), hardened by air-drying or by firing. It was probably invented E. of the Caspian, whence it spread to the Persian Gulf and to pre-Sumerian Eridu and Ur. Its presence in Danish kitchen-middens suggests that it existed in Neolithic Europe. The primeval fabrics were fired on the open hearth by the women of the household. Most of the world's utilitarian and hand-made pottery has been, and is, produced by women; their crude undecorated jars are still fired on the hearth in the Outer Hebrides. The fashioning of vessels on rounded pebbles or pivoted stone disks enabled the potters to keep the fabrics turned towards them as they modelled the clay, and this practice culminated in the invention of the potter's wheel, perhaps in early

dynastic Egypt, where also the open hearth was replaced by the pot-oven or kiln. Enamelling, painting, turning, varnishing, and glazing were later developments.

Greek pottery vases of good form of workmanship date from 900 B.C., the fine vase period extending from the 7th to the 3rd centuries. Enamelled earthenware was introduced into Europe mainly through the Moors in Spain, the art spreading to Majorca and Sicily, thus preparing the way for the great works of the Italian Renaissance. Many Italian cities became famous for ceramic productions, e.g. Gubbio, Faenza (hence the name *faience*), Siena, Urbino, Pesaro. Among the great masters of the art are Luca della Robbia, Giorgio Andreoli, and Francesco Xante. It was probably a piece of Italian majolica that inspired the Frenchman, Bernard Palissy, in his experiments which led to the perfection of his process

and stock was transferred to Derby in 1776. Worcester made porcelain from 1751, using from 1755 the true kaolin or china clay which had been discovered in Cornwall. The discoverer, W. Cookworthy, opened a factory at Plymouth, 1768, transferred to Bristol three years later. Plymouth paste was a true hard porcelain, and Bristol body is the hardest known, not excluding the ideal Chinese ware. The Bristol works were closed 1781.

During the 19th century pottery manufacture increased enormously in every country, greatly helped by the introduction of machinery and the invention of new processes; but on the whole these were all based on the processes of the late 18th century. In England the old Derby works ceased and a new factory took its place, while such well-known names as Spode and later Copeland, Minton, and Doulton, first became prominent. The district now known as the city of Stoke-on-Trent, became the centre of the British pottery trade.

POTTERY MANUFACTURE. Clay deposits are of many grades, but mostly so coarse that cracks occur when they are fabricated and kilned. The commonest clays are suitable only for making bricks and tiles. China clay in the U.K. is found in Dorset, Devon, and Cornwall, the finest deposits being at Carclaze, Cornwall. The clay is formed by the decomposition of granitic rock, and consists of the hydrated silicate of alumina, with traces of lime, potash, soda, and magnesia. But even this is seldom used in its natural state for pottery, and different manufacturers use various admixtures, based on china clay, flint, Cornish stone, or calcined bone.

For good quality pottery, ball clay and china clay are separately mixed with water in a "blunger," which is a vat or hopper with mechanically operated blades that rotate and churn the liquid to the required consistency. The clay is fed into the upper part of the vat and the knives are so placed that they knead and mix the clay downwards to eject it in the form of a cream through an opening in the bottom of the hopper. The blunging process takes from two to eight days. The additional ingredients are ground in stone mills to the consistency of fine powder, sifted through a silk screen, and mixed with water. The clay and the other ingredients are then run into separate arks, or

storage tanks, where they are kept in agitation to maintain their consistency until they are required for blending.

From the storage arks the correct proportion of each ingredient is pumped into a measuring tank, then run into a blending ark. The mixed liquid is then passed through fine sieves as well as over an electro-magnet to extract ferrous matter, then pumped by pressure into filter presses (flat chambers lined with linen), which leave a thin square slab of plastic clay weighing approximately 1 cwt.

This clay being too solid for working, it is next passed through the pug mill, where it is made homogeneous, and whence it is extruded in a snake-like roll cut into suitable lengths.

Throwing and Casting

Clay articles may be cast from moulds or turned or "thrown" on a wheel. Throwing on the potter's wheel is the most ancient method of making pottery, the only important modification since Egyptian times being the substitution of mechanical for manual power. A ball of soft clay is thrown on to the centre of the wheel, and the thrower works the rotating mass into a cone. Then he presses it down again, and continues working it up and pressing it down until he is satisfied that the clay is of even consistency and running true on the wheel. The mass of clay is then opened out by pressing the thumb into the centre and pulling the clay into a cylindrical shape. Finally, with one hand inside and the other out, the thrower forms the vase or other article, which is then cut away from the wheel with a short length of wire and set aside to dry partially.

When dried to a green hardness not unlike the consistency of cheese, surplus clay is shaved off by lathe to the correct outline and dimensions. The lathe is then reversed, and the article burnished.

Mass-produced articles are cast from plaster of Paris moulds. Plates and other shallow articles are made on a machine called a jigger. A ball of clay is placed on a revolving disk over which it is evenly distributed by the lowering of an automatic spreader. The bat, or circular pancake of clay so formed is then placed on a plaster mould, which shapes the front of the plate as it is rotated at high speed. The back of the plate is formed by a horizontal metal profile, which also rotates. Cups and small basins are shaped on a

"jolley." A ball of clay is placed in a mould to form the outside of the article. The mould containing the solid piece of clay is placed on the rotating head of the jolley, when the cup-maker draws up the clay from the inside. A metal profile is then lowered to form correctly the inside of the cup, the setting and pressure on the profile governing the thickness of the cup.

Handles are made by pressing from a mould, by casting, or from clay squeezed into long strips through a machine and then cut and shaped by hand. The handle is fixed to the jug, cup, or other article with a touch of clay mixed with water. Embossed ornamentations, which are cast from moulds, are applied by hand after moistening the surface with water.

Having dried to white hardness, the clay pieces are ready for the first, or bisque, firing. In older potteries, where kilns are coal-fired, the articles are placed in coarse earthenware containers called saggars. These prevent uneven baking, and also protect the pieces from smoke. In large modern potteries the kilns are electrically fired, and it is unnecessary to employ saggars. Cups, vases, and bowls are placed on racks, while plates are bedded in layers of sand. After having been subjected to a maximum temperature of 1200° C., the articles are cooled, and the clay has been transformed into a hard, durable, but porous substance known as bisque, or biscuit.

Decorating and Glazing

After this initial firing, the articles may be decorated, either by a printed design or by hand-painting. Sometimes they are glazed before decorating. Under-glaze colours are more durable, but the high temperature of the glazing kiln limits the number of colours which may be used. The printed design is applied to the article in the form of a transfer. As an oil vehicle is used for mixing the colours, and the paper backing to the transfer prepared with a water medium, immersing the pottery in water removes the paper and leaves the pattern upon the ware. The article is then passed through a hardening-on kiln which fixes the colours printed on the biscuit, or fuses the colour to the glaze in the case of those printed on the glaze. Printed patterns can be enriched by the addition of ceramic enamels.

The painter uses a great variety of colours, all metallic oxides.

Pottery. Modern methods of manufacture. 1. Pug machine, which prepares the clay. 2. Automatic moulding. 3. Casting from plaster mould. 4. Shaping by means of a "jigger." 5. Stacking "saggers" for firing in intermittent oven. 6. "Biscuit" entering electric oven. (J. Wedgwood & Sons, Stoke-on-Trent)

For overglaze painting, fluxes or colours containing glaze in the mixture are required. From gold is obtained crimson; from cobalt, blue; from chromium, green; from iron, red; from antimony, yellow. Considerable experience is necessary, as the purity of tone, and sometimes even of colour, does not appear until after firing. The ceramic decorator's greatest difficulty is that some colours will not mix with others, but will react in the fire to their mutual destruction.

Glazing may be done before or after decorating, except with enamel, which requires a final firing. The article is dipped in a liquid glaze compound of frit (a glass-like substance ground and mixed with water), clay and flint. The water from the glaze is absorbed by the porous biscuit ware, leaving a thin film of glaze on the surface of the piece, which is then dried in a heated chamber before passing to the glost oven. While in the oven, the articles are separated by fire-clay supports to prevent them from being pressed

together by the glaze, which vitrifies at high temperature.

Firing enamelled ware is the last process of manufacture, and some highly-decorated pieces require repeated firings according to the number of colours employed, certain colours having to be applied after preliminary firings. In the process of heating, particularly when the kiln is not constant-heated by electricity but is coal-fired, there is sometimes unequal expansion and contraction of the clay and its glaze, resulting in the enamel being covered with a network of little splits. When the network is very fine it is called speckled, and when coarse, cracked. This is occasionally deliberately done as a form of decoration.

Salt-glazed ware or stoneware is used for such common articles as drain-pipes or ginger-beer bottles. The clay article is exposed to the intense heat of an open oven or kiln, no protection being placed between the fire and the clay. When the ware is almost at white heat, a quantity of common salt is thrown upon the fires and dropped

through holes in the dome of the oven. Volatilisation takes place, and the salt vapour clings around the ware; the silica in the clay combines with the sodium from the salt, forming a thin glass glaze on the surface of the piece, while the chlorine, being set free, escapes. Potting. Placing plants either from the open ground or from seed boxes in pots, usually for cultivation under glass. Both pots and

saucers, before use, should be scrubbed inside and out to ensure cleanliness and proper porosity. To secure the necessary drainage, the pot should be filled to about one-third of its depth with pieces

Potting. Sectional views showing, left, correct method of placing broken matter in pots; right, position of plant when potting

of broken pots, chips of brick, oyster-shell, broken charcoal, etc. The usual potting mixture is loam and leaf mould, with a liberal mixture of sand, the latter inducing the plant to throw out fresh roots. *See Gardening.*

Potton. Market town of Bedfordshire, England. It is 11 m. by rly. E. of Bedford. The old church of S. Mary has a Norman font. The industries include engineering works, market gardening, and the making of leather and parchment. Potton was formerly a centre for straw plaiting and lace making. Pop. 1,955.

Pott's Fracture. Fracture of the lower end of the fibula, called after the man who suffered from it and first described it. It is associated with injury of the lower articulation between the tibia and fibula, the two long bones between the knee and the ankle. It can easily be mistaken for a sprain.

Pottsville. City of Pennsylvania, U.S.A., the co. seat of Schuylkill co. It stands on the Schuylkill river, 35 m. N.N.W. of Reading, and is served by rlys. Picturesquely situated at 700 ft. alt. on the declivity of steep hills, it is much visited by tourists and is the centre of an anthracite region. Among industrial plants are rly. workshops, boot and shoe and shirt factories, and textile and silk mills. Buildings include the co. court house and a public library. Pottsville, settled about 1800, was made a corporate town in 1828. There were Molly Maguire (*q.v.*) disturbances here, especially in 1876-77. Pop. 24,530.

Potwalloper. Name formerly given in certain English boroughs to the man entitled to vote at parliamentary elections. The origin of the word is doubtful, but it has some connexion with the right of boiling a pot, i.e. the right to a fire and hearth, this giving the right to the franchise.

There were potwallopers in Taunton until their rights were extinguished by the Reform Act of 1832.

Pouched Rat (*Geomys*). Genus of about eight species of burrowing rodents of the family Geomyidae. They are natives of N. and Central America. They have small eyes and ears, and fur-lined cheek pouches opening to the exterior. The fore-feet have strongly developed claws fitting them for digging. The best known species is the pocket gopher (*q.v.*).

Poughkeepsie. City of New York, U.S.A., the co. seat of Dutchess co. It stands on the E. bank of the Hudson river, 75 m. N. of New York City, and is served by the New York Central and Hudson River rly. and by a steam ferry. The Hudson is here crossed by a handsome cantilever bridge almost 7,000 ft. long. Poughkeepsie is the seat of Vassar College, and contains the Adirance memorial library and several educational and benevolent institutions. The manufactures include clothing, dairy machinery, and oil separators. Settled by the Dutch in 1698, Poughkeepsie became the state capital in 1778, and received a city charter in 1854. Pop. 40,478. *Pron. P'k-ippsey.*

Pouillet, CLAUDE SERVATS MATHIAS (1791-1868). French physicist. Born at Cusance, he was educated at the École Normale, Paris. He became director of the Conservatoire des Arts et Métiers in 1831, resigning in 1849 to make a study of physics. Famous for his invention of the tangent and sine galvanometers and of a type of pyrheliometer, he died June 15, 1868.

Pouishnoff, LEFF (b. 1891). Russian-born British pianist. Born Oct. 11, 1891, he studied at St. Petersburg (Leningrad) conservatoire, where he won the Rubinstein prize. He played in public at Uman in 1896, and first appeared in London in 1912. In the principal European cities and in the U.S.A. his Chopin recitals were well attended. A British subject from 1931, Pouishnoff composed works for the piano, including *Quand il Pleut*; *The Musical Box*; *Petite Valse*. His wife Dorothy (Hildreth) was also a pianist.

Poulaines or **POLEYNs**. Long pointed shoes worn in the 14th

and 15th centuries, also termed Crackowes. It is assumed that they gained this latter name from Cracow and the former from Po-

Pouched Rat. The American rodent with large cheek pouches

land, whence, apparently, the fashion came. *See Boots and Shoes.*

Poulenc, FRANCIS (b. 1899). French composer, born in Paris, Jan. 7, 1899. He began to compose during the First Great War, one of his earliest works being *Rapsodie Nègre*. Influenced by Satie, he opposed the impressionist school, and was one of the group known as Les Six. Of his ballets the best-known was *Les Biches*, 1923; his comic operas included *Le Gardarme Incompris*, and *Les Mamelles de Tirésias*. Poulenc wrote much for wind instruments and for piano. His inventiveness and sophisticated humour were at their best in such works as *Cocardes*; *Marches et un Intermède*; *Bal Masqué*. He also made settings of Apollinaire's poems.

Poulsen, VALDEMAR (1869-1942). Danish electrical engineer. Born at Copenhagen, Nov. 22, 1869, he joined the Danish telephone service, and in 1898 invented the telegraphophone, an electromagnetic phonograph registering human speech by magnetism. In 1903 he developed a singing arc which utilised inductance and capacity to produce continuous oscillations. The Poulsen arc was used by radio stations throughout the world, but was ultimately modified by later techniques. He died in New York on Aug. 6, 1942.

Poulsters' Company, THE. London city livery company. Existing as a voluntary association in the middle of the 14th century, it was first incorporated by charter, June 13, 1665. The office of the company, which lost its hall and other property in the Great Fire of 1666, is at 16, St. Andrew Street, E.C.4.

Poulton, SIR EDWARD BAGNALL (1856-1943). British scientist. Born at Reading, Jan. 27, 1856, he

Leff Pouishnoff,
Russian-British
pianist

Poulsters' Com-
pany arms

was educated at Jesus College, Oxford, where he took high honours in natural science. In 1877 he was made demonstrator in comparative anatomy at the university museum, and in 1893 Hope professor of zoology at Oxford, holding the chair for 40 years. He was vice-president of the Royal Society, 1909-10; president of the Linnean Society, 1912-16; of the British Association, 1937; and several times of the Royal Entomological Society. Among his books are *Charles Darwin and the Theory of Natural Selection*, 1896; *C. D. and the Origin of Species*, 1909. Knighted in 1935, Poulton died Nov. 20, 1943.

Poulton-le-Fylde. A market town and urban dist. of Lancashire, England. It stands on the river Wyre, 3 m. N.E. of Blackpool, and is served by rly. It has an interesting church, S. Chad's, and a market cross, near which are preserved the stocks and whipping-post. At one time Poulton was a seaport. Market days, Mon. and Thurs. Pop. 7,600.

Poultry (Old Fr. *pouletrie*, cf. Eng. *pullet*). General term for domesticated fowls, ducks, geese, and turkeys. Poultry farming may be defined as the breeding of poultry for profit derived from eggs or table birds. A poultry farm may be from five to five hundred acres in extent, and the stock may be mixed or of one breed only.

A successful poultry farmer needs a natural aptitude for the work and previous experience with poultry either on a farm as a pupil, or through a course of training at an agricultural college. Knowledge of fowls and their ailments, of foodstuffs and their constituents, of mating, artificial incubation, rearing, fattening, trussing, shaping, and preparing for market is required.

In the British Isles few localities have a soil and situation entirely unfavourable to poultry rearing, but the site should be fairly high, undulating, and well drained naturally and artificially, with a slight slope to the S.E., S., or S.W. Lack of natural drainage and exposure to cold winds are the two great objections to flat land. The soil should preferably be light loam on a gravel subsoil. Hills, woods, or belts of trees on the N. and E. are an advantage, as they afford shelter and break the force of the cold winds from those quarters; hills on the S. and W. are to be avoided as they deprive the site of most of the direct rays of the sun in autumn and winter.

An abundant and unflinching water supply is essential. Proximity to post and telegraph offices and a station on a main line is advantageous, and the farm should also be within short train distance of a good-sized industrial town, since rly. rates for produce are a heavy item of expenditure.

The farm should be equipped with up-to-date houses and appliances, and the advice of a reputable manufacturer of poultry appliances may well be sought by the beginner. The utility breeds of fowl fall into three classes: general purpose breeds that combine table with fair laying qualities, laying breeds, and table breeds. In the first named class are Langshans, Orpingtons, Plymouth Rocks, Rhode Island Reds, and Wyandottes; in the second, Leghorns, Minorcas, Andalusians, and Anconas; in the third, Dorkings, Indian Game, and some of the French varieties, or crosses of these with other breeds.

The general purpose fowls are excellent winter layers. The laying or non-sitting class are wonderfully prolific, they are hardy and quick growers, and their eggs are large, generally weighing over two ounces. Most of their eggs, however, are laid during the spring and summer, when eggs are plentiful and cheap. They possess no value as table birds, their flesh being stringy and hard. The table breeds produce carcasses most suitable for marketing.

Ducks and Geese

Ducks, although aquatic in habit, will thrive almost anywhere, and the best table birds are ducks that have never had a swim. Geese thrive in almost any situation, and so do guinea-fowl. Turkeys need great care as they are delicate. As a general rule they do better on light soils; yet, in a very dry year, when green food is scarce, they may do better reared on a heavy soil, which would not ordinarily suit them. A rich but not heavy soil gives good results in turkey breeding and rearing.

Poultry requires skilful management and enterprise on the farm, combined with careful study of and adaptation to available markets. It is generally considered that no one should embark on poultry farming who is not prepared to carry on for at least two years without profit. The establishment and running of a successful poultry farm entail hard and unremitting work, and constant attention to detail; nor are the profits normally large.

TABLE FOWLS. The price of chickens is normally low in the autumn and winter months when, the egg producing season being over chickens are killed off. Tender and easily digested, chicken flesh is ideal meat for invalids. Quality, uniformity of size, shape, colour, texture of skin and flesh of dressed poultry are important. Small active breeds usually possess small muscle but relatively tough tissue, and the flesh, when prepared for the table, is relatively tough. A well fleshed, compact body, with short legs and wings, is generally looked for in dressed poultry of good quality. Large birds have coarse flesh.

Age can be judged by the thick connective tissue surrounding the muscle fibres, and the coarseness of the flesh. The age of dressed fowls is detected by the hardness and firmness of the keel bone. A young bird has a loose and soft cartilage supporting its keel bone. Dry skin, hairs on the body, scales on the shanks, hardness of the feet, and long toe nails, hard and curved spurs, and hardened windpipe are all indications of age. Coarser skin, larger bones and body, and the development of the spur indicate the male. Capons have small heads and withered combs, narrower and pointed feathers, and undeveloped spurs.

Killing and Plucking

Birds are usually specially fed for three weeks before killing. Milk feeding, with a mash of cornmeal and buttermilk, results in good quality flesh softer than that of a corn fed bird, the skin is whiter, and the flavour better. Before killing, especially after three weeks of concentrated fattening feeding, the bird is starved for 24 hours, to empty the stomach and facilitate bleeding. Proper bleeding of the carcass is essential. The veins of birds not properly bled are usually discoloured, particularly on the breast and neck. If green coloured, showing decomposition of the blood, the bird's flesh may cause ptomaine poisoning.

Plucking is usually done at the time of killing. Scald picking, after the bird has been dipped into water at a temp. of 200° F., is much easier than dry picking, but scalding heightens the colour, tends to destroy flavour, and reduces the time the bird will keep.

After killing and plucking, animal heat is removed, in order to prevent the entrance of bacteria into the carcass, by holding the birds in a chilling temp. of 32° F. for 24 hrs. The carcasses are then

trussed and pressed and wrapped in grease proof paper, and packed, 24 to a case, in light wood cases, average weight of the filled case being 100 lb.

DOMESTIC POULTRY KEEPING. Fowls are kept in the garden usually for their eggs rather than their flesh. An expensive hen house is not necessary as a few hens can live in any shed or large case that is watertight and has a floor than can be kept clean easily. The house must have an opening protected by wire netting, and fitted with a solid, easily operated shutter; a door left open in the day, so that the hens can go in and out at will, but shut and secured at night; and perches inside the shed. Twelve birds need approx. 12 ft. of perch. The shed must have several removable nest boxes, their floors covered with plenty of hay. The whole of the interior should be lime-washed and paraffined to prevent disease.

Fowls in the Run

A run as large in area as possible, and providing not less than 10 sq. yds. per bird, should be enclosed with fencing at least six ft. high. The run should be divided into three parts, the hens using one part at a time. When they have eaten the grass and stamped down the earth on one part they should be allowed into the next, and the first ground prepared for new grass or covered with gravel.

Green stuff—lettuce and cabbage—should be hung on the fencing as high as the hens will jump. This gives them exercise. They should be given all the household scraps mixed with biscuit meal to a crumbly condition (never slop). The ration per bird is 2 oz. of corn and 2½ oz. mash per day; the mash is put in long troughs, the corn is scattered on the ground. Dried grass mowings and potato mash are substitutes. Corn in the morning and mash (served warm) in the evening is the rule.

The "battery" system, in which fowls are deprived of exercise and kept in laying boxes all their lives, is suitable for domestic as well as large-scale poultry keeping.

Fowls suffer from many diseases. Red mite is the most common; washing the house with lime mixed with paraffin is the best cure. For scaly leg or roughening or thickening of the legs, the legs should be soaked in paraffin, the remaining paraffin as well as that which runs off the legs being burned. Birds often get crop bound; salad oil is the best cure.

Successful poultry keeping entails cleanliness, method, and regularity. Thorough cleaning of shed or coop and nesting boxes is necessary at least weekly. Lime washing of interiors should be done every three months. Overcrowding must be avoided. The beginner should buy a few laying pullets and not attempt to rear chicks until he is experienced. When egg production falls off for no apparent reason it is cheaper in the long run to kill, and procure fresh pullets. Egg producing birds, when they must be killed, are usually better boiled than roast. See Bird; Duck; Egg; Fowl, with colour plates; Leghorn; Minorca; Orpington; Turkey, etc.

A. B. Miller

Poultry, THE. London thoroughfare. Linking Cheapside with the Mansion House, E.C., it is named after the market for poulterers held here in early times. On the N. side, S. of Grocers' Hall, stood a sheriff's prison famous as the Poultry Compter, which had a ward set apart for Jews. The poet Dekker and the martyr Bradford were among its occupants. It was taken down in 1815. Poultry Chapel, a Congregational building put up on part of its site, was acquired in 1872 by the London Joint Stock Bank for £50,200, which the congregation employed for the building of the City Temple (*q.v.*). Bunyan's Pilgrim's Progress

was published from a bookseller's shop in the Poultry, and Thomas Hood was born here.

Pounce (Fr. *ponce*, pumice). Powder used for rubbing on vellum or parchment where erasures had taken place, so that ink could be employed without its spreading. Pounce consisted of powdered cuttle-fish bone or sandarac. Sand used, until replaced by blotting paper, for drying writing made with ink was also known as pounce.

Pound. Unit of weight. The English unit of weight is the pound avoirdupois of 7,000 grains divided into 16 ounces. It was made the legal unit of weight in 1855, and the standard pound made of platinum is deposited in the Standards office at the board of trade, while authenticated copies are in the mint, houses of parliament,

etc. One pound is equivalent to roughly 0.4536 kilogram, and one kilogram to 2.2046 pounds. The pound troy consists of 5,760 grains, divided into 12 ounces, and is the measure used for gold and silver. The contraction lb. for pound comes from the Latin *libra*, balance. See Avoirdupois; Grain; Troy Weight.

Pound. British monetary unit, in full the pound sterling. It was originally a weight of silver, i.e. 5,760 grains of a certain standard of fineness. Such a pound weight of silver was a Roman money standard, and was adopted by the countries they conquered. The silver pound was coined in England into 20 silver shillings. The term gradually came to mean the same as the sovereign. In 1816 the silver standard was abolished and replaced by a gold one, the gold sovereign or pound sterling becoming the unit. Weight was fixed at 123.274 grains, and fineness at 22 carats. See Exchange; Sterling.

Pound (A.S. *pund*, enclosure). Enclosure erected by legal authority, in which cattle distrained for

Pound. Enclosure for cattle. The old roadside pound at East Burnham, Bucks

rent, or caught straying and doing damage on land belonging to another than their owner, or straying on the highway, can be confined pending payment of the rent, damages, or penalty and expenses. A pound was either overt—one to which persons could resort without trespassing; or covert—on private property, as when the owner of land on which animals had done damage detained the beasts thereon. Pound breach, in law, is a misdemeanour consisting in the unauthorised removal of distrained animals or goods from a pound, or in doing damage to the pound itself. The goods, in the case of distress, being from the first in the custody of the law, and not in that of the distrainer, their forcible recovery was regarded as a serious offence.

Pound, Sir Alfred Dudley PICKMAN ROGERS (1877-1943). British sailor. Born Aug. 29, 1877,

he was educated at East Grinstead and Greenwich. He commanded H.M.S. Colossus at the battle of Jutland, May 31, 1916. Director of the Admiralty plans div.,

1922-25, he next was chief of staff to Keyes in the Mediterranean. Having been assistant chief of the naval staff, 1927-29, he commanded a battle cruiser squadron, and in 1932 was appointed second sea lord and chief of naval personnel. Knighted 1933, Sir Dudley became C-in-C. Mediterranean fleet in 1936, and was first sea lord and chief of naval staff shortly before the Second Great War. He attended most of the principal conferences between Winston Churchill and Roosevelt, and was taking part in U.N. staff talks, when he died Oct. 21, 1943.

Pound, Ezra Loomis (b. 1885). American poet. Born at Hailey, Ida., Oct. 30, 1885, and educated at Pennsylvania university, he settled in Europe in 1907 and founded the Imagists school of poetry. A scholar with a remarkable knowledge of medieval literature and a gift of rhythmic invention, he became known both for individual verse and for translations of Provençal, Latin, Chinese, and Italian poets. His works included *Canzoni*, 1911; *Ripostes*, 1912; *Umbra* (collected early poems), 1920; *Personae*, 1926; and several volumes of *Cantos*. In prose he wrote a *Life of Gaudier Brzeska*, 1916; *Indiscretions*, 1923; *Imaginary Letters*, 1930. An admirer of fascism, he was accused of treason, having broadcast in Italy for Mussolini during the Second Great War, but was declared mentally unsound by an American district court jury in 1946.

Ezra Pound,
American poet

Poundal. Unit of force. It is the force which, acting on one pound weight, gives it an acceleration of one foot per sec. per sec.

Hence a pound weight (which when falling acquires a velocity of 32.19 ft. per sec. per sec.) equals 32.19 poundals, or a poundal equals 0.031 lb. wt.

Pounds, (Charles) Courtice (1862-1927). British actor and singer. Born in London, May 30, 1862, and trained at the R.A.M., he made his first success in the part of Fairfax in *The Yeomen of the Guard*, at the Savoy Theatre, London, 1888. He appeared in all Gilbert and Sullivan operas there until 1892, and afterwards toured in Australia and America. He acted in *The Duchess of Dantzic*; *Chu Chin Chow* (*q.v.*), in which for nearly five years he played Ali Baba; and *Lilac Time*, creating the part of Franz Schubert. He died Dec. 21, 1927.

Pounds, John (1766-1839). British philanthropist, born at Portsmouth, June 17, 1766. He was apprenticed to a shipwright, but at 15 was crippled through an accident, and became a shoemaker. He became interested in poor children, teaching them reading, arithmetic, and the rudiments of useful knowledge, and thus originated the movement for the institution of ragged schools (*q.v.*). His influence among the poor was great, and after his death, Jan. 1, 1839, several memorial schools were established.

Poupart's Ligament. Ligament running along the groin from the bony prominence of the pelvis at the side of the lower part of the abdomen to a bony point near the middle line. See *Anatomy; Man*.

Poussin, Gaspard, or Le Gaspre (1613-75). French painter, whose real name was Gaspard

Dughet. Born at Rome, of French parentage, he studied under his brother-in-law, Nicholas Poussin, who had become a member of the Dughet household, and whose name he adopted. Later he came under the influence of Claude. He excelled in stormy landscapes. He died at Rome, May 27, 1675.

Poussin, Nicholas (1594-1665). French painter. Born at Villers, near Les Andelys, Normandy, he studied under Quentin Varin and in Paris.

Nicholas Poussin,
French painter
Self-portrait

In 1624 he made his way to Rome, and after a hard struggle obtained the patronage of Cardinal Barberini. Painting historical pictures and landscapes in the classical style, he rapidly achieved fame, and in 1640 was induced by Richelieu to come to Paris as painter to Louis XIII. In 1643 he returned to Rome, to fetch his wife, the sister of Gaspard Dughet, and never returned, dying at Rome, Nov. 19, 1665.

In Paris Poussin executed a *Last Supper*, for a royal chapel, and *Triumph of Truth*, for Richelieu. Probably his most famous picture is the *Vision of St. Paul*. His essentially classical art and his practice of incorporating figures from Raphael and other old masters had great influence on French painting. He is well represented in England in the National Gallery and at Dulwich, and splendidly in the Louvre.

Nicholas Poussin. *The Triumph of Flora*, depicting the goddess in her car, drawn by Cupids, two of whom are crowning her with flowers: one of the artist's most beautiful classical paintings
Louvre, Paris

There are studies by P. Desjardins, 1903; W. Friedländer, 1914; E. Sutro, 1923.

Pout (*Gadus luscus*). Marine fish of the cod family. Nearly related to the whiting, from which,

Pout. Fish, nearly related to the whiting, found around the W. shores of Europe

however, it differs in the possession of a chin barbel and deeper body, it occurs round the W. shores of Europe, and reaches a weight of 5 lb. The pout is also locally known as the bib and brassy, and it is to some extent used for the table. See Fish.

Povindah. Class of Afghan merchants engaged in the caravan trade between India and central Asia. Mostly Ghilzai, they migrate each autumn from their Ghazni homes with their families, flocks, and herds, which they leave behind on reaching the Indian frontier. Thence they carry the produce of Bokhara and Samarkand through the sub-continent.

Powder Metallurgy. Metal working process. The founder of this branch of metallurgy was W. H. Wollaston (*q.v.*) who, at the beginning of the 19th century, introduced a process for producing ingots of platinum without melting, the temps. attainable with the furnaces of his day being inadequate to melt the metal. He compressed platinum sponge in a small brass barrel, removed the cake, and heated it to about 1,500° C. (more than 250° below the melting point of the metal), when it formed into a solid block which could be forged or drawn into wire. Later tungsten powder was similarly treated. In the 20th century the method was applied not only to those metals which are difficult to fuse, but also to metals such as copper and iron in the manufacture of articles too complex in shape for casting, or in particular applications.

Metal powder is prepared to about the fineness of coarse flour or fine sand; it is screened to pass a 150-mesh British standard screen, little of it being below 350 mesh. The particle size, usually distri-

buted fairly evenly between 150 and 350 mesh, varies with the metal used and the article to be manufactured. The commonest method of producing the powdered metal is to reduce the metal oxide, which can be easily crushed and sized before reduction. Town gas is commonly used for reducing powdered copper scale to pure copper powder, and iron powder of high purity can be made in this way. The refractory metals, tungsten, titanium, molybdenum, etc., are made in powder form by reduction of their oxides with hydrogen at temps. about half as high as their melting points. Another method is by electrolytic deposition, using current densities very much higher than those normally used for electro-deposition. Copper and iron are deposited in such a form that they can be scraped off the cathode in a powder. Atomisation is used not only for pure metals, such as zinc, but also for many alloys, *e.g.* bronze, brass, and aluminium alloys. The molten metal or alloy is poured into a powerful jet of air or steam, when it disintegrates into a fine powder. Ball mills and other types of attrition mill are used to produce metal powders for paint. Iron and nickel powders can be produced by the carbonyl process, devised by Alfred Mond (Lord Melchett).

Shaping and Sintering

After sieving, the powdered metal is pressed into the shape desired under pressures ranging between 5 and 50 tons per sq. in. Wear on the dies is reduced by introducing a small amount of a lubricant, such as a vegetable oil or stearic acid derivative. The compact is now in such a form that, if it is handled carefully, it does not break. It can also be further shaped, much as clay is shaped by the potter. For example, tungsten carbide tool tips are pressed and then shaped before they are sintered. Sintering, the next process, is a heat treatment. It is carried out in a reducing atmosphere of hydrogen or cracked ammonia for expensive mouldings or a treated coal gas for cheaper work. It is carried out at temps. well below the melting points of the metals used, and even under pressure there is usually no true fusion of the powder particles. Nevertheless, the powder is welded together so that the product is homogeneous and free from pores. Two or more different powdered metals can be sintered to produce a homogeneous alloy without any of the constituent metals having

been fused. A powdered non-metallic element or ceramic material can be added: for example, graphite can be incorporated in bronze bearings to act as a continual lubricant; carbon in copper for current-collecting brushes for electric motors; carbon in tungsten carbide tools; and diamond in grinding wheels. Sintered mixtures of ceramic materials with metals have been tested as materials for use in jet turbine engines.

Typical products of powder metallurgy include radio valves, in which fine tungsten and molybdenum wire is used; porous bronzes for filtering liquids and gases and in aircraft de-icing plant; porous bronze bearings, which are self-lubricating by impregnation with oil or incorporation of graphite; tungsten carbide tools and dies, where cobalt is used as a lower-melting point binder, and titanium carbide with a nickel binder. See Metallurgy.

Powderpost Beetle. Insect of the family *Lyctidae*. These creatures are wood-borers whose name refers to the fine powdery dust that results from their borings. The eggs are laid chiefly in woods that have large pores or vessels, especially oak. The grubs bore into the sapwood and may continue after it is made up into furniture, etc. *Lyctidae* have become established in Great Britain by the importation of infested foreign timber.

Powell, FREDERICK YORK (1850-1904). British historian. Born in London, Jan. 14, 1850, and educated at Rugby and Christ Church, Oxford, he was called to the bar in 1874 and lectured in law at Christ Church. By 1869 he had begun to work with Vigfusson on Scandinavian records, the subject on which his reputation rests, editing and translating two volumes of ancient northern poetry, and preparing Records of Iceland. Powell helped to found the English Historical Review, wrote a History of England, and in 1894 was made professor of modern history at Oxford, where he died, May 8, 1904. A Radical and a free-thinker, he gave much practical assistance to the poor. *Consult Life and Letters*, ed. O. Elton, 1906.

Powell River. Town of British Columbia, Canada. It is 80 m. N.W. of Vancouver, to which it is connected by coastal steamers of the C.P.R. and C.N.R. Here is the large plant of the Powell River Pulp and Paper co. Pop. 7,500.

Power. Term sometimes applied to a political state to denote its influence in world politics. It is usually based on an estimate of its power in a military sense, though sometimes on its economic resources, its size, or its population. Thus we speak of the great powers and the lesser powers. Certain states were defined at the congress of Vienna, 1815, as great powers, though there have been various additions and deletions to the list since that time. See Great Powers.

Power. In physics, the rate of doing work, i.e. the amount of work done in unit time. In the C.G.S. system the unit of power is the watt (*q.v.*), equivalent to 10^7 ergs of work per sec., or 1 joule (*q.v.*) per sec. The power expended by an electric current in watts is given by the product of the current in amperes and the E.M.F. in volts. Commercially a bigger unit, the kilowatt = 10^3 watts, is more usual, and in mechanical engineering power is generally expressed in horse-power, the equivalence being 1 h.p. = 746 watts.

Power. In English law, a right given to a person to dispose of a greater estate in land than he himself owns. A mortgagee of land, for example, may on default being made by the mortgagor, and certain conditions being fulfilled, sell the fee simple of the land although under the modern form of mortgage he has only a lease of it.

Power of appointment is an authority, given by deed or will, for the donee of the power to dispose of property. Thus, the father of a family may make a will leaving his property in trust for his wife for life, and after her death for such of their children in such shares as she shall appoint. A power to appoint amongst a class, as in the instance given, is called a special power. Sometimes it is wider, allowing the donee of the power the right to appoint to whomsoever he pleases. It is then called a general power; and under it the donee can appoint to himself if he chooses.

Power of attorney or letters of attorney is the authority given by one person to another to act on his behalf. In all English-speaking countries it is common, when a man is going abroad, for him to execute a formal deed, appointing someone to act as his attorney or agent in his absence, to manage his affairs generally or certain classes of his affairs, e.g. his business. A power of attorney may

be very general, or it may contain limitations of the agent's authority.

Power Factor. Electrical term. In a D.C. circuit the power in watts is equal to the product of volts and amperes in the circuit. In an A.C. circuit this is not always so, because the current may not be exactly in phase with the voltage, but may lag or lead, according to whether the circuit contains inductance or capacity. The power factor represents the ratio

$$\frac{\text{true power (watts)}}{\text{apparent power (volt-amperes)}}$$

and is never more than unity. It is actually a trigonometrical function (the cosine of the angle of lag or lead of the current). It is important to keep power factor as high as possible, since the heating of cables, etc., is governed by the total current. A lagging power factor, such as is produced by most industrial loads, can be improved by adding condensers to the circuit, thus neutralising the wattless current and reducing the total current carried for a given amount of true power.

Powicke, Sir Frederick Maurice (b. 1879). English historian. From Alnwick, where he was born June 16, 1879, he went to Owens College, Manchester, and Balliol College, Oxford. At the university he was a fellow of Merton College, 1908-15, and went back in 1928 as regius professor of modern history, having held chairs at Queen's university, Belfast, 1909-19, and at Manchester. During 1933-37 he was president of the Royal Historical Society. In 1946 he was knighted, and in 1947 he retired. Sir Maurice wrote *Loss of Normandy*, 1913; *Medieval England*, 1931; *Christian Life in the Middle Ages*, 1935.

Pownall, Sir Henry Royds (b. 1887). British soldier. Educated at Rugby and the R.M.A.,

Sir Henry Pownall,
British soldier

Woolwich, he served in France during the First Great War and was awarded the D.S.O. and M.C. Deputy secretary of the committee of imperial defence, 1936, he was director of military operations and intelligence at the War office 1938-39, and after the outbreak of the Second Great War was chief of general staff, B.E.F., 1939-40, and later inspector-general of Home Guard. He was knighted in 1940

and became C-in-C., Far East, 1941-42; G.O.C., Ceylon, 1942-43; and then C-in-C., Persia-Iraq. Chief of staff to Lord Louis Mountbatten (Viscount Mountbatten of Burma), S.E. Asia command, 1943-44, he retired in 1945.

Powys. Name of a family of British writers. Of the children of the Rev. C. F. Powys, three sons made literary reputations. The eldest, John Cowper Powys, was born at Shirley, Derbyshire, Oct.

J. C. Powys,
British writer

8, 1872, and spent his early years in the U.S.A., lecturing on English literature. He published several volumes of verse, as well as fiction, without attracting much attention either from critics or from the public, until two volumes of personal philosophy, *The Meaning of Culture*, and *In Defence of Sensuality* (both 1930), were widely acclaimed as examples of the way in which a highly individual personality had reacted to the age of the machine. Of his later successful novels the most generally praised were *A Glastonbury Romance*, 1933; *Jobber Skald*, 1935; *Owen Glendower*, 1941. His autobiography appeared in 1934, and in *The Pleasures of Literature*, 1938, he analysed the style and achievement of many great literary figures.

His brother, Theodore Francis, born at Shirley, 1875, wrote novels and short stories, all set within the limits of a small area in Dorset, where he lived a hermit-like existence for many years. His fiction, written in a somewhat artificial style owing something to the authorised version of the O.T., was in some respects the most striking production of any of the Powys brothers, especially as he often used an ostensibly simple story of country life to convey a moral lesson. His most successful works were *Mr. Tasker's Gods*, 1925; *Mr. Weston's Good Wine*, 1928; *Kindness in a Corner*, 1930; *Captain Patch*, 1935.

The third brother, Llewelyn Powys (1884-1939), was born at Dorchester, Aug. 13, 1884, and spent long periods in Kenya and

T. F. Powys,
British writer

in Switzerland, fighting against tuberculosis, which he contracted at the age of 25. In spite of continual ill-health, he wrote many books, mainly consisting of essays on religion, philosophy, and the countryside of the W. of England. Among the works which established him as the possessor of a delicate sense of style were *Black Laughter*, 1924; *The Cradle of God* (an account of a journey to Palestine), 1929; *The Pathetic Fallacy*, 1930; *Damnable Opinions*, 1935; *Love and Death*, 1939. On Dec. 2, 1939, having returned to Switzerland, he died at Davos. His letters were published in 1942, and his biography, by M. Elwin, appeared in 1946. *Consult* The Powys Brothers, R. H. Ward, 1935; *Welsh Ambassadors*, L. Marlow, 1936.

John Rowland

Poy. Pseudonym of a British cartoonist, Percy Hutton Fearon (1874-1948). Born in Shanghai, Sept. 6, 1874, educated in New York, he studied art under Herkomer. In 1905 cartoonist for the *Manchester Evening Chronicle*, he later worked on the *Sunday Chronicle* and *Daily Dispatch* until 1913. He achieved wide fame on the *London Evening News*, 1913-35, especially with his satirical creations, *John Citizen*, *Dora*, and *Dilly and Dally*. *Daily Mail* cartoonist 1935-38, he died Nov. 5, 1948. Several vols. of his drawings were published.

Poynings, Sir Edward (1459-1521). Lord deputy of Ireland and originator of Poyning's Law (*q.v.*). Born in Southwark, a connexion of the Pastons of Norfolk, he supported Buckingham's rebellion in 1483 by heading a rising in Kent, but on the failure of the enterprise, escaped into Brittany, where he joined the forces of Henry, earl of Richmond. With that prince he landed at Milford Haven, Aug. 7, 1485, and was at once made a knight banneret. After distinguished military services on sea and land, against the intrigues of Perkin Warbeck, he was appointed lord deputy of Ireland in 1494. He continued in active military and diplomatic service until his death.

Poyning's Law. Statute passed by the Irish parliament in 1494, during the period in which Sir Edward Poynings was acting as lord deputy in Ireland for Henry VII. It enacted that no measures might be introduced into the Irish parliament without the previous sanction of the English king and his privy council; also that all existing English laws should be

deemed to be in force in Ireland. Poyning's Law was not repealed until 1782. *See* Ireland.

Poynter. SIR EDWARD JOHN (1836-1919). British painter. Born in Paris, March 20, 1836, he studied art there at the Beaux-Arts and under Gleyre. He settled in London in 1860. In 1869 he was elected A.R.A., becoming R.A. in 1876, and succeeding Millais as president in 1896.

Sir Edward Poynter,
British painter
Russell

In 1871 he was appointed the first Slade professor at University College, London; was director of art and principal of the training schools at South Kensington, 1871-76; and director of the National Gallery, 1894-1905. His election as P.R.A. brought him a knighthood, and he became a baronet in 1902. His pictures were mostly of neo-classic subjects, after the manner of Leighton and Alma-Tadema. He designed mural decorations at S. Kensington, and mosaics at the houses of parliament. He resigned the presidency of the R.A., 1919, and died July 26 in the same year.

Poynting, John Henry (1852-1914). British physicist. Born at Manchester, Sept. 9, 1852, he was educated at Owens College, Manchester, and Trinity College, Cambridge, becoming a fellow of the latter, 1878. In 1880 he was appointed professor of physics at Masons College, later Birmingham university. In 1884 he formulated Poynting's theorem, proving the flow of energy to be expressible by a simple formula in terms of the electric and magnetic forces at a point. He also contributed to the technique of accurate weighing, and wrote much on radiation. F.R.S.

In 1888, he was president of the Physical Society in 1905. He died at Edgbaston, March 30, 1914.

Pozières. Village of France, in the dept. of Somme. It stands 4½ m. E. of Albert. It was stormed by the British 48th and 1st Australian divisions, July 23-25, 1916, the

Anzacs rushing it on the latter date. Lost in the spring of 1918, its ruins were recovered by the British, Aug. 24. A cross erected on the ruins of the village commemorates Australians who fell in its capture. Here is also a memorial to 14,668 missing Indian soldiers. *See* Somme, Battles of the.

Poznan (Ger. Posen). Province of Poland. It belonged to Prussia from the time of the partition of Poland in the 18th century until 1918, but had been a centre of resistance against the attempts of Germany to crush Polish nationality. It had (1935) a pop. of 2,180,000 in an area of 10,240 sq. m. Poznan is a flat country, with the rivers Warta and Netze flowing into the Oder as its main waterways. Much sugar-beet is grown, and lignite and salt are mined.

Poznan. Fourth largest city of Poland. It is the capital of the

Poznan,
Poland, arms

and in 1296 became a residence of the Polish dukes. Later it was a member of the Hanseatic League. Among the older buildings are the cathedral (1431), the town hall (rebuilt 1536), and several Gothic and Renaissance churches. The university, founded in 1919, had 5,000 students before the Second Great War. It is the centre of an agricultural area. Poznan was captured by the Germans shortly after their invasion of Poland in Sept., 1939, and lay in German-occupied Poland, until taken by the 1st White Russian Army on Feb. 23, 1945, after a month's siege. Pop. 267,962.

Poznan, Poland.

Dzialynski Palace, formerly a Prussian royal residence

Pozoblanco. Town of Spain. In the prov. of Córdoba, it is 32 m. N. of Córdoba. It has manufactures of woollens and leather, and a trade in agricultural produce, while famous fairs are held here. Zinc and silver lead are mined in the vicinity. Pop. 19,730.

Pozzo di Borgo, CARLO ANDREA, COUNT (1764-1842). Russian statesman. Born near Ajaccio,

Count Pozzo di Borgo,
Russian statesman
After Bayler

March 8, 1764, he became a lawyer, and in 1792 was a delegate to the national assembly in Paris. Coadjutor with Paoli in the government of Corsica, 1792-96, he fled to London on

Paoli's fall, and in 1798 went to Vienna, where he mingled in politics and exercised all his power to thwart Napoleon. Entering the Russian diplomatic service in 1804, he helped to conclude the alliance with Austria, but the Franco-Russian treaty of Tilsit, 1807, caused his retirement to Vienna. Hounded by Napoleon, he took refuge in London, remaining there until recalled to Russia in 1812. Persuading Murat to abandon Napoleon, he was active in the congresses of Frankfort, Vienna, and Aix-la-Chapelle. Russian ambassador in Paris, 1814-35, he was transferred to London, retiring in 1839. Died in Paris, Feb. 15, 1842.

Pozzuolana. Mixture of silicates of volcanic origin. It was discovered at Pozzuoli (*v.i.*), and is used, mixed with sand and slaked lime, as a hydraulic cement.

Pozzuoli (Gr. *Dicaearchia*; Lat. *Puteoli*). Seaport of Italy, in the prov. of Naples. It stands on a promontory in the Gulf of Pozzuoli, itself an inlet of the Bay of Naples, 8 m. by rly. W. of Naples. It was a commercial centre, and the sur-

rounding districts were crowded with the residences of wealthy Romans. Its mineral baths, used by the Romans, are still frequented. In the vicinity are temples, tombs, baths, cisterns, the Serapeum or Temple of Serapis, and an amphitheatre where Nero presided at gladiatorial combats, and where S. Januarius was thrown to the lions. From the local volcanic earth is made the famous pozzuolana cement. Puteoli, founded by Greeks as Dicaearchia about 520 B.C., was colonised by Rome in 194 B.C., and became an important trade centre under the emperors. Near the town the British firm of Armstrong established armament works in 1888. Pop. 23,000.

Pradesh (Skt., province, state). Name given to four constituent parts of the Indian Union: Himachal Pradesh, Madhya Pradesh, Uttar Pradesh, and Vindhya Pradesh, called in this Encyclopedia Himachal union, Madhya union, etc.

Prado. Short name for the great art gallery at Madrid, the Real Museo de Pintura del Prado. It contains works by Titian, Velazquez, and Goya, and by Rubens, Van Dyck, Raphael, Correggio, Giorgione, and El Greco. The Spanish school is represented from first to last, and there is a fine collection of Flemish paintings. During the civil war of 1936-39 most of the valuable canvases were sent to Valencia, thence to Catalonia, and finally to Geneva. See Madrid.

Praecepte (Lat., command). English law term denoting the slip of paper on which the plaintiff writes the particulars of the writ that he wishes to issue from the court. It also denotes the particulars of the writ, judgement, etc., filed by an execution creditor. It used to begin "Praecepte A.B. quod, etc."

Præd, WINTHROP MACKWORTH (1802-39). British poet. He was born in London, July 26, 1802, and educated at Eton, where he

helped to found the school magazine *The Etonian*, and at Trinity College, Cambridge, of which he became a fellow in 1827. Called to the bar in

1829, he entered parliament as Conservative member for St. Germans. Afterwards he represented Great Yarmouth, 1835-37, and Aylesbury thence until his death from consumption, July 15, 1839. Præd's genius was for light verse, in which he gave full play to his brilliant wit. Among his more serious efforts is *The Red Fisherman*, a poem of considerable imaginative power. An authorised edition of his poems, with a memoir by D. Coleridge, appeared in 1864.

W. Mackworth Præd,
British poet
After A. Mayer

Prado. The Spanish national museum of paintings and sculpture in Madrid

Praefect (Lat. *praefectus*, set over). Title held by various officials appointed by superior authority, not chosen by the people, in the Roman constitution. Under the kings the *praefectus urbi* was deputy governor of the city for the king during his absence, and under the republic was appointed by the consul who last left the city; under the empire the title was revived for an official with extensive police powers and jurisdiction.

Military praefects were the commanders of the imperial bodyguard, camp praefects, of whom each legion had one, the commanders of the engineers, and the navy had fleet praefects, as distinct from ship commanders. An important official in imperial times was the praefect of Egypt, first appointed by Augustus. See Prefect.

Praemunire, STATUTES OF. In English history, name given to certain statutes originally directed against the power of the papacy in England. The name is corrupted from the opening words (*Praemonere facias*, cause to be forewarned)

Pozzuoli, Italy. The amphitheatre in which Nero presided at the gladiatorial combats

of writs against offences of contempt against the crown, and attempts to encroach on the powers of the crown. The first statute, though not so called, of the nature of Praemunire was that of Edward I, 1306, laying down that no tax imposed by religious authority should be sent out of the realm.

The statute of Edward III, 1353, was directed against the papacy, and forbade that matters falling within the jurisdiction of the king's courts should be taken before any foreign court. The most important statute of Praemunire is that of Richard II, 1392, which imposed the penalty of forfeiture on those who should bring into the kingdom any papal bulls, rescripts, etc., without the king's sanction. Later, Praemunire was directed against several miscellaneous offences, e.g. the assertion that parliament could act independently of the sovereign, 1661. See Wolsey.

Praeneste. Ancient city of Latium, now represented by Palestrina (*q.v.*). It lay about 22 m. E. of Rome, on the borders of the country of the Aequi, and was traditionally believed to have been founded by Caeculus, son of Vulcan, its original name being Stephane. Built at the foot of a commanding hill crowned by a fortress, it had considerable strategic importance. It sided with the Latin League against Rome, but was overcome by Camillus, 380 B.C. Captured from Marius by Sulla's lieutenant, Lucretius Ofella, 82 B.C., its territory was divided among the victor's soldiery, and it later became a favourite resort.

The superb Temple of Fortune, built on the terraced hill, stood where the modern town stands, and was famed for its oracle. Claudius Aelianus, 3rd century writer on natural history, was born here. Among archaeological discoveries have been, in 1773, the Roman calendar, known as the Fasti Praenestini; and in 1886, the Fibula Praenestina, a gold brooch inscribed with early Latin of probably the 6th century B.C. See Phoenicia.

Praesepe (Lat., a manger). In astronomy, a star cluster in the constellation of Cancer. To the naked eye it appears as a misty patch of light, and from its shape is popularly known as the beehive. In the telescope it is resolved into a number of stars. *Pron.* preesep'y.

Praetor. Second in dignity among the magistrates of the Roman republic, the consuls being

first. The duties of the *praetor urbanus* were chiefly legal. He was an annually elected official with some of the consul's duties, and had jurisdiction in all civil cases among Roman citizens. On entering his year of office he published an edict setting forth the principles which were to regulate his decisions.

These edicts were the foundation of the Roman civil law. There were also *praetores militares* charged with the administration of provinces. The praetors were preceded by lictors. See Imperium; Lictor.

Praetorian Guard. Household troops of the Roman emperors. In the time of Augustus they comprised nine cohorts of 1,000 men each. The Praetorians played a prom-

inent part in the many revolutions which made and unmade emperors. See Rome.

Pragmatic Sanction (Gr. *pragma*, act, business). Term used in Roman law and afterwards in European politics for a decision dealing with a public matter affecting the state as a whole. Best known is the one by which the emperor Charles VI, being without sons, attempted to secure his lands for his daughter Maria Theresa. First put forward in 1713, it was accepted by the diets of his Austrian lands and nearly all the sovereigns of Europe, but when he died it was forgotten, and the War of the Austrian Succession was the result. Other pragmatic sanctions include one issued by Charles VII of France in 1438, ordering the reform of the Gallican Church, and one issued by the emperor Charles V in 1547. See Frederick II.

Pragmatism. Philosophical term of American origin, the idea of which was due to C. S. Pierce, and the first use of the word to William James (*q.v.*). It signifies an empiricism which considers the practical value, the consequences and bearing upon human interests of an assertion or conception, to be the criterion of its truth. See Bergson, H.; Empiricism.

Praetorian Guard, from a bas relief Louvre, Paris

time of Augustus they comprised nine cohorts of 1,000 men each. The Praetorians played a prom-

PRAGUE: CZECHO-SLOVAK CAPITAL

Edgar Stern-Rubarth, Ph.D.

An account of the origin, history, and principal features of the Bohemian city which became the capital of the republic of Czecho-Slovakia in 1918

Prague (Czech, *Praha*), the capital of the Czecho-Slovak republic, lies on the river Vltava (Moldau), 50 m. S. of the Sudeten mts. An important international rly. and air transport centre on the lines Vienna-Berlin, Paris-Stuttgart-Breslau (Wroclaw) - Warsaw, Hamburg-Trieste, etc., Prague has little river traffic. Picturesque in the distribution of the old parts of the city over a number of hills verging on the river, it is one of the most beautiful and homogeneous cities of Europe. Its eight districts are connected by 11 bridges, the most famous of which, the Charles bridge, a Gothic structure with two impressive towers and a row of 30 baroque statues, was designed by Peter Parler and built 1309-1507. From this bridge the huge castle of

Prague, the Hradčany, surmounted by the Gothic cathedral of S. Vitus, can be seen to the best advantage. Founded 1310 as a separate little town by King John I of Bohemia, the Hradčany served later as the palace and court of Bohemian rulers and German emperors.

Prague is predominantly Gothic in style, especially in the rich 14th century remains from its development under the Emperor Charles IV by Matthew of Arras, the architect of S. Vitus, and his successor Parler. S. George's, also in the Hradčany, dates from 912; All Saints was built 1263; and there are also numerous Renaissance and baroque buildings of importance, especially among the palaces of the nobles. The castle, official seat of the Czecho-Slovak president and govt., has 711 rooms, some of them very sumptuous; while the cathedral (1344-1541), erected on the site of a chapel ascribed to S. Wenceslaus (921-929), contains the reliquary of that saint and king, chandeliers

Prague arms

Prague, Czechoslovakia. 1. General view across the Manes bridge over the Vltava river, showing the palace of Hradcany and S. Vitus's cathedral. 2. Statue of King Wenceslaus in front of the National Museum. 3. The Pantheon or national monument of liberation. It contains relics and documents sacred to all Czechs. 4. Vaslavka Street

by Peter Vischer, the Bohemian crown and jewels, and a mausoleum with the silver tomb of S. John of Nepomuk, Bohemia's patron saint, as well as the tombs of S. Wenceslaus and of German and Bohemian rulers.

The Gothic Tyn (Hussite) church (1370-1463) is, next to the cathedral, Prague's most important religious monument; a school of the same name, famous in the Middle Ages, partly covers its façade. It holds the tomb of the astronomer Tycho Brahe (*q.v.*). The Loreto church (1661) with a rich treasure, including a pyx with 6,580 diamonds; S. Thomas's, with an altar painting by Rubens; a Jesuit church of S. Saviour (1578-1602); and S. Nicholas's (1737) are other religious buildings of importance. The renaissance Belvedere palace (1536-52) and the numerous rich palaces and mansions of the Prague nobility—Clam-Gallas, Lobkovitz, Waldstein, Fuerstenberg, Schwarzenberg, Bassevi Czernin, Sylva-Tarouka, Nostiz, etc.—mostly of the 17th and 18th centuries, are outstanding secular buildings.

The university, founded by Charles IV in 1348, and the first within the German empire, occupies the Clementinum (1654), a

group of formerly Jesuit buildings which includes colleges, chapels, towers, etc. There are an old powder tower (1475), remnants of a once important ghetto, a Jewish cemetery with famous tombstones and a museum. There were two old town halls one of which, with a famous clock (1381-1490), was one of the few historical buildings destroyed in Prague during the Second Great War.

From 1918, the once royal residence of Bohemia became the

capital of an independent state, and a number of impressive buildings were put up, *e.g.* the national theatre, the Wilson and Masaryk stations, the national museum.

A number of beautiful parks surrounding the historical palaces and mansions are open to the public and offer attractive views, *e.g.* from the formerly fortified Petrin hill, 1,060 ft. high, across the river Vltava. The city has a large stadium, a racecourse, and six theatres.

Prague. Plan of the Bohemian city, capital of the Czechoslovak republic

As the country's economic centre, Prague held 47,000 individual enterprises, about 3,000 of them ranging as industrial plants. They included engineering, automobile, electric, and printing works, food, wagon, textile, chemical, leather, wood, paper, and ceramic factories. It held a fair twice every year. These activities were seriously affected first by the German occupation, 1939-45, and then by a process of nationalisation which began in Oct., 1945, and, following the Communist *coup d'état* of Feb., 1948, was applied to all enterprises employing 50 or more persons.

Prague's intellectual life up to 1918 was bilingual, although even during the 19th century the German element was rapidly diminishing, especially after Prague became the centre of local govt. in 1861; the university was divided into a Czech and a German section in 1882. During 1939-45 the Germans tried to make German culture and the German language once again predominant in Prague; all the changes they introduced were swept away after the Second Great War. Five large libraries (that of the university held 650,000 vols., including 2,444 incunabula and 3,935 MSS.), numerous art galleries and museums, learned societies, etc., contribute to Prague's rôle as a seat of Slavonic culture. Prague is a R.C. archbishopric, a Czech-national bishopric.

History of the City

Founded according to legend by the mythical queen Libusa, Prague was the seat of a bishop from 973, and had German privileged settlements from about 1080. Under Charles IV it was from 1348 capital of the Holy Roman empire. There the great Wycliffite priest, scientist, and Czech martyr John Hus created the first Czech national movement about 1400; the Hussite wars and, after a period of prosperity under King George Podiebrad, the conflicts over the Reformation brought Hapsburg reprisals and, in the Thirty Years' War, great losses for the city. Occupied by the French and Bavarians in 1741, heavily attacked by Frederick of Prussia in 1757 (see Prague, Battle of); occupied 1866 by the Prussians, and seat of the Austro-Prussian peace conference; site of the declaration of Czecho-Slovak independence, Oct. 28, 1918, Prague was occupied by Hitler in March, 1939, and remained in German

hands until May, 1945. As the Allies from E. and W. closed in on Prague, the Czech national committee ordered a rising and seized the city, May 5. The Germans sent tanks against it in an effort to regain control, and the Czechs sent out from the radio station urgent appeals for help to the approaching U.S. and Red armies. Desperate street fighting developed in which some 5,000 civilians were killed, and one of the old town halls was burnt down by the Germans; German bombers attacked the city. The Germans agreed to withdraw from Prague only on May 8, the day the general German surrender was ratified in Berlin. Russian tanks and U.S. infantry entered the city simultaneously May 10, and on May 16 President Benes with the government returned to the capital from Kosice, temporary capital since its liberation by the Russians Jan. 20, where he had been since April 3. Czecho-Slovak institutions were rapidly restored, and the city resumed its normal democratic life until the Communist coup occurred here in Feb., 1948. Pop. (1946) 923,946.

Prague, BATTLE OF. Victory of Frederick the Great in the Seven Years' War, May 6, 1757. The emperor began the campaign of 1757 by marching on Prague, which was held by Charles of Lorraine with some 75,000 Austrians. Attacking the Austrians on their left flank, Frederick ordered a general advance. The battle, fiercely contested, was going against Frederick, when a desperate cavalry charge against the Austrians' wings broke their defence and put them to flight. They retreated into Prague, having lost over 10,000 men and 4,300 prisoners. The Prussian losses were even heavier, but they held the field and laid siege to the city.

Prague, DEFENESTRATION OF. Historical term for two acts of violence at Prague. The first, July 30, 1419, consisted of throwing out of the windows of the town hall two of the new town's councillors, and inaugurated the sanguinary Hussite wars (see Hussites). In the second, May 23, 1618, the imperial statthalters Martinitz and Slavata were thrown by Bohemian Protestants from the windows of the castle, but, falling upon a dung heap, were unharmed; this incident started the Thirty Years' War which swamped the Continent in blood and in many countries virtually wiped out civilization, in particular

leading to the enslavement of the Czech people.

Prah OR **PRA.** River of West Africa, in the Gold Coast Colony. It rises E. of Bompata, flows S.E. on the boundary between Ashanti and the Gold Coast Provinces, and then S. until it falls into the Atlantic Ocean.

Prai OR **KUALA PAI.** Seaport town of Province Wellesley, one of the Straits Settlements, Malaya. It stands on the channel separating the mainland from the island of Penang opposite George Town, and is served by rly. and ferry.

Praia. Capital of the Cape Verde Islands on the S. coast of Santiago I. As a port it handles coffee, medicinal products, hides, fruit, and grain. Cinchona is cultivated. The collapse of a wall on a queue waiting for govt. relief meals caused 232 deaths here, Feb. 2, 1949. Pop. approx. 4,000.

Prain, SIR DAVID (1857-1944). British botanist. Born at Fettercairn, Kincardineshire, July 11, 1857, he was educated at Aberdeen grammar school and university. In 1882, having graduated M.B., he became demonstrator in anatomy to the Edinburgh College of Surgeons. In 1884 he joined the Indian medical service, and two years later was curator of the herbarium and library at the Royal botanic garden, Calcutta. In 1897 he was appointed superintendent and placed in charge of the cultivation of cinchona in India. Director of the Indian botanical survey in 1898, he accompanied Sir Francis Younghusband to Lhasa four years later. In 1905 Prain became director of Kew Gardens, and in 1907 editor of the Botanical Magazine. Retiring from Kew in 1922, he was appointed director of the forest products research board of the department of scientific and industrial research. He was a trustee of the British Museum. Knighted in 1912, he died March 16, 1944.

Prairial. Ninth month in the year as rearranged during the French Revolution. It began on May 20 or 21. The word means the month of meadows.

Prairie (Fr. from Lat. *pratium*, meadow). Temperate natural grassland of the central plains of N. America. In the E. portions, especially in Manitoba and the Red River Valley, enormous quantities of cereals are grown, but in the drier belt nearer the Rockies stock-rearing is more important. The Prairie Provinces of Canada are Manitoba, Saskatchewan, and part of Alberta. See Pasture; Steppe.

Prairie Dog OR PRAIRIE MAR-MOT (*Cynomys ludovicianus*). Rodent found in N. America and allied to the squirrels.

There are three or four other species, all of which live in burrows in the open plains, usually in very extensive colonies. They are about a foot long, and their fur is brown on the back and yellowish white beneath. Their chief foods are grass and roots. They construct before their homes mounds which they use as watchtowers. Many of their burrows are also tenanted by the burrowing owl.

Prairie Hen (*Tympanuchus americanus*). Bird allied to the grouse, native of N. America from the valley of the Mississippi to Ontario. About 19 ins. long, it is brown above, streaked transversely with black and buff; the underside pale brown, with the transverse marks white. The head bears a small white-tipped crest. On each side of the neck of the male is an inflatable orange sac, covered by a tuft of stiff, black feathers. During the breeding season males to the number of 40 or 50 assemble before daybreak in their so-called "scratching places," and go through a performance of display in which low tooting and booming sounds are produced by means of the distended air-sacs, as well as cackling and screams of defiance. These meetings, which last only till sunrise, end in fierce battles. The birds feed on buds, berries, acorns of the scrub oak, and seeds. The flesh of the prairie hen is esteemed as food.

Prajadhipok (1893-1941). King of Siam. Son of King Chulalongkorn, he was born Nov. 8, 1893, and educated at Eton and the R.M.C., Woolwich, adopting an army career. On Nov. 26, 1925, he succeeded his brother Rama VI on the throne. His position became difficult after the revolution of 1932, in which year he granted a new constitution. After a second rebellion in 1934 differences with the government

became acute, Prajadhipok refusing to give up prerogatives. He abdicated March 2, 1935, and was succeeded by his nephew Ananda (1925-46). Spending the rest of his life in England, Prajadhipok died at Virginia Water, May 30, 1941.

Prakrit (Skt., natural, common). General name for the popular languages of India as opposed to the classical Sanskrit (=perfected), of which they are the

direct descendants. Until about A.D. 1000 the Prakrits were divided into four chief dialects: Magadhi (Bihar), Ardha-Magadhi (half-Magadhi, Benares), Apabhramsa (=decadent, valley of the Indus), Sauraseni (between the Ganges and the

Prairie Hen of North America; cock bird of the species

Jumna). These four dialects, which are the source of all the modern vernaculars of India, are related to the ancient Sanskrit as the Romance languages to Latin. The chief source for the knowledge of early Prakrit is the Indian dramas, in which it is used by characters of lower rank. See India.

Pralltriller (Ger.). Musical ornament indicated thus:

and performed as shown below:

In Great Britain it is often called the mordent, which, however, should be played with the lower auxiliary note.

Prasad, RAJENDRA (b. 1884). First president of India. Born in Bihar, Dec. 3, 1884, he went to Presidency College, Calcutta, and became a lawyer. In 1917 he joined Gandhi, and in 1920 gave up his practice to pursue non-cooperation. President of the Indian national congress, 1934 and 1939,

he was several times imprisoned for civil disobedience, and during 1942-45 for infringing the defence of India rules. In 1946 he was in the interim govt., and chairman, later pres., of the constituent assembly; he became first president of the Union of India, 1950.

Praseodymium. One of the cerium family of rare earth metals, forming an almost insoluble potassium sulphate. It is closely associated with neodymium (*q.v.*); indeed they were thought to be one element and called didymium, until in 1885 Welsbach separated them. Praseodymium, chemical symbol Pr, falls in the third long period of the periodic table. It has the atomic number 59; atomic weight, 140.9; melting point, 940° C.; specific gravity, 6.47; crystal forms, alpha-praseodymium hexagonal, beta-praseodymium face-centred cubic, with lattice constant $a=5.151$. The metal may be prepared by electrolysis of the fused chloride and purified by remelting in pure magnesium crucibles under barium chloride. It readily forms a hydride by absorption of hydrogen, but of its various salts none has commercial application. Didymium salicylate antiseptic dressings have been used.

Pratinas. One of the early Greek tragedians. A native of Phlius, in Peloponnesus, not far from Corinth, he was the contemporary of Aeschylus, against whom he competed for the prize at the Dionysia. He is said to have been the first to compose satyric dramas, the only complete extant example of which is the Cyclops of Euripides. The collapse of the wooden seats of the spectators during the performance of one of his plays is said to have led to the erection of stone theatres.

Pratincole (*Glareola*). Genus of birds. They are allied to the sandpipers, but distinguished by their short, curved bill, with wide gape, long, pointed wings, and forked tail. There are 10 species of these small, slender birds that run like plovers and fly like swallows. Best known is the collared pratincole

Pratincole. Collared pratincole, an occasional visitor to Great Britain

Prajadhipok, King of Siam

(*G. pratincola*) of S. Europe, W. Asia, and N. Africa, whence it migrates to India and S. Africa, and occasionally visits Great Britain. It is brown above, with black and white wings and tail, the breast yellow-brown, and the under parts white with blackish legs. There is a broad patch of dull buff on the throat, outlined with black. The birds frequent sandbanks and coastal lands, feeding upon insects, caught mostly on the wing. Their note is harsh and shrill. See Bird.

Prato. City of Italy, in the prov. of Florence. It stands on the Bisenzio, an affluent of the Arno, 11 m. by rly. N.W. of Florence, and is encompassed by 11th and 14th century walls. The stately marble cathedral, begun in the 12th and finished in the 15th century, has a beautiful external pulpit, from which the Virgin's Girdle is displayed to the faithful; also frescoes and pictures, and bas-reliefs by Della Robbia, who executed medallions for the 15th century early Renaissance Carceri church. There are works by the two Lippis, Agnolo Gaddi, Giovanni Pisano, and other Florentine artists. The chief manufactures are cotton and silk goods, straw, furniture, and

Pravda (Russ., truth). Official daily newspaper of the Russian Communist party. Founded in Vienna in 1912 by Lenin and Bukharin as an underground revolutionary organ, it was later published in Moscow with simultaneous editions in Leningrad and Kuibishev, and in Baku and Rostov the following day. It is nationalistic and devotes little space to non-Russian news. Daily circulation is some 3,000,000.

Prawn (*Leander serratus*). Stalk-eyed crustacean of the order Decapoda. It is common on the British

Prawn. Crustacean common in the shallow waters of the British coast

coasts, particularly where there are submerged rocks in shallow water. About four inches in length, the animal is clad in a translucent, jointed shell of greenish grey, which turns pink when the prawn is cooked for eating. The carapace, covering the combined head and thorax, is extended forwards in a long sword-like rostrum, strongly toothed on its upper and lower edges. There are two pairs of antennae, the inner pair each bearing three long lashes, and the outer pair each with a single lash extending back far beyond the broad tail fan. The first two pairs of legs are armed with pincers.

The prawn swims through the water by means of the six pairs of swimming feet (pleopods) under the hind body; and can dart back suddenly out of danger by spreading the tail and flexing the hind body. It feeds upon the small green seaweeds and the entomostraca that frequent them. Prawns are caught in a small ring-net and in wicker traps of similar formation to lobster pots. See Crustacea.

Praxiteles (fl. 360-340 B.C.). Greek sculptor. He worked at Athens, which was probably his birthplace. The only authentic

work by him known to exist is the group of Hermes and Dionysus, discovered 1877, with the base and signature intact, among the ruins of the temple of Hera at Olympia; this is now in the local museum. There are, however, numerous copies of his Aphroditē of Cos and Aphroditē of Chidus, Sleeping Satyr, Apollo the Python-slayer, and other famous statues. He chose beautiful types, but did not idealise unduly; thus his fairest goddesses are essentially human rather than divine figures. *Pron.* Prax-it-el-ez.

Prayer. Term used to denote a request made by an inferior to his superior, and more particularly a request made by man to the supernatural being or beings who form the object of his worship. Prayer in some shape or form is characteristic of every type of religion, from the lowest to the highest. Sometimes it is associated with the use of spells and charms. In Buddhism, prayer-cylinders are inscribed with a sacred formula; by causing these cylinders to revolve, the worshippers are supposed to be able to secure their desires, accumulate merit, and place themselves under the special protection of the deities who form their objects of reverence. In many forms of religion prayer is associated with magical practices.

Prayer may therefore be regarded as one of the most primitive and natural instincts of the human soul. Prayer and religion have always been regarded as inextricably bound up together.

Criticism in modern times has raised two serious objections to prayer. The first is theological. It is urged that God is immutable, and moreover does not need to be told what man needs. The usual answer given to this is: The ability of God to give is conditioned always by the ability of man to receive. Prayer increases the ability to receive, because it induces an attitude of receptivity in the soul, and consequently makes it possible for God to meet the needs of the intercessor. The second is based on scientific grounds. The universe is ruled and governed by immutable laws, which admit of no infraction or interference from without. An answer to prayer would violate the law of uniformity, and so is impossible. The reply to the objection is obvious. Man, by the use of his scientific knowledge, can use and manipulate the laws of nature for his own purposes without in any way violating the law of uniformity.

Prato, Italy. Façade and campanile of the cathedral showing the 15th century outdoor pulpit

macaroni. Near by are serpentine quarries. Prato was a republic in the Middle Ages. Pop. 76,559.

During the Second Great War Prato was entered by U.S. troops of the Allied 5th army on Sept. 6, 1944, but was not cleared until the 10th. The church of S. Bartolomeo and the house of Filippo Lippi were demolished by bombs; other buildings were damaged, none very seriously, by shells or bombs. The cathedral itself was only slightly injured, all works of art being intact; the loggia of the cloister was ruined.

Similarly God can answer prayer without violating the laws of nature. See Lord's Prayer.

Prayer Beads OR CRABS'-EYES (*Abrus precatorius*). A climbing plant of the family Leguminosae.

Prayer Beads. Foliage and flowers ;
inset, seeds

It is a native of India. The leaf is divided into two rows of narrow oblong leaflets, and the pea-like, pale purple flowers are in clusters. The oblong pods contain from four to six bright scarlet polished seeds, with a black patch around the scar marking their attachment to the pod. Buddhists thread them to make rosaries; they are also made into necklaces. They are used in India as a standard of weight.

Prayer Book. Authorised service book of the Church of England. Other churches in communion with it, such as the Church of Ireland, the Episcopal Church of Scotland, and the American Church, use basically the same Prayer Book, although their forms differ in some important details.

The Book of Common Prayer is in one sense a product of the Reformation, since it originated from the demand that the public worship of the Church should be in the vernacular; but in another sense it is a product of earlier times, since the materials from which it is compiled are the services of the medieval Church, which themselves developed from the rites of the early Christian centuries. Besides the medieval service books some influence must be attributed to Reformation orders of public worship, in particular to the so-called Consultation of Archbishop Herrmann of Cologne (1543).

The first authorised service in English was the Litany, translated and adopted in 1544 by Cramer. During the same reign of Henry VIII portions of the Mass were also read in English. In the reign of Edward VI the Prayer Book first appeared as a complete order of public worship in the English

language. The chief author of it was Cramer, though he had the assistance of several other bishops. It was, almost certainly, approved by Convocation, and was enforced by parliament in the first Act of Uniformity, 1549. The first Prayer Book did not go far enough in the direction of innovation to satisfy extreme reformers such as Ridley and Hooper, and in 1552 the second Prayer Book was authorised, which went a long way to meet their demands, and represents the nearest approach made by the Church of England to assimilation with the services of the reformed churches of the Continent.

The accession of Elizabeth saw another revision of the Prayer Book, 1559, which restored some details of the first. Under Elizabeth the Prayer Book assumed substantially the form which it still retains, and subsequent alterations have been of minor importance. During the Commonwealth the use of the Prayer Book, whether in public or private, was prohibited, but at the Restoration it became once more the service book of the nation, and in 1661 underwent its last revision. In 1927 and 1928 a revised Prayer Book was accepted by Convocation and the Church Assembly, but was twice rejected by parliament. This book restored even more of the features of the 1549 Prayer Book than did that of 1559, and brought it more closely into line with the American and Scottish books. Some of its features have been sanctioned by some bishops. The Shorter Prayer Book of 1947 simplifies the 1661 book and includes parts of the 1928 revision. See Church of England.

Bibliography. New History of the Book of Common Prayer, F. Procter and W. H. Frere, 4th ed. 1901; The Prayer Book Dictionary, ed. G. Harford, M. Stevenson, and J. W. Tyrer, 1913; The Art of Public Worship, P. Dearmer, 1919; The Background of the Prayer Book, C. S. Phillips, 1938; The Prayer Book of 1928 Reconsidered, W. K. Lowther Clarke, 1943.

Praying Mat OR CARPET. Article used by Mahomedans for kneeling upon when at prayer. About the size of a wide hearthrug, and known as a *seggadeh*, it is marked with a nick, the point of which is turned towards Mecca.

Praying-Wheel. Symbolical instrument used by Buddhists of Tibet in religious exercises. It consists of a cylinder, around which are wound paper bands inscribed with repetitions of the sacred mantra, *om mani padme hum*—O

the Jewel in the Lotus—a form of adoration of the Buddha. The cylinders are made in various sizes, and are turned by hand, or by the agency of wind, water, or fire. The paper used is so thin, and so closely printed are the symbols, that a praying-wheel 8 ft. in height may contain many more than a million repetitions of the mantra. Prayer flags, printed strips of butter muslin tied to poles from 20 to 30 ft. high, are also used.

Praying-Wheel. Two examples of this instrument used by Tibetan Buddhists

See Lamaism; consult The Buddhist Praying-Wheel, W. Simpson, 1896; Lhasa, P. Landon, 1906.

Preaching (Lat. *praedicare*, to proclaim). Public oral appeal on behalf of a religious belief, i.e. the delivery of a sermon. It is intended to convert, or at least exhort, occupies an important place in the history of Christianity, and is practised in other religions. A sermon was formerly called a homily, (*q.v.*) hence the term homiletics.

The apostles of Jesus Christ, notably S. Paul, preached a great deal, as did some of the fathers of the Church; and in the early centuries of the Christian era there were a number of men who combined religious fervour with intellectual distinction and oratorical power. The next group of great preachers were the missionaries, who, from the monasteries of Ireland and Scotland, carried the Christian faith over Europe. The Reformation gave an added importance to preaching, and Luther, Knox, Latimer, and their contemporaries realized the value of an impassioned personal appeal. Hitherto, preaching had not been a regular part of the services of the Church, but Protestants,

especially Nonconformists, soon made the sermon an integral part of divine worship. They, too, stereotyped the plan of basing it on a text taken from the Bible. After the excitement of the Reformation, preaching took a more intellectual tone, marked by the names of Bossuet, Massillon, Jeremy Taylor, South, and others.

Preaching was a feature of the religious revival of the 18th century, as of all religious revivals, Wesley and Whitefield being among the best known of many popular preachers. In the 19th century Spurgeon exercised a remarkable sway by his preaching, while Robertson and Liddon, with their more intellectual appeal, were equally though less apparently successful. Of many other great 19th century preachers may be mentioned Newman, Phillips Brooks, and Lacordaire.

The sermon declined in importance during the 20th century, accompanying not only the general diminution in religious observance but the growing unpopularity and mistrust of all forms of oratory (*q.v.*). Even in the Free Churches the length of a sermon was reduced from the hour or so customary in the 19th century to little over a quarter-hour. The style became less formal, more like that of a friendly chat. But the distinction between preaching to convert and preaching to exhort or expound is still observed, and is well expressed in the jocular saying: "Morning sermon for saints, evening sermon for sinners."

Pre-Adamites. People formerly supposed to have inhabited the world before Adam. Some hold that Adam was the first man of a new creation to take the place of an earlier people who had been exterminated. This view was advocated by Isaac de la Peyrère (1592-1676); his followers were sometimes called Pre-Adamites.

Preamble. An introductory statement at the beginning of an Act of parliament setting out the objects of the legislature in passing the Act. Preambles are now rarely used because modern Acts of parliament are so wide in their scope. The courts in construing a statute will consider the preamble in order to arrive at the intention of the legislature.

Prebend (late Lat. *praebenda*, soldier's rations). Eccles. term for the food, clothing, etc., provided for a clergyman or monk, as distinct from the income of a benefice. Later it came to be used for an endowment provided for the sup-

port of a priest attached to the staff of a cathedral; the holder of the prebend being known as a prebendary. The office of prebendary is now usually a sinecure conferred on a clergyman as a mark of distinction, and the income attached to the dignity is usually nil.

Pre-Cambrian. In geology, name given to the period older than the Cambrian. It is one of great indefiniteness in many ways, and no general classification of it has been accepted by geologists. The term is usually applied to include all those rocks which are of a greater age than those containing the Olenellus fauna of the Cambrian. The rocks are the oldest on the earth, dating from the first formation of a solid crust on the earth's surface down to Cambrian times, and comprise conglomerates, sandstones, greywacke, gneisses, slates, limestones, quartzites, etc. They are usually highly metamorphosed igneous and sedimentary strata which contain few fossils. They are rich in iron and other minerals, like graphite, talc, gold, copper, nickel, etc., and contain valuable building stones, in particular granite and marble. Pre-Cambrian rocks are found widely scattered and often receive local names.

Precedence (Lat. *praecedere*, to go before). Order in which individuals follow each other at state and other ceremonies. It begins with the sovereign or ruler and his family, and is most exactly enforced in monarchical countries. Precedence is determined either by birth or by office. In England the order rests on ancient usage and subsequent regulations as, for instance, the one which in 1905 ranked the prime minister after the archbishop of York. The first of various statutes was passed in 1539, and the regulations, based on letters patent, are issued by the lord chamberlain, assisted by the Herald's College. In Scotland the authority rests with the Lyon court. As regards local authorities in the U.K., no written code has been promulgated, but in the county the lord-lieutenant stands first, followed by the high sheriff.

Order of Precedence of Males in the United Kingdom in 1943.

The Sovereign. Duke of Gloucester. Duke of Windsor. Duke of Edinburgh. Sovereign's nephews. Ambassadors. Archbishop of Canterbury. Lord high chancellor. Archbishop of York. Prime minister. Lord president of the council. Speaker of the house of commons. Lord privy seal (if of baronial rank). Five following state officers (if dukes: (1) Lord great chamberlain (on duty). (2) Earl marshal. (3) Lord steward. (4) Lord chamberlain. (5) Master of the horse. Dukes according to their patents of creation: 1. of England; 2. of Scotland; 3. of Great Britain; 4. of Ireland; 5. Those created since the Union. Ministers

and envoys. Eldest sons of dukes of blood royal. Five above state officers of marquesses. Marquesses, in same order as dukes. Dukes' eldest sons. Five above state officers if earls. Earls, in same order as dukes. Younger sons of dukes of blood royal. Marquesses' eldest sons. Dukes' younger sons. Five above state officers if viscounts. Viscounts, in same order as dukes. Earls' eldest sons. Marquesses' younger sons. Bishops of London, Durham, and Winchester. All other English bishops, according to their seniority of consecration. Five above state officers if barons. Secretaries of state, if barons. Barons, in same order as dukes. Treasurer of H.M. household. Comptroller of H.M. household. Vice-chamberlain of H.M. household. Secretaries of state under the degree of baron. High commissioners. Viscounts' eldest sons. Earls' younger sons. Barons' eldest sons. Knights of the Garter if commoners. Privy councillors if of no higher rank. Chancellor of the exchequer. Chancellor of the duchy of Lancaster. Lord chief justice of England. Master of the rolls. President of the probate court. Lord justices of appeal. Judges of the high court. Viscount's younger sons. Barons' younger sons. Sons of life peers. Baronets of either kingdom, according to date of patents. Knights of the Thistle and S. Patrick if commoners. Members of the various orders as follows: G.C.B., G.C.S.I., G.C.M.G., G.C.I.E., G.C.V.O., G.B.E., K.C.B., K.C.S.I., K.C.M.G., K.C.I.E., G.C.V.O., K.B.E., Knights bachelor. Judicial referees of the supreme court. Judges of county courts and judges of the mayor's and City of London court. Serjeants-at-law. Masters in lunacy. C.B., C.S.I., C.M.G., C.I.E., C.V.O., G.B.E., D.S.O. Members of the 4th class of the R.V.O. Officers of the British Empire. Companions of the I.S.O. Eldest sons of younger sons of peers. Baronets' eldest sons. Eldest sons of knights of the Garter. Eldest sons of knights in order of the fathers. Members of the 5th class R.V.O. Members of the British Empire. Younger sons of the younger sons of peers. Baronets' younger sons. Younger sons of knights in the same order as their fathers. Naval, military, air, and other esquires by office.

Prince Charles (b. 1948) took second place, immediately following the Sovereign.

Precedent. An action or rule which is used as an authoritative example. In law, precedent plays an important part. In order that the course of law may be as certain and regular as possible, the practice has grown up of recording the decisions of judges, particularly on new points, so that these judgements may serve as precedents. A judge of first instance is not, strictly speaking, bound to follow the decisions of another judge of equal rank, but he is bound to follow the judgements of a superior court. The common law of England is to be found almost entirely in the decisions of judges who have expounded the principles whereon it is based. The same observation applies to equity in England. Both the house of lords and the court of appeal are bound by their own decisions. In Scotland also the common law is built upon precedent. See Justice; Law.

Precentor (late Lat. *praecinere*, to sing before). Leader of the singers in the rendering of the musical portion of the service in a cathedral. The term first appeared in the 4th century, when in chanting it became usual for the first half of each verse of the Psalms to

be sung by a precentor or precentors, and for the choir and people to take up the latter half. SS. Basil, Athanasius, and Chrysostom all allude to the custom, and the Apostolic Constitutions order it. In cathedrals of the Church of England, the precentor is usually the chief of the minor canons, and is responsible for the musical arrangements of services. The word was specially used of the leader of praise in Scottish churches before the introduction of organs.

Precept (Lat. *præcipere*, to ordain). Literally a rule or law or order. The word is used specially in England for the written warrant of a magistrate. An order from a local authority for the payment of money to it from the rates is known as a precept. See Rate.

Preceptors, COLLEGE OF. A British educational institution established in 1846 and incorporated by royal charter in 1849. Its policy is to support generally the principle of reasonable independence in education; arrange diploma examinations for teachers (A.C.P., L.C.P., F.C.P.); conduct examinations for schools; provide public lectures; and maintain headquarters in London where teachers from schools of every kind can meet in congenial surroundings. Its journal, *The Educational Times*, is published six times a year. Its headquarters are 2-3, Bloomsbury Square, W.C.1.

Precession. In astronomy, term used in connexion with the movements of the equinoctial points, i.e. the points where the equator intersects the ecliptic. The slow retrograde movement of these points, known as the precession of the equinoxes, is due to the gravitational pull of sun, moon, and planets on the earth's equatorial protuberance. The equinoctial points take 25,800 years to make a complete circuit in the heavens, and the effect of the movement is to change the position of the celestial poles and alter the signs of the zodiac relative to those of the ecliptic. The first sign of the zodiac, for example, is no longer in the constellation Aries, but in Pisces. The precession of the equinoxes was discovered by Hipparchus about 130 B.C. See Equinox; Nutation.

Précieuses Ridicules, LES. Farcical one-act comedy by Molière, produced at the Petit-Bourbon, Paris, 1659, when Molière played the part of Mascarille. Molière's first essay in contemporary satire, it was directed at the imitators of the learned, if

affected, coterie of the Hôtel Rambouillet. The *précieuses* had kindred spirits in other countries, e.g. the euphuists in England. The ridiculous euphuists of the title are two provincial belles who reject the advances of their suitors because the latter do not make love according to the novels of Mlle. de Soudéry.

Precious Stones. Names given to kinds of natural rock which, from their beauty of colour and translucence when polished and cut, have been accorded high value by mankind. Precious stones (except the opal) are crystalline in character.

The chief precious stones are: *Andalusite*, olive green or sad brown, from Spain, Brazil, Ceylon, Siberia; *Apatite*, white, blue, violet, green, yellow, from Europe, India, the Americas; *Beryl*—Emerald, green, Morcanite, pink, Heliodor, golden, Aquamarine, blue, of world-wide distribution; *Diamond*, all colours, from Africa, India, Borneo, Brazil, Australia; *Corundum*—Ruby, red, Sapphire, all colours, found all over the world; *Chrysoberyl*—Cat's Eye, yellow, brown, and green, from Russia, Alexandrite, green to red, from Ceylon; *Topaz*, all colours, found all over the world; *Opal*, all colours, found nearly everywhere; *Zircon*, all colours, from Ceylon; *Spodumene*, pink or green, from N. America.

Semi-precious stones are: *Spinel*, all colours, from Asia; *Tourmaline*, all colours, found all over the world; *Garnet*, reds, browns, greens, yellows, orange, found all over the world—Demantoid, green, from Russia; *Quartz*, all colours—Citrine, yellow, Amethyst, purple, found all over the world; *Turquoise*, blue, from Persia; *Jade*, all colours, nearly world wide—the best from Burma; *Lapis Lazuli*, blue, from Afghanistan.

The qualities that determine their relative status are brilliancy, colour, hardness. Rarity has little to do with the price and saleability of precious stones. Diamonds are not uncommon, as an inspection of any jeweller's stock will reveal, but their exceptional brilliancy allied to their great degree of hardness has made them since the beginning of the Christian era the most valuable of all human possessions. The De Beers and Kimberley mines produced over 38 million carats of diamonds in 25 years, and there are at least 30 diamonds on record that have weighed more than 400 carats each; yet on June 10, 1948, one

diamond weighing less than eleven carats was purchased by a London firm of jewellers at auction for £9,000. More than 90 p.c. of the money expended on precious stones is spent on diamonds.

Exceptional specimens of ruby or emerald command as high a price as diamonds; but stones of ordinary quality bring much less than comparable diamonds.

The asterias stone is a form of corundum that shows when polished *en cabochon* a six-rayed star of light caused by minute tubular cavities that trap the light; these stones are generally called star rubies and star sapphires; blue and red ones of a pronounced colour and distinctively marked are very scarce, the majority being of a dull greyish tint and imperfectly starred.

Most diamonds are cut in brilliant fashion, circular with 58, sometimes 88, facets. Coloured stones are usually cut in rectangular shapes, sometimes with the corners cut off; this cutting is occasionally applied to diamonds, when it reveals the pellucidity of the stone, but removes a great deal of the fire and brilliance. At one time many diamonds were rose cut, i.e. with many facets on the upper surface and flat at the base, very suitable for the covered-in settings of the 18th century. Some stones, particularly carbuncles and turquoise, are polished *en cabochon* without facets; carbuncles frequently have the base hollowed out to permit the light to pass through the stone with greater ease.

The caves of Kentucky produce a natural pearl by the slow deposits of stalactites. Although these are of gem quality, they are so scarce that only collectors purchase them.

Amber and coral are two other organic substances used for adornment, the former a fossil gum, the latter the skeleton of the coral polyp; the value of both these lies in the fashioning rather than the material.

BIRTH STONES. Many stones are believed to be fortunate for certain wearers, the natal stones being worn all over the world. The list usually accepted in England is: Jan., garnet; Feb., amethyst; March, aquamarine; April, diamond; May, emerald; June, pearl; July, ruby; Aug., peridot; Sept., sapphire (blue); Oct., opal; Nov., topaz; Dec., turquoise. See colour plate facing p. 6680; also Jewelry; Pearl.

R. H. Granville Clarke

Precipitation (Lat. *praecipitare*, to throw headlong). Term used in meteorology to denote any aqueous deposit, in liquid or solid form, derived from the atmosphere. The deposit may occur as rain, snow, hail, dew, or hoar frost. Rain and dew are collected in a rain gauge. The depth of snow can also be estimated, a foot of snow being taken as roughly equal to an inch of rain; the latter over an acre of ground has the volume of about 101 tons of water. (See Rainfall; Weather.)

Chemical precipitation is the process of separating solid particles from a solution by adding a chemical substance. For example, if a solution of sodium carbonate is added to one of calcium chloride, calcium carbonate in the form of a white precipitate results. Many methods of testing employed in chemical analysis depend upon the formation of precipitates of distinctive appearances.

Précis-Writing (Fr.; Lat. *praecisus*, cut short). Process of extracting in condensed, yet easily intelligible, form the essential facts or statements contained in a letter, dispatch, or other document. Précis-writing forms an examination subject for many govt. depts. and is particularly used in foreign office and diplomatic work.

Precognition. Term applied in Scots law to the preliminary examination of witnesses to be called in a criminal case, usually by the procurator-fiscal and before a judge, justice, or sheriff, to determine whether there is ground for trial. The word is also used less correctly of any antecedent examination of witnesses by solicitors or counsel before their examination in court, and of the written statement, or proof, of their evidence.

Predestination. Term used in Christian theology to denote the act of God in determining the destiny of individuals and peoples. The doctrine of predestination corresponds to the belief in fate which is found in some form or other in most religions—though sharply differentiated from it by the Christian conception of God.

The term is used in several senses, to denote (1) the eternal purpose of God, which was predetermined before the creation of the world; (2) the selection of certain nations or individuals for the performance of specific tasks in connexion with the realization of this purpose; (3) the selection of individuals as subjects for the exercise of Divine grace and the

inheritance of eternal life. It is in the third sense that the term is most commonly used. The doctrine was first formulated by S. Augustine, who defines predestination as the "unconditional decree, according to which God determines to select from the fallen mass of mankind, the whole of whom are alike guilty and under condemnation, a portion upon whom he bestows renewing grace."

S. Augustine never carried the doctrine to its logical conclusion. Predestination simply affected those who were selected for redemption. It was not till the 11th century that through the influence of Gottschalk the reprobation of the wicked was included in the scheme of predestination. The Biblical data upon which the theory is based are found mainly in the Pauline Epistles, and especially in Romans 8, vv. 29-30, and chaps. 9-11, though it is doubtful whether the words used by Paul will bear the construction placed upon them, and it is quite certain that the Apostle laid the utmost stress on human responsibility and the freedom of the will. See Augustine; Calvin; Calvinism.

Predicable (Lat. *praedicare*, to declare). In logic, that which can be predicted or affirmed of something. Aristotle distributed the predicables under four heads: property (the quality common to the whole of a class, but not necessary to distinguish it from other classes), definition, genus, accident (a quality which is not essential to the conception of a substance). These were increased by later logicians to five; genus, species, property, accident, difference (a characteristic mark distinguishing a thing from all others in the same class), difference being added, and species taking the place of definition. The question of the reality or non-reality of these predicables subsequently led to the dispute about universals (*q.v.*).

Predicate. Word or words expressing what is affirmed or denied of the subject of a sentence. If the predicate comes between subject and object, it will consist of a verb alone, but if there is no object the predicate may complete a statement; thus, in the sentence, "he is working cheerfully," all words except "he" are part of the predicate. In logic, the term means an attribute inherent in the subject under discussion, *e.g.* flatness is a predicate of all flat objects.

Predictor. Optical device for mechanically establishing a future position of a moving object. Pre-

dictors are used in astronomy for checking mathematical data relative to progression of the moving heavenly bodies; but their principal application is in anti-aircraft gunnery, which involves a number of factors absent in ground to ground firing. The target moves rapidly at varying heights, may change direction in a few seconds, and moves in three dimensions. Also the wind may cause the shell to drift during its flight, and there is a time lapse between the moment of firing and the moment of impact. An aircraft flying at 300 m.p.h. moves 444 ft. a second; consequently the gun must be laid in advance of the target's course.

All these factors may be calculated mathematically from tables, and the point of aim fixed; but when done by a human being the result is arrived at too late for the gun to open effective fire. The predictor, a combination of optical instruments and a calculating machine, mechanically interprets such data as height, speed, and direction of target into elevation and direction for the gun, and indicates the timing of the shell fuse. The calculations are solved continuously and transmitted to the gunlayers in 1/100th of the time necessary for human calculations.

The predictor consists of a box containing a range finder and a height finder, for each of which there is an eyepiece and telescope sight. Across the lens of each finder are two hairlines meeting at right angles. When the aircraft is picked up by both finders, the operator at each eyepiece turns a knob until the target has been brought across the intersection of the lines; the angle between observer and target, and the passage of the target across a grid of fine wires, are shown on indicators. Simultaneously, a drift recorder establishes strength and direction of wind. These factors are automatically and rapidly transmitted to the gun, where mechanical pointers moving across dials show bearing and elevation, allowance for wind drift, and the setting for the fuse. Fuse setting is thus automatic. A machine actuated by the predictor sets the fuse at the required range, rams the shell in the barrel, and closes the breech in a matter of seconds. In directing the fire of guns from a fixed site, the actual elevation and traversing gears, fuse setting machine, and firing mechanism are controlled directly by the predictor operators, and the guns ranged and fired without intervention by the gun crew. On

mobile A.A. guns, the predictor operators' dials are electrically connected to pointers geared to the gun. The defect of the predictor is that it cannot automatically allow for any deflection of the aircraft from a steady course. This is of little importance when dealing with bombers, as such aircraft must keep a set course when making their bomb run.

Predil. Mt. pass of the Carnic Alps, on the Italian-Yugoslav border. Between Tarvis, in Udine prov., and Flitsch, in Gorizia, its maximum altitude is 3,810 ft.

Preece, Sir William Henry (1834-1913). Welsh electrical engineer. Born in Carnarvon, Feb.

15, 1834, he became associated with the Electric and International Telegraph Co., 1853; was engineer to the Channel Islands Telegraph Co., 1858-62; and divisional engineer to the

Sir W. H. Preece,
British electrical
engineer
Russell

post office from 1870, engineer in chief, 1892-99, and afterwards consulting engineer to the post office and colonies. Preece carried out pioneer electrical work in wireless and wrote on telegraphy and telephony. He was knighted in 1899, and died Nov. 6, 1913.

Pready, GEORGE. One of the pen-names of the British novelist Marjorie Bowen (*q.v.*).

Pre-emption (Lat. *prae*, before; *emere*, to buy). In English law, the right of having the first choice to buy a thing. Before the Restoration the royal purveyors had this right in respect of food, etc., required by the king and his court when travelling in the country, but it was abolished by the Act 12 Charles II, c. 24, which did away with feudal rights. Under the Lands Clauses Acts, if an authority which has purchased lands compulsorily has taken more than it requires, before selling it on the market it must give the pre-emption to the former owner from whom it was compulsorily acquired. In international law, the word means the right of purchasing instead of confiscating contraband of war, or such articles which, though not usually contraband, are declared so owing to special circumstances.

Pre-existence. Doctrine that the soul exists before it is united with the body. It seems to have

originated in the East and underlies the caste system of India, which maintains that the social position into which a man is born indicates his merits or demerits in a previous existence. A further, more corrupt development of the idea is seen in the doctrine of the transmigration of souls. According to Plato the soul originally existed in a state of ideal perfection, but, falling short of the ideal, is condemned to enter a material body subject to decay, from which it can only gain release by self-purification and self-mortification. The Alexandrian School among the Jews embraced a similar theory, which found its way into the Christian Church, but was rejected by the council of Constantinople. According to this view, all souls were created together at the first with the soul of Adam, and remain in the keeping of God until the time comes when they are destined to be united with a body. This teaching has no foundation in Scripture, but is not considered heretical. See Creationism.

Prefabrication. Mass manufacture of components, later assembled into a finished article. Prefabrication developed from the Scandinavian practice of manufacturing doors and window frames in the forests where the timber was cut, and then sending them ready assembled to the house-builder. It was adopted on a large scale by motor vehicle manufacturers in the 1930s. Radiators, wings, chassis frames, electrical equipment, and bodies were made in separate factories and then assembled at a central plant. During the Second Great War, prefabrication was used in the production of tanks, artillery, and aircraft, and in the U.K.

enabled factories to be dispersed as an air-raid protection. In the U.S.A. ships were prefabricated (*see* Liberty Ship). One of the largest single prefabricated undertakings was the Mulberry Harbour (*q.v.*) used in the Allied invasion of Europe. To relieve the housing shortage existing after the Second Great War, prefabrication of houses was largely developed. Many of these were of aluminium, being manufactured in former aircraft factories. *See* Building; House; Mass Production; Shipbuilding.

Prefect (Lat. *praefectus*, set in command). Generally, one who is in a position of authority over others. In ancient Rome the praefect (*q.v.*) was an important official. In France the prefect (*préfet*) is the chief administrative officer of each department, his seat (*préfecture*) being in the chief town of his department, and the prefect of police is chief of the police of Paris and the Seine dept. In English public schools, a prefect is a senior boy who is responsible for maintaining discipline in a house or dormitory, and often has powers of inflicting punishment for minor offences, and the services of a "fag"; the titles praeposter and monitor are also used in this connexion.

Preference. Political term for a system of preferential tariffs. *See* Imperial Preference; Tariff.

Preference Share. Share in a limited company entitling the holder to preference, compared with the holder of ordinary shares, in regard to dividend and, usually, repayment in the event of dissolution. The dividend is fixed, but some participation in the general profits may also be provided for, and dividends may be cumulative or non-cumulative. Preference

Prefabrication. During and after the Second Great War extensive use was made of prefabricated houses of metal, timber, or stone-like composition. These shown in the foreground are at Carr Estate, York

shares may be redeemable or irredeemable, and the classes may be combined, as in cumulative participating redeemable preference shares.

Pregl, Fritz (1869-1930). Austrian chemist, born Sept. 3, 1869, at Laibach (Ljubljana). At Graz he started his career as assistant professor in 1903; after holding the chair of chemistry at Innsbruck, 1910-13, he went back to Graz, and died there Dec. 13, 1930. He became world-famous by devising methods of quantitative micro-analysis whereby the smallest amounts of matter permit an exact chemical analysis. His micro-balance is in general use; so is the iodine solution he developed as a general disinfectant, which bears his name. He won the Nobel prize for chemistry in 1923.

Pregnancy. Period from the time of conception to the birth of an animal. In the human species the average duration of this period is 280 days, reckoned from the first day of the last menstrual period.

Cessation of the menstrual flow is the first indication that a woman is pregnant, but is not conclusive, since it may be due to other causes. Morning sickness usually occurs in the second month and becomes more marked in the third, fourth, and fifth. There may be nausea alone, particularly when first waking in the morning, or actual vomiting, and sometimes this occurs frequently during the day, and becomes a distressing symptom. Its cause is unknown. Changes in the breast may be noticed during the second month, the breast becoming enlarged and the superficial veins more prominent. During succeeding months the nipples become enlarged, small raised follicles develop around them, and the pigmentation on the surrounding skin is darker. From the beginning of the third month generally a little mucoid secretion can be squeezed out of the breasts. Quickening, the term applied to the sensation experienced by the mother when she first feels the movements of the foetus within her, generally occurs in the fourth or fifth month. Enlargement of the uterus may be recognized by the physician in the second or third month. During the fifth month, the foetal heart beat becomes audible through the stethoscope.

Pregnancy is a natural condition and the expectant mother should not regard herself as an invalid during the period of gestation.

Any form of excess or undue exertion should be avoided, but otherwise she should depart as little as possible from a normal life. Plenty of fresh air is important, and regular exercise should be taken, walking being the best form. A normal and nourishing diet should be taken. Excitement or mental distress should be avoided, and any sudden shock or fright is dangerous, as it may cause a miscarriage. If the breasts are painful and heavy, they may be supported by bandages, and during the last three months the nipples should be hardened by bathing them daily with spirit and water.

Spurious pregnancy, or pseudocyesis, is a condition of imaginary pregnancy occasionally seen in hysterical women, particularly those who have reason to fear pregnancy or who are very anxious to have children. In this condition menstruation may cease, mammary changes occur, the abdomen enlarge (though it is only distended with gas), and the woman may assert that she feels the foetal movements. The symptoms generally disappear after the patient has been reassured by the physician regarding her condition. *See* Gestation; Menstruation.

Prehistoric. Antecedent to recorded history. That branch of the study of the human past which concerns prehistoric times as revealed by archaeology is sometimes called prehistory.

Since the word was first used in 1851 by Daniel Wilson, when recording Scotland's prehistoric annals, its scope has been greatly modified. Pictorial, monumental, and other intentional records of events antecedent to writing hold an important place in recorded history. When history implies the whole past, whether known and narrated or not, prehistory loses its meaning altogether.

The beginning of human history was not the same everywhere. In the stricter sense prehistoric Egypt crossed the threshold of history with the 1st dynasty of Men. For millenniums afterwards Europe remained in its prehistoric age, and prehistoric Britain is usually bounded by the advent of Julius Caesar. In one sense America was prehistoric until Columbus's arrival in 1492, if that of the Norsemen in 1000 be disregarded. But in view of our substantial knowledge of several centuries of Maya and Inca history, pre-Columbian is the more appropriate term.

Recorded history is sometimes held to begin with the Magdalenian

cave-pictures of France and Spain. Hence Duckworth ends his Prehistoric Man with the preceding Aurignacian period. The term is extended into prehuman or geologic time, as when Mesozoic reptiles are spoken of as prehistoric monsters. When the earth's history is said to be written in "the record of the rocks," its prehistory recedes into the remotest past, before any solid crust was formed. *See* Archaeology; Stone Age.

Prehnite. One of the zeolite group of minerals; chemically a hydrated calcium and aluminium silicate. A glassy white to light green in colour, it is often a secondary mineral in eruptive rocks, and is derived from the decomposition of feldspar; also found in some amphibolites and crystalline limestones. It resembles chrysoprase when cut and polished, and is often used as a gemstone or as an ornamental stone. *See* Zeolite.

Prelate (Lat. *praelatus*, placed over). Ecclesiastical term for one having episcopal authority, e.g. an archbishop or bishop. *See* Archbishop; Bishop; Ecclesiastical Law.

Prelude (Lat. *prae*, before; *ludus*, a play). Musical piece played before a church service, the opposite of postlude. This ecclesiastical use, however, is no longer the commonest. Bach wrote 48 preludes and fugues for organ which are pieces for performance in their own right; there are preludes as introductory pieces to plays and operas, e.g. in Wagner's *Master-singers*; and with Chopin the prelude is a composition to suit a virtuosic pianist. The Prelude is the title of one of Wordsworth's longest poems.

Premature Birth. Birth of a child before complete intra-uterine development has been reached, and after the 28th week of pregnancy, i.e. the period at which the child has become viable or capable of surviving. The most common causes of premature birth are syphilis in either parent; serious constitutional disease in the mother, such as Bright's disease, lead poisoning, and heart disease; localised disease of the uterus; mental shock or excitement and violence, e.g. a fall or strenuous exercise. A prematurely born child demands special care and skill in order that it may be reared and thrive. Hospitals place such infants in incubators. If the necessary attention is given, many such children become eventually quite as vigorous and well-developed as those whose gestation has been normal.

Premature Burial. Interment before life is extinct. Many persons have a morbid fear of being buried alive. In countries where some days are allowed to elapse between death and burial, thus giving time for the appearance of the undoubted signs of death, there is no fear of such an accident. A few cases have been recorded, but always in exceptional circumstances, usually during epidemics of cholera or plague in hot countries, when fear of infection has led to hasty burial without proper examination by a physician. The Premature Burial is the title of a short story by Poe.

Premium (Lat. *præ*, above; *emere*, to buy). Literally a prize or reward. As a financial term it implies something above the nominal or fixed price. Thus, shares at a premium are worth more than their nominal value, e.g., when £100 of stock is at £110, it is at a premium of £10. The opposite of premium in this sense is discount (*q.v.*). A sum paid by a prospective tenant to secure tenancy of a house is also called a premium. Under the Rent Restriction Acts it is illegal for a landlord to demand a premium except in a lease of 14 years or over. The term is used also for periodical payments to an insurance company in respect of a policy of insurance (*q.v.*).

Premium Bond. Document under seal, in which the borrower undertakes to repay a loan at a premium, i.e. to repay more than £100 for each £100 originally lent. This device is common as an inducement to investors. Thus, a company may offer at £99 p.c. £200,000 4 p.c. Debenture Bonds redeemable 15 years hence at £105; this means that an investor receives for every £99 supplied to the company the right to be paid £4 in interest each year for 15 years, and finally to receive in repayment £105, the extra £5 sometimes being called the premium on redemption.

Premonstratensians or NORBERTINES. Order of regular canons founded in 1120 by S. Norbert of Cleves, afterwards archbishop of Magdeburg. They are named from their first abode near Laon, Prémontré, the "meadow shown," or the "place foreshown" to the founder in a vision. The order follows the Augustinian rule, and was very powerful in N. Europe before the Reformation. It has houses for women as well as men. In England, where Welbeck Abbey was their chief house, the Premonstratensians were known as White Canons. The order has

been revived at Storrington, Sussex, and in France.

Prempeh I (d. 1931). King of Ashanti, 1886-96. Chosen to rule after a civil war in March, 1886,

Prempeh I,
King of Ashanti
From a sketch by Lord
Baden-Powell, by cour-
tesy of Methuen & Co.,
Ltd.

Premphe took the name of Kwakwada III. His election was favoured by the British, and he had some prosperous years of rule. About 1893, however, he began to ignore the terms of the treaty of 1874 with Great Britain, and, after vain negotiations, a war began which ended in his seizure and dethronement. Prempeh was detained as a political prisoner, first at Elmina and later in the Seychelles. In 1924 he was allowed to return to Ashanti, and in 1926 was chosen chief of the Kumasi div. He died May 12, 1931.

His nephew, Otumfuo Sir Osei Agyeman (b. 1892), known as Prempeh II, succeeded to the chieftainship and became head of the Ashanti confederation on its revival in 1935. He was knighted in 1937.

Prensa, La (The Press). Daily newspaper, established in Buenos Aires in 1869, by Dr. José Paz, who was succeeded by his son, E. P. Paz. At first a four-page paper, it has given for many years 20 to 30 pages daily. It has the largest circulation of any newspaper in S. America, and is the best known of the many newspapers of the same name.

Prenzlau. Town of the Land of Brandenburg, in E. Germany. It stands at the N. end of Lake Ucker, 68 m. N.N.E. of Berlin. The chief building is the Gothic church of S. Mary (14th century). Among the industries normally are the manufacture of cigars, sugar refining, and brewing. Prenzlau, which became a town in 1234, was made the capital of the Uckermark, and was fortified about that time. There are remains of its walls and towers. In 1250 it became part of Brandenburg. In Oct., 1806, 12,000 Prussians surrendered here to Murat. Captured by Marshal Rokossovsky's 2nd White Russian army, April 27, 1945, the town lay after Germany's surrender in the Russian zone of occupation. Pop. 28,000.

Preposition (Lat. *præponere*, to place before). In grammar, an indeclinable part of speech preceding a noun or pronoun in a case other than the nominative. It serves to define the relation of such noun or pronoun to some other element of the sentence. Prepositions are really adverbs, and it is incorrect to speak of prepositions "governing" certain cases. At first the meaning which it was desired to express resided in the case itself, but as the case-suffix lost force, an adverb was added to strengthen it. The term preposition is not altogether correct. In earlier times it was sometimes a postposition, placed after the noun, as it is now in many languages. As a language passes from the synthetic to the analytic stage, the need for prepositions increases. Thus, the dative *magistro* in Latin requires in English three words, to the master.

Pre-Raphaelite Brotherhood. Name adopted in 1848-49 by a group of British artists, of whom

Pre-Raphaelite Brotherhood. Millais' picture of Christ in the House of His Parents, execrated when shown in 1850, now in the Tate Gallery. See text

the leading spirits were W. Holman Hunt, J. E. Millais, and D. G. Rossetti, aged respectively 21, 19, and 20. In enthusiastic active revolt against the academic standards then prevalent in British painting—their password was “Death to sloth!”—they set themselves to lead a return to the simpler ideals of the Italian painters, which implied, in their view, a sincere transcription of natural appearances such as academic painters were neglecting in their subservience to convention. The Pre-Raphaelites tended to choose literary or scriptural subjects, and other characteristics were unusually vivid colour and a careful attention to minute and accurate detail. Their first paintings attracted little attention, but works exhibited in 1850, including especially Millais’ Christ in the House of His Parents, now in the Tate Gallery, aroused the ire and scorn of the critics, who had now perceived the calculated audacity of the revolt. There were many protests from the public, especially against Millais’ work, led by a savagely satirical article by Dickens in *Household Words*. This was not without its effect on the Brotherhood, which thereafter began to disintegrate. But Ruskin’s generous support of their work encouraged Hunt and Millais to persist in their particular style, Millais for some years, Hunt for the rest of his life; and other painters followed them in sufficient numbers to gain public acceptance and eventually to outlive the earlier formulae against which the Brotherhood had revolted. Rossetti developed a romantic literary style of his own, which was also widely followed by other painters, notably Burne-Jones who invested medieval subjects with a distinctive romantic formalism, and through the early connexion of Rossetti with the P.R.B., this style was also erroneously termed Pre-Raphaelite.

Besides the three artists mentioned, the only other members of the Brotherhood were W. M. Rossetti (writer), T. Woolner (sculptor), F. G. Stephens (writer), and J. Collinson (painter). Two issues of a periodical, *The Germ*, edited by W. M. Rossetti, were issued by the Brotherhood in 1850, to publicise and exercise their ideals. See Hunt, W. Holman; Millais, J. E.; Rossetti, D. G. *Consult* Pre-Raphaelitism and the P.R.B., W. Holman Hunt, 1905; *The Pre-Raphaelite Tragedy*, W. Gaunt, 1942.

Prerogative (Lat. *praerogare*, to ask before). In general, an exclusive right or privilege belonging to a person or body in virtue of his or its status or character. Thus the royal prerogative is the rights claimed to be inherent in the crown, either as established by historic custom, or as given by direct gift of God. The divine origin of prerogatives, as claimed by the Stuarts, was an important issue in the political philosophy of the 17th and 18th centuries. At the present day the royal prerogative includes such powers as those of declaring war, summoning and dismissing parliament, creating peers, and pardoning offenders. In theory, the royal prerogative has an extremely wide range of power, but in practice it is exercised only through the privy council or the cabinet. The crown enjoys many personal rights and privileges by prerogative, such as personal irresponsibility for crime, exemption from taxation, etc.

Prerogative writs and orders are in the nature of commands for the better execution of justice or the protection of the liberty of the subject, issued by order of the judges of the court of king’s bench. The principal ones are Habeas Corpus, Mandamus, Certiorari, and Quo Warranto. See

Divine Right; King; Petition of Right; Writ.

Prerov or **PRERAU**. A town in Czecho-Slovakia. In the Moravian division, it is 15 m. S.E. of Olomouc (Olmütz). It contains a Gothic town hall and an old castle once the residence of King Matthias Corvinus, and has manufactures of woollens, beet sugar, and farm implements. Prerov was formerly the headquarters of the Moravian Brethren. Pop. 22,362.

Presanella. Mt. mass in the Trentino, Italy. It is situated N.E. of Monte Adamello (*q.v.*) and reaches an alt. of 11,690 ft. It was first ascended by Freshfield in 1864.

Presbyopia (Gr. *presbys*, old man; *ops*, eye). Diminution in the power of focusing the eye, owing to advancing age. Near objects must be held increasingly farther from the eye in order to be seen distinctly. The condition is corrected by wearing convex glasses. See Eye; Sight.

Presbyter (Gr. *presbyteros*, elder). Alternative name for an elder of the early Christian Church, the principal official of a Jewish synagogue, and for a member of the Sanhedrin. In the Presbyterian churches it is applied to a member of a presbytery and to a ruling elder.

PRESBYTERIANISM: ORIGIN & POLITY

* Rev. A. D. HARCUS, D.D., Gen. Sec. Presbyterian C. of Eng.

In connexion with this subject see the articles Calvinism; Church of Scotland; Dutch Church; Huguenots; Protestantism; Reformation. See also the article Christianity and those on the various branches of Christianity; and biographies of Knox and other leaders of Presbyterianism.

Presbyterianism is the name for the organization of the Christian Church on the basis of rule by presbyters. These are chosen by the congregations and set apart for their twofold duties of teaching and ruling, the former office, which includes the administration of the sacraments, corresponding to the clerical, the latter to the lay element in other churches. The presbyters are equal in rank, electing temporary moderators or presidents from their own number in the presbyteries, sessions, and general assemblies, which form the three church courts.

Thus the three notes of Presbyterianism are: the parity of the clergy, in distinction from the episcopal system or the papal; the right of the congregation to govern itself by means of office-bearers chosen from its own members—a primitive right which was only taken gradually from the early Church; and the avoidance

of congregational individualism by means of administrative unity secured in the church courts, where the presbyters sit as representatives of their various congregations. The presbyters are not mere delegates, however; they are ordained for life, whether as ministers or as ruling elders.

When the Reformation broke up the monarchical idea of church polity which had been developed in the Middle Ages, the attempt to express the functions of a Christian church in polity led Calvin to organize the Genevan church on a presbyterian basis. Wherever the reformed church found itself in a monarchy, the tendency was to conserve the episcopal polity in a more or less modified form, as in the English and the Scandinavian churches. But where the Church had to assert its independence against the civil authorities, as in France, the Netherlands, and Scotland, the presbyterian polity

proved more effective; it secured for the congregation their right of self-government, although it is a mistake to identify this instinct off-hand with any modern democratic tendency; it also safeguarded the Church against anything like sacerdotalism. In insisting that the jurisdiction of the Church must be in the hands of the Church, Presbyterianism also insisted that the Church was not simply the clergy.

Questions of Divine Right

From the 17th century onwards a hot controversy raged upon the divine right of episcopacy or presbytery, which is only ceasing in our own day as historical scholarship intervenes to prove that originally the conditions of the Church held both elements together, that neither can claim more than validity on the basis of practical convenience, and that the development in the 2nd century, which led ultimately to the mediæval system of bishops and cardinals, derived from political exigencies which no longer exist, or from doctrinal movements which are open to question. All that Presbyterianism, or any other form of polity, can claim is that it suits the genius of the Church and conserves its practical ends, that it guarantees whatever is requisite to the well-being and efficiency of the Church as God's people.

Historically it is justified by its success. Even in England, as Matthew Arnold pointed out, Hooker wrote his great treatise "not because episcopalianism is essential, but because its impugnors maintained that Presbyterianism is essential, and that episcopalianism is sinful. Neither the one nor the other is essential or sinful, and much may be said on behalf of both. But what is important to be remarked is, that *both were in the Church of England at the Reformation, and that Presbyterianism was only extruded gradually.*"

The opposite process took place in Scotland, and it was largely due to Scottish settlers that Presbyterianism spread rapidly in Ireland from the 17th century onwards, whereas the Presbyterian Church in Wales owed its origin to English impetus in the 18th century.

Huguenots and Calvin

On the Continent, the French Huguenots naturally followed Calvin, though they organized their presbyterian polity on slightly different lines. East of the Rhine, political conditions hindered the presbyterian polity, but Bohemia,

even before Calvin, had developed a semi-presbyterian system. and the remarkable church of Hungary, with over half a million members, attests the vigour of the presbyterian system and its appeal to the reformed Christians of that country. Together with the scattered and smaller communities, which are thus organized elsewhere upon the Continent, the Dutch, British, French, Swiss, and Hungarian Presbyterians now number about five millions, and the polity has proved itself flexible enough to live and thrive amidst complex modern environments.

In Canada the first presbyterian movement was made by the Huguenots in the 17th century. The ill-judged policy of France, which reserved Canada for the Roman Church, checked this attempt. But during the next century the British immigrants took up the cause, and in the eastern and western provinces the Presbyterians were numerically second only to the Methodists. A union between Methodists, Congregationalists, and Presbyterians formed the United Church of Canada, but many Presbyterians remained outside. Strong Presbyterian churches have also been formed, principally through Scottish and Irish influences in Australia and New Zealand. In S. Africa, on the other hand, the impetus came from the Dutch, and the British section is smaller. When isolated missions and sections, *e.g.* in the West Indies and in Asia, are included, the numerical strength of Presbyterianism after the Second Great War was estimated at 7,000,000.

Education and Discipline

The efficiency of the polity is shown by its development of education and of discipline. The Presbyterian churches have invariably set a high standard of education for their ministers, and this has been accompanied by a corresponding conscience for instructing the people in the faith, and also for education in schools. A presbyter must "be apt to teach" according to the New Testament, and Presbyterianism has never forgotten this duty; the administration of the sacraments, for example, is steadily viewed as one aspect of preaching the Word. As for discipline, each congregation is ruled by its own session, presided over by the minister, and consisting of elders (presbyters) elected by the people, who share the spiritual supervision of the congregation with him, aid him in administering the

Lord's Supper, and generally further the interests of the church.

Each minister, with one or more elders from his congregation, is a member of the local presbytery, the main difference being that the minister is a permanent member, whereas the elder is elected for a definite period. In some larger churches presbyteries are grouped in synods, which can act as units of review. The synod is provincial, but the assembly, which meets once a year, is national. Each presbytery sends up a fixed number of delegates, ministers, and elders. A moderator is chosen, who holds office for one year. This is the final court of appeal, and any business may come up before it from any session or presbytery by regular forms of petition. The general assembly thus represents the entire Church, and its decisions cannot be reversed, except by a subsequent assembly.

A large part of the success of Presbyterianism lies in this carefully organized recognition of popular government, which on the one hand leaves the individual congregation free to manage its own affairs and yet prevents any selfish or eccentric action, which puts the minister in a position of independence instead of leaving him at the mercy of a local few, and at the same time gives to the congregation a reasonable control over him. Thus no congregation can interfere with its minister except through the presbytery, and no one kirk-session can review or object to the proceedings of another. On the other hand, a presbytery has certain powers over all church work done by the congregations belonging to it. In mission extension this polity is found effective. Weaker causes can be helped by stronger ones, and advances can be made in the way of church extension by means of concerted effort. Presbyterian principles have been fully recognized in united churches in the mission field and elsewhere.

The World Presbyterian Alliance, founded in 1877, includes well over a hundred churches. Its council, which meets every four years, is consultant, not jurisdictional.

Bibliography. History of the Presbyterians in England, A. H. Drysdale, 1889; The Presbyterian Church, W. M. Macphail, 1908; Presbyterian Churches of Christendom, J. N. Ogilvie, 1925; The Presbyterian Churches, J. Moffatt, 1928; The Presbyterian Tradition, C. L. Warr, 1933.

PRESBYTERIANISM IN THE U.S.A. There was a considerable presbyterian element among the Puritans

of early New England, and many Presbyterians emigrated from Scotland to the American colonies in the 17th century. The first presbytery, Philadelphia, was constituted in 1706. A large accession resulted from the arrival of Scotch-Irish from N. Ireland from 1710 until past the middle of the 18th century. The Congregational and Presbyterian churches of the Eastern states tacitly agreed at the beginning of the 19th century that the Congregationalists should care mainly for New England and the Presbyterians for New York, Pennsylvania, and the South.

The slavery issue served to bring about a schism in the main body of American Presbyterians. In 1861 the Southern churches withdrew from "The Presbyterian Church in the U.S.A." and formed "The Presbyterian Church in the U.S."—a distinction in name that had nothing to do with theology or ecclesiastical polity. This separation between Presbyterians of the North and the South still persists. The Presbyterian Church of the U.S.A. now claims some 2,000,000 members, the Presbyterian Church of the U.S. 500,000, and minor bodies a total of 250,000.

Presbytery (Gr. *presbyteros*, elder). Word originally applied to that part of a church which was occupied by the clergy. First of all situated behind the altar, with the seat for the bishop in the middle, it was divided from the rest of the building by a rail or screen. In later times it meant the space immediately before the altar, as distinguished from the choir.

The term was also used to signify the body of the clergy taken together. In this sense it occurs in the Greek N.T. (1 Tim. 4, v. 14), and is thus used in the Presbyterian denominations, more especially for the official assemblies of ministers for the transaction of business.

Prescot. Urban district and former market town of Lancashire, England. It is 7 m. E. by N. of Liverpool, with a rly. station on the Liverpool-Wigan line. The principal buildings are S. Mary's church and an ancient town hall where the court leet was once held. Formerly famous for watches, the town now makes electric cables and fittings, sheet metal plating, and plastics, and has bookbinding and printing industries, and coal mines are near. Pop. 12,300.

Prescott. Town in Grenville co. Ontario, Canada. It is on the St. Lawrence and at the end of lake

navigation, 12 m. N.E. of Brockville, and is served by C.N.R. and C.P.R. There are marine works, and abrasives, tools, and brassware are turned out. Pop. 3,223.

Prescott, WILLIAM HICKLING (1796-1859). American historian. Born at Salem, Mass., May 4, 1796,

W. H. Prescott,
American historian

the son of a distinguished judge, and grandson of Colonel Prescott, who commanded the American forces at the battle of Bunker Hill, he was educated at Harvard, where he graduated with distinction in 1814. While at college he lost the sight of one eye, and the other eye became so badly affected that for long spells he was virtually blind. He entered his father's legal office, but had to abandon the law, and devoted himself to historical study. With the aid of readers and secretaries, by patient memorizing and the use of a writing frame made for the blind, working in a dark room, Prescott wrote works which are classics of history: *Reign of Ferdinand and Isabella*, 1838; *Conquest of Mexico*, 1843; *Conquest of Peru*, 1847; and the unfinished *Reign of Philip II*, 1855-58. He died in Boston, Jan. 23, 1859, and was buried in S. Paul's church there. His collected works were published in 20 vols., 1906. *American Lives* may be cited that by G. Ticknor, rev. ed. 1875.

Prescription (Lat. *praescribere*, to write beforehand). In law, title by long use and enjoyment. Such title is founded on two conceptions: (1) that when anyone has enjoyed a right for a considerable length of time it is probable that the right has a legal origin; (2) that even if the original possession was not founded on strict legal right, at any rate all rival claimants have acquiesced in it; and in all systems of law it has been found necessary, and to the public advantage, to discountenance stale claims.

In English law, uninterrupted possession for 12 years gives a good prescriptive title to land. A right of light enjoyed for 20 years is indefeasible, unless it can be shown that it was enjoyed not as of right, but under a written agreement or permission. A right of common is *prima facie* established by 30 years' enjoyment; and absolutely by 60 years; again, in the absence of a written agreement. An easement

(e.g. a right of way, or of water, or of support) is *prima facie* conferred by 20, and absolutely by 40, years' uninterrupted use, and in the absence of a written agreement.

Corporations by prescription also exist. A corporation could be created at common law only by royal charter; but when a body is found which has from time immemorial acted as a corporation, though its charter cannot be found, it is presumed to have been created a corporation lawfully. The City of London is an instance of such a corporation by prescription. See Borough; Right of Way.

Prescription. Physician's order to a dispenser for the supply of medicine. The ingredients are usually written in abbreviated Latin, prefaced by the sign *R* which may originally have implied a prayer to Jupiter, but is now regarded as a contraction of *recipe* or "take thou." Quantities are usually given in apothecaries' weights, and old signs are used. Prescriptions are copied by the dispenser in a prescription book.

Present. In grammar, one of the tenses, or times, of the verb. Strictly, it denotes an action or event taking place at the time when it is referred to: e.g. I write, or I am writing. The present is also used of habitual actions, e.g. he goes to school every day; of past events (historic or graphic present), e.g. Nelson draws his sword; of future events, e.g. I start tomorrow.

Presentation. Eccles. term for the offering to a bishop, by the patron or owner of a benefice or living, of a clerk in holy orders as a suitable incumbent of that living. The English law governing presentation is set out in the Benefices Act, 1898. See Advowson; Benefice; Ecclesiastical Law.

Presentment. In English law, bringing before the court facts which a jury of inquiry and presentment has investigated. Grand juries until practically abolished in 1933 were usually called to do this, their duty being to inquire into the facts alleged against an accused and find a true bill or no bill according to whether or not they considered a case was made out on which the accused should be tried. Coroners' juries are also juries of inquiry and presentment.

Presidency. Former administrative division of British India. The name was originally given to those units of the East India Company's territory administered by the presidents of the company's factories. The original three were

Bengal, Madras, and Bombay; Penang was chosen as a fourth, but the scheme was dropped on the acquisition of Singapore. The term Presidency was abolished by the constitutional changes of 1935.

President (Lat. *praesidere*, to sit in front of). Word which denotes headship, with many applications. It is the recognized title of the head of a republic. The head of a college in a university is sometimes called the president; in some colleges at Cambridge the title is applied to the second official. The term is also used of the head of a society, and in the U.S.A. of the chairman of a company. The word occurs in the title of many British ministerial and legal offices, e.g. lord president of the council, president of the board of trade, president of the probate, divorce, and admiralty division, and lord president of the court of session. Tables are given of the presidents of the U.S.A. and of the French republic since 1870. The first two presidents of Eire were Douglas Hyde, 1938; Sean O'Kelly, 1945.

PRESIDENTS OF THE FRENCH REPUBLIC

	<i>Elected</i>
Louis Thiers	1871
M. E. P. M. MacMahon	1873
Jules Grévy	1879
†Sadi Carnot	1887
Jean Casimir-Périer	1894
Félix Faure	1895
Emile Loubet	1899
Armand Fallières	1906
Raymond Poincaré	1913
†Paul Deschanel	1920
Alexandre Millerand	1920
Gaston Doumergue	1924
†Paul Doumer	1931
Albert Lebrun	1932
(Office lapsed in 1940)	
Vincent Auriol	1947
† Died in office. ‡ Assassinated.	

President, H.M.S. Vessel of the British navy. The first President was a vessel of 42 guns built under the Commonwealth, and renamed Bonaventure at the Restoration in 1660. In 1887 a sloop of 1,140 tons was launched at Sheerness and named President. With her engines removed, she was stationed between Blackfriars Bridge and the Temple Stairs, and served as a stationary drillship for the London division of the R.N.V.R. until 1922. In that year a larger training ship, the Saxifrage, a sloop built during the First Great War, and renamed the President, took its place. In the Second Great War she was a merchant navy gunnery training school, and in 1947 was refitted at

PRESIDENTS OF THE U.S.A.

	<i>Inaugurated</i>
George Washington	1789
John Adams	1797
Thomas Jefferson	1801

Harry Shippe Truman	1945
† Died in office. ‡ Assassinated.	

Chatham. The great majority of naval officers serving at the Admiralty, or under the direct orders of Admiralty departments, are borne on the books of the President for purposes of pay and records.

Press. Comprehensive term for the output of the printing press. It is especially applied to newspapers and periodicals. See Journalism; Newspaper; Periodical. See also Censorship.

Press. For this apparatus in metallurgy see Forging Press.

Press Association, LIMITED. British news agency. It was founded in 1868, cooperatively by provincial newspaper proprietors,

to collect and distribute news. Its first news message, Feb. 5, 1870, was also the earliest press message sent over the state-owned telegraph system. The P.A. now operates its private wires (over leased post office wires) to supply home news to London and the provinces, the B.B.C., and to Reuter for overseas distribution. It is the sole distributor in the British Isles outside London of Reuter's world news. The managers have been John Lovell, 1868-80; Edmund Robbins, knighted on retirement in 1917; then H. C. Robbins; and from 1938 Edward Davies. The chief office is 85, Fleet Street, London, E.C.4.

Press Club. London club founded in 1882 by parliamentary and Fleet Street journalists, including G. A. Sala, first of a line of famous presidents. Membership, of which there are several classes, is limited to 1,500. Noted as the social centre of Fleet Street, and host to many distinguished guests, it has for its outstanding annual function the Derby lunch, started by Edgar Wallace. The club is noted for its reference library and newspaper collections. Col. J. J. Astor, proprietor of The Times, became president in 1935. The address is St. Bride's House, Salisbury Square, E.C.4.

Press-Gang. Name given to the bodies of men who formerly carried out the impressment of those liable to forced service in the army or navy. Although impressment (*g.v.*) could be for either land or sea service, it came to be used almost entirely to secure recruits for the navy. Edward III set up a commission of impressment, 1355, and the methods of carrying out the press were regulated by statute in 1378, and on other occasions. In 1641 parliament declared the system illegal, but it was used later for land service by Cromwell, and throughout the 18th century and until 1815 the press-gang operated in seaports.

Seafaring men between 18 and 55 years of age were liable, with certain excepted classes. The press-gang used to land from a warship, seizes likely men, and convey them to the ship as prisoners. Brutality was rife, as the novels of Smollett and Marryat bear

H.M.S. President. The converted sloop used as headquarters of the London division R.N.V.R., lying off the Victoria embankment, London

witness. Even sailors actually serving on board a merchantman could be seized, and vessels were thus sometimes left almost helpless. In 1798 the exemption of certain classes of seamen was suspended for five months. The press-gang method was efficient neither in the quality nor always in the number of the recruits secured by it.

The system disappeared after the Napoleonic wars. An Act of 1835 limited the service of men so taken to five years, but the right of impression was never disowned.

Press Officer. Person appointed by any corporate body, from a govt. department down to any small society or club, to maintain relations with newspapers and other journals so that the work and aims of the body shall be accurately presented therein. His function is twofold: to obtain the desired kind and amount of press publicity by a voluntary supply of information, also to supply additional information at the request of the press. The duties call for considerable exercise of discretion, as well as practical knowledge of the press point of view. Newspapers do not invariably look upon press officers with favour, being suspicious that official "hand-outs" of information may be coloured to suit the purposes of those who issue them whether the information has been asked for or not, or that other items of information they seek may be withheld. On the other hand, the press officer is admittedly useful to the newspapers in saving much time, trouble, and expense. Most govt. departments and large business enterprises now employ regular press officers, their work being often combined with, or subordinate to, the wider range of Public Relations Officer (*q.v.*).

Pressure. Concept in physics. The pressure at a point is measured by the force exerted on unit area around that point. In the C.G.S. system pressure is given in dynes per sq. cm.; but engineers use lb. per sq. in. The centre of pressure of a body is that point at which the resultant of all the pressures may be assumed to act. *See Gas.*

Pressure Cooker. This apparatus is in principle an autoclave and is so described in this work.

Pressure Gauge. Instrument for measuring the pressure of fluids. For ordinary purposes pressures are expressed in lb. per sq. in. or kg. per sq. cm. The form of gauge most widely used by engineers is the Bourdon, which takes advantage of the fact that an

elastic tube of flat section, bent to a curve and closed at one end, will endeavour to straighten itself out, if a gas or liquid be forced into it.

Another form of gauge, the Schäffer-Budenberg, depends for its action on the elasticity of a thin corrugated metal plate, exposed to pressure on one side. As the plate bulges outwards, it pushes up a rod which actuates a quadrant and rack like that of the Bourdon gauge. Vacuum gauges for condensers, brake apparatus, etc., are similar to those described above, but their motions range in the inward direction from the normal position of the spring or disk, and the index hand is set accordingly. Spring-controlled pressure gauges should be tested periodically for accuracy, as a spring is likely to lose some of its elasticity. Tests are made by either a miniature hydraulic accumulator with a sensitive ram weighted to give any desired pressure, or a gas manometer. In this instrument a body of gas, usually air, is imprisoned in a glass tube and compressed by a column of mercury. Readings are taken in accordance with Boyle's law that the pressure of the gas varies inversely as the space it occupies.

The hydrostatic manometer is useful for measuring small pressures, such as those in stokeholds under forced draught, gasometers, etc. It consists of a glass U-tube containing mercury or water. One leg is open to the air, the other to the chamber the pressure in which is being tested. Pressure is estimated from the difference in level of the surfaces in the legs, and expressed in inches of mercury or water.

In ballistics, a pressure gauge is an instrument for measuring the pressure developed by the gases when an explosive is fired in a closed space. It consists of a stout steel body having at one end a piston, provided with a gas check consisting of a copper cup. The inner end of the piston bears against a copper cylinder, and the extent to which the latter is crushed is equivalent to the pressure developed. *See Manometer.*

Pressurisation. Aeronautical term. It is applied to apparatus to maintain the interior atmosphere of a cabin at ground pressure while the machine is flying in a rarified atmosphere that makes normal breathing impossible. In most military aircraft the crew are provided with oxygen masks; but in passenger-carrying machines the cabins are pressurised. Air is drawn into the aircraft through a

combined scoop and inertia filter fitted to the leading edge of the wing outboard of the airscrew flow, away from air contaminated by exhausts. From the filter scoop the air passes through ducts to two blowers, mounted one on each outboard engine gearbox; those raise the air to a normal pressure. The filtered air then enters the fuselage through a spill valve and is distributed through floor ducts to mushroom-headed outlets in the roof and sides of the fuselage. To prevent any air other than that received through the blower entering the cabin, windows, doors, and joints are securely sealed. As the pressure of air inside is greater than that outside, pressurised cabins have to be very strongly constructed.

Prestatyn. Urban district of Flintshire, Wales. It stands on the coast 4 m. E. of Rhyl, with a rly. station. There are remains of a Roman camp, and ruins of a castle. Here also is a large holiday camp. In the neighbourhood are lead mines. Pop. 8,250.

Presteigne. Urban district and market town of Radnorshire, Wales, also the county town. It stands on the Lugg, 33 m. W. by N. of Worcester, and has a rly. station. The chief buildings are the parish church of S. Andrew, of many periods but dating mainly from the 15th century, the guild hall, and the market hall. The Warden is a hill converted into a public recreation ground; the castle formerly stood here. Lugg Bridge marks the boundary with England. Excellent angling is available. John Bradshaw, the regicide, was born in Presteigne. Owen Glendower burned the town in 1401. Market day, Wed. Pop. 1,100.

Prester John. Priest-king in the 12th century. The centre of many legends and theories, by name Jorkhan or Coirkhan, and a native of Asiatic Tartary, he is said to have been converted by Nestorians from Buddhism to Christianity. When he became king he assumed the title of Prester, i.e. presbyter or elder, vanquished the rulers of Media and Persia, and attempted to march to the aid of the Church at Jerusalem, but got no farther than the Tigris. He was succeeded by his son or brother, who also called himself Prester John, and who was killed by Jenghiz Khan.

He was reputed to have been a descendant of the ancient Magi. Pope Alexander III is reported to have addressed him as king of the Indies and most holy of priests.

PRECIOUS STONES: GEMS IN THEIR NATURAL AND FINISHED STATES See text p. 6677

Marco Polo's report of a Christian kingdom in India named Abascia or a conjecture of a Portuguese traveller, Peter Covillanus, in the 15th century, appears to be responsible for the theory that the land ruled by Prester John was Abyssinia. J. E. Fischer, in his *History of Siberia*, attempted to identify him with the first Grand Lama of Tibet.

Described in the *Travels of Sir John Mandeville* as a descendant of Ogier the Dane, one of the paladins of Charlemagne, Prester John is referred to in Shakespeare's *Much Ado About Nothing*, figures in Ariosto's *Orlando Furioso* as a blind king of Ethiopia, and gives his name to an African romance for boys by John Buchan, 1910.

Preston. County and mun. borough and seaport of Lancashire, England. It stands near the head

Preston arms

of the Ribble estuary, 209 m. N.W. of London and 31 m. of Manchester. There are rly. stations, and a canal connects it with Lancaster. The edifices include the modern municipal building, town hall (another modern building, and seriously damaged by fire in 1947), post office, sessions house, Harris institute, Harris free library

and museum, technical school, and public hall. There is a grammar school, founded in 1550, and the town has several parks, especially Avenham, Moor, Ashton, and Ribbleton Parks. The churches, which include several belonging to the Roman Catholics, are all modern; the chief are S. John's and S. Walpurgis (R.C.). Preston is one of the chief centres of the cotton industry; it has also engineering and machinery works, iron and brass foundries, and shipbuilding yards. There is a harbour with docks covering 40 acres, and owing to the deepening of the channel

after 1884, vessels of 5,000 tons can reach the port. Horse and cattle fairs are held besides an annual pot fair.

The name Preston is a corruption of priests' town, originally given because of the number of religious houses. The first charter was granted in 1179, and others followed, allowing the citizens fairs, markets, and other privileges. Preston became prosperous, with the decline of Ribchester. A Roman Catholic stronghold since the Reformation, in 1715 it was taken by the Jacobites and thereupon attacked by the king's troops, the result being that Forster and 1,400 men surrendered. Preston was the birthplace of Arkwright, who in 1769 erected his spinning jenny here. An ancient festival known as the Preston guild is held every 20 years, the first on record having taken place in 1328. The town is governed by a mayor and corporation. It owns the docks and harbour. Two members are returned to parliament. Market days, Wed. and Sat. Pop. est. 116,440. See Preston North End.

Preston, BATTLE OF. Fought between the Scots in the interests of Charles I and the parliamentarians under Cromwell, Aug. 17, 1648. Cromwell's army numbered about 9,000; the royalists had 24,000, but these were not all engaged at once. Some 4,000 royalists surrendered at Preston, and at least an equal number afterwards. Those who had not been brought to action were pursued by Cromwell, and at Winwick another 2,000 were taken prisoners. Many others of the royalists surrendered at Warring-

ton, while their leader, the duke of Hamilton, and the cavalry gave themselves up to the parliamentarians at Uttoxeter.

There was some fighting at Preston during the Jacobite invasion of England in 1715, and some 1,500 Jacobite prisoners were taken, including their leaders, Thomas Forster and the earl of Derwentwater. See Civil War; Jacobites.

Preston, SIR HARRY JOHN (1860-1936). British sportsman and philanthropist. Son of a soli-

Sir Harry Preston, British sportsman

citor, he was born Feb. 19, 1860. A boxing enthusiast, he was described as "the companion of princes, the counsellor of prize-fighters, and the bosom friend of bishops." For many years he was manager and part owner of the Royal Albion Hotel, Brighton. He raised £100,000 for hospitals, and was knighted in 1933. Preston, who published his memoirs in 1928, died Aug. 13, 1936.

Preston North End. English Association football club. One of the first clubs to adopt professionalism, Preston North End helped to form in 1888 the Football League, the championship of which they won in the first two seasons. Preston won the F.A. cup in 1889, and in that season they set up the record performance of winning the league without losing a match, and the cup without conceding a goal. They were cup finalists again in 1922 and 1937 and winners in 1938. Their ground is at Deepdale Road, Preston, and their colours are white shirts and dark blue knickers.

Prestonpans. Police burgh of East Lothian, Scotland. It stands on the Firth of

Forth, 9 m. E. of Edinburgh. The main industry is mining, but there are also brick and tile works and a brewery. The salt industry, whence the word pans in the name of the town, is still in existence. It was begun about 1200 by the monks of Newbattle, and was flourishing in the Middle Ages

Preston, Lancashire. Fishergate, the city's administration centre. Top, the Harris Museum in Market Square, with left, the memorial to the dead of the First Great War

Prestonpans was made a police burgh in 1892, but was a burgh of barony for a long period before that date. Pop. 2,819.

The battle of Prestonpans was fought between the royal troops and the Jacobites in 1745. The former under Sir John Cope, about 2,300 strong, landed at Dunbar, and marched towards Edinburgh. Prince Charles Edward with an equal force set out from that city to meet them, and the armies came face to face at Prestonpans on Sept. 21. The Highlanders dashed upon the waiting royalists under cover of the morning mist, and in a few minutes the guns were captured and the infantry put to flight, being cut down as they ran. Cope's army was destroyed, and he, with a few horsemen, fled to Berwick. The Jacobites called the engagement Gladsmuir.

Prestwich. Municipal bor. of Lancashire, England. It is 4 m. from Manchester, with three rly. stations. The town's principal building is the 13th century Gothic church of S. Mary, and the chief industry the manufacture of cotton. Here are two Manchester water reservoirs. Prestwich shares an M.P. with Middleton. Near is Heaton Park, once a seat of the earl of Wilton; it was transferred to the city of Manchester in 1903. Pop. 34,130.

Prestwich, Sir Joseph (1812-96). British scientist. Born at Clapham, March 12, 1812, he was educated at private schools and at University College, London. He entered business life in London, but spent his leisure in the study of geology, making himself one of the foremost geologists of the day. His work brought him a number of honours, including that of F.R.S. He was an authority on coal, was a member of the royal commission on the water supply, and contributed to our knowledge of primitive man. During 1874-87 he was professor of geology at Oxford. Knighted in 1896, he died at Shoreham, Kent, June 23, 1896. His chief work was *Geology: Chemical, Physical, and Stratigraphical*, 1886-88.

Prestwick. Police burgh of Ayrshire, Scotland. It stands on the Firth of Clyde, 2 m. N. of Ayr, with a rly. station. An ancient place, it was made a burgh in 1600. A great golfing centre, it has an international airport, the chief Scottish airport, and in Great Britain second only in importance to London airport. During the Second Great War this was the

British terminus of the Atlantic air ferry. Pop. 12,000.

Presumption. Legal term for an inference of fact drawn from established facts. Presumptions are a branch of the law of evidence, and are of two kinds: (1) *Juris*, or rebuttable, where, a fact or set of facts being proved, the court is bound to draw a particular inference; but that inference may be disproved by evidence. (2) *Juris et de jure*, or irrebuttable, where, a fact or facts being proved, the court is bound in law to draw a particular inference; and no proof can be received that such inference is false. An accused person is presumed innocent until his guilt is proved.

PRESUMPTION OF DEATH. In English law if no news of a person has been received for 7 years in spite of inquiries by those who would naturally hear if he were alive, the person is presumed to be dead and the court may make a declaration to that effect. Under the Matrimonial Causes Act, 1937, a presumption that a spouse is dead arises when he or she has been absent from the other party to the marriage for 7 years and that party has no reason to believe he or she has been alive within that time. In the absence of contrary evidence the court may presume the death and dissolve the marriage. Where two or more persons have died at a date later than Dec. 31, 1925, in circumstances rendering it uncertain which survived the other, e.g. in an air raid, then the deaths are presumed to have occurred in order of seniority.

Pretender (Lat. *praetendere*, to hold forward). One who makes a claim which is either false or not admitted. The term is most frequently used for those who claim crowns to which they are not lawfully entitled, e.g. Lambert Simnel. In a special sense the word is applied to the son and grandson of James II., referring to their claim to the throne of Great Britain. James Edward is known as the Old Pretender, and his son Charles Edward as the Young Pretender. See Charles Edward; Jacobites; James Edward.

Preterite (Lat. *praeter*, before). Grammatical term signifying the

Prestwick, Scotland. The airport, the site of which was chosen for its remarkable freedom from fog

tense of a verb which expresses absolute past time. "I was singing" is imperfect; "I have sung" is perfect; "I sang" is preterite.

Pretoria. City of the Transvaal, capital of the province, and administrative capital of the Union of South Africa.

Pretoria arms

It is 1,000 m. by rly. N.E. of Cape Town and lies 35 m. N. of Johannesburg. It is also on the direct line from Durban and thus an important rly. junction. It stands on both sides of the Aapjes river, alt. 4,471 ft., at the foot of the Magaliesberg Mts.

The centre of the town is Church Square, from which the main streets radiate. The chief buildings are the block erected by Sir Herbert Baker for the union government and opened in 1912, in which is accommodation for public officials. Another fine pile in Church Square, the Raadzaal, is occupied by the government of the Transvaal. Government House, the residence of the governor-general, overlooks the town, and in Pretorius Street are other public offices. There are a fine railway station, law courts, and a large post office. Other erections are the city hall and the market buildings. There are a state library and several museums. The Anglican cathedral of S. Alban is the chief of many churches.

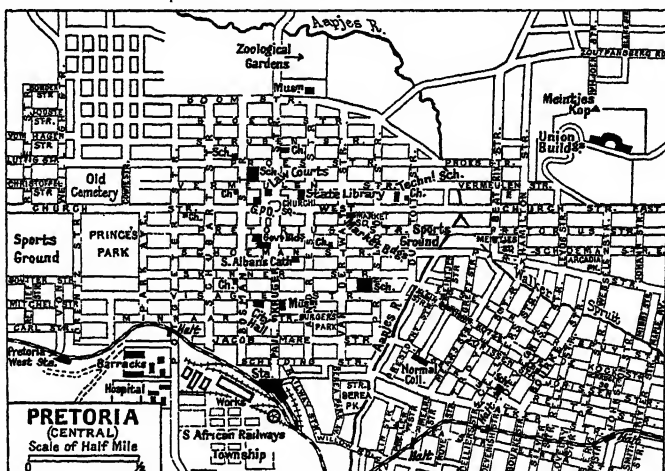

The federal university of S. Africa has its seat here, and Pretoria university was founded in 1930. A monument and amphitheatre commemorating the Voortrekkers (*q.v.*) were dedicated in 1949. The city has several parks, among them being Burger's and Prince's Parks, the latter named in memory of Prince Christian Victor, and zoological and botanic gardens; the jacaranda trees, blooming in Oct.-Nov., are a celebrated feature. The city has a good water

supply and a service of electric tramways. Manufactures include bricks, cement, furniture, leather goods, paints, pottery, insecticides, and metal products. Here also is the Radcliffe Observatory (*q.v.*) transferred from Oxford.

Paul Kruger is buried here; Winston Churchill was a prisoner of war at a school in 1899. Pretoria was founded in 1855 by M. Pretorius, first president of the Transvaal. In 1860 it became the seat of government of the Transvaal. Pop. 236,367 (124,542 white).

Pretorius, ANDRIES WILHELMUS JACOBUS (1799–1853). Boer soldier. One of the leaders of the Great Trek, he reached Natal in 1838 and there was elected commandant-general, leading his troops to defeat the Zulu king Dingaan on Dec. 16. He unsuccessfully attacked the British, 1842. In 1852 he concluded the convention with Great Britain whereby the latter recognized the independence of the Transvaal. He died July 23, 1853.

Pretorius, MARTINIUS (1819–1901). Boer leader. Son of Andries

Pretoria, Transvaal Plan of the central districts of the city

liable to suffer from outbreaks of, *e.g.*, cholera, deriving from defective conditions in the towns. The Public Health Act, 1875, brought the provision of isolation hospitals, compulsion to

structive and positive in its aim. The introduction of school medical inspection in 1907 was an important step forward for the welfare of the rising generation. The National Insurance Act of 1911

had less preventive value than had been anticipated, and the loss of manpower through minor sickness, *e.g.* even the common cold, continued to be a serious obstacle to the economic prosperity of the nation.

The Pioneer Health Centre (*q.v.*) led the way in presenting a conception of health as something other than the mere absence of disease.

Pretorius, he succeeded to the general command on his father's death, and prosecuted several vigorous campaigns against the natives. In 1856 he was elected president of the newly founded South African republic, which remained little more than a name for eight years. His policy of conciliation with the British diggers created such unpopularity with the Boers that he resigned in 1871. In 1880 he was associated with Kruger and Joubert in the Boer revolt against British annexation of the country. Pretorius died May 19, 1901.

Preventive Medicine. Term for that branch of medical science which specialises in the prevention, rather than the cure, of disease. The first Public Health Act in the U.K., 1848, was a measure which dealt with the environmental conditions of life. Experience had shown that the people could not be healthy without satisfactory sewer arrangements, adequate supplies of pure water, and decent housing. Without these the whole community was

notify infectious diseases, vaccination, supervision of common lodging-houses, etc., under the direction of the medical officer of health. Before the passing of that Act emphasis was upon the removal of nuisances. After it, preventive medicine became con-

Pretoria, Transvaal. Top, Union buildings overlooking the city. Centre, Church Square, where the Law Courts (bottom) are situated

During the Second Great War, everything possible was done to keep the men and women in the forces healthy. Health education through the radio was aimed at civilians. Rationing by its even distribution of available food throughout the whole population, the provision of canteens, and the supply of milk for mothers and young babies helped to maintain the health of the people, in spite of the strain of the war years, at an exceedingly high level.

Although the National Health Service Act, 1946, laid stress upon the hospital service, it contained the possibility of a real health service through the health centres which the local authorities are required by the Act to provide (see Health Centre). One of the difficulties of enlarging the scope of preventive medicine is that the education of doctors has always been directed too much towards specialisation in disease, and little study has been devoted to an analysis of what constitutes health. *Consult Report on the British Health Services*, P. E. P., 1937; *An Approach to Social Medicine*, J. D. Kershaw, M.D., 1946; *Local Government*, Sir A. MacNalty, 1948.

Preventive Service. Former branch of the coast defence service of the U.K. The preventive service came into existence after the end of the Napoleonic wars, to suppress smuggling on the S. coast of Sussex. Two naval vessels, *Ramillies* and *Hyperion*, were commissioned, chiefly with half-pay naval lieutenants, but the officers were actually stationed at various points along the coast with the necessary men and boats. By 1830 the service had expanded to include many vessels up to 200 tons, revenue cutters, etc., and in 1845 men who joined the preventive service were required to sign on to serve in the navy in case of emergency. After 1857 the service became the Coast Guard (*q.v.*) service.

Prevesa or PREVEZA. Town of Greece. Situated on the W. coast at the entrance of the gulf of Arta, it has a considerable shipping trade, and exports olives and olive oil. Pop. 8,659. The ruins of Nikopolis, founded by Augustus to commemorate the battle of Actium, lie 4 m. N. Prevesa gives its name to a dept. of Epirus; pop. 77,368.

Prévost, EUGÈNE MARCEL (1862-1941). French novelist. He was born in Paris, May 1, 1862, and worked as engineer in a Lille factory until 1891, by which time he had attained popularity with his stories. His novels, which

followed one another in rapid succession, include *Le Scorpion*, 1887; *La Cousine Laura*, 1890;

Eugène Prévost,
French novelist

Lettres de Femmes, 1892, followed by *Nouvelles Lettres*, 1894, and *Dernières Lettres*, 1897; *Les Demi-Vierges*, 1894; *L'Heureux Ménage*, 1901; *Lettres à Françoise Mariée*, 1908; *La Retraite Ardente*, 1927. A play, *La Plus Faible*, produced at the Comédie Française in 1904, enjoyed great success. In 1919 Prévost was elected to the Academy, and he lived until April 8, 1941. *Prom. Pray-vo.*

Prévost d'Exiles, ANTOINE FRANÇOIS (1697-1763). French abbé and author. He was born at Hesdin, Artois, April 1, 1697, and educated by the Jesuits, and saw some military service before joining the Benedictine order in 1721. In 1728, following a period of exile in Holland and England, he published his first novel, *Mémoires d'un Homme de Qualité*, of which the enchanting *Manon Lescaut*, 1733, was a sequel. He spent most of the rest of his life near Chantilly, writing industriously, but none of his other works is remembered. He died Nov. 23, 1763. His works were published in 39 vols. in 1806, and an Eng. trans. of *Manon Lescaut*, with Life of Prévost, in 1841. *Prom. Pray-vo deg-zeel.*

Preysing, KONRAD, COUNT (b. 1880). German ecclesiastic. He was born Aug. 30, 1880, near Landshtut, of the Bavarian aristocracy. Destined for diplomacy, he studied law, and worked in the foreign office at Munich and at the Italian court before going to study theology at Innsbruck. Writing on history and canonical law, he came into contact with the nuncio who was later Pope Pius XII. In 1928 Preysing took pastoral office at the chapter of Munich cathedral; in 1932 was appointed R.C. bishop of Eichstätt; in 1935, of Berlin, where he valiantly resisted Nazi suppression of thought and encroachment upon the Church. In 1946 he was created cardinal.

A.F. Prévost d'Exiles,
French author

Priam. In Greek mythology, king of Troy, son of Laomedon and father of Hector, Paris, Troilus, Deiphobus, Polyxena, Cassandra, and other children. He was popularly credited with fifty sons and daughters. He was the only one of the sons of Laomedon that was spared when Hercules came to take vengeance for being cheated out of his reward for saving Hesione (*q.v.*) from the sea-monster. When Hector had been killed by Achilles, Priam, in a pathetic and powerful scene in the *Iliad*, visits the conqueror in the night-time to beg for the body of his son. At the taking of Troy, Priam was killed by Neoptolemus, or Pyrrhus, the son of Achilles. See Homer; Troy.

Priapus. In Greek mythology, god of the reproductive powers of nature, and patron of gardens. He was the son of Dionysus and Aphrodite, and was especially worshipped at Lampsacus on the Hellespont. His worship often degenerated into licentiousness. Statues of Priapus were to be found in gardens.

Pribalkhash. District of Kazakh S.S.R. It has large refineries for smelting copper from the mines N. of lake Balkhash, and is traversed by a line linking the Transkazakh rly. with the Turkestan-Siberian rly.

Pribilof Islands. Group of small islands in Bering Sea. Situated about 200 m. S.W. of the Alaskan mainland, they are an important centre of the fur-seal fisheries, and were constituted a reservation in 1868. The islands, of volcanic formation, were first visited in 1786 by Gerasim Pribilof, after whom they were named. They were acquired by the U.S.A. from Russia in 1867. See Bering Sea Question.

Pribram. Town of Czechoslovakia, in Bohemia. It is 18 m. S. of Beraun, and is famous for its silver-lead mines. On the Sacred Mount (1,903 ft.) are the Redemptorist convent and a church, much visited by pilgrims. Pop. 10,468.

Price. Value expressed in money. The term is, however, not confined to the time of actual selling; a trader's price often states a willingness to sell for that sum; a list price or catalogue price may be merely a basis from which the true price will be calculated by the deduction of trade discount; the cost price may be the total expended to make an article; the sale price, the sum of money a manufacturer is willing to accept in exchange for the article. A market price is a price determined at any time

through the competition of buyers and sellers. It tends to be the amount that will make the quantity offered for sale equal to the quantity demanded. Normal price is the economist's term for the theoretical price that would tend over a long period to make the quantity offered equal to the quantity demanded. Market price tends to oscillate around normal price, which, since it will maintain supplies, must be above current cost of production.

During and after the Second Great War many prices were fixed by official price control orders, which stated the maximum prices that might be charged, by wholesalers and by retailers, or the maximum percentage that traders might add to their own cost prices when deciding the prices at which certain goods were to be sold. Other government orders issued under various statutes prescribed minimum prices, particularly for work done and for certain agricultural produce.

The price of a commodity tends to increase (a) if the quantity of money available to customary purchasers increases; (b) if the quantity of the commodity available for sale (stock) decreases; (c) if the desire to possess the commodity becomes more widespread or more intense through a change of taste, fashion, etc. (increased demand); (d) if buyers of the article have to pay an increased amount of purchase tax or other tax; (e) if substitute commodities cease to be available (this is a special case of (b) above); (f) if costs of production or costs to importers rise; (g) if competition among suppliers is eliminated. For these reasons prices are an important part of the mechanism for shaping economic activity. The price expected to be received is one of the indicators that producers follow when deciding what they will produce and how much, since most goods are produced only in the anticipation that it will be possible to sell them profitably; falling prices therefore discourage production. When prices generally rise, the value of money falls; and conversely. See Money; Index Number; Inflation.

Price, LILLIAN NANCY BACHE (b. 1880). British actress. Born at Kinver, Worcs, Feb. 3, 1880, she was educated at Malvern, and made her first stage appearance at Birmingham in 1899. The following year she joined Benson's company and appeared at the Lyceum, London, as Olivia in Twelfth Night.

She later became a well-known character actress, her most striking performances including: Mrs.

Nancy Price,
British actress

Alving in Ghosts, Mme. Raquin in Thou Shalt Not (dramatisation of Zola's Thérèse Raquin); Mrs. Borkmann in John Gabriel Borkmann; Adeline in Whiteoaks; and Mrs. Dundass in Lottie Dundass. She was also well known as a producer, and appeared in films. She published *Shadows on the Hill* (memoirs), 1935. Nancy Price was hon. director of the People's National Theatre from 1933.

Price, RICHARD (1723-91). British economist and philosopher. Born at Tynton, Glamorganshire, Feb. 23, 1723, he was educated in London. His father was a dissenting minister, as was he for a time, though he soon became known as a writer. His writings against the war with the American colonists, to which Burke replied, made him famous. As a philosopher, he dealt mainly with ethics, his chief work being a *Review of the Principal Questions in Morals*, 1757. Price died April 19, 1791.

Price Index. Device to make it possible to compare easily and frequently variations in the general level of prices relating to a selected list of commodities and/or services. It is commonly used for comparing changes in the cost of living, the cost of different classes of stocks and shares, etc. A base year is selected and the level of prices ruling for the commodities and/or services selected at that time is made to represent 100. Thereafter the average price for those items at any given date is expressed by a number which indicates the rise or fall above or below 100. In many cases the items are "weighted" according to their relative importance, to obtain a more accurate comparison for practical purposes, e.g. if bread and ice-cream prices were included in a list of items compiled for the construction of a cost of living price index, it would be wise to weight the price of bread relative to that of ice-cream.

Prichard, JAMES COWLES (1786-1848). British ethnologist. Born at Ross, Herefordshire, Feb. 11, 1786, of Quaker parentage, he studied medicine in London, became M.D. Edin., 1808, then studied at Cambridge and Oxford,

and practised medicine in Bristol. His *Physical History of Mankind*, 1813, culminating in his *Natural History of Man*, 1843—both subsequently enlarged—influenced British anthropological research. He was elected F.R.S. and president of the Ethnological Society. His *Eastern Origin of the Celtic Nations*, 1831, was a landmark in Aryan study. He died in London, Dec. 22, 1848.

Prickly Heat. Affection of the skin of Europeans occurring in tropical and sub-tropical regions, and occasionally in temperate zones during hot weather. It is due to the effect of heat on the sweat glands, which become sodden. An eruption of small papules occurs on the skin, associated with severe itching and profuse sweating. The condition generally disappears quickly under proper treatment. The patient should be kept cool, should not drink much, and should avoid hot tea. Sea bathing is undesirable. A lotion or powder containing boric acid may be applied to the skin after using a lotion containing one part in 1,000 of corrosive sublimate in eau de cologne.

Prickly Heath (*Pernettya mucronata*). Evergreen shrub of the family Ericaceae. A native of Pata-

Prickly Heath. Spray with leaves, flowers, and, right, berries. Inset: single flower

gonia, it has stiff oval leaves with toothed edges, and urn-shaped, nodding white flowers. The fruit is a globular berry, about the size of a pea.

Prickly Pear (*Opuntia vulgaris*). Succulent shrub of the family Cactaceae. It is a native of the warmer parts of America. A jointed, prostrate, or spreading plant, the light green joints are of oval shape, and the leaves reduced to minute scales. The spines are small, solitary, or absent, though there are clusters of barbed bristles. The flowers are pale yellow, opening only in sunshine, and are suc-

ceeded by smooth pulpy, edible, egg-shaped fruits. *O. tuna* is a larger species, more spiny, with larger

Prickly Pear. Cactus of tropical America, *Opuntia microdasys*

fruit (West Indies); and *O. ficus-indica* (Mexico) furnishes the so-called Indian figs. The last named species was introduced into the Mediterranean area for the sake of its fruit; but, finding the climate suitable, it spread so rapidly that it became a pest.

Prick-Song. Term formerly used for music which was written down, prick, in the sense of a mark, being an old name for a musical note. The term was also applied to divisions upon a ground, and to descant upon plainsong.

Pride, THOMAS (d. 1658). English regicide. On the outbreak of the Civil War he joined the parliamentary army and won rapid promotion. In 1645 he distinguished himself in command of a regiment at the battle of Naseby. On Dec. 6, 1648, to prevent the parliament from coming to an agreement with the king, Colonel Pride, with a body of soldiers, forcibly prevented about 140 members from taking their seats, arresting over 40 of them. This episode is known as Pride's Purge. At the beginning of the following year he was one of the commissioners at the trial of Charles I, and signed the death warrant. He died Oct. 23, 1658.

Pride and Prejudice. Novel by Jane Austen. Written during 1796-97, it was originally entitled *First Impressions*. The author's first novel, it was published anonymously in 1813, two years after the appearance of her second book, *Sense and Sensibility*. One of her most popular works, it is notable for the finely drawn portrait of the vivacious Elizabeth Bennet, whose prejudice against the proud Mr. Darcy gradually turns to understanding and love. Its subsidiary characters reveal Jane Austen as a

master of gentle satire: the brilliantly drawn portraits of Mr. and Mrs. Bennet, the sycophantic Mr. Collins, the bombastic Lady Catherine de Burgh, and the feckless Lydia Bennet. The best-known dramatisation was that by Helen Jerome, produced at St. James's Theatre, London, 1936. Another, Miss Elizabeth Bennet, by A. A. Milne (1936), was also based on the novel. A film version, 1940, starred Greer Garson and Laurence Olivier.

Prideaux, HUMPHREY (1648-1724). British Orientalist and divine. He was born May 3, 1648, at Padstow, Cornwall, and educated at Liskeard and Bodmin grammar schools, at Westminster, and at Christ Church, Oxford, where he was distinguished for his scholarship. In 1681 he became canon of Norwich, and during 1688-94 was archdeacon of Suffolk. He succeeded Fairfax as dean of Norwich in 1702, died there, Nov. 1, 1724, and is buried in the cathedral. Among his works are *Life of Mahomet*, 1697; and *The Connection*, 1717-18.

Prie-Dieu (Fr., pray God). Small wooden desk for prayers. It has a cushioned kneeling-piece and a sloping shelf for books. The name came into use in the early 17th century. See *Faldstool*.

Priego de Cordova. Town of Spain, in the prov. of Cordova. It stands in a fertile plain, 47 m. S.E. of Cordova, and has a 13th century church. Industries include tanning and the manufacture of cotton and silken goods, rugs, and esparto fabrics, while a thriving trade is carried on in oil, wine, cattle, horses, and mules, for which the district is noted. A Moorish stronghold, Priego was captured by the Christians in 1226, retaken by the Moors, and finally reconquered in 1407. Pop. 18,700.

Priessnitz, VINCENTZ (1799-1851). A German hydropathist. Born at Gräfenberg, Silesia, Oct. 5, 1799, he became a farmer. Having obtained the idea of the water cure for illness, he practised it on his animals and then on himself. So successful was he that he extended his farm buildings to form a hydropathic establishment, the precursor of many others. He died Nov. 28, 1851. The system of Priessnitz consisted essentially in the application of cold water to all parts of the body by bandages and other devices, supplemented by careful diet, exercise, and fresh air.

Priest (Gr. *presbyteros*, elder). Term for a member of the second order of the Christian ministry.

The original signification of the word, which is used in connexion with officiating ministers in pagan temples as well as in Christian churches, though not in the Free churches, is doubtful; but it is used by the English translators of the O.T. as an equivalent of the Hebrew *cohen*, which implies one who stands as mediator between his fellow-men and God. In the N.T. the translators also use the word priest as an equivalent of the Greek *hiereus* (Lat. *sacerdos*), sacrificing priest. Though in common use at the beginning of the 3rd century, the word priest (*hiereus*) is not applied in the N.T. to a Christian minister as distinct from the Christian people. It occurs, however, in reference to Jewish priests, to the priest of Jupiter at Lystra (Acts 14, v. 13), and to our Lord (Heb. 7, vv. 16-17; 8, v. 4). See *Clergy*; *High Priest*; *Holy Orders*; *Minister*; *Sacerdotalism*.

Priest Gun. Self-propelled British gun used in the Second Great War. It was a 105-mm. high-velocity gun-howitzer, on a General Grant tank chassis. First used by the 8th army at Alamein, it was decisive against the German 88-mm. anti-tank gun.

Priestley, JOHN BOYNTON (b. 1894). English critic, novelist, and playwright. He was born Sept. 13, 1894, son of a Bradford schoolmaster, and was educated there and at Trinity Hall, Cambridge, also serving in the First Great War. His literary career

J. B. Priestley, English writer

opened with verses, *The Chapman of Rhymes*; reputation grew with *Brief Diversions*, 1922; two short novels published in 1927; and studies of Meredith and Peacock; then in 1929 *The Good Companions* (*g.v.*) proved a best-seller, ranked by some as a picaresque novel in the Fielding tradition. Next year came *Angel Pavement*, a sombre masterpiece of middle-class life in London, and there were later novels of the same length and style.

Priestley's first play, and one of his best, was *Dangerous Corner*, 1932. He succeeded with pure comedy in *Laburnum Grove*, 1933. After coming out as a writer with social purpose in *English Journey*, 1934, he launched a memorable series of plays presenting aspects of the problem of time, in which he owed much to the

theories of Ouspensky and J. W. Dunne. Time and the Conways (1937), I Have Been Here Before (1937), and Johnson Over Jordan (1939) brought him to the Second Great War, and Music at Night was the first new play put on in the London black-out.

During and after the war Priestley's plays and novels revealed an intense concern with the lives and aspirations of those who were fighting, waiting at home, or planning a new society. They Came to a City, 1943, was a symbolic drama, but Desert Highway was set in Libya, and the story Three Men in New Suits dealt with the adjustment of servicemen to civilian life. The Linden Tree, 1947, showed that while strongly Left-wing himself, Priestley could create sympathetic stage characters to speak for the other side.

A man of diverse activities, he excelled as a broadcaster, either of entertaining causeries or of postscripts to news when it seemed dark in 1940. Books described as chapters of autobiography gave interesting glimpses into his method of work. If there may be found one quality common to all Priestley's writing, that quality is humanism.

Alan Phillips

Priestley, JOSEPH (1733-1804)
British chemist and divine. Born at Birstall, Yorks, March 13, 1733,

Joseph Priestley,
British chemist

he was educated at Daventry for the Nonconformist ministry. In 1755 he became minister of a church at Needham, removing to Leeds in 1767 and to Birmingham in 1780. During all his life he held theological views in advance of the time; but it is as a scientist that Priestley is remembered. He early took an interest in chemistry and electricity, and in 1767 published his History of Electricity. He carried out brilliant but unmethodical experiments with electricity, 1761-70, suggesting explanations of certain phenomena which required a century to pass for final proof.

Turning his attention to chemistry, in 1772 he read his paper on Different Kinds of Air, in which he announced the discovery of hydrochloric acid and nitrous oxide. This paper contained a suggestion for saturating water with carbon dioxide which led to a new in-

dustrial process in the manufacture of mineral waters. His remarkable discovery of oxygen in 1774 followed, one of the landmarks in the history of chemistry. Priestley was a strong advocate of the phlogiston theory, and this prevented him from realizing the full value of many of his discoveries. Sulphur dioxide, silicon tetrafluoride, and other gases were discovered by Priestley, who showed their effect on plants and animals.

Politically a reformer, Priestley was known to be sympathetic to the French Revolutionaries, and on July 14, 1791, a mob in Birmingham attacked his house and chapel, destroying records and instruments. Joining his sons in America in 1795, he died Feb. 6, 1804, at Northumberland, Pa. His Works were edited by J. T. Rutledge, 1817-32. There are Lives by J. Corry, 1804; A. Holt, 1931.

Priluki. Town in the Chernigov region of Ukraine S.S.R. It lies 150 m. N.W. of Poltava, on the Udai, and on a branch line of the Kiev-Voronezh rly. Overrun by the Germans during the Second Great War, Sept., 1941, it was recaptured by the Russians, Sept. 17-18, 1943. Considerable trade was carried on in grain and cattle, and there were tobacco plantations in the neighborhood.

Prim, JUAN, MARQUIS DE LOS CASTILLEJOS, COUNT DE REUS (1814-70). Spanish soldier. Born Dec. 6, 1814, he spent his youth under arms, but was exiled by Espartero in 1839. Four years later he was instrumental in causing that minister's downfall, but was again exiled shortly after, living in England and France until his return to Spain in 1847. His military services, 1847-60, were rewarded with a marquessate, but in 1868, angered at Queen Isabella's favouritism to the Jesuits, he and Serrano led an insurrection, the latter being declared regent. On the election of Amadeo, duke of Aosta, to the Spanish throne, Prim was assassinated, Dec. 30, 1870.

Primage (Lat. *premium*, reward). Term used in shipping for an allowance made by the shipper to the captain of the vessel for the use of the tackle, etc., in loading and unloading cargo. Now simply any addition to the quoted rate of freight, usually to repay the captain for his care, its amount varies from port to port and also in different trades.

Primaries. Word used in the U.S. A. to denote those elections by which members of the great political parties choose their candidates for

public office as well as their delegates to party functions. The primaries, though purely party matters, are regulated by laws varying from state to state, but usually laying down the definition of a party, the rules determining its membership, the method of balloting, dates, polling places, payment of expenses, etc.

Oregon passed a law in 1910 instituting a primary election of delegates to the party conventions which choose the presidential candidates. Progressive elements in both parties adopted the idea, and by 1916 such primaries were held by law in 24 states. By 1948 they were held in only 14 states.

Primary Rocks. Those ranging from the Cambrian period in geology to the Permian period; perhaps from 500 million to 200 million years ago. They are well represented in the British Isles. For fuller treatment, see Geology.

Primate (Lat. *primus*, first). In England, term applied to the archbishops of Canterbury and York. It means the bishop highest in rank in a nation or province. In the R.C. church primates are bishops to whose see the dignity of vicar of the Holy See was formerly attached, these including Arles, Armagh, Gran, Lyons, Mainz, Pisa, Salerno, and Toledo. See Archbishop; Canterbury; Exarch; Metropolitan.

Primates (Lat., *primus*, first). Highest order of the mammalia. It is divided into three sections, the Lemuroidea, which include the lemurs; the Tarsiodea; and the Anthropoidea, which include the monkeys, apes, and man. These sections are regarded as distinct orders by some authorities. With the single exception of man, all members of this order are inhabitants of tropical and sub-tropical countries, and are arboreal in habit, though some baboons are more usually found among rocks than in trees. Hence they are essentially climbing animals, and the four feet are adapted for grasping, whence the old name of quadrumana or four-handed animals; where there is a tail it is generally prehensile for the same reason.

Except in man, the great toe is opposable to the others, but the thumb is often imperfectly so. The upper halves of the limbs are free from the body and not embedded in it, as in the ungulates and others. The fingers and toes do not taper to a point, but are more or less broad at the tip and bear a nail instead of a claw.

Another notable distinction is that the eyes are brought round to the front of the head, and not placed at the sides. The mammae or teats are normally only two in number and are situated on the breast, and never on the abdomen. In the higher primates, a more or less erect attitude has been adopted; and in man the brain has been greatly developed both in size and in elaboration of structure. The dentition differs essentially from that of both carnivores and herbivores, and is indicative of a mixed diet. *See* Animal; Mammal.

Prime Meridian. Zero longitude from which all meridians are reckoned or numbered E. and W. The choice of meridian is arbitrary, but international agreement in 1884 selected that of Greenwich. *See* Longitude.

Prime Minister. Head of the British government and the principal adviser of the sovereign, called also the premier. He must be a member of parliament and enjoy the confidence of a majority of the house of commons, and through them that of the country. Under the party system, he is also the leader of his own party. His powers are enormous, as he selects the cabinet, advises the sovereign when to dissolve parliament, and exercises patronage.

Sir Robert Walpole is generally regarded as the first prime minister, the evolution of this office being due to George I's unwillingness to attend cabinet meetings because of his ignorance of the language. Since Walpole's time the power and prestige attached to the office have steadily increased. In the constitution the position of prime minister was unknown, and the holder, therefore, always had in addition some other office, usually, but not always, that of first lord of the treasury. In 1905 Edward VII recognized the existence of the position, and gave the prime minister precedence on state occasions immediately after the archbishop of York.

The Ministers of the Crown Act, 1937, which provided for the payment of a salary of £10,000 and a pension of £2,000 to the prime minister, was the first statutory recognition of his existence. Salisbury, 1895-1902, was the last premier to be in the house of lords; since his time peers have been tacitly disqualified, as was seen in 1923, when Bonar Law was succeeded not by Lord Curzon but by the far less prominent Baldwin.

There is a tendency for the prime minister to perform a dual rôle, to be the head of the government, representing only one party or a coalition of parties, and also to be the adviser of the sovereign in his relations with the self-governing dominions, each of which has its prime minister.

PRIME MINISTERS SINCE 1721

1721-42	Sir Robert Walpole.
1742-44	Lord Carteret, later Earl Granville.
1744-54	Henry Pelham.
1754-56	Duke of Newcastle.
1756-62	William Pitt (later Earl of Chatham) and Duke of Newcastle.
1762-63	Earl of Bute.
1763-65	George Grenville.
1765-66	Marquess of Rockingham.
1766-67	Earl of Chatham.
1767-70	Duke of Grafton.
1770-82	Lord North, later Earl of Guilford.
1782	Marquess of Rockingham (2nd time).
1782-83	Earl of Shelburne, later Marquess of Lansdowne.
1783	Lord North (2nd time).
1783-1801	William Pitt, the younger.
1801-04	Henry Addington, later Viscount Sidmouth.
1804-06	William Pitt (2nd time).
1806-07	Lord Grenville.
1807-08	Duke of Portland.
1809-12	Spencer Perceval (assassinated).
1812-27	Earl of Liverpool.
1827	George Canning.
1827-28	Viscount Goderich, later Earl of Epsom.
1828-30	Duke of Wellington.
1830-34	Earl Grey.
1834	Viscount Melbourne.
1834-35	Sir Robert Peel.
1835-38	Viscount Melbourne (2nd time).
1841-46	Sir Robert Peel (2nd time).
1846-53	Lord Russell, later Earl Russell.
1852	Earl of Derby.
1852-55	Earl of Aberdeen.
1855-58	Viscount Palmerston.
1858-59	Earl of Derby (2nd time).
1859-65	Viscount Palmerston (2nd time).
1865-68	Earl Russell (2nd time).
1868-69	Earl of Derby (3rd time).
1869	Benjamin Disraeli, later Earl of Beaconsfield.
1869-74	W. E. Gladstone.
1874-80	Earl of Beaconsfield (2nd time).
1880-85	W. E. Gladstone (2nd time).
1885-86	Marquess of Salisbury.
1886-91	W. E. Gladstone (3rd time).
1886-92	Marquess of Salisbury (2nd time).
1892-94	W. E. Gladstone (4th time).
1894-95	Earl of Rosebery.
1895-1902	Marquess of Salisbury (3rd time).
1902-05	Arthur Balfour.
1905-08	Sir H. Campbell-Bannerman.
1908-16	H. H. Asquith, later Earl of Oxford and Asquith.
1916-22	David Lloyd George, later Earl Lloyd-George.
1922-23	Andrew Bonar Law.
1923-24	Stanley Baldwin, later Earl Baldwin.
1924	J. Ramsay MacDonald.
1924-29	Stanley Baldwin (2nd time).
1929-35	J. Ramsay MacDonald (2nd time).
1935-37	Stanley Baldwin (3rd time).
1937-40	Neville Chamberlain.
1940-45	Winston Churchill.
1945-	Clement Attlee.

From the above list it will be seen that Walpole was continuously prime minister for a longer period—21 years—than anyone else. The younger Pitt was premier for 18 years, and Lord Liverpool for 15 years continuously. No one save Gladstone has held office four times.

Prime Number. Term in mathematics to denote any number which is indivisible without a remainder, save by itself and unity. Thus 1, 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, and 37 are prime numbers, whereas 4, 6, 8, 9, 10, 12, 14, 15, 16, 18, and 20 are composite because they can be re-

solved into factors. When an odd number exceeds four figures it is difficult for any but a mathematician to decide whether or not it is prime. For example, 36,087 is a composite number with factors 3 and 12,029, whereas 36,083 is a prime number. There is no limit to the size of prime numbers and the largest so far worked out is 170,141,183,460,469,231,731-687,303,715,884,105,727; it was established by the French mathematician E. Lucas in 1876. *See* Mathematics.

Primer. Device for igniting an explosive charge. It consists of a small quantity of an easily detonated substance which will explode a large quantity of a less easily detonated material. Dry gun cotton packed in a varnished paper envelope may thus be used to explode the main charge, which is wet gun cotton. The primer may be activated electrically or by percussion or friction fuses. (*See* Ammunition; Cartridge; Explosive; Explosives; Ordnance.)

The word is also used for a small elementary book for children to read and hence for any small book dealing with elementary principles, e.g. a primer of grammar.

Prime Vertical. Name given to the vertical circle perpendicular to the meridian. It passes through the E. and W. points of the horizon and the zenith (*q.v.*).

Priming. In oil painting, the coating of a canvas or panel with size, so as to form a ground for the colours. The Van Eycks used a pure white gesso ground, but later priming mixtures formed of white lead, various oils, and earths were light grey or even brightly tinted. Opinions differ as to how far the colour of the ground affects the brilliancy of the picture, but it is usually held to correct the subsequent darkening of the oil. *See* Painting.

Priming. Engineering term. When particles of water, suspended in steam, pass out of a boiler into a steam pipe, the boiler is said to be priming. With most boilers working at or near full capacity, water is carried into the steam space with the steam issuing from the water surface or from the tubes. Baffles are fitted to trap the larger particles, but a certain amount of water in the form of a fine mist escapes. Sudden demands for an excessive quantity of steam will usually cause priming. Unless a superheater is fitted to the boiler, a separator should be fitted in the steam pipe.

Primitive Methodists. Body of Methodists. They arose as the result of difference of opinion on the subject of camp meetings, a species of open-air revival services long popular in America, especially among the negroes. In the opening years of the 19th century they were introduced into Staffordshire by an American Methodist named Lorenzo Dow, the first camp meeting being held in 1807 and speedily followed by others.

Most conspicuous among the organizers and leaders was Hugh Bourne, a Methodist local preacher, who was joined by several energetic preachers of like mind. They founded a new denomination, which soon included 16 congregations and 28 preachers in Lancashire and Cheshire. The name Primitive Methodist indicated that the new body sought to revive the primitive fervour of the early Methodists under Wesley.

The new connexion grew with remarkable rapidity, and within 30 years numbered 36,000 adherents—more than the original Methodists had numbered after 30 years of Wesley's preaching and organizing. Within 30 years it had spread over Great Britain and had sent its agents to the U.S.A. and Canada. For many years it had to face keen opposition from Wesleyans and others, and often its preachers were imprisoned. In 1844 it first extended its work to the foreign field, and in 1870 its African mission was started. After the death of Bourne in 1852, the connexion was reorganized and was for some years administered in seven districts; not until 1902 did the body unify and consolidate its system of government.

Statistics for 1923 showed a membership of 210,923, with 1,091 ministers and 13,939 local preachers, chapels numbering 4,405. In 1932 the Primitive Methodists, United Methodists, and Wesleyan Methodists united as the Methodist Church. *See* Methodism.

Primo de Rivera y Orbaneja, MARQUIS DE ESTELLA, MIGUEL (1870–1930). Spanish statesman. Born at Jerez de la Frontera, Jan. 8, 1870, he was educated at the military academy, Madrid and, commissioned in 1890, first saw action in Morocco in 1893.

He served in the Philippines and in Morocco until 1915, when he returned to Spain as governor of Cadiz. He was removed from office a year later for criticising military mismanagement. In 1921 he was elected to the Cortes, where he advocated withdrawal

from Morocco. In 1922 he was appointed military governor of Barcelona, and in 1923 led a revolt, whereupon King Alphonso XIII appointed him president of a military directorate and suspended the constitution.

Primo de Rivera secured his position by proclaiming martial law throughout Spain and formed a government in which he was the only minister, departments being headed by permanent officials. He visited Italy and formed in Spain the Union Patriótica, modelled on fascism. In 1924 he took over personal command in Morocco and began a campaign which ended in victory two years later. After 1925, he gradually lost the army's support on which he had depended, and eventually resigned, Jan. 28, 1930. Retiring to Paris, he died there on March 16, 1930. His body was brought to Madrid for burial, and in 1947 was at Gen. Franco's command reinterred at Jerez de la Frontera. *See* Spain.

Primogeniture (Lat. *primus*, first; *genitus*, begotten). Seniority by birth; by extension, the system under which the eldest son succeeds to the entire real estate of a father dying intestate, to the exclusion of all other children. This right of primogeniture in males existed among the Jews, but not among other ancient peoples, nearly all of whom divided the lands equally, some among all the children, some among the males only. It was not part of the Roman law, and was abolished in England in 1925, though it still applies to heritage in Scotland.

It originated in the feudal system, when the honorary feuds, or titles of nobility, created were of necessity made indivisible and inheritable by the eldest son only. The inconveniences resulting from the division of estates, by the consequent division of military services, next led to the establishment of a custom whereby the eldest son inherited the whole of the lands held by his father in military tenure. This rule of inheritance was introduced into England by William the Conqueror. It still remained part of the English constitution that socage fees were divisible among all male children, though knight's fees descended to the eldest son. By the time of Henry III, however, socage lands also had almost entirely fallen into the right of succession by primogeniture, except in certain parts, such as Kent, where the ancient gavel-kind tenure was jealously preserved,

and in some manors and townships, where succession was still determined by local custom.

With regard to females, succession by primogeniture exists only in respect to inheritance of the crown. In respect of female dignities and titles of honour the right of succession, but not of primogeniture, is established. Thus, if a man holds an earldom to himself and the heirs of his body, and dies leaving daughters only, the eldest does not become countess as a matter of course, but the dignity falls into abeyance until the sovereign, as the fountain of honour, confers it upon one of the daughters or her descendant, or the line of one of the daughters dies out. *See* Family; Genealogy; Peerage.

Primrose (*Primula vulgaris*). Perennial woodland herb of the family Primulaceae. It is a native

Primrose. *Primula vulgaris*, flowering in British woods in spring

of Europe and N. Africa, and grows profusely in Great Britain. From the thick, fleshy rootstock the wrinkled and almost stalkless leaves rise in a circle. The long-stalked flowers which appear in April really form an umbel, as in cowslip, but the common flowering stem is suppressed and concealed between the leaves. The funnel-shaped flowers are of a pale yellow tint, and of two forms: in one there is a long style bringing the round stigma to the mouth of the flower-tube, with the stamens half-way down; and in the other the style reaches only half-way up, whilst the stamens partly fill the mouth. This arrangement secures cross-pollination, the long tongue of the bee-fly (*Bombylus*)—the chief pollinating agent—touching both these points in its search for the nectar that lies at the bottom. Pollen is carried from the anthers of the long-styled (called pin-eyed) to the stigma of the short-styled (thrum-eyed), and vice versa.

Primrose Day (April 19). *See* Primrose League.

Primrose Hill. London eminence and open space. Adjoining St. John's Wood and Regent's Park, and covering about 50 acres,

the park, with adjoining property now largely built upon, passed from the leper hospital of S. James to Eton College, and was in the early part of Queen Victoria's reign handed over to the government in exchange for lands at Eton. The summit of the hill, 206 ft., commands one of the finest views in London. The hill preceded Hyde Park as a place of popular assembly. Mother Shipton prophesied that the hill would one day be the centre of London.

Primrose League. A British political organization. It was formed by Conservatives in 1883 on the suggestion of Sir Henry Drummond Wolff, Lord Randolph Churchill, Sir John Gorst, and Sir Alfred Slade, in memory of the earl of Beaconsfield, who had died two years before; and its title (and symbol) was that of the favourite flower of this great statesman. (It has, however, been held by some authorities that when Queen Victoria said of the primrose, "his favourite flower," she was referring not to Beaconsfield but to the Prince Consort.) Though the organization is open to both sexes, the larger part of its membership has always been women, even before their enfranchisement. Women accordingly exercised influence on the Conservative party, with which the Primrose League is closely associated, before they were actively helping any other political party. Primrose Day is April 19, the anniversary of Beaconsfield's death, which is celebrated by decorating his statue in Parliament Square with wreaths of primroses and by a service of remembrance at Hughenden church. The headquarters of the League are at 54, Victoria Street, London, S.W.1.

Primula (Lat. *primus*, first). Genus comprising about 300 perennial herbs of the family Primulaceae (*q.v.*), chiefly natives of hilly districts in the N. temperate regions. Five species are native to Great Britain: primrose (*Primula vulgaris*), cowslip (*P. veris*), oxlip (*P. elatior*), bird's-eye (*P. farinosa*), and Scottish primrose (*P. scotica*). The garden polyanthus is believed to be a hybrid between the cowslip and primrose. Many hardy exotic species are in general cultivation, especially in rock gardens.

The auricula (*P. auricula*) was introduced from the European Alps as far back as 1596. *P. japonica*, perhaps the most beautiful of the hardy species, which succeeds in moist rich loam, has a stem from 1 ft. to 2 ft. high, on which the

white, pink, crimson, or maroon flowers are produced in several whorls. Siebold's primrose, also

Primula. Flowers of *P. obconica*, a greenhouse favourite

from Japan, is another fine plant, with rosy flowers in umbels. Among the greenhouse favourites are the Chinese primrose (*P. sinensis*), with variable lilac flowers, and *P. obconica*, also from China, has drooping purplish flowers. This species must be handled with care, as contact with its hairy leaves produces a troublesome rash on sensitive skins. Seeds of all the kinds should be sown as soon as ripe, in shallow pans of leaf-mould, covered with a sheet of glass and placed in the shade.

Primulaceae. Family of herbs (mostly perennials) including about 550 species. They are natives chiefly of the N. temperate regions, being but slightly represented in the S. and the tropics. The flowers are usually regular, showy, and sweet-scented; more or less tubular, with spreading limb. The fruit is a single-celled capsule. Well-known genera are *Primula*, *Anagallis*, *Lysimachia*, and *Cyclamen*.

Primuline. Yellow aniline dye discovered by A. G. Green in 1887 and used for dyeing cotton. See Aniline.

Primum Mobile (Lat., first source of motion). In ancient astronomy, the tenth or outer sphere of the universe in the Ptolemaic system (*q.v.*). *Pron. mo-bil-ee*.

Primus (Lat., first). Term applied to the bishop elected to preside over the synod of the Episcopal Church of Scotland.

Prince (Lat. *princeps*, chief). Title of dignity. It was first applied in the Roman republic to the *princeps senatus* (the senator who stood first on the censor's list), and was later adopted for the *princeps juventutis* (the first on the roll of the Roman knightly order). The assumption of the style of *princeps senatus* by Augustus asso-

ciated the word with royalty, and thereafter it came to be applied as a title for one of the highest rank, sometimes meaning the sovereign or ruler of a state. In the Holy Roman Empire, the title was given to the heads of all great feudatories, but was later reserved to those entitled to seats in the college of princes. In medieval Italy, many rulers of duchies styled themselves prince, as did those of Rumania, Serbia, Bulgaria, Montenegro, and Albania before adopting higher titles.

After the dissolution of the Holy Roman Empire in 1806, the heads of most German states continued as princes; even after the German federation of 1871, seven states continued to be ruled by princes, though owing fealty to the emperor. German princes without sovereign rights were styled *Fürst*. In Germany and Austria distinguished persons of non-royal blood were sometimes elevated to the rank of prince, *e.g.* Bismarck and Metternich. The title of prince or princess has long been given to sons and daughters of the sovereigns of England, Scotland, France, Spain, etc., and in Russia it was held by heads of the highest families. In Great Britain the children of the sovereign are by courtesy prince or princess, but require a royal warrant to legalise the title, and remain commoners until this is done. The eldest son becomes prince of Wales (*q.v.*). Today the title prince, for head of a state, continues in Monaco and Liechtenstein. A prince of the church is a bishop or archbishop of an R.C. see which has enjoyed sovereign rights.

Prince, THE (Ital. *Il Principe*). Political treatise by Machiavelli (*q.v.*). It was published in Italian and has been translated into English and most modern languages. It outlines the way in which a prince should act, if he wishes to preserve and strengthen his inheritance. The lessons are pressed home with a wealth of illustrations taken from the history of Italy in Machiavelli's own time and of the ancient world. The book is one of the greatest of its kind, for Machiavelli was the first writer to apply the inductive method to politics, and to break with the theories laid down by the Church.

Prince Albert. City of Saskatchewan, Canada. It stands on the North Saskatchewan river, about 200 m. N. by W. of Regina, and is served by C.N.R. and C.P.R. It is the headquarters of the R.C.M.P. for central and N. Saskatchewan.

Prince Edward Island. Map of the smallest province of the Dominion of Canada

There are brickyards, flour mills, and brewing, packing, and lumbering industries. Pop. 14,290.

Prince Albert national park 35 m. N.W. of the town, covering 1,869 sq. m., was opened in 1928.

Prince Albert Peninsula. N.W. projection of Victoria Island, Arctic America. It lies N. of Prince Albert Sound, S. of Banks Strait, and is separated from Banks Land by the Prince of Wales Strait. The coast is indented by Minto Inlet, Collinson Inlet, and Glenelg Bay. Its most N. point is Peel Pt.

Prince Edward. Small island in the Indian Ocean, about 1,200 m. S.E. of Cape Town, in lat. 46° S., long. 37° E. approx. It is 15 m. in circumference. With Marion Island, about 12 m. distant, it was adopted by the South African government in 1947 for strategic and meteorological purposes. It was discovered by Marion du Fresne in 1772.

Prince Edward Island. Island in the Gulf of St. Lawrence, and the smallest and most thickly settled province of the dominion of Canada. The coast is deeply indented, and Northumberland Strait divides it from the mainland. Its area is 2,184 sq. m., and pop. 95,047. Wheat, oats, potatoes, etc., are grown; butter and cheese are made; cattle and horses are reared; and foxes are bred for their fur. Mackerel, cod, oysters, and lobsters are plentiful. The prov. is served by the Prince Edward Island rly., a state concern, now part of the C.N.R. The

province is governed by a legislative assembly of 30 members, elected for four years, and four members are sent to the senate and four to the house of commons of the dominion. Charlottetown is the capital, and Summerside the next largest place. Nearly half the people profess the R.C. faith. Prohibition is retained.

The earliest name of the province, which was discovered by the French, was Île St. Jean. It was French from 1603, when Champlain took possession of it, until the peace of 1763. It then became part of Nova Scotia, and in 1773 a separate colony. About this time it was surveyed, and the land disposed of in grants, much of it to absentees. As a compliment to Edward, duke of Kent, then

governor-general of Canada, the island received its present name. It joined the dominion, after having received certain financial advantages, in 1873.

Prince George. A town of British Columbia, Canada. It is situated at the junction of the Nechako and Fraser rivers, 526 m. N. of Vancouver, on the C.N.R., and is the centre of a mining and lumbering district. Its importance is linked with an extension of the Pacific Great Eastern rly., intended to open up the rich Peace River country. Pop. 2,027.

Prince Igor. Opera by Borodin, consisting of 4 acts and a prologue. It was unfinished at the composer's death, and was completed by Rimsky-Korsakov and Glazounov. It was published by Belaiev in 1889, and later performed at the chief opera houses of Europe and the U.S.A. One of the most robust and strongly nationalist of Russian operas, it is notable for its blending of tragedy and comedy. A ballet based on the well-known Polovtsian dances was first performed by the Diaghilev company shortly before the First Great War.

Princé Imperial. For details of the French prince often given this title, see under Eugène.

Prince of Wales. British title conferred upon the male heir apparent of the sovereign. It was first borne by Edward, eldest surviving son of Edward I, who in 1301 invested his heir with the principality; his motive was probably to placate Welsh feeling after his wars of conquest. It has been wrongly asserted that Mary,

PRINCES OF WALES

	Son of	Created	
Edward	Edward I	1301	Edward II, 1307
Edward, Black Prince	Edward III	1343	Died 1376
Richard	Black Prince	1376	Richard II, 1377
Henry	Henry IV	1399	Henry V, 1413
Edward	Henry VI	1454	Died 1471
Edward	Edward IV	1472	Edward V, 1483
Edward	Richard III	1483	Died 1484
Arthur	Henry VII	1489	Died 1502

George	George I	1714	George II, 1727
Frederick	George II	1727	Died 1751
George	Prince Frederick	1751	George III, 1760
George	George III	1762	George IV, 1820
Albert Edward	Victoria	1841	Edward VII, 1901
George	Edward VII	1901	George V, 1910
Edward	George V	1910	Edward VIII, 1936 (later Duke of Windsor)

Edward VI, nine years old when his father Henry VIII died, had never been created prince of Wales

daughter of Henry VIII, held the title of princess of Wales in her own right. In order of precedence the prince is second only to the sovereign. The plume commonly called the prince of Wales's feathers is really the badge of the heir apparent, in whom it is vested, whether created prince of Wales or not. This badge consists of a plume of three ostrich feathers enfiled by a coronet of alternate fleurs de lys and crosses patée or, and the motto is *Ich Dien* (Ger., I serve), adopted by the Black Prince in 1346. A list of those who have held the title is given in a table in page 6697. See *Ich Dien*.

Prince of Wales, H.M.S. Former British battleship. One of the five vessels of the King George V class authorised in 1936, she was built during 1937-40. Displacing 35,000 tons on a length of 739 ft. and a beam of 103 ft., she was powered by geared turbines developing 152,000 s.h.p. to give a maximum speed of 30 knots. Her armament consisted of ten 14-in., sixteen 5.25-in., and a number of A.A. guns. She carried four aircraft and a complement of 1,500 men. She took a prominent part in the chase of the Bismarck (*q.v.*) in 1941, and later in the year F. D. Roosevelt and Winston Churchill met on board her in mid-Atlantic for the conference resulting in the signing of the Atlantic Charter (*q.v.*). She was then transferred to the Far East in company with H.M.S. Repulse (*q.v.*). On Dec. 9, 1941, the two warships, with destroyer escort, sailed from Singapore under the command of Admiral Sir T. Phillips to intercept a Japanese convoy. No contact with the convoy was made, and the ships turned back but were spotted by a Japanese aircraft. Shortly before noon (local time) on Dec. 10, a large force of Japanese bombers made an attack and were followed by 27 torpedo-carrying aircraft in three waves. Hits were scored on Repulse and she sank almost at once. A hit on the Prince of Wales put her propellers and steering gear out of action, and after further concentrated attacks she sank at 12.30 p.m. Under cover of British fighters, which arrived after the sinkings, the escorting destroyers rescued 2,300 of the 3,000 men from the two ships. Phillips went down with his ship. The disaster proved that battleships could not operate in narrow waters without adequate air cover, and the loss of the ships, coupled with the Pearl Harbour (*q.v.*) attack, gave Japan virtual control of the Pacific.

Prince of Wales Island. Former name for the island officially called Penang (*q.v.*), in Federation of Malaya. There are also three other islands of this name: (1) The largest island of the Alexander group, S.E. Alaska; length, 135 m.; breadth, 40 m. It has extensive mineral deposits, including gold, silver, copper, and iron. (2) An island of the Malay Archipelago, in Sunda Strait, between Sumatra and Java. (3) A small island in the Low Archipelago, Pacific Ocean.

Prince Patrick Island. Westernmost of the Parry group (*q.v.*), Canada. Situated N. of Banks Island, and W. of Melville Sound, its coasts are deeply indented, especially on the S. and W.

Prince Rupert. Port and town of British Columbia. It stands on Kaizen Island at the mouth of the Skeena river, 550 m. N. of Vancouver. It is a terminus of the C.N.R., and has a fine natural harbour, 14 m. long. There are a floating dry dock, shipyards, elevators, and a fine cold-storage plant. In a mining and lumbering district, Prince Rupert is also the centre of the N. Pacific halibut fishery. Pop. 6,714.

Princes' Islands. Islands of the sea of Marmara, the ancient Demonesi. Nine in number, four of them being inhabited, they lie in the E. part of the sea of Marmara, about 12 m. S.E. of Istanbul. They are famous for their delightful climate. The chief island is Prinkipo (*q.v.*).

Princes Risborough. Market town of Bucks, England. It is 7 m. S. of Aylesbury, near the Chiltern Hills, with a rly. station. The name is due to the fact that the Black Prince had a palace here. The govt.'s forest products research laboratory is here. Pop. approx. 3,500. Monks Risborough, 2 m. to the N., belonged to the archbishop of Canterbury. About 3½ m. N. of Princes Risborough is Chequers (*q.v.*).

Princess, ТНЭ. Fanciful romantic poem in blank verse by Lord Tennyson, and described in its sub-title as *A Medley*. First published in 1847, it received later additions, notably the lyrics with which, as completed, it is interspersed. Dealing in half-mocking fashion with the movement for women's fuller education and "women's rights," the poem embodies many passages of real beauty. Gilbert and Sullivan's *Princess Ida* (*q.v.*) was a freely adapted musical version of Tennyson's poem.

Princess Charlotte Bay. Indentation of Queensland, Australia. It is situated on the N.E. coast between Capes Melville and Sidmouth, and receives many streams, of which the largest is N. Kennedy river. Between Cooktown land dist. and Cape York peninsula, the bay has no harbours, being N. of the settled area.

Princess Ida, or Castle Adamant. Comic opera by W. S. Gilbert, with music by Arthur Sullivan, produced Jan. 5, 1884, at the Savoy Theatre, London, where it ran for 246 performances. It is a musical and flippant dramatic version of Tennyson's narrative poem *The Princess*, bearing much the same relation to its original as Strauss's musical comedy *The Chocolate Soldier* to Shaw's *Arms and the Man*. It has never ranked high in popularity among the Gilbert and Sullivan operas, possibly because of the difficulty of satirising what was itself satirical, namely the existence of an imaginary stronghold of learned women; but it afforded Sullivan the opportunity of composing some of his most delightful music. The best-remembered song is probably that of King Gama, "The Disagreeable Man."

Princess Royal. Title of dignity sometimes created in favour of the eldest daughter of a sovereign, provided she is not in direct succession to the crown. The first British princess royal was Mary, princess of Orange, so created by her brother Charles II, after his restoration. Charlotte (1766-1828) was given the title by her father, George III; Princess Victoria (1840-1901) by her mother, Queen Victoria; and Princess Louise (1867-1931) by her father Edward VII. Princess Mary, Viscountess Lascelles, was created princess royal by her father, George V, on Jan. 1, 1932. The title is held for life, irrespective of the death of a sovereign; thus Princess Louise remained princess royal until 1931, and only on her death was the title available to be conferred on Princess Mary.

Princes Street. Principal thoroughfare of Edinburgh, Scotland. Originally called Lang Gait (Long Walk), it is about a mile long and was renamed in honour of the two elder sons of George III. Running from E. to W., it has continuous buildings on the N. side only, the S. side being occupied by W. and E. Princes Street Gardens, from which (on the other side of a rly. cutting running parallel to the street)

Princes Street, Edinburgh. The western half of this famous mile-long thoroughfare, looking W. towards the spires of St. Mary's Cathedral. The dome, right, is that of St. George's Church

rise the Castle and the long line of the Old Town. At the E. end is the Waverley rly. station and the Waverley market; at the W. end is Princes Street rly. station. In E. Princes Street Gardens are statues of Livingstone, Christopher North (John Wilson), and the Sir Walter Scott Monument, the last-named being surmounted by a Gothic spire 200 ft. high. On the Mound which separates E. and W. Princes Street Gardens is the Scottish national gallery. The Mound itself was made from earth excavated during the building of the New Town.

Prince Steamship Line. British steamship company. Founded in Newcastle-upon-Tyne, 1883, its vessels all bear a second name of Prince, e.g. Spanish Prince. Regular services are maintained between Manchester and N. African ports; Tyne, Antwerp, and London and N. African ports, also S. America. Vessels of this line also ply between New York and S. America, S. Africa, and the Far East.

Princes Theatre. London playhouse, in Shaftesbury Avenue, W.C.2. Opened Dec. 26, 1911, by W. F. Melville, with a performance of *The Three Musketeers*, it became a favourite centre for musical plays, comedies, and farces, seating 1,850 spectators, with a particularly large gallery known as the amphitheatre.

Princeton. Bor. of New Jersey, U.S.A., in Mercer co. It is 10 m. N.N.E. of Trenton, and is on the Pennsylvania rly. and the Delaware and Raritan canal. The seat of Princeton university and of the Institute for Advanced Study (where Einstein worked from 1933), it has also a theological seminary (S. Joseph's College) and the Rockefeller medical research institute.

Princeton was the scene in 1777 of a success by Washington over a British force. Congress sat temporarily in 1783. Pop. 7,719. Another Princeton is a small city in Indiana; pop. 7,786.

Princeton University. Educational institution of the U.S.A., situated at Princeton, N.J. It was founded as the College of New Jersey, at Elizabethtown, in 1746; moved to Newark, 1748, and to Princeton, 1756. The buildings suffered severely during the War of Independence, but were rebuilt and extended throughout the 19th century. Nassau Hall was founded in 1756, and there are more than a dozen dormitory halls, together with museums, laboratories, stadium, etc. John Gunther has called this "the most sophisticated of all American universities," and its record is outstanding in scholarship and sport. Though it is undenominational, all its presidents have been Presbyterians. Among them was Woodrow Wilson. No negro has ever been admitted to the university. The professional staff numbers about 365, and the students exceed 2,800. Consult Princeton 1746-1896, T. J. Westenbaker, 1947.

Princetown. Village of Devon, England. It stands on the W. side of Dartmoor, 15 m. N.E. of Plymouth, and is served by branch rly. The existence of the place is due to the prison opened here in 1809; now it is also a holiday centre. See Dartmoor Prison.

Princip, GAVRILO (1894-1918). Assassin of the archduke Ferdinand and his wife at Serajevo, June 28, 1914. Born July 13, 1894, in Grahovo, Bosnia, Princip had been a student of Belgrade university. Princip, who fired the fatal shots, acted in concert with

Chabrinovich, who threw the bomb which missed the royal pair, and it was suspected that the young men were the agents of persons engaged in a wider conspiracy. This crime precipitated the First Great War. Princip and Chabrinovich were sentenced to twenty years' penal servitude, and the former died from tuberculosis at the fortress of Theresienstadt, near Prague, May 1, 1918.

Principal (Lat. *princeps*, chief). In general, one who is chief and is entrusted with the lead. As a title, principal is often used for the head of colleges, seminaries, universities, etc. In finance, the principal is a sum of money which, in an investment, produces interest or revenue.

In law, the principal is the person who commits a crime, whether in the first degree the absolute perpetrator or in the second degree the aider and abettor. Also a person competent to do an act himself and employing another to do it for him is a principal, the other being an agent. A principal is liable to third parties in respect of all acts done by an agent, either upon express authority or instructions, or within the scope of his authority. The maxim applicable is *Qui facit per alium, facit per se*, who acts by another, acts by himself.

Principality. Any territory ruled by a prince, e.g. that of Monaco. In the U.K., "the principality" refers to Wales (sometimes including Monmouthshire), because the title of prince of Wales has for centuries been borne by the king's eldest son.

Principe. Portuguese island in the Gulf of Biafra. It lies midway between the islands of Fernando Po (q.v.) and St. Thomas (q.v.). With the latter it forms a prov. The island is mountainous, and the climate unhealthy. The chief product is cocoa. Pop. 5,000.

Pringle, THOMAS (1789-1834). Scottish poet. Born at Blaiklaw, Teviotdale, Jan. 5, 1789, the son of a farmer, he was educated at Edinburgh university. With James Cleghorn, he edited the first number of the *Edinburgh Monthly Magazine*, which, after Pringle had severed his connexion, became Blackwood's Magazine. In 1820 he emigrated to Cape Colony, but his Whig politics got him into trouble, and in 1826 he was back in London as secretary of the Anti-Slavery Society, a post which he held till his death on Dec. 5, 1834. His earlier poems were issued in 1828, under the title *Ephemerides*, but his finest efforts are to be found in *South African Sketches*. 1834.

Sextuple newspaper press which is capable of printing up to 64,000 twelve-page papers, 26½ ins. by 19½ ins., per hour, folded to half-page size and counted in quires. It will produce papers up to 24 pages at the rate of 32,000 copies per hour, also folded and counted in quires. A, B, C. Reels for paper, G, H, K. Plate-carrying cylinders printing on one side of the paper. D, E, F. Similar cylinders printing on the other side of the paper. G, H, K. Similar cylinders printing on the other side of the paper. N. Folding and counting cylinders, which cut the paper and give to it the final fold before it is delivered to the folding band. The motive power is supplied at O by an electric motor which is situated in a pit under the floor. A sextuple press carries eight plates on each cylinder

After passing G, H, K, the paper from each reel is cut into two-page widths, and the six strips are ganged together at L. M. The "former," which gives the first fold to the sheet. N. Folding and counting cylinders, which cut the paper and give to it the final fold before it is delivered to the folding band. The motive power is supplied at O by an electric motor which is situated in a pit under the floor. A sextuple press carries eight plates on each cylinder

notably the well-known lyric, *The Emigrant's Farewell*.

Pringles. Town in Argentina, in the province of Buenos Aires, 304 m. S.W. of the capital, with which it is connected by rly. It is surrounded by a fertile agricultural district. Alt. 900 ft. Pop. 12,000. Another town of the same name is in the province of Río Negro.

Prinkipo (Turkish, Kizil Adasi, the red island). Turkish island in the sea of Marmara. It is the largest island in the group of Princes' Islands (*q.v.*), and came into prominence in 1919 in connexion with a proposed conference, never held, between Soviet Russia and the Western powers.

Prinsep, VALENTINE CAMERON (1838-1904). British artist. Born at Calcutta, Feb. 4, 1838, he studied under Watts in London, and Gleyre in Paris, where he was fellow student with Du Maurier. He is introduced into the latter's *Trilby* as Taffy. One of the Oxford Union frescoists, he drifted away from Pre-Raphaelitism under Leighton's influence. He became A.R.A. in 1878, and R.A. in 1894. He painted history and genre, wrote plays, and was an enthusiastic Volunteer. Val Prinsep died at Kensington, Nov. 11, 1904.

Print. Impression on paper from an engraving on metal, stone, or wood. The chief varieties of engraving are etching, mezzotint, line-engraving, stipple, aquatint, woodcut, and lithograph, each of which will be found described under its title. Prints from engravings are classified as states, and vary with the condition of the engraving at the time of printing; the number of states also varies with individual engravers. Changes constituting a fresh state may take place in the subject, in the handling, or in the lettering, or in all three. Only prints, however, from a completed engraving are recognized as states. It is the first state impression that generally offers the greatest attraction to the collector. In 1847 the Print-sellers' Association was formed in England, with the principal aim of preventing more than a declared number of impressions of each state from being printed.

Print. Term used in photography rather loosely to denote any positive image on a paper or equivalent base for viewing by reflected light. Prints are made from a negative either by contact in a printing frame and exposure to light, or by projection.

Printing-out paper, known as P.O.P., is a photographic printing paper coated with a gelatine emulsion containing silver chloride and silver citrate. First marketed in 1891, it superseded albumen papers but has itself since lost ground to bromide and other development papers. Permanence and a more pleasing colour can be secured by toning with gold and fixing in hypo. Self-toning paper is a variety of P.O.P. containing a gold compound in the emulsion. See *Photography*.

Printemps, YVONNE (b. 1895). French actress. Born at Ermont, Seine-et-Oise, July 25, 1895, she made her début at the Cigale, Paris, in 1908, and later was en-

gaged at the Folies-Bergère. After playing at the Bouffes-Parisiens in *Jean de la Fontaine* by Sacha Guitry (*q.v.*), whom she married (separated 1932), she appeared in many other Guitry productions, scoring a special success in *Mozartin* 1926 (London, 1929),

Yvonne Printemps,
French actress

and in Noel Coward's *Conversation Piece*, in New York, 1934. She became director of the Théâtre Michodière, Paris, where she appeared in *Auprès de ma Blonde*, 1946.

PRINTING: ITS HISTORY AND PRACTICE

For further information on this subject see under Book; Colour Printing; Lithography; Photogravure; Type, etc. See also Intertype; Linotype; Monotype; and the biographies of Caxton, Gutenberg, and other printers

It has long been accepted, though disputed by some, that prints from wooden blocks appeared in Europe in the 6th century from China; but certainly not until the time of Dutch wood-cutters of the 15th century was the idea of duplicating copies by a process of inking the raised surface of a block realized and exploited. It was an easy transition from the cutting of designs upon wood to the cutting of lettering also. The next step was the making of movable wooden types. The movable metal types cast from matrices or moulds appeared between 1440 and 1450.

The invention of printing came at a time when calligraphy was at its best. Excellent models existed at the time both for the form of lettering (the early types were quite naturally modified imitations of the written script) and for the arrangement of the printed page. Nothing finer has been produced than the Gothic type "42 line" Bible of 1455, attributed to Gutenberg of Mainz, with its illuminated initials.

Of the great early printers, Peter Schöffer, also of Mainz, to whom the invention of cast type is attributed, and who introduced a more legible simplified Gothic type; Sweynheim and Pannartz, of Subiaco, whose type showed the transition from the Gothic to the Roman used first by Adolf Rusch; and the Frenchman, Nicolas Jensen, working at Venice about 1470, all deserve special recognition for their share in the development of the art and craft of printing. The Englishman, William Caxton, who possibly

learned his printing at Cologne and certainly printed at Bruges, began work, near Westminster Abbey, in 1476-77, which was continued after his death by his foreman, Wynkyn de Worde. To Germany and, some way after, to Italy, in the 15th century, must be given the greatest share of credit. There were but 12 English towns with presses in the 16th century to the 20 of Germany and the hundred of Italy. Early in the 16th century France took the lead; and afterwards the religious persecution in France drove some of the finest French printers into the neighbouring countries. Plantin (*q.v.*), of Antwerp, is the most famous of these refugees. The appearance of the *Italic* type, the sloping letter supposed to have been modelled on the handwriting of the poet Petrarch and first used by Aldus of Venice in his *Virgil*, 1501, deserves to be noted.

The 17th and early 18th centuries may be considered the period of decadence in printing. To the Englishman Baskerville must be attributed the over-emphasis upon the "thicks" and "thins" of letters, an example widely imitated on the Continent, as by Bodoni and Didot. But Baskerville's contemporary, William Caslon, the type-founder, designed a beautiful font in the older tradition.

While England can claim no considerable share in the early development of printing, she has made amends in the modern revival through the work of the Kilmesscott Press and other famous private presses of the late 19th and early 20th centuries.

PRINTING PROCESSES. Printing may be defined as a process for multiplying copies of an original by inking a prepared surface and transferring the impression to paper or other material. There are three processes, determined by the nature of the printing surface :

(1) Relief or surface printing, for which a general term is found in letterpress printing. In this, as the various terms imply, the printing surface is raised. The most familiar example is the ordinary rubber stamp, which, being inked from a pad, is then impressed upon the paper. By far the greater volume of printing is produced by the letterpress process. It is indeed the normal method of book and newspaper production.

(2) The intaglio process. Here the ink is forced into excised lines or hollows cut or etched in the plate. The paper is then pressed down into the plate and so takes up the ink. A common example is the copperplate visiting card, on which the finger can detect a perceptible raised lettering as contrasted, say, with the letterpress effect of a page of this Encyclopedia. Rotary photogravure is a mechanical development of intaglio printing. (See Photogravure.)

(3) Flat surface, planographic, or lithographic printing. (See Lithography.)

There are, besides, variations of these main processes, e.g. the offset (*q.v.*) process.

LETTERPRESS PRINTING. The main material consists of movable types and blocks or plates, or stereotypes and electrotypes moulded from them, the printing surface being in relief or raised.

The arrangement of type and the general preparation of the printing surface before it goes to the machine is included under the heading of composition. Composition is of two kinds, hand setting and machine setting.

For hand-set work, the compositor stands at a high desk, on which are arranged, one above the other, two cases divided into compartments containing metal letters. The upper case contains the capital letters; the lower, nearer to the operator's hand, contains the more frequently used small letters. The position of the letters in the cases is dictated by the frequency with which they are required. The cases contain, besides letters with a printing surface, metal blanks, called "spaces" and "quads," to place between the words and at the ends of short lines. The compositor, holding in

his hand a metal case, called a composing stick, or setting stick, gauged to the width of the panel of type decided on for the page, picks the letters one by one from his cases, and sets them upside down from left to right, his first line of type being at the bottom of the stick. The type is transferred from the setting stick to trays of metal, called galleys. From these galleys rough proofs are taken on long strips of paper called galley proofs.

When the matter in galley form has been corrected, the compositor makes up the pages. He arranges or "imposes" them, together with any engraved plates or blocks of pictures, or plans which are to be used, in an iron frame or "forme," in such a way that they fold in proper sequence, with accurate allotment of marginal spaces. These spaces are allowed for by the insertion of metal or wooden blocks, called "furniture."

If two or more colours are to be used in the printed page, their accurate adjustment or "register" is a matter of peculiar delicacy.

Printing. Diagram showing the main features of a single cylinder flat-bed press

With regard to machine composition, the types of machine in most common use are the linotype, the intertype, and the monotype; the first two generally used for newspapers, the latter mainly for book and magazine printing. (See Intertype; Linotype; Monotype.)

MACHINING. The chief features of a flat-bed printing machine, as used for all printing from the 15th to the 19th centuries are a flat bed on which the frame or "forme" containing the type is placed face upwards, and a folding leaf, holding the paper to be printed, which lowers it on to type that is inked either with the old inking ball or the more modern hand ink-roller. Pressure is then applied by lever and screw to a plate or platen of metal, which forces the paper on to the type, and so transfers the impression.

The first radical mechanical innovation was that of König, in

1811. In König's machine the paper is applied to the forme by means of a revolving cylinder, which holds the paper in its passage across the type. This is the normal type of machine employed for the production of book printing today. Modern machines on this principle are fitted with an auxiliary attachment which feeds sheets into the machine automatically, and will produce 1,000 sheets per hour, 65 ins. \times 45 ins., in two colours simultaneously. The introduction of the impression cylinder developed speed. The modern newspaper press proceeds with that development by the addition of a plate-carrying cylinder.

Of the flat forme a mould is taken by laying a thin sheet of a tough, clayey cardboard ("dry flong") over the type, and passing it through the mangle; under enormous pressure it takes an impression of the matter in the forme. This is then dried and fitted into a curved casting box of the auto-plate machine, which produces a replica of the forme in the shape of a metal plate, semi-cylindrical in form. This, with similar plates of the other pages, is attached to the type cylinder, and the huge machines are ready to be set in motion.

In practice, a modern newspaper press is a composite machine with many replicas of the type matter and cutting and folding apparatus, producing completed copies at several delivery points at from 60,000 copies per hour. The ink is pressed into the ink ducts through tubes connected with an ink reservoir overhead. The paper spool unwinds itself into the machine, the paper passing between the type and impression cylinders (each pair printing one side of the paper), and so through into the cutting and folding gear. The whole machine is electrically operated, being put in and out of action by control push-buttons.

Aldis, 1916; Printing for Business, Joseph Thorp, 1919; The Practice of Typography, T. L. de Vinne, 4 vols., 1920-21; A Brief Survey of Printing, S. Morison and N. Jackson, 1923; Gutenberg to Plantin, G. Winship, 1926; Print-

ing: a Short History, ed. R. A. Peddie, 1927; Printers and Printing, D. Pottinger, 1941.

Printing House Square. London square. It is at the E. end of Printing House Lane, Blackfriars Lane, E.C.4. Since 1788 occupied by the printing office of The Times (*q.v.*), its name is due to the existence here, from the time of Charles II until 1770, of the king's printers. Part of the Roman wall was uncovered here in 1849.

Prinz Eugen. Former German cruiser. A vessel of the Hipper class, she was built during 1936-38. Displacing 10,000 tons on a length of 639 ft. and a beam of 69 ft., her engines developed 80,000 s.h.p. to give her a maximum speed of 32 knots. Her armament consisted of eight 8 in., twelve 4.1 in. and twelve 37 mm. guns, and she carried twelve 21 in. torpedo tubes and four aircraft. During 1939-40 she made a number of raids in the Atlantic, and was with the Bismarck (*q.v.*) when the latter was sunk in 1941. Escaping to Brest, she later accompanied the Scharnhorst and Gneisenau (*q.v.*) in their dash up the English Channel in 1942, being later damaged on several occasions off the German and Norwegian coasts. She was then confined to port. At Copenhagen when the war in Europe ended, the Prinz Eugen opened fire in support of German troops before surrendering. Transferred to the U.S. Navy, she was one of the ships used in the Bikini Atoll (*q.v.*) atomic bomb experiments, and although surviving both explosions her stern plates were damaged and she capsized and sank in Kwajalein lagoon on Dec. 16, 1946.

Prior. Ecclesiastical title for the member of a monastic establishment second in rank to the abbot, or, where there is no abbot, the head of the establishment. The original term was *praepositus*, provost. The prior is generally entrusted with the discipline of the monks, management of property, etc. The position of the prioress is a corresponding one in women's orders. The house over which a prior or prioress presided was known as a priory. *See* Abbey; Monastery.

Prior, MATTHEW (1664-1721). English poet and diplomatist. Born probably at Wimborne Minster, Dorset, July 21, 1664, the son of a joiner, he went to Westminster School and St. John's College, Cambridge, of which he became a fellow in 1688. This fellowship he retained until his death. Friend of

Bolingbroke, Gay, Swift, and Arbuthnot, Prior spent the greater part of his life in the diplomatic service, at The Hague and in Paris. The treaty of Utrecht, 1713, was familiarly known as Matt's peace. He was on good terms with William III and Louis XIV, was M.P. for

Matthew Prior

East Grinstead in 1701, succeeded Locke as commissioner of trade, 1700-07, and was commissioner of customs, 1711-14. At first an adherent of the Whigs, he joined the Tories in 1702. During 1715-17 he was imprisoned in the Tower on a charge of treasonable intrigue in connexion with the treaty of Utrecht.

In 1719, by the assistance of friends, he brought out a sumptuous folio edition of his poems, which brought him 4,000 guineas. To this Lord Harley added an equal sum for the purchase of Down Hall, near to Hatfield Broad Oak, Essex, where Prior henceforth chiefly resided. He died while on a visit to Lord Harley at Wimpole, Cambridge, Sept. 18, 1721, and was buried in Westminster Abbey.

As writer of *vers de société* none perhaps has excelled Prior in humour, grace, ease, and spontaneity. Master of many metres, he liberated English verse from the thralldom of the heroic couplet. Of his two longer works, *Alma*, or The Progress of Mind, modelled on Hudibras, is the more notable. But he is at his best in his epigrams, as that on Bibb and Charon; his verses to children; and in such light verse as The English Padlock, The Garland, and The Female Phaeton (Kitty). His *Tales* are largely lost to the modern reader on account of the change in literary taste. *Consult* Lives, F. Bickley, 1914; C. W. Legg, 1921.

Priority. In general, the state of being antecedent to something else. In loose usage it has come to imply also a relative importance or urgency, the claim to priority arising from such importance being confused with priority itself. Hence its use as a descriptive adjective, as in priority milk, *i.e.* milk for those with an important claim to be served in preference to others in distribution of milk. This usage has naturally grown with the development of controlled

supplies. In English law, the term is used in connexion with the law relating to mortgages and other charges on property. The owner of property may mortgage or charge it as often as he pleases, so long as he can get people to lend him money on it; if he has it is important to know whether one mortgage or charge has priority over another, because when the property is eventually realized there may not be enough to satisfy everybody. As a rule, such charges rank for priority in order of date.

Pripet. River of W. Russia. Rising in the swamps near Pinsk, in White Russia S.S.R., it flows E. across that republic, turns S.E. at Mozir, enters Ukraine S.S.R., and after flowing through vast tracts of almost uninhabited country, the Pinsk or Pripet marshes, falls into the Dnieper, 50 m. N. of Kiev. It is mostly navigable and is connected by canals with the Niemen and Vistula. Its length is about 500 m.

During the First Great War the district was prominent in fighting between the Germans and Russians, engagements taking place at various points, Sept., 1915, a Russian force being driven back to the marshes where further pursuit was impossible. After their invasion of Russia in 1941, the German armies outflanked these marshes by a southern thrust towards Kiev and a northern one through Minsk towards Moscow and Smolensk. When the Germans were forced back on the line of the Dnieper in 1943, they launched an offensive in the Kiev bulge, but this collapsed, and in Dec. a Russian counter-offensive broke the German line. In 1944 a Russian advance N. of the marshes resulted in the capture of the German bastion of Vitebsk on June 26, and Pinsk was taken on July 14.

Priscillian (d. 385). Spanish heretic. A man of birth, fortune, eloquence, and learning, he appears to have taught an admixture of Gnostic and Manichaean doctrines. He exerted influence at the court of the emperor Gratian, and secured the support of two bishops, who made him bishop of Avila. The civil power being invoked, Priscillian and several of his followers were, by order of Maximus, put to death at Treves, the first victims of a criminal prosecution for heresy. The sect founded by Priscillian existed until about 560. The term Priscillianists is sometimes applied to the Montanists from an early prophetess of Montanism (*q.v.*) called Priscilla.

Prism (Gr. *prisma*, something sawn). Semi-regular solid. The two faces or bases are equal polygons, and the lateral faces parallelograms.

lateral faces perpendicular to the bases. If the bases are regular polygons, and the prism is also a right prism, it is called a regular prism. The prism used in optics is usually a triangular prism, i.e. its bases are triangles. In the figure above A is a source of light and A B a ray which is refracted at the faces E G and F G containing the refracting angle E G F of the prism. The light appears to the observer

D to be in the line D C H. A right-angle prism E G F (below) may be used to invert any image A B as shown, use being made of the fact that the rays of light incident on

the faces E G and G F are totally internally reflected. See Binocular; Crystallography; Dispersion; Lens; Optics; Periscope; Spectrum.

If a prisoner could not pay, he might linger on till death. Prisons were so unhealthy that it was computed that every year a quarter of the prisoners died of gaol fever, a virulent form of typhus so infectious that at the "black sessions" of the Old Bailey in 1750 nearly everyone in court was taken ill, and four out of the six judges and some 40 other persons died.

In the last half of the 17th century magistrates were permitted to send people to "bridewells" or "houses of correction." These places were under the control of the justices of quarter sessions. They seem to have started as workhouses, where vagrants could be made to labour for their keep. Later they were used for the punishment of minor offenders, a practice made legal in 1711, by which time the bridewells were almost indistinguishable from the gaols, and were often housed in the same building, though the theoretical distinction between them lasted till 1865.

When in 1776 the American colonies liberated themselves, the practice of transporting criminals to them, which had gone on since Elizabeth's reign, came to an end, and until transportation to Australia began in 1788, extra prisoners had to be housed. Old ships at Woolwich and elsewhere were converted to this purpose, and the convicts (some of them under 16) held in them were employed on public works. This system of "the hulks" lasted for eighty years.

The Beginnings of Reform

From time to time from the 13th century onwards, voices were raised protesting against the utter wretchedness and degradation of prisoners. But no serious attempts at change were made until, at the end of 1773, John Howard began his work as a prison reformer, travelling constantly in England and throughout Europe. In England several Acts of parliament embodied the reforms he advocated, but were not put into effect; and although the new prison at Millbank, finished in 1816, showed considerable advances, most of the gaols soon relapsed into "their former horrid state." When Elizabeth Fry began to visit women prisoners in Newgate in 1817 their ward was described as a "hell above ground." Through her labours and those of the Prison Discipline Society improvements were made and fresh Acts of parliament passed, too often still evaded; moreover, they did

PRISON AND PRISON REFORM

S. Margery Fry, Hon. Sec. Howard League for Penal Reform, 1919-26

This account of the prison system in the U.K., with some reference to the system in the U.S.A. and elsewhere, is supplemented by articles on the Borstal System; Prisoner of War; Punishment; Transportation, etc.; and on prison reformers, notably Fry, Elizabeth, and Howard, John

From very early times people in authority have maintained places of confinement, or prisons (from Lat. *prendere*, to seize). The early Babylonian name was houses of darkness; and we read in the Bible that Joseph's master, displeased with him, "put him into the prison, a place where the king's prisoners were bound."

Most famous among the prisons of antiquity were the great quarries of Syracuse; in the time of Cicero they served for the safe keeping of criminals from all over Sicily. But though people were confined in prison at the whim of arbitrary authority, while awaiting legal trial and punishment, or to enforce the payment of debts, the use of a prison as a punishment in itself is comparatively modern. Beccaria, writing in 1764, urged its more frequent use, in place of other more cruel punishments, but with the proviso that prisons must first be greatly improved.

In England, imprisonment does not seem to have been in general use as a punishment before the 17th century, though it was earlier recognized for enforcing the payment of fines. At that time the punishment for felonies was still death (with transportation as a

later alternative), though many felons, through various devices (such as benefit of clergy), escaped with lighter punishments. Misdemeanours were punished by fines, whipping, the pillory, and mutilation. In 1403 a statute was passed which provided that justices should commit prisoners only to the common gaol. Though all such gaols in theory belonged to the king, it was only in the county gaols that the sheriff, as the king's officer, had real control. The right to keep gaols was granted to many people or corporations, amongst them the archbishop of York, the dean and chapter of Westminster, and the dean of York, who got £4 a year from his gaoler. For it was the usual practice to farm out prisons to individuals. One man in the 18th century paid £5,000 for the control of one prison for his own and his son's life. The gaoler made his profit in various ways, often being at once tavern master and brothel keeper. He charged fees to the prisoners for entering the prison, for being put into irons, for bed and room, for food, for light or firing, for playing games or gambling or drinking, for having irons struck off, and for discharge.

not apply to the three great debtor prisons, nor to the small local gaols and bridewells; and they made no provision for inspection.

The English reformers of the late 18th and early 19th centuries, contrary to popular belief, were not responsible for solitary confinement and other psychological cruelties of the 19th century. As Bernard Shaw pointed out: "Howard is not responsible; he warned us that absolute silence is more than human nature can bear without the hazard of distraction and despair." Elizabeth Fry saw nothing but mischief in prison silence and prison solitude. Bentham also inveighed against the belief that "by vacancy of mind mental improvement can be assured."

The plea of these early reformers for separation at night-time is too often read as though it involved solitude by day.

Early American Reforms

The belief in solitude had its origin overseas. In N. America, after a first short attempt by William Penn to deal with offenders on less cruel lines than he had known in England, the evil features of English prisons had been duplicated in the colonies. But shortly after American Independence had been declared, a group of men, amongst them Benjamin Franklin, founded the Philadelphia Society for alleviating the miseries of public prisons. They actually built and for some years managed a most successful prison on the lines of individual treatment, forbidding the use of irons or the carrying of arms or even a cane by the keepers.

Twelve voluntary inspectors managed the place, and gave themselves to their task with great devotion, providing books, lectures, and remunerated work for the prisoners. One of the inspectors visited daily. A remarkable diminution of crime was noticed. But the place soon degenerated owing to less wise and disinterested management and overcrowding. Inspired by Howard's work in Europe, Pennsylvania met the latter difficulty by building two new prisons, with a separate cell for each inmate. But, influenced more by a horror of contamination than by Howard's humanity, they introduced solitary confinement, night and day, for any period up to life, with severe punishments to enforce obedience. New York followed suit with a prison founded upon a method of "solitude, silence, and darkness."

Many victims of this regime went mad, and as a result the mitigated system called, from its place of origin, the Auburn system was inaugurated; it consisted of segregation at night, with associated work by day in absolute silence, imposed with continual corporal punishment even for looking up from work. This same method was followed at the new prison at Sing Sing.

Not all the U.S. prisons adopted this severity, but the main trend of American penology was towards solitude, silence, and severity, and its influence upon British practice was direct and powerful. The 19th century in the U.K. saw an unedifying succession of attempts to make men virtuous by making them miserable, by solitary or by separate confinement (the latter system allowing intercourse with officers and instructors of the prison and the leaving of the cell for chapel and exercise), through the heart-breaking toil of treadmill and crank, and by boredom to the limits of sanity. Deterrence rather than reform was often frankly admitted to be the aim of the system, even an archbishop asserting "we cannot admit that the reformation of the convict is an essential part of the punishment."

Home Office in Control

By the Prison Act of 1877 all local prisons were brought under the control of the Home Office, and managed by a body of commissioners already responsible for convict prisons—a great advance in organization which brought the two sentences of imprisonment (up to two years) and penal servitude (from three years upwards), under the same administration. The Prison Act of 1898 abolished the treadmill and the crank, and gave the Home office greater freedom in the administration of prisons. The Prevention of Crime Act, 1908, created two new forms of sentence, preventive detention and Borstal treatment, making these also part of a unified structure. Preventive detention had little success: the procedure leading to it was cumbersome and the results as shown by the discharged prisoners were not encouraging.

The marked change in the general attitude to prisoners which the 20th century brought was shown in the Criminal Justice Act of 1948. Experiments, particularly in Sweden, had already shown the possibility and value of dealing with a large percentage of prisoners on terms of "minimum

security," allowing of a regime in which more training in responsibility was possible than under the old system of rigid control at all times. The Criminal Justice Act swept away the distinctions between hard labour and simple imprisonment, between imprisonment and penal servitude; introduced new regulations for preventive detention, and a new form of sentence, corrective training; and gave very wide powers to the commissioners in the matter of the classification of prisoners. These changes were in the direction of making prison, instead of simply a punishment, a training for the prisoner who showed capacity for abandoning a life of crime, and they made it necessary to group prisoners according to their capacity for education and industrial training rather than according to offence.

Special Types of Prison

Before the Act of 1948 was introduced Borstal institutions already specialised for different types of young offenders, and some prisons were organized to meet particular needs: e.g. at Maidstone and at Wakefield emphasis was laid upon industrial training; the prisons at Askham Grange for women and Leyhill for men were run on "open" lines. With the cooperation of local education authorities, educational facilities and libraries were steadily improved. More attention was paid to the causes of crime in individuals, psychiatric treatment being provided in suitable cases.

The imprisonment of young children was forbidden by the Children Act of 1908, though young persons aged 15 and over (magistrates' courts 17 and over) may be sent to prison if no other means of dealing with them can be found.

The prison commission for Scotland, set up by the Act of 1877, became in 1929 the Scottish Prisons dept. In 1939 this became a div. of the Home dept. It now has under its charge all the prisons of Scotland and six Borstals, two for girls and four for boys, of which two are experimental institutions of the "open" type, and two are in parts of ordinary prisons.

The prison systems of the world vary enormously, and it is not possible to describe them all here. The League of Nations drew up Rules for the Treatment of Prisoners which received the approval of a large number of national govts. These rules were intended to represent the minimum

rather than the maximum of good treatment, but few countries at the end of the Second Great War had reached even that minimum standard. The United Nations studied the treatment of prisoners through its human rights commission.

R. Calvert, 1933; The Modern English Prison, L. W. Fox, 1934; Crime and the Community, Leo Page, 1938; Annual Reports of the Commissioners of Prisons, H.M.S.O.; Publications of the Howard League for Penal Reform, Parliament Mans., London, S.W.1.

Prison Commission. Home office department which looks after prisons in England and Wales. It has a chairman and two paid commissioners, assisted by six directors and other officials. In Scotland similar duties are performed by the Prison Commission, 11, Rutland Square, Edinburgh.

Prisoner of War. Subject of a belligerent country detained for a period of war. In early times prisoners of war were regarded as the property of their captors, and as such were liable to slavery, or to ransom, if their rank and wealth permitted it; and it was not until the 13th century that the exchange of prisoners began.

During the 19th century the growth of humanitarian sentiment gradually brought recognition that a prisoner had certain rights, and the Hague Convention of 1907 included detailed regulations designed to ameliorate the condition of life in internment camps. The U.S.A. did not sign, and it was not until the morning of Nov. 11, 1918, that an agreement regarding prisoners was arrived at between the U.S.A. and Germany.

In 1929 delegates of 47 nations met at Geneva and, except Russia and Japan, ratified an agreement regarding prisoners of war. This stated that prisoners must be humanely treated and protected from violence, insult, and public curiosity, and reprisals were forbidden. Food was to be equal to that of troops of the detaining power at base camps, and sanitary and medical facilities provided. Prisoners were not to be individually confined unless they offended against specified regulations. Prisoners other than officers are liable to work for the retaining power, being paid according to rank and ability. The work must not be directly connected with

military operations. Officers are paid the same as those of corresponding rank in the forces of the detaining power. It is the duty of officer prisoners to make every endeavour to escape, provided they have not given parole, but they may be punished if captured. The convention further allowed for information about prisoners to be provided through information bureaux in the belligerent countries. In the First and Second Great Wars a central information bureau was at Geneva, where the International Red Cross maintained a detailed card index.

In time of war, a neutral power looks after the interests of prisoners; such protecting powers are entitled to visit prison camps and question the inmates. Certain non-combatant military personnel, such as padres, doctors, and medical orderlies, may claim repatriation. Provided the interested powers agree, prisoners may be exchanged in proportions mutually satisfactory. On capture, a prisoner is bound to give his true name, rank, and service number, but he is not to be forced to disclose other information. Prisoners of war may be held by the victor power after hostilities until the signing of the official peace treaty.

The Second Great War, in which forces were often by-passed in an advance, resulted in the capture of exceptionally large numbers of prisoners. Two of the major powers concerned, Russia and Japan, had not ratified the Geneva Convention of 1929, but Russia agreed to apply the Hague Convention of 1907, which did not provide for neutral observation of prison camps or for the exchange of prisoners' names. Japan agreed to abide by the terms of the 1929 convention, but without ratifying it. In general, Germany strictly observed the convention with British prisoners of war; but other captives were virtually employed as slave labour. The large numbers of French prisoners of war were used as hostages in negotiations with the Vichy government. Japan broke every convention and employed prisoners as unpaid coolie labour; but this was understandable, as the Japanese military code does not recognize any necessity for a combatant to surrender.

At the end of the Second Great War the victorious Allied powers held some 14,000,000 prisoners, of whom nearly 7,000,000 were German. Most of them had returned home by the end of 1948. During 1946 and 1947 several meetings to

consider revisions of the Geneva Convention of 1929 as it affected prisoners of war were held at Geneva under the auspices of the International Red Cross. They were chiefly concerned with strengthening the interests of prisoners (see Geneva Convention in N.V.). In 1945, the International Red Cross received the Nobel Peace Prize for its work on behalf of prisoners of war of all nations in the Second Great War. See Casualty; Geneva Convention; International Red Cross.

Prisoner of Zenda, THE. Romantic novel by Anthony Hope, published 1894. It introduced the word Ruritania to the language, this being the name the author gave to the small imaginary European state in whose perilous court intrigues his hero, a travelling English aristocrat, becomes so involved that for a time he impersonates their king. A sequel, *Rupert of Hentzau*, appeared in 1898. A stage version of the original book was produced at the St. James's Theatre, London, in 1896, in which George Alexander played the part of the English traveller, Rudolf Rassendyl, as well as that of the king of Ruritania. On the screen the same part has been played by Henry Ainley (silent) and Ronald Colman. A dramatic version of the story has also been broadcast as a serial play by the B.B.C. (1939).

Prisoner's Friend. At courts martial, a person, officially styled friend of accused, authorised to assist the accused in his defence. He may be a qualified legal adviser or any other person. If the friend is not a barrister, a solicitor, or an officer subject to military law, he can only advise the accused and suggest questions to be put by him to witnesses; but if he is a barrister, a solicitor, or an officer subject to military law, he has the rights and duties of counsel under the rules of military law.

Pristina or PRISHTINA. Tn. of Yugoslavia, in Kossovo-Metahija prov. On the E. of the Kossovo Plain, it is 60 m. N. of Usküb close to the rly. from Usküb to Mitrovitsa. In normal times it has a fair trade in grain and wine. It was captured by the Serbs from the Turks on Oct. 22, 1912. During the First Great War it was occupied by the Austro-Germans, Nov. 26, 1915, and reoccupied by the Allies in Oct., 1918. Pop. est. 10,000.

Privas. Town of France. The capital of the dept. of Ardèche, it stands on the N.E. slope of Mont Toulon between three valleys, 95

m. S.W. of Lyons. There are iron mines, distilleries, and silk factories, and a trade is carried on in truffles, butter, cheese, and game. The town grew up round a castle, built in the 12th century, and was the ancient capital of Boutières. It became a stronghold of the Huguenots, and in 1629 Louis XIII decided to reduce it. After a stubborn defence the place surrendered to him, the castle and other buildings being razed.

Private. The lowest rank in an army; a soldier who does not hold any commissioned or non-commissioned rank. In medieval armies the term was applied to men who served as personal attendants to knights; their principal duty was to act as a bodyguard to their master. They were paid by the knight and were not on the army pay list, as distinct from the ordinary serving soldiery, paid by the crown. In the 17th century, the term was applied to soldiers voluntarily joining a regiment, being paid by the commanding officer, to distinguish them from the impressed men whose pay was a charge on the crown. Ultimately the term was adopted for any soldier below non-commissioned rank. In 1946 the British army introduced two classes of private; one star and two star. A one star private is a soldier without any trade, a two star private a man who has an army trade. Most foreign armies have first and second-class privates. The private's equivalent rank in the navy is seaman and in the R.A.F. aircrewman.

Private Bill. In British parliamentary procedure, a bill promoted for private purposes. Private bills may be either local or personal. Local bills are usually obtained by corporations for public utilities. Personal bills may be passed to change the name of a person or to give a trust additional powers. A private member's bill is one introduced not by the govt. but by an M.P. See Bill; Parliament; Standing Order.

Private Company. Company which by its constitution restricts the transfer of its shares, limits its shareholders to fifty, apart from employees, and prohibits any invitation being made to the public in general to subscribe for its shares. Such companies receive certain privileges under the law governing limited companies and are often family concerns. In contrast, the public company issues its shares to the public, and is usually a larger enterprise.

Privateer. Armed vessel privately owned and furnished with letters of marque. These empowered it to attack the ships of any power with which its country was at war. Privateers are things of the past. See International Law; Letter of Marque.

Private Secretary. THE Farical comedy in four acts. Adapted by Charles Hawtrey from Von Moser's *Der Bibliothekar*, it was produced at the Prince's—now Prince of Wales's—Theatre, London, March 29, 1884, with Beerbohm Tree as the Rev. Robert Spalding, the chief comic character, whose cry is "I don't like London." It was afterwards transferred to the (old) Globe, where W. S. Penley took up the part of Spalding.

Privet (*Ligustrum vulgare*). Shrub of the family Oleaceae, native of Europe and N. Africa.

Privet. Leaves and berries of the European shrub

It has opposite, oblong-lance-shaped leaves and small, funnel-shaped white flowers in abundant clusters. The fruit is a small, round, purple-black berry, which yields oil and a rose-coloured dye. Privet makes a neat and fairly close-set hedge, suitable for gardens.

Privilege (Lat. *privilegium*). Word used in two related senses: (1) exemption of an individual or class from ordinary law; (2) peculiar right or advantage enjoyed by a person or body of persons in the community.

In English law both houses of parliament have certain privileges, some applying to each house as a whole and some to the members as individuals. The privileges of the commons are freedom from arrest, except for certain serious crimes; freedom of speech; freedom from jury service; right of access to the crown through the speaker; right to regulate their own proceedings; right to exclude strangers from debates; right to punish those who infringe their privileges. It is an infringement of the privileges

of the commons to libel the house as a whole, to libel any member in his capacity as member, or to attempt to influence a member by threats as to the way he should vote. Alleged infringements of privilege are referred to the committee of privileges. The house has power to punish infringements of its privileges by committing the offender to prison for the remainder of the session, by reprimand and admonition, and in the case of members by expulsion or suspension.

The privileges of the house of lords are similar. They have the additional privilege of being tried by the house lords and not by a jury in the ordinary courts on any charge of felony.

Questions of privilege raised in parliament take precedence of all other business, for hard-won privileges are jealously guarded.

Clergymen are privileged from arrest while going to service, holding service, and returning from service, and barristers while going to, performing, and coming back from their professional duties in court. By charter corporations of various kinds enjoy definite privileges, many of which are of long standing. See Libel; Parliament.

Privy. Term used in English and American law to denote a direct legal relation. Privy in blood indicates a blood relationship, e.g. heir and ancestor. Privy of estate indicates that the persons of whom it is predicated have a relationship with regard to the title to property. For example, there is privy of estate between a lessor and lessee and their assignees, between joint tenants; and the privy lasts so long as the estate lasts, so that an assignee of a lease ceases to have privy with the lessor if he assigns the lease again. Between a lessor and sub-lessee there is no privy. Privy of contract is the term used to describe the relation between parties who have entered into contractual relations with each other, or between the assignees of the contracting parties who, by law, are put in the place of the persons who originally contracted.

Privy (F. *privé*, private). Closet containing a receptacle for faecal matter. The early privy was a small building erected over an excavation, lined with brick or cement, and having seating accommodation. The contents were emptied at intervals of some months, so that a nuisance was set up by the effluvia. In districts where it is not practicable to

connect a closet to a private or public sewer, privies are still used, but the receptacle is much smaller, a strong galvanised bucket which can be removed and emptied. An earth closet is preferable. Pail-privies are recognized by by-laws of sanitary authorities; the method of construction is rigorously controlled, as also its distance from other premises and from a well or other supply of drinking water. The building must be paved with a hard and jointless impervious material; the walls, of brick or concrete, must be rendered with a similar material. See Water Closet.

Privy Council. The British sovereign's body of advisers with judicial powers. In the Middle Ages in England there was but one king's council. Under Henry III it was a *magnum concilium*; under Edward I purely royal. Under Edward II the barons again came to the front, and the king sought to counter their offensive by developing a council which was called *concilium continuum*, *secretum*, or *privatum*. Now the council might be held in or out of parliament, and there was little difference between the great council in parliament and the body which, in Henry VIII's reign, came to be called the house of lords. Hence the great council in parliament merged in the house of lords, while the great council out of parliament was summoned less often, until it flickered out of existence on the eve of the Great Rebellion.

The small royal council continued to develop, and by Richard II's reign was known as the privy council. It governed during the minority of Henry VI, but suffered from the subsequent decline in royal authority, and the Wars of the Roses broke out because the privy council foundered between the factions of York and Lancaster. Henry VII at first governed personally with such advice as he chose to take from councillors who were not apparently organized in a body, but before the end of his reign there was a president of the council, and the council itself was completely reorganized under Henry VIII.

From 1540 it possessed a regular staff of clerks and other officials; its records became regular and abundant; and from it most of the existing administrative system has developed. It had two main functions during the 16th and 17th centuries. First, it sat "at the council board" to act as a council of state, discussing and advising the crown on all matters of policy

and taking administrative action; and secondly, reinforced by judicial and other assessors, it sat on Wednesdays and Fridays in a room known as the Star Chamber (*q.v.*), which was better adapted for the functions of a court of law. Besides these functions it controlled similar subordinate bodies, namely, the councils of the North, of Wales and its Marches, and the Irish privy council.

The privy council consisted of a selection of the "ordinary" councillors of the crown who survive today only in the K.C.s. Under Henry VIII twenty was about the average number, in the reign of Mary there were over fifty. Elizabeth reduced the number to twenty or even fewer, and they remained at this figure until the Restoration. Then they increased again, and "inner rings" began to appear, like the Cabal.

This tendency resulted in the modern cabinet, and the privy council was gradually reduced to formal business. It retained, however, one function of importance in the 18th century, and continued to debate and to determine the fate of Irish bills, which, by Poynings' Law, had to receive its sanction before they could be introduced into the Irish parliament. This function disappeared with the establishment of Grattan's parliament in 1782.

Privy Council Committees

Of these the most important is the Judicial Committee (*q.v.*) of the privy council. The Long Parliament abolished the court of Star Chamber in 1641, but the civil jurisdiction which the privy council had exercised "at the council board" survived and expanded until the judicial committee became the most important law court in the empire. It was long the supreme court of appeal for all civil cases arising in the British Commonwealth outside the U.K., and within it the supreme court for ecclesiastical appeals, although ecclesiastical prejudice hampers recourse to it. Its members sit at 9, Downing St., without any trappings, state, or dignity, except that given by the importance of their business. Technically they are engaged in giving advice to the crown, and that advice has more effect than the decisions of any law court in the world. No other body has done so much to give the Commonwealth its legal and constitutional unity.

Apart from its committees the privy council has ceased to discharge any but formal functions, and membership has become an

honorary distinction, conveying the style "right honourable," and frequently conferred upon men without any qualification to perform the duties once assigned to the privy council. All cabinet ministers belong to it. So do ministers of the crown in Canada, Australia, S. Africa, and elsewhere.

In Canada a privy council has been formed for the dominion on the English model. Scotland had a privy council until the union of 1707, when it was merged in the English one. Privy councils or their equivalent, councils of state, exist in several foreign countries. Consult Constitutional History of England, W. Stubbs, 1884-1903; The Privy Council, A. V. Dicey, 1887; The King's Council in England during the Middle Ages, J. F. Baldwin, 1913.

Privy Purse. Money granted to the king and queen from the civil list for their own personal expenditure. Under the king's direction the expenditure of this money is managed by the privy purse office, at the head of which is the keeper. In 1910 the amount was fixed at £110,000 a year. See Civil List.

Privy Seal. In the U.K., a seal used by the sovereign. It is second in importance to the great seal, but is now rarely used. This seal was used on warrants requesting the lord chancellor to affix the great seal, and for documents which were not of sufficient importance to require the great seal. The necessity for the former was abolished in 1884. The keeper of this seal is known as the lord privy seal (*q.v.*).

Prix de Rome. A French academic award, founded by Louis XIV in 1666. Its purpose was to educate young painters and sculptors of promise at the cost of the state, by study of the antique in Rome. In 1720 architects were allowed to compete for the prize, and after 1803 musicians, medallists, and engravers. At this date the school was transferred to the Villa Medici, its present site. Winners of the prize have four years' training during which they are exempt from military service. The Académie des Beaux-Arts, a section of the French Institute, is in charge of the school at Rome; the director is usually a French painter.

For details of a British equivalent to the Prix de Rome, see Rome Scholarships.

Prize Bounty. Monetary grant made out of public funds and divided among the officers and crews of ships of war who are "actually present" at the taking

or destroying of an armed enemy ship. This payment was first introduced in 1649. The amount depended on the number of guns in the enemy ship, being £20 for each gun on an admiral's ship and lesser sums for each gun on other ships. By the first Naval Prize Act (1708) the total sum to be divided was £5 for each man living on the enemy ship at the beginning of the engagement, and was then occasionally called head money.

The provisions were substantially reproduced in the Naval Prize Act, 1864. In 1918 the right was extended to officers and men of aircraft operating under the directions of the Admiralty. No right to prize bounty can arise in any war unless the crown makes a proclamation to that effect. Such a proclamation was made in the First Great War and payments were made in respect of the principal naval engagements, e.g. the battle of Jutland, in respect of which the total bounty amounted to £22,685, there being 4,537 persons on the eleven enemy ships destroyed. This was divided among the whole fleet. No proclamation was made during the Second Great War, and it was announced in the house of commons in 1945 that bounty must be considered obsolete, since the credit for the taking or destruction of an enemy ship must now be shared by many not actually present at the engagement.

Prize Court. Court of law held in time of war. On the outbreak of a war involving hostilities at sea every country sets up a tribunal called a prize court, the business of which it is to examine the validity of capture of ships and goods made at sea by the navy of its country. Such a court is really an international tribunal, and its decisions ought to be governed by international law, so that, theoretically, any question at issue would be decided the same way wherever it was tried. Each country, however, makes its own rules of procedure, but in England, at any rate, no rule is allowed to be made which will hamper the court in deciding cases according to international law, or which will result in any litigant being deprived of his rights under that code. The British courts of prize are constituted by commission under the great seal. In many parts of the British Commonwealth there is an appeal to the judicial committee of the privy council. See Blockade; International Law.

Prize Fight. Term used for a pugilistic contest, fought with bare fists, for a money prize. This is now forbidden by law in the U.K., the U.S.A., and other civilized countries, and its place has been taken by contests in which boxing-gloves are worn. In England the age of prize fights was from about 1750 to 1850. The last great prize fight was the one between Sayers and Heenan, April 17, 1860. See Boxing.

Prize Money. Net proceeds of the sale of enemy property and contraband lawfully captured at sea. Before 1914 the money was divided among those actually engaged in the capture, and large fortunes were often made. Thus Anson in his voyage round the world took prize of over £1,000,000 of which he received about £125,000. In 1762 the Spanish treasure ship *Hermione*, to the value of over £500,000, was taken by *Active* (frigate) and *Favourite* (sloop). The admiral received £64,963, every lieutenant £13,000, and every seaman £485.

In the First Great War it was held that conditions made it unfair to limit the payment to those actually engaged in the capture, and accordingly all actively serving in the Navy were entitled to share. The total fund amounted to about £14,000,000, and the amount of the shares varied from £3,000 for an admiral to £25 for a seaman. After the Second Great War a fund of £4,000,000 was divided among all men and women who had served 180 days at sea between 1939 and 1945, an admiral of the fleet receiving 40 guineas and an ordinary seaman four guineas. It was announced in 1945 that this would be the last distribution of prize money. Prize money should be distinguished from the grant known as Prize Bounty (*q.v.*).

Prizren. Town of Yugoslavia, in Kossovo-Metahija province. On the E. edge of the Albanian Mts., the centre of a department of the same name, it is about 60 m. N.W. of Üsküb, and at one time was famous for its manufacture of weapons. Before the First Great War it had a brisk trade, and a glass industry. It is the seat of a R.C. archbishop and of a Greek metropolitan. In the first Balkan war it was occupied by the Serbs in Oct., 1912. During the First Great War it was the scene of heavy fighting before the major part of the Serbian army retreated through it into the Albanian Mts., Nov.-Dec., 1915. It was occupied by the Bulgars, Nov. 28, and

retaken by the French about Oct. 12, 1918. Pop., 18,952.

Proa (Malay *prahu*). Malaysian sailing boat. Both ends being built in bow form, it can sail equally well in both directions, and it is fitted with an outrigger contrivance projecting a boat-like float to prevent capsizing. Rigged with large lateen-like sails, proas attain remarkably high speed, and are used in many parts of Polynesia. See Boat; Catamaran.

Probabilism. Doctrine or theory according to which no action is sinful when there exists the slightest probability that it may be lawful, or when it has the approval of a reputable teacher. The origin of the doctrine has been traced to the Greek Sophists and Jewish Talmudists, but it was first made systematic by the Jesuits. Condemned by the Sorbonne, 1620, it was disapproved by Alexander VII, 1665, and Innocent XI, 1679. The Jesuit general Gonzales attacked it in his *Fundamenta Theologiae Moralis*, 1691, but it later found a champion in Alfonso Maria de Liguori (1696-1787). The term is often used in connexion with cases arising in confession. See Casuistry.

Probability. The chance of an event; the likelihood of a statement being true or of a stated event occurring; the strength of the belief in the correspondence between statement and fact. Where probability is high, the scope for doubt is small; probability therefore indicates the basis for rational belief. A jury has the task of assessing probability in the conflicting evidence of witnesses; a trader when buying goods has to consider the probability of being able to sell them profitably. Everyday judgements are estimates of probability, which has been called "the very guide of life."

Often there cannot be precise measurement; e.g. with the probability that a particular person on a certain occasion is telling the truth, or that it will rain tomorrow. Sometimes experience provides a quantitative basis for assessing probability; a life assurance premium is based on the probability that the individual's span of life will conform to the pattern revealed by statistics of deaths; records of illness indicate the probability that a certain percentage of the population will contract diphtheria next month, and that a percentage of those under five years old will die from the disease. Much statistical science is con-

cerned with collecting and interpreting material for estimating probabilities.

Sometimes the probability of an event can be stated definitely because of the nature of the event; thus, the probability that a tossed coin will fall with the head uppermost is $1/2$; that an ace will be cut from a pack of cards, is $4/52$ or $1/13$, which probability may be expressed by saying that the chance is 1 in 13 or the odds are 12 to 1 against. The mathematical theory of probability was developed principally through the study of such precise chances. It has considerable importance in scientific research. *Consult* History of the Theory of Probabilities, I. Todhunter, 1865.

Probate. Official proof of the legality of a will. In English law, derived in this respect from ecclesiastical law, it is necessary for the will of a deceased person to be proved in the probate division of the high court of justice before it can be acted upon. The judge or other officer of the court must be satisfied by proof that the document in question is really the will of the deceased. With a will which appears to have been duly executed, and to which there is no opposition, the officials of the probate registry grant probate without trouble; but when there appears to be some irregularity in the execution of the will, or there is opposition from anyone interested, the matter comes before a judge in court. Probate can be granted by any officer of inland revenue in cases where the personal estate does not exceed £500.

When the will is admitted to probate, the original will is filed in Somerset House, London, and is a public document which can be inspected by anybody on payment of a small fee. The will is photographed and a photographic copy may be obtained and attached to the grant. The grant is accepted everywhere as evidence of the will. At the personal applications department at Somerset House persons may get help in obtaining probate without the assistance of a solicitor. In the majority of county towns there is a district registry at which probate may be obtained. *See* Administrator; Estate Duty; Executor; Will.

Probation. System in criminal courts for releasing delinquents without punishment under supervision of a probation officer. At first, in the U.K., the movement was not wholly successful. The Probation of First Offenders Act,

1887, was restricted in scope, and provided no means of making probation really effective. Such means were first sought in the American courts, where probation officers were appointed to supervise offenders during their time of testing. So fruitful did the experiment prove that its methods were applied in the U.K. by the Probation of Offenders Act, 1907.

The Criminal Justice Act, 1948, made several alterations in the system. Under this Act a court, if it is of opinion that having regard to the circumstances including the nature of the offence and the character of the offender it is expedient to do so, may, instead of sentencing a convicted person, make a probation order placing him under the supervision of a probation officer for a minimum of one year and maximum of three years. The order may also require the offender to comply with certain requirements for securing his good conduct, e.g. as to his residence. He may be required to reside in a probation home or an institution. If the offender fails to fulfil these requirements he may be fined or sentenced for his original offence.

In dealing with offenders who have been led into crime by sudden temptation, weakness of character, or adverse home conditions, the surveillance of a kind but firm officer proves invaluable. *See* Binding Over; Borstal System; Criminology; Reformatory Schools.

Probationer (Lat. *probatio*, test). Term applied to one undergoing trial for membership of a church or other religious community; for election or call to a pastorate; or for admittance to a profession, such as nursing. In Scotland, a divinity student admitted by a presbytery to trial as a preacher before ordination is called a probationer. *See* Presbyterianism.

Problem. In geometry, a proposition in which some operation or construction is required, e.g. to construct a circle within a given triangle. The term is used in contradistinction to porism (q.v.) and theorem (q.v.).

Proboscis Monkey (*Nasalis larvatus*). Species of monkey, found only in Borneo. It is distinguished by its long and bulbous

nose, which in the adult male hangs down and conceals most of the mouth. In the female it is smaller,

Proboscis Monkey of Borneo

while in young specimens it is turned upwards. The monkey is about 80 ins. long in body, with a tail of about 26 ins. The hair is chestnut on the head and back, and yellow elsewhere. The face is naked, surrounded with a fringe of outstanding hair. These monkeys are usually found in large companies in the woods, but little is known of their food or habits.

Probus. MARCUS AURELIUS. Roman emperor (A.D. 276-282). A native of Pannonia, he entered the military service of Rome, and became Aurelian's most distinguished general. On the death of the emperor Tacitus he was proclaimed emperor by the armies of the east, where he was in chief command. He proved an excellent ruler and an able general, defeating the Germans on the Rhine, and restoring order in Egypt and Gaul. He was preparing an expedition against Persia when he was murdered at Sirmium by his own soldiers, who resented the severity of his discipline.

Procedure (Lat. *procedere*, to go forward). Legal term for the manner in which suits, actions, and prosecutions are conducted in courts of law. Procedure is regulated in the high court and court of appeal by the Supreme Court of Judicature Act, 1925, and in county courts by the County Courts Act, 1934. There are also rules of court made under these Acts. *See* Parliament.

Process. Term in English law denoting the various steps taken in legal proceedings, such as the issue of a writ of summons, the issue of a writ of execution, and the like. When legal proceedings are taken which are found to be, on the face of them, not taken for the purpose of establishing a legal claim, but merely to vex and annoy the defendant, or to compel him to pay money or damages when obviously none are claimable, the court will summarily dismiss such proceedings, on the ground that they constitute an abuse of process of the court.

Process Engraving. General term embodying all processes of photo-mechanical reproduction,

i.e. making of printing surfaces, blocks, or mechanically engraved plates by photographic agency. It supplanted the wood block engraver, in the case of letterpress relief printing; by its means photogravure printing has become possible as produced today.

Excluding mammoth posters, the aid of process engraving is evoked in some manner or other for all modern illustrations and reproductions; it is the initial stage whereby it is possible to duplicate a subject or a photograph in hundreds of thousands. Every single illustration, map, and colour plate in this Encyclopedia has been duplicated from the original by process engraving in a fraction of the time and at a tithe of the cost of the wood engraver or the lithographic draughtsman.

Photo-Engraving

The processes of Colour Printing, Half-tone, Lithography, and Photogravure are described under their separate headings. Photo-engraving is the term used for the making of printing blocks from originals in line, e.g. pen and ink drawings, by photographic methods. The process consists essentially in forming on a zinc plate an image of the design, consisting of material which is an obstacle or "resist" to the action of an etching fluid. The parts of the metal representing the lines of the drawing are thus left standing in relief on the etched metal plate. The latter, when mounted on a wood block, is known as a line block or zinco, and is suitable for printing with type in a typographic press.

The method of preparing such blocks consists in: (1) making a photographic negative of the original to the required scale in a camera; (2) printing from the negative on to sensitised zinc; (3) converting the impression on the zinc into a resist capable of withstanding the acid used in (4) etching the zinc plate. The negative is made either by the wet collodion process or from dry-plates. It requires to be one in which the lines of the original are represented by clear glass and the ground by dense deposit. For printing from it on to zinc a solution of albumen (white of egg) and bichromate of ammonium is poured on the zinc plate, which is whirled to leave a thin sensitive coating and quickly dried over a gas-ring. The sensitised plate and the negative are pressed film to film in a strongly made printing-frame and exposed, usually to arc

light. The exposure renders the albumen forming the lines insoluble in water and also retentive of greasy ink.

The plate is then inked all over very thinly with lithographic printing ink, which is thus fixed on the lines; that on the ground is cleared off by immersing the plate in water and rubbing it with cotton-wool. The thinly inked lines remaining on the plate do not suffice to protect the metal beneath them from the etching liquid, but require to be reinforced before etching is begun, and also by successive operations as etching is done, in order to prevent the etching liquid from attacking the sides of the lines. Unless means are taken to prevent this sideways etching action—or undercut, as it is called—the lines will be broken and ragged.

Procession (Lat. *processus*, proceeding). Term used for a march or progress of a ceremonial kind, e.g. in the United Kingdom the procession of the king and his train to open parliament. It is used for the march of any organized body, but usually suggests an occasion of rejoicing. Under the Public Order Act, 1936, a chief officer of police may impose restrictions on processions—e.g. prescribe a special route when he thinks serious public disorder may be caused, or apply to the local council for an order prohibiting public processions in an area for three months. In London the commissioner of police may likewise prohibit processions with the consent of the Home secretary.

Processions, which were very elaborate among the Greeks and Romans, have always played a great part in religious ceremonial. They were introduced into the Christian Church at an early date, and are still generally used in the R.C. and Greek Churches. The R.C. Church lays down rules for processions which are held on feast days and other occasions. They frequently take the form of an ordered march through the town or village, the cross and sometimes the host being carried.

The reformed churches make far less use of this form of ceremonial, which was to a great extent abolished at the Reformation. Processions exist, however, in the Lutheran Church, especially funeral processions. In the Church of England, too, the funeral procession has always been recognized. The Oxford Movement led to the revival of other processions, and today in most episcopal churches the clergy

and choir enter and leave the church in procession, sometimes carrying the cross, in high churches with a more elaborate ritual. The hymn sung on these occasions is called the processional hymn.

In theology, the procession of the Holy Ghost is the emanation of the Holy Spirit from God. In the U.S.A. processioning is the term used for a periodical survey of boundaries, the official charged therewith being the processioner.

Procida (anc. *Prochyta*). Small island at the N.W. end of the Bay of Naples. It lies between Cape Miseno and Ischia, 12 m. S.W. of Naples. Of volcanic origin, its outline is very irregular; its length is about 2 m. The vine is cultivated and fruit is grown; coral is also produced. The neighbouring waters are prolific in tunny and sardines. The town of Procida, on the E. coast, has a castle and a royal palace. Procida was occupied by the British during the Napoleonic wars; and was occupied by Allied forces with Italian cooperation Sept. 15, 1943, during the Second Great War. It is said to have received its ancient name from having been formed by eruption from Vesuvius (Gr. *prochylos*, poured forth). Pop. est. 14,500.

Proclamation (Lat. *pro*, before; *clamare*, to cry aloud). Public announcement by royal authority of anything which the sovereign thinks proper to notify to the people. By extension the word is used of that which is so advertised, a public ordinance.

British proclamations emanate from the king in council, are issued under the great seal, and may be read aloud in the capital cities by the heralds, preceded by a fanfare of trumpets, and by other specially appointed officers elsewhere. It is sufficient, however, if they are published in the London, Edinburgh, or Belfast Gazette. They are always issued on the demise of the crown and the accession of a new sovereign, and on declaration of war. In times of war and other emergency they contain the instructions of the executive government with regard to the duties and liabilities of the people.

In normal times proclamations are concerned with the dissolution or prorogation of parliament, with the calling and adjourning or discharge of certain courts of law, and the like. Proclamations are binding only when issued to enforce the execution of existing law. Attempts made by Henry VIII to give them the effect of statute law, and thus to set the will of the

sovereign above the authority of the legislature, were defeated by parliament in the reign of Edward VI, and proclamations are thus the utterance of the legally constituted executive authority.

Proclus (A.D. 410-485). Neo-Platonist philosopher. Born at Constantinople, of Lycian descent, he studied at Athens, where he succeeded Syrianus as head of the Neo-Platonist school. A violent opponent of Christianity, he is chiefly important as having rigidly systematised the doctrines of his predecessors. He was in some ways a follower of Plotinus, although more of a mystic; but some of his views in regard to the divine unities and the intelligible are new. Besides commentaries on certain dialogues of Plato, he wrote mathematical and astronomical works. It is uncertain whether he was the author of a Grammatical Chrestomathy, the only source of our knowledge of the so-called epic cycle, extracts of which are preserved in the Bibliotheca of Photius. See Homer; Neo-Platonism; Plotinus; Plotinus.

Proconsul. Magistrate of ancient Rome invested with the power of a consul, and charged with the command of an army or the administration of a province. In the later republican period the wide powers or *imperium* granted to proconsuls were often shamefully abused. See Consul; Rome.

Procopius. East Roman emperor, A.D. 365-366. Born in Cilicia, he was a kinsman of Julian the Apostate, who made him joint commander of the army in Mesopotamia, and is said to have intended him to be his successor. On the accession of Valens (364), Procopius, finding his life in danger, fled to the Bosphorus, crossed over to Constantinople, and, favoured by popular discontent, was proclaimed emperor. Valens at first thought of abdicating; but after two severe defeats in Phrygia, Procopius, abandoned by his army, was captured and beheaded.

Procopius (fl. A.D. 560). Byzantine historian. Born at Caesarea in Palestine, and trained as a lawyer, he acted as secretary to Belisarius in several of his campaigns, and seems to have found favour with the emperor Justinian, who appointed him prefect of Constantinople in 562. He wrote histories of the Persian, Vandal, and Gothic wars, and a book on the public buildings erected by Justinian, but his most interesting work is his *Secret History*, a sort of *chronique scandaleuse* of the

court of Constantinople from 549 to 562, containing an attack on the Empress Theodora.

Procrustes (Gr., the stretcher). In Greek legend, the nickname of Polypemon, a robber of Attica, killed by Theseus. He boasted that he had a bed which fitted everyone, and made good his boast by stretching the limbs of victims who were too short, and cutting those of persons who were too long for the bed. Procrustes and his methods have become a proverbial expression for attempts to make everyone conform to one standard.

Procter, ADELAIDE ANN (1825-64). British poet. She was born in London, Oct. 30, 1825, a daughter

Adelaide Procter,
British poet

of Barry Cornwall (q.v.). Her poems, collected as *Legends and Lyrics*, 1858-60, and issued with an introduction by Dickens, include *The Angel's Story* and

The Legend of Provence, and such well-known lyrics as *The Lost Chord*. The hymn beginning *My God, I thank Thee*, is hers. She died of consumption, Feb. 2, 1864.

Procter, BRYAN WALLER. British poet, better known under his pen-name of Barry Cornwall (q.v.).

Procter, DOB. Contemporary British painter. After education in Paris, she studied at Newlyn, Cornwall, with which school she became associated. Many of her best-known compositions were nude studies, characterised by strong, solid draughtsmanship and decorative colour. She exhibited regularly at the R.A., her picture *Morning* (bought for the nation) achieving outstanding success in 1927. Elected A.R.A. in 1934, she became R.A. in 1942. She married in 1912 the painter Ernest Procter (d. 1935).

Proctor. One who manages the affairs of another. It is a contracted form of procurator. The king's proctor is an official entitled to intervene in a divorce or nullity suit where collusion or fraud is suspected. At Oxford and Cambridge the proctors are two university officials whose duties include that of maintaining discipline. They hold office for only one year. Sworn special constables who accompany them on their nightly rounds are known as "bulldogs." The representative of certain ecclesiastical bodies in convocation (q.v.) is called a proctor.

Proctor, RICHARD ANTHONY (1837-88). British astronomer. Born at Chelsea, March 23, 1837, he was educated at King's College, London, and S. John's College, Cambridge. His book, *Saturn and his System*, 1865, established Proctor as a popular scientific writer. He followed it with *Half-Hours with the Telescope*, 1868; *Other Worlds than Ours*, 1870; *The Orbs Around Us*, 1872; *The Poetry of Astronomy*, 1880. An able lecturer, he several times toured America, where he settled in 1884. The founder of the scientific monthly, *Knowledge*, Proctor died in New York, Sept. 12, 1888.

Procuration. Term for the providing of women for the purpose of illicit intercourse. In England, the Criminal Law Amendment Act of 1885 was directed mainly against the trading in women and girls disclosed by the investigations of W. T. Stead (q.v.). This statute imposes heavy penalties for procuring any girl under 21, who is not of known immoral character, to have illicit relations with any person, or procuring any woman of any age to become a prostitute, or to become an inmate of a house of ill-fame. It deals also with the offence of administering drugs, or using threats or false representations for the purpose of procuration. Where there is reason to suspect that a woman is detained in a disorderly house, magistrates are empowered to grant a search warrant. The Act of 1885 was modified by the Criminal Law Amendment Act, 1912. See Prostitution; White Slave Traffic.

Procurator (Lat. *procurare*, to take charge of). An authorised agent, especially one who conducts legal business for another, and is his accredited representative. In Rome under the empire, the title was held by governors of provinces, and also by the officer, corresponding to the modern collector, who had the management of the imperial revenues in a province. Procurator is the technical term for an attorney conducting an action by law, and in Scotland is the usual designation of the legal representative of a litigant in the inferior courts. The faculty of procurators in Glasgow was incorporated by charter in 1796, supplemented by a charter in 1897. It fixes standards for the professional fees of procurators and also undertakes the auditing of their accounts.

Procurator-fiscal. In Scottish law, title of the public prosecutor in the sheriff courts. H

is the sheriff's chief executive officer for his particular district, makes investigation of criminal charges, performs a coroner's duties by inquiring into causes of suspicious deaths, prosecutes cases indicted before the supreme court of judiciary, and is responsible to the sheriff and the lord advocate. He carries out also those duties which in England come within the scope of the grand jury. No action for wrongful arrest lies against him unless malice can be proved. Generally an enrolled law agent, his appointment is made by the lord advocate.

Procyon OR THE LESSER DOG STAR. One of the bright stars situated in the constellation of *Canis minor*. The star is remarkable for being one of the nearest stars to the earth, having a parallax of $0.29''$, and for its proper motion. It is approaching the sun at the rate of nearly 150 m. a minute. In 1896 it was discovered to be a double star.

Prodicus (c. 480-400 B.C.). Greek sophist. A native of Iulis in the island of Ceos, he early came to Athens, where his rhetorical gifts gained him the friendship of all the distinguished men of his time. One of his speeches contains the well-known apologue of the Choice of Hercules, of which an abstract is preserved in the *Memorabilia* of Xenophon. Hercules is represented at the parting of the ways, where he had to choose between Virtue and Vice, who plead their cause in the form of two women.

Producer-Gas. Fuel gas made in a furnace by passing air and steam through an incandescent mass of coke, anthracite, or other solid fuel. It consists mainly of carbon monoxide (up to about 40 p.c.) and nitrogen, and is described under the heading Gas: for Light, Heat, and Power. A plant for making the gas was devised by J. E. Dowson in 1878, and there have been many later developments; one of the most familiar is the portable producer trailed behind petrol-engined vehicles as a war-time source of power when petrol and such liquid fuels were scarce. Similar plant was used on small motor-vessels. The diagram shows the principal features of a suction gas producer, in which the suction caused through the engine pistons is used to induce a draught through the glowing fuel bed and so also to feed the gaseous fuel to the engine.

G is the generator with a feeder at the top, and a water-sealed ash-

pit at the bottom. Round the top runs a closed annular cast-iron trough which acts as boiler. The boiler communicates with the ash-

Producer-Gas. Sectional diagram of a suction gas producer plant. See text

pit by pipe C, which has a branch, F, running to a hand-driven ventilating fan. Pipe H connects the furnace with the dust-catcher, D. To start the apparatus, a fire is lighted in G and blown up by the fan, cocks *a* and *c* having been closed, and cocks *b* and *d* opened. In about ten minutes good gas is being produced, so cock *d* is shut and *c* is opened. The gas now passes through the system to an auxiliary vent near the engine, clearing out any stale gases. Blowing is continued for a short time after the engine has been started up, and *a* can then be opened and *b* shut. Air drawn in at A by the suction of the engine passes over the surface of the water in B, and absorbs moisture before traversing C to the ash-pit. The gas formed in the producer is sucked into the dust-catcher, where the heavier dust is deposited in a water-sealed pit. The finer dust is removed in the scrubber while passing up through coke, kept wet by water sprayed on it from the top. The gas then goes to the engine.

Water-Gas (*g.v.*) is made in somewhat similar plant. After the fuel in the producer has been made incandescent and raised to a suitable temperature by blowing air, the air supply is cut off and steam is blown through until the temperature falls; the cycle begins again, with air blowing, and so on.

Production (Lat. *producere*, to bring forth). Term used in industry to denote the making of goods: output: working processes; and in economics, in a wider sense, for the creation of wealth. In the economist's view this can be done by increasing the

utility of things through any of the following ways. (a) changing their form or appearance (manufacture): (b) altering their position in time (ware-

housing), or in place (trade): (c) raising their desirability through publicity of various kinds, and hence their utility. Since manufacture has become a much smaller part of the total production process than formerly, economists are justified in extending the sense of the word production; yet it is still most commonly used in regard to manufacture. Here should be distinguished individual

production, as with a suit of clothes made to measure; batch production, as with a ready-made suit; and mass production, as with an ordinary button, of which hundreds of thousands all identical are produced by one piece of machinery. This last is possible only where mass demand is known or can be anticipated. It generally involves automatic machinery, and frequently automatic conveyance of the material from process to process. Production engineering is concerned with analysing processes in order to select and arrange appropriate machines, tools, materials, and labour. Production control has the task of putting production engineering plans into operation and supervising the work. To the economist, the agents of production are land, capital, labour, and that specialised form of labour, organization, which co-ordinates the other three. (See Capital. Economics: Labour: Wealth.)

CENSUS OF PRODUCTION. This is a comprehensive inquiry into the composition, value, and volume of the output and the expenditure of the industries of a country. It provides government departments with necessary information, while the publication of the results gives information on economic trends to industrialists, economists, etc. The Census of Production Act, 1906, empowered the board of trade to require from industry statistics of manufacturing production. Except for interruptions caused by the First Great War, a census was taken every five years until 1935.

Experience during another war convinced government depart-

ments and many industrialists and business men that fuller information was needed than was available from quinquennial censuses. The Statistics of Trade Act, 1947, was therefore passed, authorising a census of production every year, and one of distribution and other services in any year prescribed by order. Each annual census is based on the activity of the preceding year. It may require information on the nature of an undertaking; employees and their work, remuneration, and hours; output, sales, deliveries, and services provided; articles bought or used; orders, stocks, work in progress; outgoings and costs; capital expenditure; receipts and book debts; electric and other power; and equipment and premises.

The first full census of production for 1948, taken in 1949, covered 160 different industries, grouped as follows: textiles, leather, fur, and clothing; metal; engineering and electrical; vehicle; food, drink, and tobacco; chemical and allied; wood and paper; mining; building materials and clay; building and civil engineering; public utilities; and other trades.

Production, MINISTRY OF. British govt. department set up in Feb., 1942. It replaced the production executive established in 1941 and its function was to develop British resources for maximum prosecution of the Second Great War. It allocated available resources of productive capacity and raw materials, and settled priorities where necessary. The ministry was merged with the board of trade in Oct., 1945.

Proetus. In Greek legend, the twin brother of Acrisius (*q.v.*). After a struggle he secured part of his kingdom of Argolis. His three daughters were driven mad by Dionysus or Hera. Perseus, to avenge Acrisius, turned Proetus into stone by showing the Gorgon's head. See Bellerophon; Perseus. *Prom. Preetus.*

Professionalism. Term applied to the system under which exponents of games employ their skill as a means of livelihood. It is thus sharply opposed to that displayed by the true amateur, who plays for sheer love of the game or sport without thought of material recompense. Professionalism is no new phenomenon. The Roman gladiator risked his life in the arena as a professional fighter, to whom success brought money as well as reputation; and the Greek culture of the body did not wholly exclude the element of professional-

ism. Indeed, there have been few civilizations or countries in which prowess at arms or in some form of sport could not claim substantial reward.

In modern times the term professionalism has acquired a fairly definite meaning, though in some sports the distinction between professional and amateur may seem to be rather finely drawn. The latter half of the 18th century in England marked the growth of rivalry and popular interest in sport and games, which has since developed to an amazing and almost disconcerting degree. Professional pugilists fought with bare knuckles in contests of endurance under the critical gaze of sportsmen who were their pupils in the noble art, and the loser did not, as in later years, receive a handsome *douceur* after recovering from the knock-out blow.

Cricket was then on the road to becoming the national game, but, as in football, the amateurs showed the way. Rugby football is, except in the North of England, confined to amateurs; while in first-class Association football amateurs and professionals rarely meet. In cricket, amateurs hold their own in a fixture like *Gentlemen v. Players*, but not numerically, for all county teams normally contain a majority of professionals. The universities, fed by the public schools, are the homes of amateur sport; their boat race still affords an instance of the amateur spirit at its best. As to golf and lawn tennis, the champion amateurs devote as much attention to the

word came into use in the universities of the Middle Ages, and is now the general term for those who fill the chief positions therein. Nearly all professorships are endowed, and the office is often spoken of as the chair. At Oxford and Cambridge many professorships are held in conjunction with college fellowships. Most professors are appointed by the university authorities, but the regius professors at the older universities are chosen by the crown. About 1600 the first professorship was endowed at Oxford, and later Henry VIII endowed several regius professorships at both Oxford and Cambridge. Every university and college has now a staff of professors. The title is also assumed by teachers of dancing and other arts, some being without academic qualification. A professor emeritus is one who has resigned after long service or through age or ill-health. See University.

Professor at the Breakfast Table, THE. Second series of O. W. Holmes's philosophical and humorous talks, of which the first was *The Autocrat of the Breakfast Table* (*q.v.*). After appearing in *The Atlantic Monthly* it came out in book form in 1860.

Profit and Loss Account. In accountancy, statement in which are summarised gains made and losses or expenses incurred by an undertaking. The profits or gains are entered on the right-hand or credit side of the account, and the losses and expenses on the left-hand or debit side. Thus

PROFIT AND LOSS ACCOUNT FOR THE YEAR ENDED 1950		£	£
To Selling Expenses ..	4,000	By Trading Profit b/d from	
.. General Expenses ..	8,000	Trading Account ..	30,000
.. Partners' Salaries ..	1,500	.. Interest received ..	200
.. Interest on Capital ..	900	.. Dividends on Investments ..	600
.. Income Tax ..	9,500		
.. Provision for Depreciation ..	3,500		
.. Net Profit, transferred to Partners' Current Accounts:			
.. S. Brown, £1,700			
.. W. Black, £1,700 ..	3,400		
	£30,800		£30,800

game as if it were their living. Whether professionalism on the whole has a good or bad influence upon sport, it has come to stay. The best professionals "play the game" as well as any amateur, and are rightly honoured for their achievements. See Amateur.

Professor. Term used for a teacher in universities and institutions for higher education. The

The profit and loss account or a company is usually divided into two parts; one shows how the net profit is arrived at; the other, often called the appropriation account, shows the purposes to which the net profit has been allocated, e.g. to dividends, staff superannuation funds, provision for income tax, reserve funds, etc. The Companies Act 1948. con-

tains detailed directions concerning the form and the contents of the profit and loss account of different kinds of companies.

Profiteering. Term introduced during the First Great War for the practice of making exceptional profits by taking advantage of abnormal shortages. Soon after the outbreak of war the first Rent Restriction Act (*q.v.*) was passed to prevent profiteering by landlords; and at various times orders were issued under the Defence of the Realm Act to control the prices of commodities, either by relating the current price to that charged formerly, or by fixing maxima. In 1919 the first Profiteering Act authorised the board of trade to investigate complaints of "unreasonable" prices, and to take legal proceedings against offenders, who could be fined or imprisoned. Local price control committees were established. This provision against profiteering came to an end in 1921; but the Rent Restriction Acts continued.

During 1939-45 the government practised a comprehensive system of price control and instituted much more comprehensive rationing than during the First Great War. These measures prevented many abuses of the earlier war. It was also found necessary to control the re-sale of second-hand goods by traders, particularly after the institution of purchase tax. But re-sale by others than traders was left uncontrolled; and second-hand furniture and motor cars were sold for much more than they cost originally.

Difficulty of Definition

This illustrates the great difficulty of defining profiteering. Should the reasonableness of a price be judged merely by considering the cash difference between the cost price and the resale price; or should one bear in mind the cost to the seller of replacing the article sold? Is it profiteering to sell for £500 a car that cost £170, if another could not be bought for less than £500? All profits are overstated during a period of rising prices and understated during one of falling prices. Further, it is exceedingly difficult to say what is a fair margin of gross profit. Overhead expenses of traders differ so widely when expressed as a percentage of their sales that a price ruinous to one might yield another a large profit. Hence prices must be fixed at a higher level than would be reasonable for some businesses. An attempt was

made to adjust matters by imposing a 100 p.c. excess profits tax, which took for the state at least part of the extra profit resulting from wartime shortages. But this did not benefit the individuals who were obliged to pay the high prices; the purchaser was better protected by price control orders and by rationing. Much profiteering after 1939 was associated with the attempt to evade control by "black market" transactions

H. Watson

Profits. In commerce or industry the surplus resulting from business transactions; the balance of the profit and loss account; the amount of gain from transactions during a financial period; the amount by which net assets have increased since the last balance-sheet was prepared. The exact meaning of the term depends upon the details of book-keeping by which the profit and loss account has been prepared, particularly upon what items have been charged as expenses or losses against income; and upon the method of valuing stock (goods intended for sale) and equipment (land, premises, machinery, furniture, vehicles, etc.).

Profits are exaggerated if stock-in-hand is overvalued or if inadequate allowance has been made for wear and tear or depreciation of machinery, etc. Sometimes the owners of small businesses overstate their profits by not charging as expenses (a) a salary for themselves similar to that which they could secure from an employer; (b) interest on the capital they supply, similar to that which they could expect if the money had been invested in some other way. Thus the assessment of the real profit in any particular business can be a nice problem, as the inland revenue department recognizes in making calculations in accordance with an elaborate set of rules to ascertain the statutory profit.

Economists point out that ordinary business profits often include (a) interest on the capital invested in the business; (b) economic rent of the land owned; (c) wages of management; (d) depreciation, wholly or in part; (e) reward for risk-bearing and insurance against loss through obsolescence, etc.; (f) monopoly gains; (g) accidental gain through unforeseeable change of circumstances; (h) "pure" profit, an amount accruing through exceptionally good management, a differential gain arising from superior effi-

ciency. This last, it is considered, does not enter into the determination of price. Often "book" profits are not enough to cover (a), (b), (c), (d), and (e), and there is no pure profit, particularly in one-man businesses. In large businesses, if there is, most of it accrues to the managers and not the shareholders.

Profit-Sharing. Term applied to a contract of employment "in which the employer agrees with his employees that they shall receive in partial remuneration of their labour and in addition to their wages a share, fixed beforehand, in the profits realized by the undertaking." Thus, the essential features of profit-sharing are (a) that it should provide for something wholly additional to wages; (b) that it should relate only to profits; (c) that the arrangements for sharing should be known beforehand. A premium bonus added to piecework wages is not an instance of profit-sharing; nor is a special bonus allocated as a mark of appreciation by directors after the result of the year's working is known.

Profit-sharing generally develops into co-partnership, the term used when the employees receive part of their entitlement in stock or share certificates of the company. Such certificates may become the absolute property of the employee, or may have to be surrendered when he leaves the service of the company.

Advantages and Disadvantages

Those who advocate this system consider that it (a) encourages employees to identify their own interests with those of the business; (b) discourages valued employees from leaving the company; (c) creates an interest in efficiency, reduction of waste, etc.; and (d) fosters thrift, self-respect, and a sense of property. It is easily possible to exaggerate the influence of such schemes, since generally the individual's share of profit is small in comparison with his ordinary remuneration; and it is difficult for the employee to associate individual acts with the company's total profit. Trade unions have opposed profit-sharing schemes that interfered with ordinary methods of fixing wages or with the right to join a union.

Profit-sharing originated in France more than a hundred years ago, and was extensively developed in Maison Leclair, painters and decorators, of Paris, and Maison Godin, an ironworks at Guise. In the U.K. it has been associated

principally with the gas industry, other public utility companies, municipal trading undertakings, and cooperative societies. Small businesses and a few large-scale companies have introduced profit-sharing and co-partnership schemes applying to certain groups of employees. In 1929, 517 undertakings, including 182 cooperative societies, were known to have profit-sharing schemes; but in 1938 the number had fallen to 399. *Consult Profit-Sharing and Stock-Partnership, G. James, 1926.*

H. Watson

Prognathism (Gr. *pro*, before; *gnathos*, jaw). Term denoting the projection of the upper jaw, especially in man and the anthropoid apes. By one calculation, a line being drawn from the forehead to the chin-point, the angle formed by the jaw, the maxillary angle, ranges from 160° in Europeans to 140° in the African negro. It is 110° in orang-utans. The European face is called orthognathous, the negro prognathous. *See Anthropology; Man.*

Prognosis (Gr., foreknowledge). Opinion expressed by a physician or surgeon as to the outlook of a case, as opposed to diagnosis (*q.v.*), which is the recognition and statement of the nature of a disease.

Programme Music. Name applied to musical compositions designed to suggest to the auditor a definite series of events or scenes. This class of composition has reached mature development only in modern times, but early composers frequently imitated the songs of birds, battle-cries, etc., to add descriptive force. Beethoven himself used the notes of the cuckoo in the Pastoral (No. 6) Symphony, and declared that his composition was always based on mental pictures. But the term should be confined to works where the "literary" basis is clearly defined, e.g. the popular Battle of Prague, for piano and strings, by Franz Kotzwara (d. 1791), or on higher planes, Mendelssohn's Midsummer Night's Dream and Tchaikovsky's Romeo and Juliet overtures, Schumann's Carnival, many orchestral works of Berlioz, an enthusiast of the programme in music, Liszt's symphonic poems, Saint-Saëns's Danse Macabre, Richard Strauss's Don Quixote. *See Leit-Motiv.*

Progress and Poverty. Work on social philosophy by Henry George (*q.v.*), further described as An Inquiry into the Cause of Industrial Depressions and of the Increase of Want, with the Increase of Wealth, the Remedy.

Published in 1879, it finds the principal cause of poverty and wretchedness in the private ownership of land, and advocates a single tax on the use of land as the remedy. *See Single Tax.*

Progression. Name given in mathematics to certain kinds of series. An arithmetical progression (A.P.) is a series in which a term differs from the preceding term by a constant amount; thus, 3, 7, 11, 15 . . . is an A.P. with a common difference of 4. If *a* denotes the first term of a progression and *d* the common difference, the *n*th term = *a* + (*n* - 1) *d*. In a geometrical progression (G.P.), successive terms are formed by multiplying the preceding term by a constant number, called the ratio; thus, 2, 6, 18, 54 . . . is a G.P. with a constant ratio of 3.

The *n*th term of a G.P. is *a.rⁿ⁻¹* where *a* is the first term and *r* the common ratio. The principle occurs frequently in calculations involving compound interest. A harmonic progression (H.P.) is a series in which the difference between the first and the second of any three terms is to the difference between the second and the third as the first term is to the third; if *a*, *b*, and *c* are any three consecutive terms, $\frac{a}{c} = \frac{a-b}{b-c}$, e.g. 3, $3\frac{1}{2}$, 5.

The H.P. is important in geometry and the theory of sound. *See Geometrical Progression; Series.*

Progreso. Seaport of Mexico, in the state of Yucatan. Its shipments of sisal fibre are considerable and have an annual value of several millions of pesos. It is connected by rly. with Merida, the capital of the state, 35 m. to the S. Population 15,000.

Prohibited Degrees. Degrees of blood relationship within which marriage is forbidden by the law or the Church. For the latter, *consult* the Table of Kindred and Affinity in the Book of Common Prayer. The law, less stringent than the Church, is intended mainly for the prevention of incest (*q.v.*). *See also Marriage.*

Prohibition. Term applied particularly to prohibition of the manufacture and sale of alcoholic liquors as beverages throughout an administrative area. The movement for prohibition originated in the eastern states of the U.S.A. early in the 19th cent., when various measures were introduced. The most successful was passed by the Maine legislature in 1851. Several states adopted similar measures during the next few years, but all quickly failed, ex-

cept in New England. Increase in drinking after the Civil War revived the prohibition movement, and in 1872 a prohibition party first nominated candidates for the presidency and vice-presidency. The activities of the Women's Christian Temperance Union, founded 1874, reinforced from 1895 by those of the Anti-Saloon League, was to the forefront in publicity for the movement, which made great headway during the 20th century. By 1917, 27 states out of 45 had become "dry," including the whole of the west except California.

On June 30, 1919, there came into effect a wartime prohibition law, passed by congress the previous Nov., of which the main purpose was to conserve grain. Meanwhile the prohibitionists had concentrated their efforts upon working prohibition into the Federal constitution. On Dec. 17, 1917, a joint resolution was carried through congress for the submission to the various states of an amendment to the constitution, subsequently known as the "eighteenth amendment" (*q.v.*). By Jan., 1919, the requisite 36 states had approved the amendment, which came into effect Jan. 16, 1920 (though already anticipated by the wartime act). The Volstead Act, which provided the appropriate legislation, came into force the following day.

The difficulties of enforcement, however, proved insuperable. Legal problems arose in connexion with the operation of "concurrent power," the industrial applications of alcohol, the inspection of foreign vessels nearing the "three-mile limit" of the American coast, and "rum-running" from the Canadian and Mexican borders. Racketeering in illicit spirits became the basis of many fortunes and much organized immorality; and it became so doubtful if prohibition really "prohibited" that a nation-wide reaction set in. A new amendment, the 21st, repealing the 18th, was submitted by congress to the states in Feb., 1933, and was adopted so speedily that it became law Dec. 5, 1933. The situation thereafter was that each state enjoyed complete home rule in the matter of its liquor laws (some of which, especially in the W. and E., are more drastic than the Volstead Act) and was protected against the intrusion of intoxicants from other states.

Prohibition was also introduced in Canada between 1907 and 1917. By the latter date the whole

dominion except Quebec had abolished the open liquor traffic, and in Quebec almost the whole province outside Montreal was under prohibition by local option. British Columbia was the first prov. to repeal the law, 1920, and prohibition now applies only to Prince Edward Is. Elsewhere beer is sold freely in saloons, but is not served with meals (except in Quebec). There is a provincial monopoly in the sale of wines and spirits, and purchasers must obtain an annual licence. Newfoundland had prohibition from 1917 to 1925, but it has never obtained in Australia (except for a brief period in Canberra) or New Zealand. From 1948 prohibition was gradually introduced in India and Pakistan. The movement has made little headway in the U.K., though Edwin Soryngour, a temperance advocate, sat as a prohibitionist M.P. for Dundee, 1922-31. See Local Option

Prohibition. Order by the common law of England, used also in America and all parts of the British Dominions where English common law prevails. By it one of the superior courts (exchequer, common pleas, and king's bench) forbade an inferior court to take cognizance of a case. In England the order is now in practice confined to cases where an inferior court—e.g. a county court—is assuming jurisdiction over a cause which it has no jurisdiction to try. The defendant applies to the high court for leave to apply for an order. In special cases the judge may make an order of prohibition forthwith; usually he merely grants leave to apply. At the hearing of this application for the order the case is argued, and it is decided whether the inferior court has jurisdiction or not.

Projectile. Term in ballistics to describe a shell or other explosive container discharged from the barrel of a firearm. It is also used in relation to an arrow discharged from a bow or pellet shot from an air gun. Projectiles range in size from dust shot weighing a few grains to the two-ton shell discharged from a 16-in. naval gun. A projectile depends upon external energy for its initial projection: thus a hand grenade (thrown), and an aerial bomb (dropped), are not classed as projectiles but as missiles. A bomb discharged from a mortar becomes a projectile.

Projection. Term applied to the graticules or frameworks of lines of latitude and longitude upon which maps are drawn, and now used for any map network and not

restricted to those which are true geometrical projections, e.g. Mercator's and simple conic projections. See Maps.

Since a map is flat, and the earth's surface is curved, it is not possible to make a map in which there is not some distortion, and it is the business of the cartographer to design various methods by which the inevitable distortion is at a minimum. In so doing he concentrates upon the network of meridians and parallels. The simplest methods of drawing the network are based upon the easy projections, although in nearly every case the final product contains modifications introduced after mathematical calculations.

If we imagine a ground glass globe on which the meridians and parallels are marked in black, and at the centre of which is placed a brilliant point of light, then we can use photographic paper to record the simple projections. If the paper is made into a cylinder to touch the globe at the equator, the record will show horizontal lines for the parallels and vertical lines for the meridians. This is the cylindrical principle of projection. If the paper be made into a cone, and fitted to touch the globe along one parallel of latitude, the record will show circular lines for the parallels, and straight lines converging to a common point for the meridians. This is the conical principle of projection. If the paper be flat and arranged to touch the globe at a pole, then the parallels are recorded as circles, and the meridians are radii of the circles. This is called the zenithal principle.

The cylindrical principle yields distortion of size for high latitudes, and distortion of shape by rapidly increasing E.-W. distances everywhere; these distortions are reduced in Mercator's projection, where the cylindrical principle is modified in order to give true compass directions from place to place. Mercator's maps are useful for navigators' charts. In the case of the conical principle distortion increases with distance from the parallel of contact. A modification is introduced by the use of a cone imagined to pierce the globe and pass through two parallels, and this development gives satisfactory maps for areas which are not very wide from E. to W. and not far N. or S. of the two chosen parallels. These conical projections are modified further in several ways, and tables have been constructed from which various networks may be drawn

The zenithal principle is modified to show distances or areas to scale, and is general for polar maps or maps of continents.

Projection. ANGLE OF. Elevation of the line of departure of a projectile with reference to the lateral line of sight. When a gun or rifle is fired, the projectile does not travel in a direct horizontal line from barrel to target, but rises in a gradually increasing arc, which sharply decreases in radius after the projectile has reached the apex of trajectory. The angle formed by the line of sight and a line drawn from the apex of the trajectory is the angle of elevation. Increasing this angle increases the range. Naval guns generally fire at a high angle of projection, and all howitzers show a high figure.

Projector. In cinematography (q.v.) the instrument by which a moving picture is thrown on to the screen. In optics, any apparatus used for directing rays of light. See Epidiascope; Searchlight.

Prokofiev, SERGEI SERGEYEVITCH (b. 1891). Russian composer. Born April 11, 1891, at

Sergei Prokofiev,
Russian composer

Soutsova, he studied at St. Petersburg (Leningrad) under Rimsky-Korsakov, becoming a brilliant pianist. After the Revolution he lived successively in London, Paris, Japan, and the U.S.A., returning to Russia in 1933 and settling at Moscow. Prokofiev was induced by the Soviet government to popularise his style, but, his music not proving acceptable to audiences, he was accused in 1948 of exploiting an "individualism intolerable to Soviet society." Prokofiev's first piano concerto gained the Rubinstein prize in 1910. His opera, *Love of the Three Oranges*, produced at Chicago in 1921, was soon popular. During the 1920s he composed ballets for Diaghilev; the well-known classical symphony also belongs to this period. His later works include the opera *War and Peace*; the overture *Toast to Stalin*; *Peter and the Wolf*; and music for films including *Ivan the Terrible*, and *Alexander Nevsky*.

Prokop, ANDREW (1380-1434). Bohemian monk and leader. He studied in Prague and travelled extensively in Europe. He joined the army of Jan Ziska on the outbreak of the Hussite war, and after

Ziska's death in 1424 became general of the Taborites, who under his guidance won a series of victories over Saxons, Germans, and Austrians. In 1427 he was master of Prague, and in fact of Bohemia. His followers carried out numerous devastating raids on neighbouring states, and in 1431 the war was renewed, and Prokop's army advanced as far as Frankfort-on-Oder. On May 30, 1434, Prokop was defeated at Lippau by an army raised by the Bohemian aristocracy, and fell on the field of battle.

Proletariat (Lat. *proles*, offspring). Term used by political economists and socialists to signify the poorest and lowest class of a community, and recently extended to include all the wage-earners of a nation. It dates from the time of Servius Tullius, when the Roman state was divided into the classified citizens who had property (*locupletes*), and the unclassified who had not, but served the state with offspring instead. See Communism; Democracy; Marx.

Prologue (Gr. *pro*, fore; *logos*, word). Preface or introduction, more especially one spoken before the opening of a dramatic performance, either to indicate its nature or to commend it to the audience. The use of the prologue dates back to the classic dramatists, when all that preceded the first choral song was called *prologos*, and though it continued fairly general with new pieces in the English theatre up to the 19th century, it later dropped almost entirely out of use.

Prome. District and town of Lower Burma, in the Pegu division. The dist. occupies the Irawadi valley just above the delta. It connects the central basin, the original home of the Burmese, with the deltaic plains, the ancient kingdom of the Talaings. Rice is almost the only cereal cultivated. Area, 2,915 sq. m. Pop. 436,714.

The town, on the left bank of the Irawadi, is the terminus of the rly. from Rangoon. Here is the Shive-sandaw Pagoda, 180 ft. high and surmounted by 83 small gilt temples, much visited by pilgrims. There was a factory of the East India Company in 1612 at Prome, which has a large trade in silk and cotton goods, lacquerware, and paper. In the Second Great War the town was captured by the Japanese on April 2, 1942, the British being forced to withdraw N. It was liberated May 3, 1945, during the British 14th army's land advance on Rangoon. Pop. 28,295.

Promenade Concert. Type of popular orchestral concert, a feature being that the audience, or part of the audience, is not seated, and is therefore free to move about as desired. Although the concerts given at Ranelagh, Vauxhall, Marylebone, and other public gardens in the 18th and early 19th centuries were precursors, this entertainment as known today was introduced to London from Paris in the 1830s. Concerts *à la Musard* were given at the Lyceum in 1838. Jullien's concerts were popular at Drury Lane during 1841-59, as were those given by Balfe at Her Majesty's in 1850.

On Aug. 10, 1895, a series destined to become world-famous was inaugurated at Queen's Hall under the direction of Henry J. (later Sir Henry) Wood. At first frankly popular, the programmes developed with each later summer season until they contained the best classical music and contemporary compositions. They continued under Wood's direction until his death in 1944. In 1927 the B.B.C. took over the concerts and made them a national institution. German air raids curtailed the 1940 season, and next year the destruction of Queen's Hall on May 10 necessitated a transfer to the Royal Albert Hall, where an outstanding season was given, July 12-Aug. 23. For the first time there was employed an associate conductor, Basil Cameron. In 1942 Sir Adrian Boult also took part. The 1944 Jubilee season had to be abandoned on account of flying bombs, and Wood died on Aug. 19. Later conductors at the "Proms" included Sir Malcolm Sargent, Constant Lambert, and Stanford Robinson.

Other regular series of promenade concerts have been given at Boston, Mass., and Sydney, Australia.

Promethean Match. Former device for obtaining fire quickly. It replaced the chemical matches which had come into use about 1807. It consisted of a small, tight roll of paper coated with sulphur, and containing at one end a sugar and potassium chlorate mixture, and a thin glass bulb filled with sulphuric acid. To obtain a light the glass was broken by pinching the end of the match, when the mixture fired owing to contact with the acid. See Bickford Fuse; Match; Safety Fuse.

Prometheus. In Greek mythology, originally a god of fire, later a Titan. The chief legend about him is that he stole fire from heaven for the use of mortals

For this he was chained by Zeus to a rock in Scythia, and every day an eagle consumed his liver, which grew again in the night. Prometheus suffered this torture until he was rescued by Hercules, who killed the eagle and released him from the rock. There are various and somewhat conflicting forms of the legend. See Aeschylus; Pandora. *Pron.* Pro-mee-thewss.

Prometheus Unbound. Lyric drama by Shelley, considered by many his greatest work, written 1819. Prometheus, the spirit of man, who has made Jupiter powerful and become his captive, revolts and is freed by the mysterious Demogorgon, who destroys Jupiter. Prometheus is reunited to his wife Asia, or Nature, and the new age of human freedom and happiness begins.

Prometheus Vincitus (Prometheus Bound). Tragedy by Aeschylus, produced about 430 B.C. It was the first or second piece of a trilogy, the other two being Prometheus the Fire-Bringer and Prometheus Unbound. For having taught mankind the rudiments of civilization, especially the use of fire, contrary to the will of Zeus, Prometheus was chained to a rock in Scythia, and predicted the dethronement of Zeus. At the end the rock sinks with him into Hades, where he suffers further tortures.

Prominence. In astronomy, the name given to the gaseous structures round the rim of the sun. They are great quiescent or eruptive gas clouds which reach sometimes 50,000 m. alt. and consist chiefly of hydrogen and helium. Invisible to the naked eye except during a total eclipse, they can be seen at all times in a spectroscope, and their motions have been filmed. See Sun.

Promissory Note. "An unconditional promise in writing, made by one person to another, signed by the maker, engaging to pay on demand or at a fixed or determinable future time, a sum certain in money, to or to the order of a specified person or to bearer." The person making the promise is the maker. The person to whom the promise is given is the payee. The usual form of such a note is:—

London, May 1, 1948.
Three months after date I promise to pay Mr. John Jones or order the sum of One hundred pounds for value received. £100.

(Signed) Septimus Smith.

As between the maker and the payee, if the payee sues on the note, the maker can always defend on the ground that there has been no valuable consideration, or use

any other defence that would be open on an action of contract. But if the payee indorses the note to a third party, called indorsee, the latter can sue the maker for the money without regard to the original want of consideration. Thus, a promissory note is negotiable. Speaking generally, a note which has once been indorsed to an indorsee has all the characteristics of a bill of exchange; and the maker and all indorsers are liable to a holder in due course for its face value.

Promontory. The general geographical term for a cape, as in Cape Clear; headland, Beachy Head; point, Start Point; ness, Buchanan Ness. Promontories vary from sandy spits like Dungeness to the fractured ends of hill-ridges as in the North and South Forelands, the eroded fragments of a ridge as at the Needles, and to bluff headlands like the North Cape. See Geography.

Promoter. In a legal sense, one who is a principal, not a subordinate or other employee, who alone, or with others, forms or floats a company or undertaking. A promoter conceives the idea of the company, sets out a scheme, procures persons to act as the first directors, causes the memorandum and articles to be prepared, and undertakes to form a company with reference to a given project, and to set it going, and to take the necessary steps for that purpose.

A promoter stands in the position of a trustee towards the new company, must act in the utmost good faith, and must not make a profit without disclosing it, and if he does make a secret profit, will be compelled to disgorge it. See Company Law; Prospectus.

Promptorium (PROMPTUARIUM) **Parvulorum** (Lat., storehouse of the young). The first English-Latin dictionary. Supposed to have been compiled about 1440 by a Dominican friar named Galfridus (Godfrey) Grammaticus of Lynn Episcopi in Norfolk, it illustrates the language of the period, especially the East Anglian dialect, and contains numerous examples of medieval Latin.

Promulgation (Lat. *promulgare*, to put before the people). In law, the steps taken to make a law known to those who have to obey it. In English law, everybody is deemed to know when a new law comes into operation, and promulgation is not necessary to its validity. For statutory instruments the Statutory Instruments Act, 1946, provided that copies

must, as soon as possible after the instrument is made, be put on sale to the public. Where a person is charged with contravening any such instrument, it is a good defence to prove that the instrument had not been issued by the stationery office, unless it is proved that at the date of the offence reasonable steps had been taken to bring the instrument to the notice of the public. This Act was made necessary by the delay in printing the many regulations and orders made during and after the Second Great War. See Proclamation.

Pronephros. The most anterior part of the primitive kidney. See under Wolffian duct.

Prong Buck (*Antilocapra americana*). North American ungulate mammal. It is usually placed by zoologists between the antelopes and the giraffes. Though only one species is known, it forms a separate family, the Antilocapridae. It resembles an antelope, but the horns consist of bony cores supporting sheaths which are periodically shed and renewed. The cores are covered with hairy skin, as in the giraffes. The animal is about 36 ins. high at the shoulder, and the pelt is handsomely coloured. The upper parts are chestnut; the face is almost black, with white cheeks; and the lower parts and a large patch on the rump are white. The white throat is crossed with brownish-yellow bars. The prong

Prong Buck. Young specimen of this small North American mammal

buck is found only in the western parts of North America.

Pronoun (Lat. *pro*, for; *nomen*, noun). In grammar, a class of words used in place of a person or thing. They are divided into personal (I, you); demonstrative, indicating objects (this, that); relative (who, which); interrogative (who? which?); indefinite (any, either); possessive (mine, yours). The personal pronouns include reflexive (him-, herself, themselves), and reciprocal (one another). Many languages show a distinction of gender in the demonstrative, relative, interrogative, and indefinite pronouns, the others having no gender. See Noun.

PRONUNCIATION: RULES OF SPEECH

A. B. Gough, M.A., Ph.D., late of The Oxford English Dictionary

In this article are outlines of some rules which should serve as a useful guide to pronunciations. See also Consonant; Larynx; Phonetics Voice; Vowel; and the article on each letter of the alphabet

Pronunciation (Lat. *pronuntiare*, to utter) is the manner in which an individual or a linguistic group utters articulate words or sounds. There are four principal elements in pronunciation, viz. quantity or length; stress, accent, or loudness; intonation or tone; articulation. Quantity applies to consonants as well as vowels, but is more important in the latter. English makes a greater difference than many languages between long and short vowels. Stress depends on the volume of sound emitted at one time, and has nothing to do with the duration of the sound, although long syllables tend to acquire stress. It is very marked in English speech, and is often exaggerated by English speakers of other languages. Intonation includes the rising or falling in the musical pitch of the voice. Most European languages

agree with English in using falling tones for statements and rising tones for questions, although Swedish employs rising tones very extensively.

Articulation is the production of distinct sounds by the organs of speech. Its scientific study belongs to Phonetics (*q.v.*). The present article is concerned with practical hints on the pronunciation of foreign words. Much greater space and the free use of symbols would be necessary for the precise and full treatment of the subject, and the following statements indicate only very roughly the characteristic sounds of some important languages. An ideal alphabet would have one symbol for each sound: 28 vowels and 32 consonants are not heard in standard English, which itself has about 31 sounds. All that can be done here is to omit

from consideration sounds of rare occurrence, to group together as one sound those which closely resemble each other, and to indicate the mode of formation of certain sounds, fundamentally different from any English sound. Where digraphs, i.e. combinations of two letters to express one sound, are used, it must be remembered that the sounds thus expressed are simple, e.g. *ay* is not *a+y*.

English spelling, especially in regard to its vowels, is much less phonetic than that of any of the other great European languages. English has also developed an unusually large number of obscure and mixed vowels, diphthongs, and glides. The English vowel system is confronted with a very different and tolerably uniform Continental vowel system, of which the purest types are to be found in Spanish and Italian. Important exceptions will be noted in their places.

It is usual, though by no means a universally followed plan, to spell in English books the proper names belonging to languages which use other alphabets than the Latin (including black letter), or which are not written at all, with English consonants and Continental vowels. If these are mastered there should be little difficulty in pronouncing names in modern Greek, Russian, Serbian, Bulgarian, and the various Asiatic and African languages, except for accentuation and for certain sounds, as in Arabic, Hindustani, and Russian, for which we have no equivalents.

ENGLISH VOWELS.		Continental
Long	Short	
ah <i>father</i>	a <i>arise</i>	a
ai <i>air</i>	ä <i>cat</i>	ä
aw <i>saw</i>	o <i>not</i>	o (Swed. ä)
ay <i>date</i>	e <i>bell</i>	e
ee <i>peel</i>	i <i>pill</i>	i
oh <i>poker</i>	o <i> fellow</i>	o
ö (er) <i>hurt</i>	u (er) <i>summer</i>	ö
oo <i>blue</i>	ü <i>put</i>	u
ü Ger. <i>über</i> , Fr. <i>du</i>	ü Ger. <i>üppig</i> , Fr. <i>tulle</i>	ü
English Diphthongs		Continental
i <i>fine</i>		ai
ow <i>now</i>		au
oi <i>boil</i>		oi

Of these vowels the only one that presents real difficulty, apart from niceties, is *ü*. It is the Continental *i* rounded, and may be pronounced by attempting to utter the *ee* of *peel* or the *i* of *pill* with the lips protruded and rounded as in *oo*. The sound is heard in Scottish and Devonshire forms of *good*. Nasalised vowels, common in French, Portuguese, and Polish, are absent from standard English, though heard in some forms of American English. In them the vowel coalesces with a following *m*, *n*, or *ng*, to form a single sound,

not a vowel followed by a nasal consonant. They are formed by leaving a slight opening between the lips (with *m*), or between the tongue and palate (with *n* and *ng*), thus allowing some of the air to pass through the mouth as well as the nose.

CONSONANTS. *Kh* is used in this article to denote both the guttural and palatal voiceless fricatives (or spirants) heard respectively in Ger. *ach* and *ich*. The former occurs in Scottish *loch*. One symbol suffices, as the difference is automatically produced by the following vowel. The sounds are formed by putting the tongue in the positions of *ahk*, *eek*, but not allowing it quite to touch the palate. *Gh* represents the voiced fricative corresponding to the guttural *kh*, as in Ger. *sagen*, and is formed as above, substituting *ahg* for *ahk*.

Th is reserved here for the voiceless fricative heard in *thick*, and *dh* represents the voiced sound in *then*. Similarly *zh* stands for the voiced sound in *pleasure*. *Ly* represents the palatal *l* spelt in French and Spanish *ll*, in Italian *gl*, and in Polish *l*. It is one simple sound, and not quite the *l+y* heard in English *million*, but is formed by placing the tongue in a position between those for *l* and *y*. In French, S. American Spanish, and Hungarian, it often passes into *y*. *Ng* is the simple guttural sound of *sing*. *N̄* is the corresponding palatal nasal, formed by pressing the tongue against the front palate, between the positions for *n* and *ng*. It resembles the *ni* in *senior*, but is one simple sound.

ITALIAN. The stress is generally on the penultimate, except when that syllable is short in Latin, when it is on the antepenultimate, as in the diminutives in *olo*, *ola*. Occasional stress on the last syllable is marked by a grave accent, e.g. *pode-tà*. The two vowels in diphthongs are separately pronounced. A doubled consonant is pronounced twice. *C* before *e*, *i*=tsh; *c* before *e*, *i*=t+tsh; *ch* before *e*, *i*=k; *g* before *e*, *i*=j; *gi* before *a*, *o*, *u*=j; *gh* before *e*, *i*=g hard; *gl*=*ly*, rarely *gl*; *gn*=*ñ*; *h* is silent; *j*=Ital. short *i*; *s* initial or before a consonant=*s*; *s* medial before a vowel generally=*z*, sometimes *s*; *sc* before *e*, *i*=sh; *sch* before *e*, *i*=sk; *z*=ts or dz, but sometimes=*z*.

RUMANIAN. *Â* nearly=*ü*; *ă*=short *ö*; *e* initial=short *ye*; *â*, *î* nearly=*ü*; *i* and *u* final are silent; *y*=*i*; *c* before *i*=k; *c* before *e*, *i*=tsh; *d*=z; *g* before *e*, *i*=j; *gh*=g hard; *h*=kh; *j*=zh; *ș* and *șch* before *e*, *i*=s; *s* before *e*, *i*=sk; *ț*=ts.

SPANISH. The stress is penultimate in words ending in a vowel, or in *n* or *s* without written accent; in others it is final. Exceptions are marked by an acute accent. *B=v* formed with both lips; *c* before *e*, *i*=th, but in S. America=*s*; *ch*=tsh; *cu* before *a*=qu (kw), but before *e*, *i*, *o*=ku (often written *cü* or *cú* before *a*); *d* between vowels or final often=*dh*; *g* before *e*, *i*=Span. *j*; *gu* before *e*, *i*=g hard, but *gü*=gu; *gu* before *a*, *o*, *u*=gw, often almost *w*; *h* is silent except in combination with a consonant; *j* is a strong guttural *h*, almost *kh*; *ll*=*ly*, in S. America *y*; *ñ*=*ñ*; *qu* before *e*, *i*=k; *x* now=*x*, but formerly was often written where *j* is now used, e.g. *Xerez*=*Jerez*, pronounced *herayth*; in S. America *x* often=*s*; *z*=th, in S. America, *s*.

PORTUGUESE. The stress is on the penultimate if the word ends with a vowel, or in some cases on the antepenultimate; in words ending with a consonant it is final. *A*, *e*, *o*, *u* may be nasalised (see above); the nasal *a* is written *am*, *an* when final or before any other consonant than *m* or *n*, otherwise it is written *ã*; nasal *e* is written *em*, *en*; nasal *o* is *ô*; nasal *u* is *um*, *un*; *ãe*=Eng. long *i* nasalised; *ão*=ow nasalised; *õe*=oi nasalised; *e* final is almost silent; *o* final=*oo*; *ô*=long *o*; *ô*=o as in Eng. *not*; *ou*=o as in Eng. *no*; *c* before *e*, *i*=s; *ch*=sh; *g* before *e*, *i*=zh; *gu* before *e*, *i*=g hard; *h* is silent except in combination; *j*=zh; *lh*=Span. *ll*; *nh*=*ñ*; *qu* before *e*, *i*=k; *s* medial=*z*; *s* final or before voiceless consonants except *s*=sh; *x*=sh.

FRENCH. The stress is always on the last syllable, not counting final *e*, which is silent. The written accents do not denote stress, but the nature of the vowel. Vowels with the grave (*père*) and circumflex (*rôle*) accents are always long; those with the acute accent (*â*) always short. *E* in unstressed syllables has a dull sound almost like a short *ö* (Eng. *her*); *é* is like *e* in *fell*, but with the tongue arched; *i*, whether long or short, is formed with the tongue more arched than in Eng. *ee*, *i*; *u*=*ü*; *y* vowel=Fr. *i*; *ai*=ai (*fair*); *ay* has the same sound unless a vowel follows, when the sound of *y* consonant is interposed, e.g. *payer*, *pai-yai*. In proper names *y* often=*ah+y*, e.g. *Exyèur*, *bal-yô*; *au*, *eau*=o long or short; *ei*, *ey*=Fr. *i*; *eu*=o long or short. *oei*=*ö*+*ee*; *oeu*=*ö*; *oi*, *oy*=wa(h); *ou*=oo, but before a vowel=*w*; *ui*, *uy* strictly Fr. *u*+Fr. *i*, but approximately=*wee*. The diaeresis on the second of two vowels indicates that they

are sounded separately, e.g. *Moïse*, *moh-eez*. Final e, es, and ue, ues are silent.

Nasalised vowels are those followed by m, n, either final, or before any consonant except m, n. In these syllables the m, n coalesces with the preceding vowel to form a single nasal sound. Nasalised e has two values, viz. en final (but not the preposition and adverb en), which is the short a of Eng. *an* nasalised, and en before a consonant other than n, which = the Fr. nasalised a. Nasalised i, ai, ei = Eng. short a (as in *an*) nasalised.

Final d, s, t, x, z, are generally silent unless the following word in the same clause begins with a vowel; final r is generally silent after e. C before e, i, y = s; c = s; ch = sh; g before e, i, y = zh; gn = ñ; gu before e, i, y = g hard; h is silent except in combination; j = zh; ll often but not always = ly; qu = k; s between vowels = z; th = t; ti in the endings -tion, -tiel, -tien, etc. = Fr. si; w = v; x = ks or gz, but between vowels = s, z.

GERMAN. The stress is generally on the root syllable, and in compounds on that of the first element, if that is a word in itself. Generally speaking, the accentuation resembles that of English. Ae, ā = ai (*fair*); ai = i (*fine*); au = ow; āu = oi; e final nearly = short ō; ei = i (*fine*); eu = oi; ie medial = ee; oe, ö = ō; ue, ü = ü; y vowel = Ger. i, sometimes ü; b final or before a cons. ending the same syllable = p; c before ae, ā, e, i = ts; ch = kh; chs = ks; d final = t; g initial = g hard; g between vowels = gh (fricative); g final = kh; h is silent between a vowel and a consonant, only indicating the length of the vowel; h is also silent when final after a vowel, and between vowels when the following vowel is unstressed; j = y; ng is always as in *sing*; qu = kv; s before a vowel = z; s before p, t = sh; sch = sh; th = t; v = f except between vowels; w = v, but is silent in some names ending in -ow; z = ts.

DUTCH and FLEMISH. The stress is as in German. Ae (modern Du. aa) = ah; unstressed e nearly = ō; euw = ay + Du. w; ei = long i (as in *fine*); eu = ō; ie before r = ee; ij = long i (*fine*); oe = oo; oo = oh; ou, ouw = ow; u, uu = ü; ui, uy nearly = oi or ah + ü; b, d as in German, but d between oe, ō, ui and a vowel = y; g initial = kh, otherwise nearly as in Ger.; j = y; s always = s; sch before vowels (except the obscure or dull e in unstressed syllables) = skh, otherwise sch = s; sj = sh; th = t; tj = tsh, w = w without rounding the lips.

DANISH and NORWEGIAN. The stress is as in German. aa = aw; æ is a close e nearly like Fr. é or Eng. e in *bell*; aj = long i; av before a consonant = ow; ej = long i; ø, ö = ō; øj = oi; y = ü; c before e, i = s; ch = k; d, dd between vowels or final = dh; d is silent after l, n, in the same syllable, and before s; f at end of a syllable = v; g before ā, e, i, ō, y = y; gi = y; hj = y; hv = v; j = y cons; k before e, i, j = tsh; kv = kv; sj, sk, skj = sh; th = t; z = z, ts, dz.

SWEDISH. The stress is as in Ger. Aa, ā = aw or o in *not*; æ, ae as in Dan.; o final and in some other cases = oo, u; y = ü; c before e, i, y = s; dj = y; dt = t; f final = v; g before ā, e, i, ō, y, or after l, r at end of a syllable = y cons.; g before t = k; gj = y; hj = y; hv = v; j = y; k before ā, e, i, ō, y in same syllable nearly = tsh; lj initial = y; qv = kv; sk initial before ā, e, i, ō, y = sh; sj, skj, stj nearly = sh; tj = tsh; z = s.

CROATIAN and DALMATIAN. Ie, é = ye; b, d as in Ger.; c, cz = ts; č nearly = ts; č, cs = tsh; dj, ds, dz, gj = j; h = kh; j = y; ű, nj = ñ; r is sometimes a vowel; š = sh; sz = s; v = f or v; ž = zh; but ž final = sh.

CZECH. The stress is on the first syllable. v Written accents mark length. E = ye; ey = ay; ou = o + oo; ů = oo; y = ü; c = ts; ck = tsk; č = tsh; ch = kh; d as in Ger., but di, di = dyi, dyee; h final = kh; ň = ñ; ř = rzh; š = sh; ti, tí = tyi, tyee; ž = zh; ž final = sh.

POLISH. The stress is usually on the penultimate. Written accents mark length. ę, ę are nasal vowels; é = yay; ó, o are close vowels, approaching oo, u; y = ü. Consonants with the acute accent are palatalised, the sound being something like that produced by a closely following y. C = ts; c = tsh; ch = kh or k; cz = tsh; d as in Ger.; dz = j; h = kh; j = y; l = ly; barred l nearly = w; ŋ = ñ; rz = rzh; sz = sh; v = f; w = v; ż = zh.

WELSH. The stress is generally on the penultimate. Ae = long i, as in *fine*; au = ah + ü; aw = ow; ei = long i as in *fine*; oe = oi; u = ü; ui = i; w as vowel = oo; y = u as in *but*. The other vowels have the Continental values. C = k; dd = dh (*then*); f = v; ff = f; ll = voiceless l, i.e. l without vibration of the vocal cords, the effect being something like khl or thl, the first consonant being sounded faintly.

IRISH. The stress is usually on the first syllable, but usage varies locally. Written accents mark length. Vowels have the Continental values, except that ā, a = aw, o (in *not*); and that o has a close

sound, almost like u in *but*. Combinations of vowels are very numerous: ai, ea = short a, aoi = ee; ea = ah; éa, eu = ay; ei = short e; eo = short u as in *but*; éo = yoh; eoi = oh + short i; io = ee; io, ui = short i; iai = ee + short i; iú = yoo. The consonants b, c, d, f, g, m, p, s, t are aspirated, i.e. turned into fricatives by a following h, representing a point over the letter in the Irish alphabet; thus bh = v; ch = kh; mh = v; ph = f. Bp = b; c = k; dl, dn = ll, nn; dt = d; f is bilabial; g is always hard; gc = g; ln = ll; mb = m; s before or after e, i = sh.

HUNGARIAN. The stress is on the first syllable. Written accents mark length. Á = ah; a nearly = o in *cot*; áj = long i as in *fine*; aj = oi; cs = tsh; cz = ts; g is always hard, but gy is a palatalised dental somewhat like dy; j = y; ly is the palatal ly, almost passing into y; ny = ñ; s, ss = sh; sz, ssz = s; ty is the voiceless palatal corresponding to the voiced gy (dy), and resembles ty; ts = tsh; tz = ts; y is never a vowel, but is used to modify the preceding consonant; zs = zh.

CLASSICAL NAMES. The pronunciation of ancient Greek and Latin hitherto current in England is admittedly conventional, words being pronounced much as if they were English, with the following exceptions: e is never silent; when final it is always long; y is always a vowel, and pronounced like Eng. i. The diphthongs are represented by the following sounds, which are not all diphthongs: ae = ee; au = aw; eu = (y)ew; oe = ee; Gr. ei = long i; Gr. ou (more often spelt u) = oo. In some words the two vowels form separate syllables, when the second is often marked with the diaeresis, e.g. *Phaëthon*. In other combinations of vowels both are distinct, length being never indicated by doubling, e.g. *Bootes* = bo-ōteez; *Boeotia* = bee-ōsha. The termination -eus is (1) yéws (*Zeus, Orpheus*), (2) e-us (*Timotheus*), or (3) ee-us (*Peneus*). The termination -es in personal names is always eez. Ch = k; initial ps, pt = ps, pt, or s, t; sc before e, i, y = s; initial x = z.

The accent is usually on the antepenultimate, or the first in words of two syllables. In words of three or more syllables it falls on the penultimate, when the vowel of that syllable is followed by two consonants, unless the second alone is a liquid.

Consult Practical Training in Pronunciation, G. N. Trenité, 1932; Language, L. Bloomfield, 1935; various B.B.C. pronunciation lists.

Proof. Term used in English law and the systems derived from it. It indicates the means whereby a fact is brought to the knowledge of a court of law, so that the court may properly take cognizance of it. As a rule the contents of a document are proved by producing the document itself. A copy will not be received in proof unless either (a) the original is proved to be lost or destroyed; or (b) the original is in the hands of the opposing party, who refuses to produce it after due notice. Exceptions to this rule are to be found with certain public documents, e.g. a marriage register need not be produced—a certified copy is enough. In Scotland the trial of a case by a judge alone is called a proof. See Evidence.

Proof. In engraving and etching, an early impression on paper, or print from the plate or stone or wood block. Trial proofs are those printed by the engraver for his own use, as a test of the work. Artists' proofs, which come next, are signed by the artist or the engraver or both. There are also proofs before letters, i.e. before the letters of the title or other inscription have been added. In printing and photography, a proof is a test print submitted to the client for approval. See Print.

Proof Correction. Term for the work involved in reading and correcting or altering a proof or impression of printed matter before it is cast or otherwise made ready in a technical sense for the press or printing machine. Every printing office has a dept. for this work staffed by "printers' readers."

Every author who wishes to see his work accurately produced should make himself familiar with the practical side of proof correction. The corrections are made in the margin of a proof by means of such marks as those shown in the accompanying illus. Consult Authors' and Printers' Dictionary, F. H. Collins, 9th ed. 1946; Rules for Compositors and Readers, H. Hart, 33rd ed. 1946.

Proof Spirit. Alcohol defined in English law as "that which at the temperature of 51° F. weighs exactly 12/13 of an equal measure of distilled water." The term is derived from the old smuggling days when the strength of spirit seized by coastguards was roughly tested by pouring a little on gunpowder and lighting the spirit. If when the spirit had burned away the gunpowder ignited, the sample was "over-proof." When the amount of water present in the

Proof Spirit. Alcohol defined in English law as "that which at the temperature of 51° F. weighs exactly 12/13 of an equal measure of distilled water." The term is derived from the old smuggling days when the strength of spirit seized by coastguards was roughly tested by pouring a little on gunpowder and lighting the spirit. If when the spirit had burned away the gunpowder ignited, the sample was "over-proof." When the amount of present water in the spirit was sufficient to make the gunpowder too damp to fire, the sample was "under-proof."

English proof spirit contains 49.3 p.c. by wt. or 57.1 p.c. by vol. of absolute alcohol; but U.S. is weaker at 50 p.c. by vol.

Propaganda. Name given to one of the great Roman congregations of cardinals charged with the administration of the various departments of the government of the Church. The *Congregatio de Propaganda Fide* has charge of all missionary operations of the Church. It was founded by Pope Gregory XIII in the 16th century. The *Propaganda* College is an institution at Rome for training missionaries.

Proof Correction. Examples of the principal marks used in correcting proofs for the press. The paragraphs as corrected appear in this page. Where a new paragraph is to be made the letters N.P. are written in the margin. Underlining a word with three short dashes indicates that it is to be set in capitals; for small capitals, two short dashes are made; or the letters may be simply underlined and the contractions caps and s.c. inserted in the margin

spirit was sufficient to make the gunpowder too damp to fire, the sample was "under-proof." English proof spirit contains 49.3 p.c. by wt. or 57.1 p.c. by vol. of absolute alcohol; but U.S. proof spirit is weaker at 50 p.c. by vol.

Propaganda. Name given to one of the great Roman congregations of cardinals charged with the administration of the various departments of the government of the church. The *Congregatio de Propaganda Fide* has charge of all missionary operations of the church. It was founded by Pope Gregory XIII in the 16th century. The Propaganda College is an institution at Rome for training missionaries.

Propaganda. The art and science of convincing others of the value of an idea, particularly a political or religious belief. The word is derived from a Vatican institution (v.s.). In politics it uses slogans and symbols, books and pamphlets designed to a definite end, flags and songs, and, above all, martyrs for a cause or an idea. From Galileo and Bruno to Edith Cavell and Matteotti, all who suffered for their beliefs

helped to make those beliefs more acceptable. The exploitation of press and films during the First Great War, and of press, films, and radio during the Second, all contributed to victory. In the First Great War the impressive organization established at Crewe House under the direction of Lord Northcliffe made a great contribution to the disruption of the Hapsburg empire by strengthening the claims of its heterogeneous nationalities to self-government. In the Second Great War almost all the belligerent powers established ministries of information, which performed similar functions.

However, propaganda is not necessarily a mere activity of wartime. The spreading of the culture of one nation does not necessarily involve the elimination of that of others; the ends of bodies like the Alliance Française or the British Council do not exclude each other, although they may tend to compete. Such activities, utilising cartoons and caricatures, plays, lectures, etc., may be used either to produce sympathy with, or antipathy against, an idea or a nation.

The study of propaganda is a branch of psychology, particularly mass psychology. The first to treat it systematically was the Frenchman, Gustave Le Bon, with his *Psychologie des Foules* (1895), and a more intensive treatment was given by W. F. Trotter in his *Instincts of the Herd in Peace and War* (1916). E. Stern-Rubarth, in *Propaganda as a Political Instrument* (1921), dealt more fully with its purely political aspects, and various psychologists in the U.S.A., e.g. F. Schoenemann, Quincey Wright, elaborated it still further. Totalitarian regimes in the 20th century used this knowledge ruthlessly, backing it with force. More democratic bodies, using propaganda as a means of peaceful penetration, sometimes succeeded in gaining recognition for positive ideas of value. The development and widespread use of propaganda has had a considerable sociological influence upon art and technique, on style and even language; and upon the handling of public affairs, in which the propagandist is often disguised as a Public Relations Officer (*q.v.*).

Propagation (Lat. *propagare*, to set slips). Horticultural term for the art of increasing or reproducing stocks of plants. There are various methods of propagation, e.g. seeding, cuttings, budding, grafting, layering, etc., described under their respective headings. Bulbs are propagated by seed, and also by bulbets, or offshoots, young bulbs attached to the side of the parent. Propagation of plants generally, on a large scale, for the public markets is now carried on by a process of rapid forcing, and the employment of bottom heat for the purpose. *See* Budding; Gardening; Grafting; Market Gardening.

Propellant. Material used in fire-arms to impart motion to the projectile. Whilst a propellant is popularly regarded as an explosive, there is actually a marked difference between them, the object of the latter being to cause a disruptive effect, while a propellant is required to exert a high pressure of a fairly constant character over an appreciable interval of time. The essential difference between the deflagration of a propellant and the detonation of an explosive is that in the former case decomposition begins on the outside of the grains, and proceeds through the mass by the consecutive combustion of parallel layers and at a slower rate than the velocity of detonation of a high explosive.

It follows that with a propellant the speed of decomposition can be varied by altering the shape or physical form of the material.

Vieille, the French scientist, made exhaustive researches on this subject, which culminated in his invention of *poudre B*. He came to the conclusion that to obtain regular results it was essential that the propellant be in the form of a colloid. With a propellant of this nature he was able to establish (1) that the grains of colloidal powders retain their original shape, but merely diminish in size, until completely consumed, and (2) that the rate of combustion varies directly as the pressure. All modern propellants have a nitrocellulose base, this compound being gelatinised by the use of a suitable solvent. British powders contain nitroglycerine in addition to the nitrocellulose. *See* Ammunition; Collodion; Cotton; Cordite; Explosives; Gunpowder; Lyddite; Pyrocollodion.

Propeller (Lat. *pro.*, forward; *pellere*, to push). Alternative name for device to propel a ship or aircraft. The marine propeller is dealt with under *Screw*; the aeronautical propeller under *Air-screw*.

Proper Motion. In astronomy, the angular rate of change in the position of a star in the sky caused by that part of its own motion through space which is transverse to the line of sight (*see* Radial Velocity). The so-called fixed stars are in fact moving at speeds up to about 100 m. a sec., but owing to their enormous distances the resulting proper motions rarely exceed a second of arc a year, and the shapes of the constellations have changed but little since the dawn of history.

Propertius, SEXTUS (c. 49-16 B.C.). Roman elegiac poet. He was born at Asisium (Assisi) and was educated and made his home in Rome, where he won the patronage of Maecenas and Augustus, and was a friend of Virgil and Ovid. Propertius belongs to the circle of poets who, like Keats, Byron, and Shelley, matured early and died young, his elegies revealing a rich vein of original genius and many passages of deep passion. The majority of his earlier poems deal with the relations of the poet with his mistress "Cynthia," whose real name was Hostia, but the subjects of the last book are chiefly drawn from Roman legend and history. There is a translation by Prof. Butler in the Loeb Classical Library, 1912.

Property (Lat. *proprius*, one's own). In law, the same as ownership. It does not mean, as it does in popular language, the thing owned. Indeed many people may have property in the same thing. Thus a person to whom an article is let on hire has a limited property in it, though the absolute ownership remains in the person who lets it. Property, or ownership, is, in law, a bundle of rights, indefinite, but not unlimited in extent; and, except in cases of limited ownership, of unlimited duration. They include the right of disposal in all its forms.

Property Tax. Another name for income tax, particularly the tax on income arising from land.

Prophecy (Gr. *prophēteia*). The term generally used in English to denote "prediction," or the power to foretell the future. This interpretation however, lays stress upon what was only an insignificant part of the work of the prophet. There are two words for prophet in Hebrew—*nābi* and *ro'eh*—and neither of them implies the power of prediction; the former meaning "he who announces," and the latter "the seer." In classical Greek, too, the term "prophet" signifies "the interpreter" rather than "the foreteller." Originally, therefore, prophecy signified the act of interpreting the will of God to men—and that was the supreme function of the prophets of the O.T.

"It is of the very essence of prophecy," says Canon Driver, "to address itself to the needs of the prophet's own age; it was the prophet's office to preach to his own contemporaries, to announce to them the judgements or the consolations which arose out of the circumstances of his own time." It is an entirely false conception of prophecy to regard it, as Bishop Butler does, as "nothing but the history of events before they come to pass." There are elements of prediction in all prophecy, but they do not constitute its essence, and sometimes the predictions were not fulfilled. The essence of prophecy lies in its moral and religious teaching, i.e. in its revelation of the purpose and will of God. *See* Inspiration.

Prophylaxis (Gr. *prophylax*, advanced guard). Term applied to measures taken for preventing a disease. *See* Public Health.

Propionic Acid, OR METHYL-ACETIC ACID. Acid produced during certain fermentation processes, and also in the destructive distillation of wood. It may be made by oxidising propyl alcohol with

potassium dichromate and sulphuric acid. Its salts are called propionates.

Proportion. In mathematics, an equality of ratios. As an example, the ratio 6 to 4 equals that of 24 to 16, and the statement as 6 is to 4, so is 24 to 16, is a statement of proportion. In general the proportion between four quantities, a, b, c, d , is written $a : b :: c : d$, a symbolism invented by the English mathematician William Oughtred (1575-1660). The theorem arising from the proportion is that the multiple of the first and last terms, ad , is equal to that of the intermediate terms, bc . If one quantity varies inversely as another, the two are said to be inversely proportional.

Proportional Representation. Method of conducting elections so that there shall be among those elected a proportional representation of all shades of opinion. Suppose an electorate of 200,000 persons votes to choose four representatives from among eight candidates, and the votes cast are: A, 70,000; B, 60,000; C, 25,000; D, 12,000; E, 9,000; F, 7,000; G, 6,000; H, 5,000. According to the method ordinarily used, A, B, C, D, E would be equally declared elected. As a result, (1) the votes of those who favoured F, G, and H would be ignored; (2) the votes of those who chose E would have nearly eight times the power of those who voted for A.

Those who advocate proportional representation propose that (a) constituencies should be large enough to return more than one member; (b) there should be a minimum number of votes, a quota, for election, calculated according to a formula; (c) voters should indicate their order of preference by writing on the ballot paper the figures 1, 2, 3, 4, 5, etc.; (d) those who gain the quota of first preferences should be declared elected, and their surplus votes credited to the unsuccessful candidates according to the second preferences; (e) the votes of the least successful candidates should be redistributed according to the second preferences shown with ballot papers in which they were first choice.

P.R. was adopted in the U.K. for some university constituencies, 1918-45, and for elections to the houses of laity and clergy of the Church of England. It applies in Eire, Tasmania, and to some extent in New South Wales, New Zealand, South Africa, Canada (for some municipal elections), and extensively on the Continent. It is

obviously most suitable when there are many parties of organized shades of opinion, and it leads naturally to coalitions. Some consider that where there is a fundamental difference of belief, P.R. may prevent governments from functioning effectively; but its advocates contend that in such circumstances it would merely prevent the majority from ignoring the views of the minority.

Propyl Alcohol, PROPANOL, OR ETHYL CARBINOL. One of the products of the fermentation of sugar. It is also found in the latter portions of the distillate obtained in rectifying crude spirits of wine, i.e. in fusel oil. Iso-propyl alcohol, isopropanol, or dimethyl carbinol is made from propylene and sulphuric acid; it is used as a solvent. Both substances have the same chemical formula, C_3H_7OH , the former boiling at $97.4^\circ C$. and the latter at $82.4^\circ C$.

Propylitisation, OR PROPYLITIC FACIES. In geology, a rock which has been permeated by thermal solutions of deep-seated origin, causing the abundant development of secondary chlorite, pyrite, and sometimes epidote, carbonates, and sericite. The original rock, often an andesite, basalt, or a rhyolite, assumes a dull green colour. The solutions responsible for this change are often associated with ore mineralisation; and its presence is therefore a useful guide in the search for mineral deposits.

Prorogation (Fr., from Lat. *prorogare*, to ask publicly, to defer). In parliamentary procedure, the interruption of a sitting of both houses by royal authority at the close of the session. It is a formal process by which parliament stands prorogued until a certain day, when, unless further prorogued, parliament meets. After prorogation all bills automatically expire, and must be introduced *de novo* in the following session. For this reason parliament has occasionally been prorogued for a single day in order to enable a bill to be introduced a second time, since no second bill of the same substance as a previous one may be introduced in the same session. See Parliament.

Proscenium (Gr. *pro*, before; *skēnē*, tent). In the theatre of ancient Greece, a wall with doors in it that hid the structure of the stage, and served as a background for the actors. In the modern theatre, that portion of the stage between the curtain or drop scene and the orchestra pit: though it

may include the curtain, which is sometimes attached to the proscenium arch.

Prose (Lat. *prorsus*, straight-forward). Direct language composed as the vehicle of thought intended to be spoken. It is thus one of the two principal forms into which literature (*q.v.*) is divided, the other being verse, language composed as an expression of thought primarily intended to be sung or chanted to musical accompaniment. The complete emancipation of prose from the laws of metre that are the subject matter of prosody thus furnishes the distinction between prose and verse. Rhythm (*q.v.*) is an integral part of good prose, but if it is to fulfil its primary function the first three essentials of prose are directness, lucidity, and appropriateness of the language it employs.

Prose as a studied literary form is preceded by poetry in the history of every literature. Another general truth is that classic Greece set a standard of excellence in every sub-division of prose as of poetry, upon which no later civilization has improved. Herodotus with the confident swing of his narrative, Thucydides with his chiselled periods polished to the nail, and Xenophon with his almost indolent facility, remain the types upon which all later historians have modelled their style. No detail of technique has been added to the art of oratory since the voice of Demosthenes was stilled. Plato remains the perfect master of prose applied to the expression of human thought in its widest range.

Of the few great Roman names that need be recalled here, Cicero stands out as the most versatile master of Latin prose, excelling as orator, as essayist, and as letter writer. Caesar's commentaries on the war in Gaul give hardly sufficient evidence of the qualities that must have informed works lost to us to justify the very high encomiums lavished on them by his contemporaries, but they are indisputably the work of a great writer, if not indisputably a great work. Sallust owed much to Thucydides; Livy introduced an intricate embroidery into the pattern of the language, which has a fascination that was not lost upon Macaulay eighteen hundred years later. Tacitus, whose style sometimes perilously approximates mannerism, closes the era of classic Latin prose.

Of the prose literatures of the modern world much is said in the articles scattered throughout this Encyclopedia. Perhaps the most

original, in the sense of not being derived from classic sources, is that of Iceland, where a purely native form of prose heroic narrative was developed in the 12th century. Even earlier than that England had a prose literature of her own, but this was based on Latin models, and it was not until the 16th century that the wonderful flower of English literature appeared in full perfection in the authorised translation of the Bible, especially the O.T. Thereafter the story must be followed elsewhere, through Donne, Cowley, Taylor, Temple, and Dryden, and through the romantic revival to the present day. In Germany, too, the Reformation brought in Luther's Bible the beginning of a vernacular prose literature. Elsewhere, in France and Italy and Spain, the story may be said to begin with the Renaissance; it is packed with great names, a few immortal. In all European countries the inheritance is rich. There is no indication, however, that, in any, trustees will fail to be forthcoming to preserve that which has been bequeathed, or lovers of literature to strive to increase the rich store for posterity.

Bibliography. English Prose, Sir H. Craik, 5 vols., 1893-96; On the Art of Writing, Sir A. Quiller-Couch, 1916; English Prose Style, H. Read, 1928.

Prosecution. A proceeding in a criminal court to put an accused person on trial. A prosecution usually begins by an information (i.e. a formal accusation) in a magistrates' court with the object of the accused either being tried summarily in that court or being committed for trial by a jury on indictment. A person may, however, be brought to trial by a jury without any preliminary proceedings or commitment by a magistrates' court for any offence on a bill of indictment being preferred by any person with the consent of a judge of the high court, or for murder, manslaughter, or infanticide on the inquisition of a coroner's jury, or for perjury on a bill of indictment being preferred by a judge or magistrate who considers that some person has committed perjury in proceedings before him. A prosecution may be begun in exceptional cases by an information filed in the king's bench division by the attorney-general.

Prosecutions are always in the name of the crown but they may be started by any private person of his own initiative, except where under various acts of parliament it is required that prosecutions must

be by order of a judge or by or with the consent of some official, e.g. the attorney-general, solicitor-general, or director of public prosecutions.

Proselyte (Gr. *pros*, to; *elthein*, to come). Term applied to a convert from one religion, opinion, or party to another. Originally it meant a Gentile convert to Jewish law and belief. Proselytes to Judaism were distinguished as proselytes of righteousness and proselytes of the gate. The first received circumcision and baptism; the second, also called sojourners, undertook to observe the precepts against idolatry, blasphemy, bloodshed, uncleanness, and the eating of flesh with its blood. Unless a proselyte was the son of a Jewess he could hold no public office nor become a member of the Sanhedrin.

Proskurov. Town of Ukraine S.S.R. It is a junction on the Odessa-Volochitsk rly, 55 m. N.E. of Kamenetz-Podolsk. In the district were remains of an old wall, called the Wall of Trajan, coins of whom have been found. Grain, fruit, and tobacco have been cultivated in the neighbourhood. Pop. est. 41,000.

Prosody (Gr. *prosodia*, relating to song). That part of grammar which treats of quantity, accent, and the laws of versification. See Verse.

Prosopopoeia (Gr. *prosopon*, person; *poiein*, to make). In rhetoric, a figure by which inanimate things or abstract conceptions are represented as animate beings with human attributes. Such personification is common in the poetry of all peoples. Another kind of prosopopoeia attributes probable but fictitious speech and action to historical persons.

Prospecting. Term for the search for mineral deposits. By the beginning of the 20th century most of the more obvious ore-bodies had already been found by old-time prospectors equipped with little except practical experience in the observation of the relationship between certain types of rock and ore, and the significance of gossans (see Secondary Enrichment), and in following traces of mineral in stream-beds upstream to their site of origin. Exhaustion of obvious sites of ore-bodies coupled with rising demand for ores led to the development of scientific prospecting based on applied geology.

Knowledge of local geology is facilitated by the study of geological maps; if these do not already exist reconnaissance traverses are made and the geologic

formations broadly outlined. More detailed work is then done in regions where the geologic conditions are favourable to mineralisation. Structural features of folding and faulting are closely inspected; the distribution of types of igneous rock is carefully noted, on account of the common association between such rocks and hypogene ore deposits (see under Ore Deposits). Limestones intruded by granite or granodiorite, introduced mineral of any kind, and rock alteration are closely examined for contact metamorphic (pyrometamorphic) ore deposits. Weathered areas, especially gossans, are studied for indications of the nature and grade of pre-existing sulphides. Scree, stream sands and gravels, glacial boulders, etc., are examined, and any minerals suggestive of mineralisation, whether valuable or not, are traced back to their source, often with satisfactory results, e.g. in Sweden, where copper-gold-bearing glacial boulders were followed towards glacial striae with success, and in Africa, where tin, gold, diamond, manganese, etc., have been found by panning and tracing the ore upstream.

Aerial surveys, like the old-time prospector's trip into the bush, can locate only surface outcroppings, or surface evidence indicating deeper mineralisation. Geophysical prospecting, however, makes it possible to locate certain types of ore bodies that lie hidden in the earth. Geophysical methods are magnetic; electrical; electromagnetic; gravitational; seismic; or depend on radioactivity. Magnetic bodies within the earth, e.g. magnetic iron ore, pyrrhotite, nickel, and cobalt ores, and rocks high in iron, such as basalt flows, that may contain copper, cause local deviations of the compass needle; variations in the magnetic susceptibility of the earth's crust can be measured with an instrument called a magnetometer.

Electrical methods are used chiefly for locating metallic deposits, but also in finding oil. determining geological structure, and in the logging of wells and bore-holes. Several methods are based on the low specific electrical resistance and electrical conductivity of metallic minerals. Variations in electrical resistivities of rocks at different places are measured; current is passed into the ground and potential differences are determined; or the natural currents caused by the rocks themselves may be used.

Electromagnetic methods are slower in operation than some of the others, but they are the most general since they give more precise information regarding shape and position of a hidden ore body. All make use of the fact that if a current be made to flow through a conductor an induced field is set up around the conductor. If another conductor (an ore body) lies within the induced field, it sets up a secondary induced field around it, which can be measured. Electromagnetic methods have been used in Sweden, Canada, and the U.S.A.

A plumb-bob normally points towards the centre of the earth, but a nearby mountain mass will cause it to be deflected from the vertical. A geologic body within the earth, heavier than its surroundings, will cause a similar deflection, depending on its size and distance from the plumb-bob. Lighter bodies appear to repel the bob. In this way, variations in density can be located and the presence of heavy ore-minerals or light oil may be indicated. The pendulum, torsion balance, and gravimeter are used in this method of prospecting.

Seismic Methods

Seismic methods are based on the fact that shock waves caused by an explosion in the earth's crust travel more quickly through some rocks than others, and are refracted (or bent) on passing from one type of rock to another. It is thus possible, by recording the arrival of shock-waves at different points, to build up a picture of the distribution of types of rock below the surface between the recording instruments and the dynamite charge used to set up the shock waves. Seismic methods have been used in prospecting for oil, gold and diamonds, ground water, etc., and in determining bed-rock formations.

Radioactive deposits are located by detecting the disintegration products of radioactive substances. The best known instrument for this is the Geiger-Muller counter. Minor methods of geophysical prospecting include one which depends on the fact that certain minerals fluoresce in ultra-violet light (see Fluorescence).

Geochemical methods of prospecting are chemical, biogeochemical, and geobotanical. The first two depend on principles laid down by V. M. Goldschmidt in 1933 concerning the distribution and natural history of the chemical elements. When rocks undergo

weathering and the rock minerals and ores break down, the elements may be dissolved by circulating ground water or absorbed on freshly precipitated iron and manganese hydroxides. Chemical prospecting involves the analysis of the trace elements in surface and ground water, in bog iron and manganese ores, in weathering deposits (especially laterites). Since plants take in the ground water solutions through their roots, and dissolved substances are concentrated in the plant at the places of maximum evaporation, the leaves, analysis of the ash of plant leaves indicates the metals in the ground water, and hence in the neighbouring rocks. The presence of a copper ore body, for example, may be indicated in a high copper content of leaves of plants growing in the vicinity. The geobotanical method depends on the fact that certain plants thrive on a soil rich in a certain metal. Geochemical are not so precise as geophysical methods, but they are useful where the latter are unsuitable, e.g. especially where the mineral occurs in thin veins.

Indications by one or more of these processes are further tested by pitting, trenching, and core-drilling before exploitation of deposits begins. *Consult* Applied Geophysics, A. S. Eve and D. A. Keys, 3rd. ed., 1938; Geophysical Exploration, C. A. Heiland, 1940; Exploration Geophysics, J. J. Jakowsky, 1940; Field and Mining Geology, J. D. Forrester, 1946.

John S. Webb

Prospectus. In commerce, document offering for subscription or purchase any shares or debentures of a company. It states the prospects of the undertaking for which money is required, and invites members of the public to furnish it. Usually appended to the prospectus is a form of application to be signed and sent with money by subscribers. Some prospectuses have contained misleading and false statements, and have made the most extravagant claims and promises in order to entice credulous investors to part with their money; but the company legislation of the 20th century, particularly the Companies Act, 1929 and the Companies Act, 1948, have imposed such stringent conditions that there is fairly complete protection against wilful deception, either positively by false statements or, what is equally important, negatively by omission of material facts. There is also

protection against gross misuse of money subscribed. The provisions of the Companies Acts concerning what must be stated in a prospectus are so comprehensive that the preparation is generally entrusted to specialists, either solicitors or experts employed by issuing houses. A company which does not issue a prospectus has to file with the Registrar of Companies a statement in lieu of prospectus, giving essential information similar to that which would have been available to the public had a prospectus been issued.

Prospero. Character in Shakespeare's play *The Tempest*. The victim of a plot by his brother Antonio, the usurping duke of Milan, and Alonso, king of Naples, he spends 12 years in exile on an island with his daughter Miranda. There he studies and masters the forces of nature; and, served by Ariel and Caliban, spirits of the air and earth, is able to practise magic. Raising a mimic storm, he lands his enemies on the island, and with them Alonso's son, Ferdinand, who, falling in love with Miranda, paves the way for a general reconciliation. In Prospero's final renunciation of his magic powers, many have found an analogy to Shakespeare himself. *The Tempest* being his last play. It is Prospero who delivers the famous lines: "We are such stuff as dreams are made on, and our little life is rounded with a sleep."

Prostate Gland. Organ which surrounds the neck of the bladder and first part of the urethra in the male. Somewhat resembling in shape a Spanish chestnut, it is about 1½ ins. across and contains a secretion which forms an important constituent of the spermatic fluid. Prostatitis, inflammation of the prostate, is often a result of gonorrhoea or of infection travelling down from teeth or tonsils. It spoils the chemistry of the prostatic fluid necessary to the health of spermatozoa, and is a frequent cause of sterility. In older men fibrous tissue in the prostate may block the flow of urine. The gland can be surgically removed and cancer of the prostate can be cured by injection of female hormone.

Prostitution. (Lat. *pro*, before; *statuere*, to place). Promiscuous sexual intercourse for the sake of gain. The women who practise it, usually for a livelihood, are known as prostitutes. Prostitution has existed in every country and in every age in history. In

Greece and Rome it was recognized and regulated, and the same was true of the countries of Europe, including England, during the Middle Ages. Today in the U.K. the law treats it as an offence against public order, but cases are extremely difficult to prove and it flourishes openly. In several countries prostitutes are registered, examined, and confined to certain areas. *See* Prostitution.

Protactinium. Radio-active element, symbol Pa, at. no. 91. Protactinium 231 has a half-life of 32,000 years, emits α - and β -rays, and decays to actinium. Isotopes are: protactinium 233, half-life 27.4 days; uranium X₂, 1.14 min.; uranium Z, 6.7 hours. The latter two are isomers of mass no. 234, in the radium series.

Protagoras (490-415 B.C.). Greek philosopher. Born at Abdera in Thrace, he taught in Sicily and at Athens, fleeing from the latter place after conviction on a charge of atheism brought against him for opinions expressed in a treatise on theology. He was drowned at sea. He was the author of a treatise which began with the famous sentence, "Man is the measure of all things." By this he meant that truth was relative, and that what each man holds to be true, that is true to him. The same principle also applied to morality, right and wrong being dependent on opinion. Protagoras was the first to study and write on grammar. He is one of the chief interlocutors in Plato's *Dialogue* which bears his name. *See* Sophists; *consult* Greek Thinkers, T. Gomperz, Eng. trans. L. Magnus, 1901-12.

Proteaceae. Family of trees and shrubs (a few perennial herbs). They are natives of the warm regions of the S. hemisphere. They have leathery leaves of varied form, from entire to much divided, in the different species. The flower parts are in fours, but the form, like that of the fruits, varies. There are nearly a thousand species. Some Australian species yield close-grained red or pink wood of considerable value to the cabinet-maker on account of its markings. Representative genera are *Banksia*, *Persea*, *Grevillea*, *Hakea*, and *Protea*.

Protecting Power. Neutral country which in time of war looks after the interests of one or other of the belligerents during the suspension of diplomatic relations. The protecting power has the right to inspect prisoner-of-war camps to see that nationals of the

country it represents are being treated properly. In the Second Great War Switzerland was protecting power in Germany and Italy for Great Britain and the U.S.A.; for the U.S.A. in Japan; for Germany, Italy, and Japan in the U.S.A.; for Germany in the N.E.I.; and for Japan in Hong Kong.

Protection. Political term applied primarily to the taxing of imports in order to increase their cost and thus to make it easier for home producers of such goods to compete with foreign suppliers. Protective taxes are wholly successful when they yield no revenue, that is, when they completely prevent the import of the taxed goods. They are, therefore, essentially different from taxes imposed on goods as a means of revenue. The opposite of protection is free trade, the condition in which, if goods are taxed, no distinction is made between goods from abroad and those produced at home.

Although the taxing of imports is the primary instrument of protection, there are many others: the total prohibition of imports, agreements between govts. to restrict the total quantity of goods to be imported (that is, the fixing of quotas), import licensing, govt. monopoly of foreign trade and bulk purchase, customs regulations concerning the valuation of imported goods, legislation concerning the nationality or the equipment of ships bringing imports, etc.

From the earliest times kings and other rulers issued decrees or signed treaties that assumed complete power to control imports and exports. In England there was much protectionist legislation before the end of the 14th century to protect retailers, to assist in establishing industries, and to foster merchant shipping. This policy was greatly extended during the Tudor period. Behind much of it lay the idea that it was desirable to export more than was imported, and to receive money (treasure) in order to balance trade. The balance of trade is still called unfavourable when imports exceed exports.

The policy of protecting industry against foreign competition developed excessively during the 17th and the 18th centuries, but the publication of Adam Smith's *Wealth of Nations* in 1776 turned men's ideas in the opposite direction. During the next 50 years the tariff system in the U.K. was simplified, most prohibitions on trade were abolished, and many duties were either removed or lowered

until in 1846 the Corn Laws were repealed, and the U.K. adopted virtually a free trade policy, and pursued it for more than 50 years. Towards the end of the century, however, the growing interest in the British empire and the decline of Great Britain's supremacy as a manufacturing country led to a demand for imperial preference, a form of protection intended to develop trade within the empire. In 1903 Joseph Chamberlain launched a campaign for tariff reform of a kind involving the abandonment of free trade. The First Great War revealed an almost total dependence on Germany for dyes and other chemicals, for optical glass and many kinds of scientific instruments. To foster home manufactures the Safeguarding of Industries Act, 1921, imposed duties on numerous articles produced by the so-called key industries. The Import Duties Act, 1932, created machinery for a general protective tariff, extended from time to time in many directions.

The U.S.A. is a large free trade area strongly protectionist in external trade; the U.S.S.R. is a large free trade area wholly protectionist in its external trade relations. Groups of countries within a customs union, e.g. Belgium, the Netherlands, and Luxemburg under the Benelux agreement, 1947, also constitute areas for internal free trade and external protection. *See* Corn Laws; Free Trade; Mercantile System; Navigation Acts; *consult* Industry and Trade, A. Marshall, 1919; Modern Tariff History, P. Ashley, 3rd ed., 1920; Tariffs: the Case Examined, W. H. Beveridge and others, 1931; International Trade and Tariffs, R. A. Hodgson, 1932.

Protection Order. In English law, an order that may be granted by a magistrate to a wife who has been deserted by her husband. Its effect is to protect any property she has, or may acquire, against her husband and his creditors, or any person claiming under him.

The term is also applied to an order that may be made by a court of summary jurisdiction when it is proposed to transfer to a new licensee a justice's licence for the sale of intoxicating liquor. The proposed transferee applies for the order, and if it is granted he is temporarily entitled to sell intoxicating liquor on the premises until the licence is transferred to him at the next transfer sessions.

Protective Colouring. Biological term for natural colour schemes which enable animals

liable to destruction by their enemies to escape observation when at rest, their colours harmonising with those of their natural surroundings. In consequence they merge into the environment and are invisible at a short distance. Several striking examples were known to the earlier naturalists and hunters, but they were regarded as exceptional. Among these were the striping of the tiger harmonising with the grasses of the jungle, the spotting of the leopard reproducing the shadows of leaves on sun-lighted ground, and the assimilative colouring of the upper parts of ground birds, such as woodcock and partridge, which rendered them invisible to birds of prey hovering far above.

So far, however, from being exceptional, such protective colouring is rather the rule for beasts, birds, reptiles, crustacea, insects, etc., whose mode of life requires it. Where the animal is inedible or has some offensive quality, as in the case of the skunk (*g.v.*), the coloration is of a character to render the animal highly conspicuous. As one general example, animals that feed on open sandy plains, such as the lion, camel, antelope, kangaroo, sand-grouse, and the lizards and snakes of such regions, are uniformly of a sandy tint in colour.

The generally accepted explanation is that these cryptic colours and patterns, originally due to the tendency to variation in all living things, have been reached through natural selection; the individuals who harmonise least with their environment being the most likely to fall a prey to their enemies. Protective coloration does not give immunity from attack to every individual; but it gives a chance to the most fit. *See* Animal; Bird: Colour; also col. plate to this article.

Protective Custody. Term invented to justify detention of a prisoner without trial on the grounds that it is for the prisoner's own benefit, either to save him from molestation or to save him from breaking the law. It was much used by the German Nazis in an attempt to excuse the incarceration in concentration camps of Jews and political prisoners or of any potential enemy. It has no place in English law.

Protector. In England a title bestowed on those, usually royal princes or leading noblemen, who acted as governors of the kingdom, when the king was a minor or otherwise incapacitated from ruling

Thus the dukes of Bedford and Gloucester were protectors during the minority of Henry VI, the duke of York in 1455 during Henry's illness, and the duke of Somerset during the minority of Edward VI. Such protectors were appointed by the privy council. Cromwell's title of lord protector of the Commonwealth was given him in 1653. *See* Cromwell; Regent.

Protectorate. Word used in two distinct senses: (1) the authority exercised by a protector or quasi-dictator, with particular reference in English history to the regimes of Oliver and Richard Cromwell; (2) more generally, the protectorship of the weak, especially of less advanced races by a stronger race, and, hence, the territory thus occupied. The term was in frequent use during the latter half of the 19th century, when large tracts of Africa and Asia came under European influence. Often a protectorate was followed by definite annexation.

A British protectorate is not part of the dominions but is within the British sphere of influence: its internal affairs are locally administered, but the British govt. exercises control over its foreign relations. The international status of protectorates was established by chapter 6 of the general Act of the African Conference held at Berlin in 1885. International law recognizes native subjects of a protected state as subjects of the protecting power. The principal British protectorates are Aden, Ashanti, Bechuanaland, Brunei, Nigeria, Nyasaland, Somaliland, Uganda, and Zanzibar. Some are administered in close association with a colony: thus the legislative council of Kenya has power to legislate for the Kenya protectorate. In Europe, the republic of San Marino was originally a protectorate of the Papal See and later of Italy, and Monaco a protectorate of France. *See* Colony; Mandated Territories.

Protein or **PROTEIN.** Complex organic compound containing carbon, hydrogen, oxygen, and nitrogen with a little sulphur. Proteins form an important part of all living organisms, and are the essential nitrogenous constituents of food. They are classified into (1) simple proteins, (2) conjugated proteins, and (3) products of protein hydrolysis. These include the albumen of white of egg, the globulin, fibrin, and albumen of blood, the ossein of bone, the gelatine and collagen of connective tissue, the casein of milk, and the creatin of meat. There are 50

proteins known to occur naturally in plants and animals. These all differ from one another in physical and chemical properties. *See* Albumin; Food and Nutrition; Gelatine; Haemoglobin.

Protein Plastics. Complex protein-containing materials of animal and vegetable origin, the most important of which are based on (a) casein and (b) soya bean. Casein plastics, which were first developed in the early years of the 20th century and are therefore among the pioneers of plastics, are based on casein, the main protein in cow's milk, in which it occurs as a calcium compound contributing 3 p.c. of the whole. Before 1940 the best casein came from France, but supplies are now mainly drawn from the Argentine, Australia, and New Zealand. Casein is separated from the milk by precipitation either with acid or by the addition of the rennet enzyme, rennin. Produced in this way, it is a translucent, yellowish powder. For the plastics it should not contain more than 2 p.c. fat.

The plastic is formed by mixing the dry powder and a dyestuff with water and plasticising agents, *e.g.* glycerine or methyl diphenylamine, and is then extruded through a screw press. The extruded mass is cut into small "nibs," which may be further mixed according to the colour required, and re-extruded or pressed into sheets in tray moulds of duralumin at 600 lb./sq. in. and 180–190°F. for 3 mins., followed by 2 tons/sq. in. for a further 3 mins. The sheets are cooled before removal from the press, after which they are hardened by immersion in formalin. The sheets and rod are then washed and dried.

Casein plastics are today mainly applied in the manufacture of buttons and colourful decorative trinkets. For manipulation casein plastics can be softened by immersion in water or heating in an oil bath at 80–100°C. or between hot platens at 85–90°C.

Casein plastics have a specific gravity of 1.33–1.45; ash content, 7–19 p.c.; water absorption after 48 hours' immersion at 72°F., 15 p.c. They are marketed in sheets 16 in. × 20 in., 2 mm. to 20 mm. thick, and rods 2 mm. to 20 mm. diameter, polished, unpolished, or trapped.

The potential importance of the soya bean as a raw material for plastics and oil led Henry Ford to spend considerable sums to establish its growth in the U.S.A. and in Essex. The beans are flaked,

1. Beetle (*Lithinus nigrocrustatus*) on a branch. 2. Spot insect (*Aerophylla chronos*). 3. Caterpillar of Spiny Moth (*Euclyptus artemisia*). 4. Red-winged Grasshopper (*Cedipoda* insect). 5. Leafhopper (*Acrida* insect). 6. Orange-tip Butterfly (*Delia* insect). 7. Homopterous Insect (*Umbra* insect). 8. Homopterous Insect (*Umbra* insect). 9. Lappet Moth (*Gastrophysa* insect).

10. Moth (*Umbra* insect). 11. Moth (*Umbra* insect). 12. Moth (*Umbra* insect). 13. Leafhopper (*Acrida* insect). 14. Leafhopper (*Acrida* insect). 15. Leafhopper (*Acrida* insect). 16. Leafhopper (*Acrida* insect). 17. Leafhopper (*Acrida* insect). 18. Leafhopper (*Acrida* insect).

PROTECTIVE COLOURING IN ANIMAL BIRD AND INSECT LIFE

and then extracted on the counter-current principle with a solvent, usually hexane, to yield soya meal which contains 48 p.c. protein (mainly casein), 32 p.c. carbohydrates, 7 p.c. cellulose, 7 p.c. ash. Whilst it is possible to produce from soya meal a plastic resembling standard casein plastic, it is more usual to use it as a modifier in a phenol formaldehyde composition. In much the same way plastics have been produced from coffee beans, but these are likely to be of interest only if the price of coffee fluctuates widely.

Protesilaus. In Greek mythology, first of the Greek leaders to be killed in the Trojan war. He was slain by either Aeneas or Hector, as he leapt from the ship to the shore. For the story of his wife's devotion, see Laodamia.

Protestant Alliance. Society founded in 1845 "to maintain the defence, against all the encroachments of Popery, of the Scriptural doctrines of the Reformation and the principles of Civil and Religious liberty, as the best security under God for the temporal and spiritual welfare of the British Empire." It issues a bi-monthly organ, *The Reformer*, and its offices are at 119, Earlsfield Road, Wandsworth, London, S.W.18.

Protestant Episcopal Church. Official and legal designation of the episcopal Church in America which is in communion with the see of Canterbury. It was introduced into Virginia in 1617, when the first English colonists arrived. In both Virginia and Maryland it was for a long period an established church. By the time of the revolution it had spread to most of the colonies, being still under the jurisdiction of the bishop of London and having no resident bishops.

In the 18th century urgent appeals were made to the bishops in England to consecrate a bishop for America. In 1783 Samuel Seabury, who had worked as a clergyman in New Brunswick and New Jersey, was chosen by the clergy of Connecticut to be their first bishop, and was sent to England for consecration. Political complications and supposed legal difficulties prevented the English bishops from acting; but on Nov. 14, 1784, Seabury was consecrated bishop at Longacre, Aberdeen, by Scottish bishops, with the knowledge and implicit consent of the archbishop of Canterbury. In 1787 the archbishop consecrated Samuel Provoost of New York and William White of Pennsylvania, in Lambeth Palace chapel.

The supreme governing body of the church is its triennial general convention, which has a presiding bishop at its head, and consists of a house of bishops and a house of deputies, composed of an equal number of clergy and laymen, elected by the several dioceses and missionary districts. Every diocese elects its own bishop, but his election has to be confirmed by a majority of the house of bishops and also of the standing committees of all the dioceses. There are 73 dioceses, 16 missionary districts at home, and 13 abroad. The overseas activities of the church extend to Cuba, the Dominican republic, Haiti, Puerto Rico, the Panama

Canal zone, Mexico, Brazil, the Philippines, Hawaii, China, Liberia, and the continent of Europe.

The original Prayer Book was considerably revised in 1789, 1892, and 1928. As to the ministry, the church holds to the threefold historical order of bishops, priests, and deacons. It has founded many important educational institutions. It claims over 1,500,000 communicants, as well as more than 2,000,000 baptized members. Since the practical cessation of immigration during decade 1930-40, the increase in the number of its communicants has been proportionately greater than that of the population of the U.S.A.

PROTESTANTISM AND ITS PRINCIPLES

Rev. P. Carnegie Simpson, D.D.

The reader of this article is also referred to that on Christianity and to those on the various branches of Protestantism, e.g. Church of England; Nonconformity; Presbyterianism, etc. See also Church; Reformation; also Calvin; Knox; Luther; and biographies of other reformers

The term Protestant had a definite historical origin. During the progress of the German Reformation a diet was held at Spire in 1526. At this diet the reforming party was in the ascendancy—the papal party being weak through the absence of the emperor Charles V and his open hostility both to France and to the pope—and it was agreed that each German state should be at liberty to settle its own form of religion. The result of this was to protect and establish the Lutheran Church in nearly all North Germany, where the princes favoured the reformed faith.

This settlement was never accepted by the Roman party or by the emperor; and the latter, as soon as he had concluded the French war and ceased to be in conflict with the pope, called a second diet at Spire in 1529. On this occasion the Roman party obtained a majority. The territorial arrangement, sanctioned by the former diet, was abolished, and instead enactments were made which continued the protection and endowment of the "old Church" in reformed Germany, while not tolerating Lutheranism in R.C. states. Against these decrees the minority of the diet—princes and representatives of cities—lodged a protest. This was not against any of the doctrines of the Roman Church. It was not theological, but legal and ethical. Legally, it *protested* against a unanimous agreement of one diet being reversed by a majority of another. Ethically, it asserted the principle that in matters of religion a

majority must not and cannot coerce the individual conscience. This is what historically and originally Protestantism is.

The word came rapidly into more general use to describe the system separated from the Roman Church. In this use it had first a positive and only later a merely negative meaning. When the Reformed Churches were described or described themselves as Protestant, that did not mean merely a denial of Roman beliefs; it was also an assertion of the faith held by these Churches. In this sense early Anglican divines used the term; thus even Laud disclaims any practices "to Popery or any way blemishing the true Protestant religion established in the Church of England."

Here the "true Protestant religion" is the full faith without either Roman accretion or any form of diminution. In the same sense the word is used in the English coronation service, where the sovereign swears to maintain "the laws of God, the true profession of the Gospel and the Protestant Reformed Religion established by law." But a narrower and negative use of the term inevitably grew up as non-Roman Christianity in the West developed various sects and sections, some of which had little positive church teaching, and the common feature of which was not their affirmations but their agreement in denying Romanism. Thus Protestantism gradually lost its original positive and evangelical character and became little more than an equiva-

lent for the denial of Roman Catholicism.

When we turn from the historical to the theological meaning of the term, it is important to note that beneath all the doctrinal antagonism, or divergence, which arose in the 16th century, there was still great fundamental agreement. The Reformers were careful to maintain their allegiance to the verities of the Catholic creeds, and on the Being of God and the Person of Christ, Lutherans and Calvinists did not disagree with the ancient council of Nicaea. Where Protestantism differed from the Roman Church was on matters subordinate to these primary articles of Christian faith. Into the details of this divergence—the opposing doctrines on such matters as sacraments, the Church, justification, and so on—it is impossible here to enter. It may suffice to indicate the two root principles which are the source of the separation.

Protestants and Romanists differ as to what is the rule of faith—i.e. the standard or authority of Christian truth and practice. Both sides admit the authority of the Christian Scriptures; but to Protestants this is supreme and sufficient, while to Romanists it may be added to by ecclesiastical tradition, and it is always to be accepted as interpreted by the Church. The Roman Church, therefore, does not admit an appeal to Scripture against authoritative Church doctrine or practice, whereas this is the appeal constantly made, or professedly made, by the Reformed Churches.

Here is the source of a number of the most conspicuous divergences between the two systems, in such matters, for example, as the number of the sacraments or the manner of their observance, and in many features of worship and of religious life. It should be added that the Protestant appeal to Scripture as the rule of faith does not—and in the early days of the Reformation did not—imply a rigid or literal view of Biblical inspiration and verbal inerrancy; the appeal was rather to the word, or utterance, of God which is to be found in the Bible. But Protestantism has often exaggerated the authority of the Biblical, as Romanism has that of the ecclesiastical, inspiration.

The other main source of divergence between the two systems goes deeper than any differences as to an external standard, and concerns the experience of religion. The Romanist system of religion is characteristically and essentially

sacramental and sacerdotal. Its sacraments are the sole authorised means of saving grace, and they are authorised to be such only

Proteus. Blind amphibian of subterranean waters showing the rudimentary limbs
W. S. Berridge, F.Z.S.

when administered by a validly qualified order of priests. Protestantism, however, took its rise out of a religious experience which did not depend on this. It found justification and all else that might be contained in salvation through the direct and personal relationship of the soul and Christ, unconditioned by the necessity of a sacramental and sacerdotal system. This did not imply that Protestantism denied or dispensed with either the sacraments or the ministry; but it did deny that only through these is the Christian salvation given. Thus the Protestant—or as the Reformed Churches would call it, the evangelical—experience of justification by faith led to an entire revision of the view of the relation of the individual soul to God and His grace, and to what was called “the universal priesthood of believers,” which means that God’s grace or salvation is immediately available through faith and not through the priesthood.

This was really the deepest dividing line at the Reformation; it had effects on the whole system of church doctrine and practice. It would be an exaggeration to say that here are two religions, but here are two irreconcilable ways of religion. Yet deep as are the differences between the Protestant and the Roman systems, they are not differences as to the source of religion. The aggregate number of persons accepting generally the Reformed principles may be reckoned at between 160,000,000 and 180,000,000.

Bibliography. History of Protestantism, J. A. Wylie, 1874; History of the Reformation and Modern Protestantism, C. T. Bettany, 1895; Principles of Protestantism, J. P. Lilley, 1898; Protestantism, W. R. Inge, 1935; Protestants, the Free Churches and the Future, R. S. Frayn, 1944.

Proteus (*Proteus anguinus*). Genus of amphibians, found in

subterranean waters in Dalmatia, Carinthia, and Carniola. It is eel-like in general appearance, 10 to 12 ins. in length, but has four small and rudimentary limbs, and retains external red gills throughout its life. The skin is smooth and flesh-coloured, and the eyes are beneath the skin. When the proteus is kept in captivity and exposed to the light, the skin tends to turn black. The animal is totally blind. *Pron.* Pro-tewss.

Proteus. In Greek mythology, a sea deity, son of Poseidon. He had the power to foretell the future but was always reluctant to exercise it. When consulted as to the future, he was in the habit of assuming different and sometimes terrifying shapes. Those who were bold enough to seize him and keep a hold throughout all his changes of form would eventually succeed in getting him to speak. Proteus was supposed to live in the island of Pharos, where he tended Poseidon’s flocks of sea-monsters. In the theatre, especially on the music-hall stage, a “Protean act” is the term for a performance in which one player assumes every part, appearing in different guises and assuming different characters in succession, with great rapidity.

Proteus. One of the two gentlemen of Verona in Shakespeare’s play of that name. His name typifies his changeableness, for when his friend is banished he woos that friend’s love, Silvia, forgetting his own absent Julia, only to return to Julia on her reappearance.

Proteuangelium Jacobi. Work ascribed to S. James, “the Lord’s brother” and first bishop of Jerusalem. Part of the N.T. Apocrypha, it contains 25 chapters, in which is given a legendary account of the birth of the Virgin and that of Christ. It shows traces of Ebionitic origin, and may have been based late in the 3rd century upon an earlier work. See Apocrypha.

Prothallus. The sexual (gametophyte) stage in the alternation of generations (*q.v.*) common to ferns, mosses, and many fungi and algae. The ordinary fern plant is an organism with diploid nuclei. When it is about to reproduce, meiosis occurs in the nuclei of certain cells of the sporangia which arise on its leaves, and as a result haploid spores are formed, later to be liberated. Each of these given suitable conditions will germinate to produce a thin plate of haploid chloroplastid containing cells fixed to the soil by numerous colourless hairs or rhizoids. This

is the fern prothallus. It is seldom more than about 1 cm. in diameter and never develops the complexities of stem, leaf, and root, or of tissues, which are found in its parent. Its only outstanding resemblance to that plant is that it is capable of self-nourishment.

In due course archegonia, each containing one egg cell, and antheridia, which liberate numerous motile male gametes or antherozoids, appear on the prothallus. The antherozoids fertilise the egg cells, and the diploid oospores so formed subsequently grow into ordinary fern plants deriving their nourishment at first from the prothalli, which on this account become exhausted and shrivel. The prothallus is thus the haploid gamete producing offspring of one diploid plant and the parent of another. In some pteridophytes two kinds of prothalli are formed, one female and the other male. In some the prothalli lack chlorophyll, depending on food passed on in the spore from the parent or derived from organic matter in the soil. In gymnosperms female prothalli constitute the main mass of the ovule; vestigial male prothalli occur as one or two cells in their pollen grains.

Prothero, SIR GEORGE WALTER (1848-1922). British historian.

Born Oct. 14, 1848, he was educated at Eton and King's College, Cambridge. He became in 1876 tutor and lecturer in history at King's College, London, and in 1894 professor of modern history at Edinburgh. There he stayed until 1899, when he succeeded his brother as editor of *The Quarterly Review*. He was one of the editors of the *Cambridge Modern History*, and for four years president of the Royal Historical Society. In 1918 he was appointed director of the historical section of the foreign office. Made K.B.E. in 1920, he died July 10, 1922. His brother was Lord Ernle (*q.v.*).

Protocol (Gr. *protos*, first; *kolla*, glue). Originally the first sheet of a papyrus roll. The *protocollum* of the Romans was a volume of papyrus leaves, bound together with glue, in which the senate's acts were recorded. The word later meant the original drafts of such acts, and ultimately came to refer to a fly-leaf, glued on to an MS. and containing the writer's name and a précis of the subject. In diplomatic language a protocol is the minutes of the sittings of a conference or congress which, although signed by the plenipotentiaries present, have the

validity only of a verbal engagement; also a document which, without having the authority of a treaty or convention, records the principles upon which an agreement has been reached; also an agreement between powers to proclaim an identity of views without binding such powers to common action (*see* Geneva Protocol). The *protocol diplomatique* is a collection of internationally recognized ceremonial rules to be observed in written and verbal intercourse between the heads of states or their ministers.

Protocols of the Elders of Zion. Documents alleged to be the minutes of a secret Zionist congress held at Basel in 1897. They described alleged secret Jewish ritual, including the sacrifice of Christian infants, and gave details of a conspiracy to overthrow Christian civilization and replace it by a Zionist world state. First published in 1905 by the anti-Semites of tsarist Russia, they became the basis for anti-Semitic campaigns in many countries. In 1921 *The Times* revealed that the protocols had been forged by a former member of the Russian secret police, who had founded them on a pamphlet by a French lawyer, Maurice Joly. Although proved a forgery, the protocols were adopted as a fundamental of the Nazi persecution of Jews. But in 1933 the Jewish communities in Switzerland secured a ruling from the high court that the protocols were a forgery and their publication constituted an offence against the penal code. *See* Anti-Semitism.

Protagoras. Greek painter of the 4th century B.C. Born at Caunus, in Caria, he worked at Rhodes, where he had a house just outside the city walls, and here he continued to paint tranquilly during the siege of the city by Demetrius Poliorcetes, 305-304 B.C. His imperturbability delayed the capture of Rhodes, since the assailants refrained from attacking in that quarter, being reluctant to destroy the artist and his works. He painted a picture into which he introduced a partridge so life-like that some living partridges were deceived. *Pron.* Pro-toj-eneez.

Proton. Subatomic particle having a mass of 1.6725×10^{-24} gm, or approximately 1,836 times the mass of an electron, and a positive electric charge of 1.6020×10^{-19} coulomb, equal and opposite to the charge on an electron. The number of protons in the nucleus of an atom (the atomic number *Z*) is equal to

the number of electrons surrounding it, and determines the element. Moving protons constitute some forms of canal rays and cosmic rays.

Protophyta. Division of plant life. The term was adopted by some authorities to include the lowest forms of Algae and Fungi, which are now more generally considered as Thallophyta (*q.v.*).

Protoplasm (Gr. *protos*, first; *plasma*, thing moulded) Name given to the slimy translucent substance which constitutes the living material of all plants and animals. It has been defined as the physical basis of life. Chemical analysis of protoplasm shows that it contains large quantities of water, the amount varying in different organisms and in their different parts and also with their stage in development. A jelly fish consists almost entirely of water; man's body contains some 65 p.c. water in youth and health, somewhat less in age and disease; in resting seeds the percentage is only about 10. Apart from water the outstanding materials found by the analyst are proteins, the remainder being principally sugars, fats, and salts. To the unaided eye a mass of protoplasm would appear something like uncooked white of egg. Under the microscope it is seen to consist of numerous particles and a structureless matrix in which they are distributed. The particles are of various sizes. The smallest, usually too small for their shape to be discerned, often oscillate in the manner—Brownian movement—exhibited by all small particles suspended in a fluid. It may then be inferred that the matrix is a liquid. The larger particles are frequently globular. Which of them are liquid droplets and which rounded masses of solid it is sometimes impossible to determine; but some are undoubtedly globules of fat, others masses of protein. The matrix just as certainly contains much water.

Protoplasm has thus a superficial resemblance to an emulsion, but it differs from pure emulsions in that it is elastic and can be coagulated. The former characteristic becomes evident when plant cells are plasmolysed in a sufficiently strong sugar solution. Water is withdrawn from the cell vacuole by osmosis and as the protoplasm is thus relieved of the outward pressure of the sap it contracts into a rounded vesicle; it does not simply collapse as it would do were the decrease in size simply due to the pressure exerted upon it by the plasmolysing fluid.

Congulation may in some instances be brought about by treatment with dilute acids, and reversal of the process by subsequent removal of the acid condition. In both these features, and in its propensity for absorbing water by imbibition, just as a piece of gelatine will do, protoplasm shows close resemblance to jellies. Like them it can change its consistency, being readily fluid or relatively solid according to circumstances. Changes may also occur in the microscopical appearance of protoplasm. The larger particles sometimes appear polygonal as if by mutual pressure, or, especially when the protoplasm is under strain or is streaming, they may be elongated as if drawn into that form by forces acting upon them.

Viscosity of the Matrix

The intensity of the Brownian movement exhibited by the smallest particles is also variable. When for example, an amoeba is in motion by means of its pseudopodia many of the particles in its protoplasm vibrate and the amplitude of vibration is pronounced. When, however, the animal is still, few particles vibrate and those that do so move very little in any direction. This shows that the viscosity of the matrix is low when the animal as a whole is moving and greater when it is still. It is then about that of glycerine. Thus it is clear that although the matrix contains much water, it is not water alone. It probably contains sugars and salts in solution, but must have in it something else which imparts the higher viscosity and the elasticity of the protoplasm as a whole. One widely accepted view is that there is in the matrix one or more of the simpler proteins such as albumen. From analogy with other elastic colloids it would seem that some such material must be present in the form of ultramicroscopic molecular aggregates which, like match sticks in an inordinately piled heap, are criss-crossed to form a three-dimensional elastic net, but, being re-arrangeable, do not inhibit flow. Protoplasm is however intrinsically different from any other conglomeration of its known chemical constituents in its capacity for carrying out the various processes which constitute its life in a manner tending to result in self-perpetuation. It has, e.g., the power to modify unlike material into kinds suitable for incorporation into its own substance and so of forming new material of its own kind, of deriving energy for its

sundry activities by means of exothermic reactions within itself, of changing its activity in response to changes in its surroundings. What it is that gives protoplasm this intrinsic peculiarity has been much debated. One theory is that some one substance or collection of substances holds the vital potentialities and, on account of the preponderance of proteins in protoplasm, that it is among such that the ultimate living material will be found. A contrasting view suggests that no individual constituent of protoplasm is alive, but that life is the outcome of the association of a number of materials in a peculiarly organized system, a view that is supported by the similarity between the chemical components and the visible structure of samples of protoplasm derived from widely different sources. The colloidal nature of protoplasm alone would, by providing extensive interfaces in which adsorption could occur, facilitate many of the reactions which make up its metabolism.

Comyns J. A. Berkeley

Protopterus annectens. Species of lung-fish. It is found only in the rivers of tropical Africa, it resembles a bulky eel, and may attain a length of 6 ft. The swimming bladder is modified to serve the purpose of a lung, so that the animal is able to live for long periods out of water. When the streams dry up in the summer, the protopterus buries itself in the mud, where it forms a kind of cocoon, and remains dormant until the wet season. It seems to be nocturnal in habit, and creeps over the mud in shallow water by the aid of its limb-like fins. In the breeding season the male constructs a hole in the edge of a swamp, and when the eggs are deposited by the female, he watches over them till they hatch. By constantly waving his tail over them he causes currents in the water, and ensures their sufficient aeration. In the early stages, the young of the protopterus are very much like the tadpoles of a newt.

Prototheria (Gr. *protos*, first; *thērion*, wild beast). Lowest division of the zoological class Mammalia. It includes only *Ornithorhynchus* and the two spiny ant-eaters, all of which are restricted to Australasia

and New Guinea. These animals lay eggs and have only one external excretory, anal, and reproductive aperture. See Animal; Mammal.

Prototype. In engineering, the first full-scale model of a new type of a product, tested before going into production. Aircraft prototypes are subjected to tests in all flying conditions. Defects are made good before the factories are equipped to build large numbers of of the type.

Protozoa (Gr. *protos*, first; *zoon*, animal). Zoological term for the sub-kingdom of animals not divided up into cells. Members of this group are in general small, but the largest of them is larger than the smallest of the animals which are divided up into cells (Metazoa, *q.v.*). It seems likely that, as the name suggests, non-cellular animals appeared on the earth before those which are divided into cells; but the naïve equation of the many-celled animals with colonies of protozoa is probably too simple an explanation of the evolutionary process. It is probably better to think of a protozoön as being something like a house not divided into rooms, and of a metazoön as being something like a house divided into rooms, rather than to imagine a metazoön as being built up out of protozoa in the way a house is built up of bricks.

Similarly, it is important not to fall into the error of imagining that a protozoön is necessarily simpler than a metazoön. In many, although not all, protozoa the capacity to perform most of the varying functions of life seems to be distributed throughout the animal. In what we often refer to as "higher forms" the capacity to perform one bit or another of the process of life tends to be restricted to one part of the animal.

The protozoa properly so called are animals, not plants, though as a result of history some forms which are really plants are often wrongly included in the group. They need fairly complex substances in their environment available for them to capture and build into themselves. They are not in general surrounded by strong dead membranes through which material entering them must penetrate. This means that they can make use of larger molecules than are available to a plant. They may develop strong skeletal structures, but, if they do, these structures do not cut them off from the outside world.

The protozoa are extremely numerous. There are many kinds, and many individuals of some kinds. A small proportion of the protozoa in the world are pathogenic—a few very seriously so. The attention paid to these forms may lead to a false impression of their relative frequency in the group. The sub-kingdom is conveniently divided into two great groups, Plasmadroma and Ciliophora. The members of the former move by a number of devices, but never by ciliary action; the Ciliophora move by ciliary action, except for a few decadent varieties which for most of their lives hardly move at all.

In the Plasmadroma there are three classes. (1) The Mastigophora, among which are innumerable creatures all of which move by waving in various ways a whip-like (Gr. *mastix*, whip) structure or flagellum, in which waves travel from the animal to the tip. Some, e.g. the Trypanosomes, parasitic forms dwelling in the blood stream of many animals, have a membrane attaching the flagellum to their bodies. Most of these are harmless, but a few, probably those in process of rapid evolution which have not yet adapted themselves fully to their hosts, are deadly. They cause a number of very serious diseases in man and in his domestic animals. Dourine, a disease of horses, and the true sleeping sickness of Africa, as well as a number of other illnesses, are caused by members of this class.

(2) The Sarcodina, e.g. the amoeba, among which movement is by creeping. Some pathogenic forms exist, e.g. those responsible for amoebic dysentery. Here also are the foraminifera and the radiolaria whose skeletons, falling to the bottom of the ocean on the death of the animal, produce the great strata of chalk (foraminifera) and certain siliceous rocks (radiolaria).

(3) The Sporozoa, which specialise in parasitism. Almost every member of the class is parasitic at some stage at least of its life history; and many are pathogenic, some seriously. One sub-group, the Coccidiorhiza (Gr., shaped like a barley-corn) includes forms responsible for the many coccidiosis affecting domestic animals, rabbits, chickens, pheasants, etc.; here also are the plasmodia which cause the many varieties of malaria.

Parasitic protozoa, like other parasites, have to get from host

to host. They frequently make use of what are called vectors, that is, some other animal related to their host in a particular way. For instance, the malaria parasite gets from man to man by way of a mosquito, which transfers the parasite by biting man and sucking his blood. This makes possible indirect attack upon the parasite by destruction of the vector. (If the mosquito had a point of view, of course, it would regard man as the vector and the mosquito as the primary host.)

In the Ciliophora there are comparatively few parasitic forms and those which are parasitic do, as a rule, comparatively little harm. They all exhibit ciliary locomotion—for instance in the orderly beating or rowing motion of very numerous hair-like structures reminiscent of eye-lashes. Some of them are attached to a substrate and use their cilia for creating currents in the water out of which they strain minute organisms for food.

All the protozoa carry on their vital activities in water, some in fresh water and some in the sea and some in the fluid of the blood of animals. Many of them are, however, capable of existing out of water, and within a protective coat, in a state of more or less completely suspended animation for long periods; in particular the Sporozoa form these thick protective coats and in the form of "spores" may blow about in the wind, or get eaten in food.

Protractor. Four varieties of this instrument. Top, boxwood metric; centre, semi-circular celluloid; bottom, left, draughtman's, and right, engineer's

REPRODUCTION. Throughout the group the nucleus (*q.v.*) periodically undergoes a process of reduplication which, though it is not possible in many cases to prove this cytologically, is almost certainly homologous with, or very closely analogous to, the process of mitosis (*q.v.*). Such nuclear reduplications almost certainly involve the reduplication of entities which can be called genes (*q.v.*). The resulting replicas of the original nucleus may remain in the original undivided cytoplasm, or each replication may be followed by a division of the cytoplasm. The former situation will give multinucleate forms and the latter numbers of separate individual animals. The process of nuclear division is sometimes called amitotic in those cases in which the phenomena of mitosis cannot be clearly demonstrated, and in which chromosomes (*q.v.*) are not obviously present. The distinction between mitotic and amitotic division seems more likely to be a distinction between forms that are understood and forms that are not than between methods of replication differing in their essential characteristics.

In many, though not in all, forms there is a process of syngamy (Gr., marrying together), which is the precise opposite of reproduction and involves the reduction by fusion of two individuals to one. It is tolerably certain that at least in some forms this is preceded by the reduction of the number of genes (whether grouped on chromosomes or not) to half by a process of meiosis (*q.v.*), and even in those forms where it cannot be demonstrated it is fairly safe to infer it. The process, as in other forms, results in a re-sorting of hereditary units and their recombination. It is therefore of great importance in evolution. Syngamy (*q.v.*) is often followed by renewed reproduction at an increased rate.

Consult Protozoology, C. M. Wenyon, 2 vols., 1926; The Biology of Protozoa, G. D. Calkin, 2nd ed., 1933; Animal Cytology and Evolution, M. J. D. White, 1945.

Paul 'Espinasse

Protractor (Lat. *pro*, before; *trahere*, to draw). Instrument for measuring and laying down angles. The simple protractor consists of a quadrant or semicircle of wood, metal, or some transparent material graduated along the arcuated edge into degrees. Straight-edge protractors are also used, the graduation lines

appearing drawn obliquely from the centre of one edge to points on the other edge. In marine surveying a three-arm protractor is used, the middle arm being fixed at the zero of a circular scale, the other two movable for measuring angles on either side. See Surveying.

Proud Flesh. Overgrowth of new tissue during an unhealthy condition of wounds or ulcers. It demands stimulating treatment, or treatment by X-ray.

Proudhon, PIERRE JOSEPH (1809-65). French political philosopher. He was born at Besançon,

Pierre Proudhon,
French philosopher

July 15, 1809, and worked for some years in a printer's office. In 1837 he published his *Essai de Grammaire Générale*, a philological study. In 1840 appeared his *Qu'est ce que la Propriété?*—a strong attack on the principle of property, which he declared to be theft. Subsequent works were *Avertissement aux Propriétaires*, 1842; *Création de l'Ordre dans l'Humanité*, 1843; and *Contradictions Économiques*, 1846. In 1848 he was elected to the Assembly, edited the *Représentant du Peuple*, and was imprisoned 1850. Prosecuted after publishing *De la Justice dans la Révolution et dans l'Église*, 1858, he lived in Belgium, 1858-63. A man of high personal character, he died at Passy, Jan. 19, 1865. Proudhon is important in socialist thought as a forerunner of Marx. He urged the ideal of service balancing service in society, and that the ultimate end of government was anarchy, i.e. that in the ideal society government would be unnecessary. His ideas were partly crystallised in the suggestion he put forward for a bank of exchange. The main principle of this was the issue of bank notes against produce handed into the bank. A bank on these lines, however, failed. His collected works were issued, 1867-70, and his correspondence, 1875. *Consult Lives*, C. A. Sainte-Beuve, 3rd ed. 1873, D. W. Brogan, 1934; *The Un-Marxian Socialist*, H. de Lubac, 1948.

Proust, JOSEPH LOUIS (1754-1826). French chemist. Born at Angers, Sept. 26, 1754, and educated as an apothecary, he became chief pharmacist at the Salpêtrière, Paris. Afterwards he went to Spain, where ultimately he became director of the royal laboratory at

Madrid, but was ruined by the Spanish war, the French on taking Madrid destroying his laboratory and collections.

He returned to France, 1806, later receiving a pension from Louis XVIII, was elected to the academy of science, 1816, and died at Angers, July 5, 1826. Proust discovered grapesugar, 1805, in various natural products, and was the first to prove that the elements combine in a small number of fixed proportions, Dalton afterwards establishing the law of multiple proportions.

Proust, MARCEL (1871-1922). French writer. Son of a professor at Paris university, he was born July 10, 1871, and educated at the Lycée Condorcet, Paris. Of delicate constitution, he became a leader of a group of intellectuals, and frequented fashionable salons of the day, publishing a collection of stories, *Les Plaisirs et les Jours*, in 1896. In 1902 his health began to fail, and he embarked upon a long and leisurely work in which was captured his whole experience of life—a re-living of the past, wherein he dwelt subtly upon every impression received—a process of development, change, and continual creation. A supreme artist, he made his characters live vividly in the minds of his readers. *Du Côté de chez Swann*, 1913, was the first of a series of novels published under the collective title of *À la Recherche du Temps Perdu*. The second of the series *À l'Ombre des Jeunes Filles en Fleur*, won the Goncourt prize in 1918. Next came *Le Côté de Guermantes*,

Marcel Proust,
French writer

1920; *Sodome et Gomorrhe*, 1921; *La Prisonnière*, 1922, and, posthumously, *Albertine Disparue* and *Le Temps Retrouvé*. With the exception of the last book (which was translated into English by S. Hudson) the complete series was translated by R. Scott-Moncrieff under the title *In Pursuit of Lost Time*. Proust died in Paris, Nov. 18, 1922.

His influence was considerable; his discursive manner, with its slow unfolding of detail, aroused

much discussion. Rich in thought and poetic in treatment, his writing was notable for its involuted style and delicate precision; his intention—brilliantly achieved—was a conquest of the past, and the term "creative time" was used to describe his masterly analyses of memory and motive. *Pron.* Proost.

Bibliography. Studies by J. Rivière, 1924; L. Pierre-Quint, 1925; P. Souday, 1927; C. Bell, 1927; S. Beckett, 1931; G. D. Lindner, 1943.

Proustite. In mineralogy, a sulphide of silver and arsenic ($3Ag_2S \cdot As_2S_3$), containing 65 p.c. of silver. A bright red colour giving it the alternative name of ruby silver ore, it is found in association with other silver minerals, galena, etc., in vein deposits. The mineral is named after Joseph Louis Proust.

Prout, FATHER. Pseudonym of the Irish humorist, Francis Sylvester Mahony (*q.v.*).

Prout, JOHN (1810-94). British agriculturist. Born Oct. 1, 1810, he took up farming in Canada, and, returning to England, settled at Sawbridgeworth in 1861. He established on scientific lines a farm, where he made valuable experiments in cereal raising on clay soils, publishing the results of his observations in *Profitable Clay Farming*, 1881. He died Dec. 7, 1894.

Prout, SAMUEL (1783-1852). British painter. Born at Plymouth, Sept. 17, 1783, he studied under John Britton, and settled in London in 1812. His earlier works were landscapes and coast scenes, but visits to the European continent in 1818 and 1824 stimulated his talent for picturesque architectural subjects. He died at Camberwell, Feb. 10, 1852.

Prout

Prout, WILLIAM (1785-1850). British chemist and physician. Born Jan. 15, 1785, at Horton, Gloucestershire, and educated at Edinburgh, where he took the degree of M.D., he turned his attention to chemistry. In 1815 he published his paper on atomic weights, in which he first announced that the atomic weights of all elements are exact multiples of that of hydrogen. Prout was the first to obtain urea in a pure form and, in 1823, to discover the existence of free hydrochloric acid in the stomach. Prout died April 9, 1850.

Provence. Province, one of those into which France was divided before the Revolution. It was a province of the Roman Empire, before the opening of the Christian era, and lay between the Rhône, the Alps, and the Mediterranean. Its capital was at first Aix, and then Arles, with Marseilles as another important city. Its boundaries were continually changing, and its close association with Burgundy has led to much confusion between the two. After the fall of the Roman Empire, the S. part of Provence was seized by the Visigoths, and in the 6th century the whole of it appears to have come under the rule of the Franks.

History after Charlemagne

It was transferred, either in whole or in part, from one king to another during the century which followed the death of Charlemagne, but before 900 it had been again united and formed into a kingdom for a certain Boso, brother-in-law of Charles the Bald. This was called the kingdom of Provence, or Burgundy, but it must not be confused with the other kingdom of Burgundy, away to the N. It had but a brief existence, and Provence was next included in the more N. Burgundy, which, in 1032, passed by bequest to the German king, Conrad II.

Before this time, as all over the Carolingian Empire, a number of counts had arisen in the district, one of whom soon made himself paramount. He was called the count, duke, or marquess of Arles, or sometimes of Provence. Early in the 12th century the heiress of this family, the real although not the nominal sovereign of Provence, married the count of Barcelona, to whose heir, Alphonso, king of Aragon, it passed about 60 years later. He and his son ruled it for some years, and then it went, again by marriage, to Charles of Anjou, king of Naples, who had trouble with the Provençal towns, then becoming rich and turbulent.

During the next two centuries, i.e. the period between 1250 and 1470, the country of Provence was disturbed and impoverished by warfare between its Angevin rulers and their many foes. In 1482 the last count bequeathed Provence to Louis XI of France, whose successor Charles VIII made good his authority therein against other claimants. Provence, whose overlord had been the German king, thus passed definitely to France. It retained certain special privileges, including an assembly of estates which endured until the 17th century, and it was never quite merged in the rest of France as

were other provinces. Provence now constitutes the departments of Bouches du Rhône, Var, Vaucluse, and Basses-Alpes. It is noted for its valuable Roman remains.

LANGUAGE AND LITERATURE. Provençal proper was originally the most important dialect of the broader Romance language known as the *langue d'oc*, which in the 12-14th centuries was the spoken tongue of S. France, Italy, and Spain. A highly developed literary language by the 12th century, its hold was weakened by the political developments of France and Provence and by contact with the *langue d'oïl*, and by the mid-14th century it was little more than a patois. Derived directly from Latin, Provençal bears a close general resemblance to the French language, but has important phonetic differences. With many local variations and French modifications, the dialect survives in S. France.

Provençal literature was rich both in quantity and in variety of form. The chivalrous romances of Provence, such as *Flor et Blancheflor* or *Gérard de Roussillon*, were overshadowed by those of the north, but in the lyric poetry of the troubadours it was unrivalled in its time. Among the principal forms were the *canzones* and *albas*, love songs, the *sirventes*, satiric songs, the *plants*, plaints, *prèzies*, war songs, *tensons*, dialogues, and *pastorelas*, shepherd songs. Prose works are few and of minor interest. The development of this great literature reached its climax during the 12th century and ended practically with the 13th.

The 19th Century Revival

A notable revival, however, in Provençal literature took place in the 19th century. Chiefly under the impulse of Joseph Roumanille and F. Mistral, the *Félibrige* was founded in 1854, with the object of preserving the vitality and purity of the language. Among other notable poets associated with the revival have been Jacques Jasmin, Théodore Aubanel, Jean Brunet, Paul Giera, Xavier de Ricard, Félix Gras, and Pierre Devoluy. The annual publication *Armana Prouvençau*, founded in 1854, reflects the main current of the movement and has reached a wide circulation in the Midi, and several Provençal periodicals appear in the principal towns. See France; Troubadour; *consult also* *Histoire de P.*, 4 vols., A. Fabre, 1833; Old P., T. A. Cook, 1905; P. and Languedoc, C. Headlam, 1912; Provence, F. M. Ford, 1933.

Proverb (Lat. *pro*; *verbum*, word). Short familiar sentence, an obvious truth or moral lesson. De-

scribed as the collective wisdom of mankind, or, by Cervantes, as "short sentences drawn from long experience," they are the most intimate folk-lore, for they embody, in simplest, pithiest terms, the homely knowledge of the common people, their everyday philosophy learned from experience of the ways of men and women and universal nature. Any clever man may make an aphorism, but no aphorism becomes a proverb, in the accepted sense of the word, until it has been tried by time, and obtained currency by general consent.

It is impossible to name the author of any proverb. Some obscure sage must first have formulated each one of them in words, but they seem rather to have emanated from the common consciousness and crystallised into phrases, much as seeds scattered by the wind put forth branch and leaf and open into flower before any man is aware of them. Certainly, the majority of proverbs were familiar in the mouths of the multitude long before they were written down. Many have found niches in the ancient literatures of Greece and Rome, of China, India, and Arabia. Each country, often each part of each country, has its own characteristic sayings, Spain, perhaps owing to Moorish influence, being very rich in them, but human nature and experience being essentially at one the world over, there is a marked affinity between them.

Frequently the same proverb, with colloquial variations, belongs to so many nations that none would venture to say in which country it was originally born, or whether it was spontaneously generated in all. "There's many a slip 'twixt the cup and the lip" is an old English proverb; but the French have one as old: "The soup is often lost between the hand and the mouth"; and in the 2nd century A.D. Gellius quoted "Many things happen betwixt the cup and the lip" as a Greek proverb matching a world-old Latin one. "It is too late to shut the door when the horse is stolen" has equivalents in France, Holland, Denmark, Italy, India, and Japan. Sterne is credited with "God tempers the wind to the shorn lamb," but a century earlier George Herbert included in his *Jacula Prudentium* "To a close-shorn sheep God gives wind to measure," and his was a collection of such wise saws, English and foreign, as were already popular.

Before Herbert, John Heywood, in 1546, compiled a book of English proverbs, and Ray followed his example in 1670. In 1855 a Hand-

book of Proverbs was added to Bohn's Library, and there has been a later collection by W. C. Hazlitt. The Scots have shown pious care in the preservation of their own proverbs. Since David Ferguson's in 1641, there have been four collections, in addition to one of Gaelic proverbs, by Macintosh, 1785, and another by Alexander Nicholson, 1882. Good French and Italian collections are *Livre des Proverbes Français*, 1859, and *Proverbi Veneti*, 1882. Spain, which is rich in proverbial lore, is adequately represented in Collins's Dictionary of Spanish Proverbs, 1822; and there are similar collections in Chinese, Japanese, Hindustani, Turkish, Persian, Arabic, as well as in Flemish, Russian, German, Dutch, and all other European languages.

Proverbs, Book of. One of the most important of the books of the O.T., belonging to a class of Hebrew writings called Wisdom Literature. The full title is "The Proverbs of Solomon, son of David, King of Israel." The book is a compilation of wise sayings and proverbs, and not, it would appear, the work of a single writer. Other authors besides Solomon are mentioned, such as Agur, the son of Jakeh (30, v. 1), and King Lemuel (31, v. 1). To a collection known as the Proverbs of Solomon were added presumably other collections of various dates and origins, but the fame of Solomon (*cf.* 1 Kings 4, v. 32), whose name became a symbol for wisdom, led to the retention of the original title for the whole compilation.

C. H. Joy describes the divisions of the book as follows: 1, a group of discourses on wisdom and wise conduct, chaps. 1-9; 2, a collection of aphorisms in couplet form, 10, v. 1-22, v. 16; 3, two collections of aphoristic quatrains, 22, v. 17-24, v. 22, and 24, vv. 23-34; 4, a collection of aphoristic couplets, 25-29; 5, a collection of discourses of various characters, 30-31. The philosophy and ethics of the book have much in common with those of the other products of the Wisdom Literature (Job, Ecclesiastics, Ecclesiastes, and Wisdom of Solomon). This suggests that the Book of Proverbs as a whole belongs to the post-exilic age. *See Bible.*

Providence. City of Rhode Island, U.S.A. It is the state capital, the second largest of the New England cities, and the co. seat of Providence co. A seaport, it stands at the head of navigation of Providence river, 45 m. S.W.

of Boston, and is served by the New York, New Haven and Hartford, and other rlys., and by ocean-going steamers. Prominent buildings are the state house, R.C. cathedral, Butler and Rhode Island hospitals, the Athenaeum, and a public library. The chief educational institution is Brown university, seventh oldest college

Providence, Rhode Island, U.S.A. The State House, opened in 1900

in the U.S.A. (1764), with fine buildings, several museums, and the Ladd Observatory, where the transit of Venus was observed in 1769. A large quantity of coal is shipped, and among the principal manufactures are jewelry, cotton, woollen and worsted goods, and machinery. South of the city is Roger Williams Park, with a statue of Williams, who first landed at What Cheer Rock. Pop. 253,504.

Providence was settled in 1636, on land which two years later the Indians conveyed to Williams by a formal deed. It was long a refuge for victims of religious persecution both in England and in the neighbouring Massachusetts Bay Colony. Its prosperity was built on commerce, and in 1832 it became a city. After the Civil War the basis was transformed to an industrial one, with textile mills prominent. Its original character has been drastically altered by twentieth century immigration.

EAST PROVIDENCE. This town, on Narragansett Bay and on the W. bank of the Blackstone or Seekonk river, faces the city of Providence, with which it is joined by bridge and has rly. communication. There are bleach works, paper mills, manufactures of wire, chemicals, and optical goods, petroleum refineries, and a baking powder industry. Oyster fisheries are valuable. Settled in 1636, East Providence was incorporated in 1862. Pop. 32,165.

Province (Lat. *provincia*, territory, etymology doubtful). Word specifically applied to the district round about Massilia (Marseilles), which, as Rome's first conquest outside the Italian peninsula, was known as the Province and is still called Provence. Successive conquests were formed into provinces for administrative purposes, Britain being one, and the term was subsequently used in a wider, more general sense. France before the Revolution was divided into provinces, which at an earlier date had been separate kingdoms or semi-independent territories. The dominion of Canada, too, is made up of federal provinces, and the term is also applied to

administrative divisions in several other countries of the world, *e.g.* the provinces of S. Africa.

For ecclesiastical purposes England is divided into two provinces, Canterbury and York, each being under the jurisdiction of an archbishop, and the term is also used in connexion with the Anglican Church overseas. Generally the provinces are contrasted with the metropolis of a country; *e.g.* in England there are London, the home counties, and the provinces. In a figurative sense, province means the proper sphere or function of a person or body of persons, *e.g.* "That is not within the province of the legislature."

Province Wellesley. Settlement of the Malayan Federation, formerly part of Penang in the crown colony of the Straits Settlements. It is a strip of territory along the W. coast of the Malay peninsula, bounded N. and E. by Kedah and S. by Perak, 31 m. long and averaging 11 m. in width, with an area of 290 sq. m. and a pop. of 171,587. Rice, pepper, spices, sugar, and tobacco are grown. Prai is the chief town and seaport. Province Wellesley, which became British in 1800, was captured by the Japanese on Dec. 17-18, 1941. *See Malaya, Federation of; Penang.*

Provincial Letters, THE. Familiar name of a series of 18 letters by Blaise Pascal, published under the pseudonym of Louis de Montalte, and supposed to be sent by a Parisian to a friend in the

provinces. The letters, published between Jan. 13, 1656, and March 24, 1657, embody an ironical attack on the Jesuits, rendered in singularly clear and powerful language. The standard English translation is that by T. McCrie, 1847. See Jansenism; Pascal; Port-Royal.

Provins. Town of France, in the dept. of Seine-et-Marne. It stands on the Voulzie, 59 m. S.E. of Paris. The 11th-century Romanesque Gothic church of S. Ayoul, the 12th-century Transitional church of S. Quiriace and its contiguous bell-tower, the Grosse Tour, the 13th-century church of Ste. Croix, and town hall are the main historic buildings. The town is noted for its rose culture. The Roman Pruvium, and a medieval industrial city, with a pop. of 80,000, it has declined since the Hundred Years War. Pop. 9,000.

Provision (Lat. *pro*, before; *videre*, to see). Legally, a provision is a clause in a will or deed, and in this sense it is used in constitutional history, e.g. the provisions of Oxford. The word is sometimes spelled proviso. Ecclesiastically, provision refers to an appointment by the pope to a benefice, but this question is more usually dealt with under the form provisor (*q.v.*).

Provisional Order. In the U.K., an order granted under statutory powers by certain government departments, authorising local undertakings of public usefulness, e.g. harbour and water works. Such orders are subsequently confirmed by statute. The Statutory Orders (Special Procedure) Act, 1945, introduced an alternative and more speedy procedure by which statutory powers might be obtained by various bodies to meet the special needs of reconstruction after war. See Bill; Parliament.

Provisions of Oxford. Plan for the better government of England formulated by the barons in 1258. In May the barons compelled Henry III to agree to the appointment of a committee of 24 persons to carry out certain reforms in the government necessitated by his extravagance. A parliament therefore met at Oxford to choose them, and Henry was allowed to nominate twelve.

The provisions drawn up by this body and accepted by the king provided for a standing council of fifteen members to advise and control the king, for another council of twelve to consult three times a year with the standing council,

and for a third council of 24 to make grants of money. All aliens were to be removed from office and expelled. The work of reform began with the appointment of new ministers and the flight of the aliens. The new constitution worked only until the end of 1259. By that time the barons were quarrelling amongst themselves, and in 1261 Henry, taking advantage of the position, obtained a papal bull releasing him from his obligation to observe the provisions.

Provisor. Literally, one who provides. In ecclesiastical language a provisor is one to whom the pope has granted the right of having the next vacancy in a benefice. The statutes of provisors were laws passed by the parliament of England in 1351 and 1390. The first recited a statute against papal aggression passed in 1307, declared invalid all ecclesiastical appointments secured by papal provision, and ordered the imprisonment of all who accepted such. The statute of 1390 made the penalties more severe. See Praemunire.

Provo. City of Utah, U.S.A., the co. seat of Utah co. It stands on the Provo river, 47 m. by rly. S.E. of Salt Lake City, and is served by the Denver and Rio Grande rly. A Mormon city, it is the seat of Brigham Young university, and has a Mormon tabernacle. Woollen goods, tin roofing, and flour are manufactured, a trade in lumber is carried on, and agriculture, stock raising, and fruit growing thrive in the vicinity. The city was named after Provot, who explored the valley in 1825, and in 1858 was a retreat of 30,000 Mormons. Civic rights date from 1851. Population 18,071.

Provost (Lat. *praepositus*, placed before). Chief municipal magistrate of a city or burgh in Scotland. The provosts of Edinburgh, Glasgow, Aberdeen, Perth, and Dundee are styled lord provosts. During office, the lord provost of Edinburgh is entitled to the prefix right honourable. The term is also applied to the heads of certain colleges, e.g. provost of Eton; King's College, Cambridge; Queen's College, Oxford. *Pron.* prov-ost.

Provost Marshal. Chief of military police in a camp or garrison town. An army officer, he is attached to headquarters, acting under the adjutant-general, and is responsible for maintaining order, arresting offenders against

regulations, and apprehending deserters. He keeps records of courts martial and carries out their sentences. In wartime a provost marshal is appointed to each army corps on active service, his police being responsible for collecting stragglers and, in conjunction with security police, preventing espionage. Where martial law is proclaimed, civilians have to carry passes signed by the provost marshal. Where there is no provost marshal, the military police are under a provost sergeant. The master-at-arms on board a warship where a court martial is in session is called a provost marshal. *Pron.* prov-o'. See Military Police.

Proxy (late Lat. *procuratia*, acting for another). Term used for a person who acts for another, and also for the authority by which he acts. It is chiefly used in the U.K. in connexion with voting. During the Second Great War Servicemen were permitted to vote by proxy at political elections; this was confirmed, and extended to certain other persons, by the Representation of the People Act, 1948. Company law allows the use of proxy votes, which may be either general or special. Proxies are also used in bankruptcy proceedings. Voting by proxy was allowed in the house of lords until 1868. Proxies are permitted in convocation and in the political conventions of the U.S.A. See Proctor; Vote.

Marriage by proxy cannot take place in England, though it is permitted in certain countries, particularly for members of the armed forces away from home in war-time.

Prudential Assurance Co. British insurance company. Established in 1848, its founders in 1854 undertook the insuring of members of the working classes for small sums, collecting the premiums weekly, this being then a new field. In the latter part of the 19th century the more ordinary life assurance business was much expanded, and in 1919 the company began to transact all classes of general insurance. The company has in force over 35,000,000 policies, invested funds to the amount of £500,000,000, and has paid claims of £870,000,000. It has agents in every town and almost every village of the U.K. and the head offices are at Holborn Bars, London, E.C.1

Prudentius (c. A.D. 348-410). Christian poet, whose full name was Aurelius Prudentius Clemens.

Born in Spain, probably at Saragossa, he practised as an advocate, held several provincial appointments, and lived for some time at the court of Honorius. Having lost the imperial favour, he retired to a monastery and wrote religious poems to stone for a misspent youth. His chief works, hexameters and lyrics, all the titles of which are in Greek, are *Cathermerinôn*, prayers for daily use; *Peristephanôn*, acts of martyrs; and *Hamartigenia*, the origin of evil. He was regarded as the outstanding poet of the early Latin Church.

Prudhoe. Village of Northumberland, England. It stands on the Tyne, 11 m. W. of Newcastle, with a station on the rly. to Hexham. Near are the ruins of Prudhoe Castle. Built by the Normans, this was defended against William the Lion in 1174, and later became the property of the Percys. The local industry is coal mining. Pop. 9,260.

Prudhoe Lând. Coastal tract of N.W. Greenland. It is situated N. of Hayes Peninsula, and is indented by Inglefield Gulf, which contains several small islands. It contains the settlement of Etah.

Prud'hon, PIERRE PAUL (1758-1823). French painter. Born at Cluny, April 4, 1758, of poor parents, he studied at the Dijon academy and in Italy. He returned to Paris in 1789, and after a hard struggle with poverty won reputation as an historical painter. His principal work was the decoration of the Louvre with ceiling paintings. He died in Paris, Feb. 16, 1823. See Marie Louise, illus.

Prune (Lat. *prunum*, a plum). Dried fruit of various plum trees grown in France, Portugal, other European countries, and America, especially in California. The plums are dried slowly and with much care, the best being sun-dried. They are eaten dry, or soaked and stewed, and are valuable for their laxative quality.

Prunella or **PRUNELLO.** Stout silk or worsted stuff formerly used for clergymen's and barristers' gowns. The word probably comes from French *prunelle* (sloe), in allusion to the colour of the cloth. The term was later applied to a doekskin twill.

Pruning (O.F. *proignier*). The process of cutting away superfluous stems, branches, and other wood from a tree, in order to induce healthy growth and increased productivity of flowers or fruit. Newly planted standard roses, shrubs, and fruit trees should

be pruned severely, to ensure the future shape and welfare of the tree or bush. If the scion has only two shoots, both should be cut back to a point as near to a bud as possible. This will result usually in the appearance of four healthy shoots the second year, and these in turn should be cut back to a bud, with the expectancy of the establishment of eight good branches in the third season. After that, pruning is at discretion, the chief objects being to keep the branches from crossing one another and to maintain the centre of the tree in a free and open condition. The actual cut should sever the stem at an angle of approximately 45°, and the operation is usually carried out with a pruning knife. Feb. and March are the best months. See illus. facing p. 6729.

Prunus. Genus of trees of the family Rosaceae. Natives of the N. temperate zone, many cultivated varieties yield valuable fruit, e.g. plum (*P. communis*), peach (*P. persica*), and cherry (*P. cerasus*). See Cherry; Cherry Laurel; Fruit; Peach; Plum.

Pruritus (Lat. *prurio*, itch). Another name for itch (*q.v.*).

Prussia. Geographical term which has been used for four distinct and, up to a point, different territories: (1) the lands of the once Slavonic and heathen Pruzzi (Prussians), roughly identical with the later prov. of East Prussia, but embracing areas, later Polish, on the E. bank of the lower Vistula; (2) from 1701 the new kingdom of the Hohenzollerns (former electors of Brandenburg), of which the older part, roughly between the river Elbe and the E. border of Pomerania, was part of the German empire; (3) the largest of the German states, 1866-1918, embracing the conquests under Bismarck's chancellorship and covering virtually all N. Germany from the French to the Russian border; (4) the remnants of that kingdom, from 1918 to 1945 a republic.

The "Prussian idea," as initiated by Frederick William (*q.v.*), the Great Elector, his grandson, the "corporal king" Frederick William I (*q.v.*), and Frederick the Great (*q.v.*), and enforced upon the whole of Germany by Bismarck (*q.v.*), is one of strict discipline, service to the state, and predominance, over all other citizens, of the ill paid, but glorified, military and next of the civil servants, most members of the higher ranks of both being drawn from the landed nobility,

the *Junker* class. This idea turned a comparatively poor and small land into one of the great powers, destroying the old Hapsburg empire, and replacing it by a new, smaller, but more powerful and efficient empire under the Hohenzollerns.

Prussia, at her greatest, from 1866 to 1918, extended across the central European plain about 700 m. from E.N.E. to W.S.W., and about 550 m. from the Danish border to the S. tip of Silesia, covering a total area of 136,000 sq. m. Of this area, 22,800 sq. m. were lost in 1919 under the treaty of Versailles (*q.v.*) to Poland, Denmark, Belgium, and Memel territory (later included in Lithuania), the Danzig free state, and, until 1935, to France (the Saar area). Pop. of Prussia, as it existed in 1935, was just over 40 millions, of whom 25 millions were Protestant, 12 million R.C., 420,000 Jews. It contained 33 towns and cities of more than 100,000 inhabitants; 41 p.c. of the working pop. was engaged in industry and crafts, 29.5 p.c. in agriculture, forestry, etc., 17 p.c. in trade and transport. Divided into 14 provs., one of which was the capital, Berlin, another the S. German dynastic area of the Hohenzollerns, Prussia's chief cities were, after Berlin and in order, Cologne, Breslau, Essen, Frankfurt-on-Main, Dortmund, Düsseldorf, Hanover, Duisburg, Wuppertal, Gelsenkirchen, Bochum, Magdeburg, Königsberg, Stettin, Kiel.

The chief rivers, flowing S.-N., were the Rhine, Weser, Elbe, Oder, and, until the loss of the Polish corridor and Danzig, the lower Vistula; Prussia included nearly the whole of Germany's coast line on the Baltic and the North sea, had an extensive network of canals (total nearly 1,000 m.), a number of lakes, many mineral springs and spas, and a considerable wealth of mineral deposits: coal in the Ruhr, Saar, and Silesian-Saxon areas, potassium and petroleum in Hanover, lignite in Saxony. Potatoes, rye, oats, some wheat, and sugar-beet were the principal agricultural products. Cattle-breeding, and in some provs. horse and pig rearing were important. Heavy industry was concentrated in Westphalia and the Rhineland, cotton in the Rhineland and Silesia, linen in Westphalia and Silesia, silk in the Rhineland, glass and ceramics in Saxony, Silesia, and the Rhineland, fishery

products along the Baltic coast. There was a large network for the distribution of electric power, from water and from coal and lignite. Prussia had a rly. system of 22,000 m., waterways serving inland ports (15 of which each had a turnover of more than a million tons a yr.) and a network of motor-roads completed in the 1930s. The balance between agriculture and industry thus developed was destroyed when the area E. of the Oder-Neisse rivers was placed under Polish administration in 1945, and most of its German inhabitants were expelled to the already overcrowded and most heavily war-damaged W.

HISTORY. The nucleus around which the later kingdom of Prussia arose was the march of Brandenburg (*q.v.*), conquered from Slavonic tribes by the emperor Otto I in the 10th century, and, as an electorate, transferred in 1415 to the wealthy burgrave of Nuremberg, Frederick of Hohenzollern. In the 13th century the order of the Teutonic knights had conquered the Pruzzi, and when in 1525 their territory was recognized as a secular duchy under the Polish crown, Joachim II, elector of Brandenburg (1535-71), was enfeoffed with it.

The First Kings

After becoming Protestant and gaining, by inheritance, the W. German duchies of Cleves and Juliers, 1614, and uniting Prussia with Brandenburg in 1618, Brandenburg-Prussia began to win recognition as a European power under Frederick William, the Great Elector (1620-88), who created a standing army, the first of its kind, and won victories over French and, especially, Swedish armies. After Frederick William's son and successor crowned himself king of Prussia at Königsberg, 1701, his kingdom successfully rivalled the imperial power at Vienna. Frederick William I (1688-1740) and his son Frederick II (1712-86), later dubbed the Great, completed the Prussian predominance in Germany. By alliance with Catherine the Great and the first partition of Poland the latter gained W. Prussia, linking his previously dispersed lands.

Frederick William II added enormous territories to his possessions for a short time; he was, however, defeated in a war against the new French republic. His son Frederick William III, defeated at Jena, 1806, lost his territory W. of the Elbe and all Polish territories except W. Prussia.

But after the wars of 1813-15, the new Prussia was established by the peace of Vienna, 1815.

This brought Prussia the N. half of Saxony, as a new prov., Danzig (previously a free city), Thorn, and the once Polish prov. of Posen (Poznan), the previously Swedish part of Pomerania with Rügen, and the bulk of the Rhineland and Westphalia. Rivalry with the Hapsburg dynasty for the domination of a future, reunited Reich, became the main political trend in Prussia.

When William I (*q.v.*) came to the throne, 1861, he appointed Bismarck (*q.v.*) his premier and inaugurated, 1862, what he himself called the "policy of blood and iron." He acquired the duchies of Schleswig-Holstein, 1864, from Denmark by war; challenged, 1866, Austria and defeated her, together with the W. and S. German states allied with her, annexing subsequently the kingdom of Hanover, the electorate of Hesse, the duchy of Nassau, and the free city of Frankfurt; thus linking the two parts of Prussia, and establishing, first, a N. German confederation under Prussia, and, at Versailles on Jan. 18, 1871, the new German empire under Prussian domination.

William I had established what was, in fact, a much enlarged Prussia. For the twenty-odd individual federal states theoretically forming a union of equals, among whom the king of Prussia—not emperor of Germany, but German emperor—officiated as hereditary chairman, were much weaker individually, and also in the aggregate, than was Prussia. And while the successful war of 1870-71 against France brought Alsace-Lorraine into the Reich as a part of the whole empire, the new acquisition was administered, taught, and garrisoned in the main by Prussians. Bismarck kept Prussia as a huge fortress within an empire. He increased the supremacy of the Prussian army and—the young navy being a Reich institution under the emperor—the fleet.

The personal ambition of William II (*q.v.*), backed by the natural expansionist trend of a rapidly growing industry and world trade, led to an application of Bismarckian methods in the sphere of world politics. This culminated in the First Great War and the defeat of Nov., 1918.

Within the Weimar republic, Prussia, while still numerically its main part, lost most of her

individuality and predominance, moral as well as material. The strong Socialist element was in general anti-federalist and emphasised the primacy of the Reich govt. and parliament.

When superseded by a *coup de main* under Papen's chancellorship in 1932, the Prussian govt. was united with that of the Reich, first by a personal union, Papen having himself appointed Reich commissar for Prussia; later, as soon as the Nazis took power, by making the Reich ministers simultaneously ministers for the corresponding depts. in Prussia, Goering acting as Prussian premier and appointing a council, the Staatsrat, as a substitute for parliament. The previous dualism under which Prussia was able to dominate the Reich in decisive matters was further curtailed by making the heads of the provs. directly dependent upon the Reich govt. and the Nazi party. Prussia thus ceased to possess a political personality of her own, and her history came to an end. The state of Prussia was officially abolished by the Allies, 1946. *See* East Prussia. *Consult* Twelve Books of Prussian History, L. von Ranke, 1930; Evolution of Prussia, J. A. R. Marriott and C. G. Robertson, rev. ed., 1937; Exit Prussia, E. Stern-Rubarth, 1940; Frederick the Great, G. P. Gooch, 1947.

E. Stern-Rubarth

Prussian Blue. Dark blue colouring matter, first made by Diesbach of Berlin in 1704, hence the name. It is a ferrocyanide of iron and an alkalic metal—sodium, potassium, or ammonium. The potassium compound is the best and is generally used. Ammonium blues, though better than the sodium, are not much used. The pigment is of very great staining power, one part in 1,000 of white lead giving a perceptible tint. It is frequently used reduced with blanc fixe or barytes, these grades being known as Brunswick blues. It can be produced in a variety of shades ranging from a greenish to a reddish tint. The highest grades having a fine bronze lustre are called Chinese blue. Prussian blue is fast to acids but very sensitive to alkalis. It is very transparent in oil and is therefore used in conjunction with other pigments and extenders. It is fast to light and can be used with most pigments, though pale tints made with white lead, zinc oxide, or chromes are apt to fade owing to chemical reaction. *See* Pigment.

Prussian Guard. Corps of the German army as it existed until 1918. Its nucleus was one of the regiments of guards maintained by the kings of Prussia. When the Prussian army was organized in the 19th century, these were formed into a corps of two divisions of infantry, each of four regiments and twelve battalions, in addition to cavalry and artillery, and a battalion of riflemen. It numbered about 40,000. This corps, regarded as one of special valour, secured the pick of the recruits and was called upon in times of special need, as at St. Privat, in Aug., 1870, and Ypres, in Nov., 1914.

Prussic Acid. Common name for hydrocyanic acid (*q.v.*). It was so called by Gayton de Morveau because the acid can be made by distilling Prussian blue.

Prut. River of the U.S.S.R. A left bank tributary of the Danube, it rises in the Carpathians, in territory which during 1919-39 was Polish; flows E. past Cernauti in Bukovina; and turning S.E., marks the boundary between Bessarabia and Rumanian Moldavia, falling into the Danube below Galatz. It is used for floating timber; boats can reach Jassy, 170 m. upstream on the Rumanian bank. Its length is 500 m.

One of the main thrusts of the German attack on Russia in 1941 was directed through Bessarabia towards Odessa and Rostov, but was temporarily held on the line of the Prut. German and Rumanian troops forced several crossings on July 2. On March 26, 1944, the 1st Ukrainian army reached the Prut on a 50-mile front, to capture Cernauti on March 30, and further crossings were made by the 2nd Ukrainian army in April.

Frynne, WILLIAM (1600-69). English Puritan. He was born at Swainswick, Somerset, and educated at Bath

g r a m m a r school and Oriel College, Oxford. Called to the bar in 1628, at Lincoln's Inn, he began writing polemical pamphlets, and in 1632

produced *Histriomastix*, an attack on stage plays and players, which violently offended the court. The author was prosecuted in the Star Chamber, fined £5,000, expelled from his university and Lincoln's Inn, pilloried, had both his ears

cut off, and was condemned to perpetual imprisonment. Although in prison, he managed in 1636 to get another pamphlet printed, which gained him a similar sentence, including the shearing off of the stumps of his ears and branding on the cheeks.

In 1640 the Long Parliament declared Frynne's sentence illegal, and voted him £4,000, though the award was never granted. He sat in parliament in 1648 for Newport, Cornwall, and after the Restoration became member for Bath, of which city he was made recorder in 1647. He was appointed keeper of the records in the Tower, and published some valuable historical materials. He died in Lincoln's Inn, Oct. 24, 1669. *Consult* W. P., a study in Puritanism, E. W. Kirby, 1931.

Przasnysz. Town of Poland. It is situated 59 m. N.E. of Plock and 55 m. N. of Warsaw, and is an important road centre. Early in the First Great War the town was the centre of heavy fighting between Germans and Russians, and changed hands several times. Its capture by the Russians in March, 1915, ended Hindenburg's offensive against the Narev, but it fell to the Germans later that year. In the Second Great War, Przasnysz was occupied by German forces after the fall of Warsaw, and after the partition of Poland remained in the German zone until taken by the Russians on Jan. 18, 1945.

Przemysl. A town of Poland, lying just W. of the Curzon Line, 60 m. by rly. W. of Lwow. Before the First Great War an Austrian fortress, designed to watch the passes across the E. Beskids, a section of the Carpathians to the S., it is situated on the San, which gives it easy lines of communication to the Vistula, Cracow, and Lwow. A hill S.W. of the town is crowned by ruins of a castle built by Casimir the Great.

In the First Great War, Russian forces advanced into Galicia in Sept., 1914, and after driving the Austrians from Lwow forced them into Przemysl, which was invested. The town was relieved by an Austro-German army, but a few weeks later was again besieged and held out until March 22, 1915. Following Mackensen's offensive in May, the Russians were driven back beyond the San and made Przemysl the pivot of their line. Mackensen, assaulting the town from both flanks, forced its evacuation on June 1. When the Germans invaded Poland in the Second Great War, Przemysl was captured

on Sept. 9, 1939, and at the partition of the country was included in the Soviet zone. After the German attack on Russia, it changed hands several times before being occupied by the Germans at the end of June, 1941. It was retaken by troops of the 1st Ukrainian Front on July 28, 1944. *Pron.* Pzhem-isl.

P.S.A. Abbreviation for Pleasant Sunday Afternoon. The movement for holding popular religious meetings under this name was started by John Blackham of West Bromwich in 1875 and soon took a firm hold in the midland counties of England. The meetings were chiefly organized in connexion with the Free Churches, especially the Congregationalists and Baptists, and the movement spread all over the country. Separate meetings were held for men and women, music was much in evidence, and addresses of a semi-religious or social character were delivered. In the 20th century the movement became merged in that known as the Brotherhood (*q.v.*).

Psalm (Gr. *psalmos*, a twanging of the strings of a harp.) Term for a sacred song accompanied by stringed instruments. The Psalter derives its name from the Gr. *psalterion*, a harp. *See* Psalms.

Psalmazar, GEORGE (c. 1679-1763). Name adopted by a literary impostor. He is believed to have been born in the S. of France and educated by the Jesuits, but nothing is known as to his real name. As a young man wandering about on the Continent in search of occupation, he stated that he was a native of Formosa. He was brought to England by an army chaplain, converted to Christianity, and sent to Oxford by zealous patrons, to continue his studies. He published in 1704 a Historical and Geographical Description of Formosa, partly taken from a Latin work and partly invented, with an elaborately fabricated grammar of the Formosan language. About 1712 he repented of his elaborate imposture, confessed it, and became a literary hack in London, later winning the esteem of Dr. Johnson by his piety. He died May 3, 1763. The following year was published his *Memoirs of—*, Commonly Known as George Psalmazar.

Psalmody. Practice of singing psalms and other spiritual songs. Although the character of the music used by the ancient Hebrews is not known with certainty, it is clear that singing formed an important part of their religious services. The practice persisted

William Frynne,
English Puritan

amongst the primitive Christians, who developed it in course of time. The Ambrosian Tones, first systematised in the 4th century, may possibly be traced to a Jewish origin; the Gregorian Tones, in the 6th century, mark a further development. There were three methods of singing the psalms and canticles: (a) responsorial, between a soloist and the choir; (b) antiphonal, between two choirs; (c) direct, sung full, without alternation. For the music to which the psalms were sung see Anglican Chant and Plainsong. See also Hymn; Psalter.

Psalms, Book of. Book of the Old Testament. It is a collection of 150 poems. The designation "Psalms" is derived, like the term Psalter, from the Septuagint. The Hebrew title is "Book of Praise-songs"; and in the Hebrew Bible this book is divided into five smaller books: (1) Ps. 1-41; (2) 42-72; (3) 73-89; (4) 90-106; and (5) 107-150. According to Jewish tradition the fivefold division was intended to correspond to the fivefold division of the Law, i.e. the Pentateuch. Each of the first four books closes with a doxology, and in the fifth book the last psalm seems to serve as such. In the Septuagint sometimes two psalms are united (9 and 10; 114 and 115), or one psalm is divided into two (116; 147).

In the Hebrew Bible and in the Septuagint, all but thirty-four bear titles or superscriptions which make statements about the authorship or occasion of composition, or give musical directions. These, like other O.T. superscriptions, are later additions, being due probably to post exilic editors. Psalms are here assigned to Moses (90): to David (in Bk. I all except 1, 2, 10, and 33; in Bk. II 51-65, 68-70; in Bk. III 86; in Bk. IV 101 and 103; in Bk. V 108-110, 122, 124, 131, 133, 138-145); to Solomon (72 and 127); to Asaph (50, 73-83), Heman the Ezrahite (88) and Ethan the Ezrahite (89), who are reputed to have been founders of the guilds of singers in the Second Temple; and to the Sons of Korah (42, 44-49, 84, 85, 87, and 88), gate-keepers of the Temple (cf. I Chron. ix, 19; xxvi, 1-19).

Thus, according to the tradition represented by the titles themselves, the Psalter is a collection of psalms of various authorship. It is also a collection of smaller groups. Other groupings are mentioned, such as the Psalms of Ascents (120-134), that is to say, probably pilgrim songs, sung on the way up to Jerusalem; and some others may be detected, such as Hallelujah-psalms (i.e. Praise-Jehovah

psalms; 111-113 and 146-150), Hallel-psalms (i.e. Praise - him psalms; 113-118), treated as a liturgical unit in Jewish literature, and Hodu-psalms (i.e. Give-thanks psalms; 105-107). The words "Of the Precentor" (or choir-master) with the musical directions in the superscriptions of many psalms suggest that, before the final collection was made, a large collection known as the Precentor's or Choir-master's Psalter was in use already. We learn further from the superscriptions that some of the psalms were sung to the melodies of old folk-songs such as "The Hind of the Morning" (22), "The Lilies" (45), and "The Dove of the Distant Terebinths" (56).

We know from the Second Book of Samuel (i, 17 ff., iii, 33 f.) that David composed funeral elegies, and from Amos vi, 5 that he was a famous musician. It is quite likely, therefore, that he composed religious songs or hymns. But it is felt by many scholars that many of the psalms ascribed to him by tradition reflect the circumstances and feelings of a much later age, some of them those of the Maccabean age. Even Theodore of Mopsuestia (b. c. A.D. 350) was driven to assume that seventeen of the Davidic psalms were "prophetic" of the Maccabean struggles. The expression Davidic Psalter, therefore, would be more correct than Psalter of David. A collection of psalms may have been called Davidic because David was the author of some of them, and was famous as a musician. The poems in the Book of Psalms are not all of equal value. By the side of much that is real poetry there is much that is more commonplace hymnology. But at their best the Psalms are gems of Hebrew religious poetry. See Bible.

M. A. Canney
Bibliography. The Psalms in Human Life, R. E. Prothero, 1903; The Book of Psalms, T. K. Cheyne, 1904; Critical and Exegetical Commentary on the Book of Psalms, G. A. and E. G. Briggs, 2 vols., 1906-07; Intro. to the Literature of the O.T., S. R. Driver, 9th ed. 1913; The Psalms, W. E. Barnes, 1931; W. O. E. Oesterley, 2 vols. 1940.

Psalms, PENITENTIAL. Seven of the O.T. Psalms (6, 32, 38, 51, 102, 130, 143), which have been grouped together because they all express the contrition and penitence of the sinner. In the Latin numeration the psalms are 6, 31, 37, 50, 101, 129, 142. Their recitation in Lent was ordered by Pope Innocent III, and Friday (with a few exceptions, such as Good Friday) was the day ordained by Pius V. In the Angli-

can Book of Common Prayer they are given (with the exception of 51) as the proper psalms for Ash Wednesday. Ps. 51 is assigned a separate place in the special Communion Service which is to be used on the first day of Lent (Ash Wednesday), but also at other times. See Miserere.

Psalter. Book containing the Psalms or other hymns, especially metrical paraphrases of the former, either with or without accompanying music. The practice of singing these paraphrases is anterior to the Reformation, but that event gave it fresh vigour in Germany, France, Switzerland, and England.

In England there appeared in 1549 a metrical version of the whole Book of Psalms by Robert Crowley, with accompanying music, and also in the same year a small volume containing nineteen versions by Thomas Sternhold. With the assistance of John Hopkins and other writers it was gradually enlarged in successive editions until in 1562 it embraced the whole of the Psalms, set to 65 different tunes, the melody alone being given. "Sternhold and Hopkins," as it is called, became the authorised version. Later versions, mostly doggerel, were those by Thomas Este, 1592; Thomas Ravenscroft, 1621; N. Tate and N. Brady, 1696. The singing of metrical paraphrases still persists in Scotland, but in England only a few of the finest specimens, such as "All people that on earth do dwell" (Ps. 100), are now used in worship. Consult Introduction to Historical Edition of Hymns Ancient and Modern, W. H. Frere, 1909.

Psaltéry (Gr. *psallérion*, a harp). Ancient string instrument of a type used by the Jews, the

Psaltéry of medieval design. From a 9th century MS.

or without a plectrum. It was so highly esteemed for its tone and purity as to be frequently introduced into pictures by medieval artists, from which source alone we gain an idea of its character, no specimen of a psaltéry being extant. The word as used in the A.V. of the Bible designates the Egyptian *nebel* or portable harp.

Psammetichus. Name of three Egyptian kings of the XXVth dynasty, a grecoised form of the Egyptian Psamtek. Psammetichus I (864-810 B.C.) secured the throne by favour of Ashurbanipal, but with Greek mercenary aid threw off the Assyrian yoke. The second king of this name reigned 594-589 B.C. With Psammetichus III, 525 B.C., whom Cambyses overthrew, the Egyptian empire ended.

Pseudomorphism (Gr., false shape). In geology, the development of a mineral or aggregate of minerals which have the outward crystalline shape of one but the chemical composition of another. These are known as pseudomorphs. This may be brought about first by substitution, a process of chemical replacement; and secondly by infiltration, when a cavity has been formed by the solution of one mineral which has left a mould of its shape behind, a second mineral or group of minerals having been deposited in the empty hole. Other processes are also known to occur. The new mineral is referred to as a pseudomorph after the original.

Pseudonym (Gr. *pseudes*, false; *nomos*, name). Fictitious name, especially one adopted by a writer, artist, or actor. It differs from alias, which is a false name assumed by a criminal to conceal identity. The pseudonym may be taken because it sounds well, but in the past had often a more practical reason for its existence. In journalism and pamphleteering, pseudonymity and anonymity have long been the custom. They gave greater security to the expression of opinion when libel law was less precisely defined than now; they prevented the influence of a periodical being diminished by the attribution of its corporate opinion to one perhaps prejudiced person. When Swift inveighed against debased coinage, he did so in letters signed M. B. Drapier. Junius (whose identity was never established) attacked the throne itself. The practice prevailed through the days of Historicus (Sir William Harcourt), up to the Second Great War, when party polemics were still conducted under Roman names like Cassius (Michael Foot).

In creative literature the pen-name may be due to several motives. Mary Ann Evans called herself George Eliot from a native modesty that was afraid of failure; the Brontë sisters submitted manuscripts in the names of Currer, Ellis, and Acton Bell because they

believed women's work would be rejected by publishers. William Sharp wrote as Fiona Macleod to give an air of reality to a second nature of which he was aware. Lewis Carroll was the Rev. C. L. Dodgson, a professor of mathematics, who may have thought the public would disapprove of light books bearing a scholar's name. Gen. Sir Ernest Swinton, otherwise Ole-Luk-Oie, is an example of the writer who makes contributions to knowledge under his own name and diverts himself under another. As a comment on the style of his work, G. R. Sims called himself Dagonet after the jester in the Arthurian legend. What may be called the occupational pseudonym explains Sapper (Cyril MacNeile), and in a sense Mark Twain, which was the call of the leadman on Mississippi steamboats heard by the young Samuel Clemens. H. W. Shaw wrote as Josh Billings perhaps to suggest the uneducated man whose language he affected.

Ashley Sterne was an anagram of Ernest Halsey. Initials come from shortening an awkward name, as in Q for Sir A. Quiller-Couch, or may themselves stand for a pseudonym, as in A. L. O. E., meaning A Lady of England (Charlotte Tucker); or mean nothing in particular, as in Y. Y. (Robert Lynd). Racing correspondents and contributors to the magazine features in newspapers and periodicals are given to the pseudonym. Often this survives its originator; several wits have been Beachcomber in the Daily Express. Broadcasting gave rise to a famous pseudonym in A. J. Alan, who was not discovered until after his death to have been L. H. Lambert. In this medium also different names may be used as the class of work varies, e.g. the Russian operatic singer Oda Slobodskaya broadcast light ballads as Odali Careno. An exceptional reason for adopting a pseudonym, the secret of which was long kept, was given by Sir Henry Wood, who composed occasional musical works as Paul Klenovsky in the belief that a Russian name would ensure a less critical reception than an English.

In addition to those already mentioned, other famous pseudonyms of writers and artists have included Bab (Sir W. S. Gilbert), George A. Birmingham (Canon J. O. Hannay), Boz (Charles Dickens), Caran d'Ache (Emmanuel Poiré), Carmen Sylva (Elizabeth, queen of Rumania), Elia (Charles Lamb), Fougasse (C. K. Bird), Anatole France

(Jacques Anatole Thibault), O. Henry (W. S. Porter), Edna Lyall (Ada Ellen Bayly), H. Seton Merriman (Hugh Stowell Scott), Molière (J. B. Poquelin), Ouida (Louise de la Ramée), Saki (H. H. Munro), Spy (Leslie Ward), Michael Angelo Titmarsh (W. M. Thackeray), Toby, M.P. (Sir Henry Lucy) Voltaire (François Marie Arouet), Artemus Ward (Charles F. Browne).

The adoption of stage names by actors is so common a practice that examples would be invidious. The reason seems to be a desire for a more distinctive name than the actor already possesses, though the practice may have originated in the low estimation in which the profession of acting was once held.

Psilomelane. Important ore mineral of manganese. Hydrated manganese oxide with varying amounts of barium and potassium, it occurs as black amorphous masses or in various stalactitic forms. Psilomelane is found in sedimentary or residual manganese deposits associated with other minerals, such as pyrolusite.

Psittacosis (Gr. *psittakos*, parrot). Disease caught by human beings from infected parrots and love birds. It is caused by a filtrable virus. The patient falls ill with what looks like influenza or typhoid, but the course of the disease does not fit either of those conditions. Diagnosis is confirmed by a specific blood reaction and rapid involvement of the lung. Treatment is by symptom. Though young patients usually recover, the overall mortality rate remains one in six. After an epidemic of psittacosis, an order prohibiting the importation of parrots into the U.K. was made May 20, 1930.

Psittacus (Gr. *psittakos*, parrot). Small genus of birds of the order Psittaciformes. It consists of the true parrots, natives mainly of Africa. As in all the family Psittacidae, the strongly arched and hooked upper mandible is hinged to the skull, giving the bill great mobility. The tongue is thick and fleshy; and two of the four toes are turned back and two forwards. The best known example of the genus is the grey parrot (*P. erithacus*) of equatorial Africa, whose powers of talking are remarkable. Its general colour is ashy-grey, but the primary wing-feathers are black, and the short tail is red. It is an admirable climber, flies in large flocks at a considerable height, and its wild note is a chattering scream. See Bird: Parrot.

Pskov or **Pleskov**. Town of the R.S.F.S.R. It stands on the Velikaja and the Leningrad-Warsaw rly., 170 m. S.S.W. of Leningrad, near the Estonian border. Its tanneries and leather factories are famous, and there is trade in timber, hemp, and flax. Founded in 965, Pskov was an independent state from 1348 until it was united to Russia in 1510. The old cathedral in the Kremlin, the cathedral of SS. Peter and Paul, and conventual churches are the chief historic buildings. Pop. 59,898.

In the First Great War the town was captured by the Germans in Feb., 1918, just before the Treaty of Brest-Litovsk. It was one of the first towns taken by the Germans when they advanced into Russia across the Estonian border in June, 1941. During the Russian offensive in the summer of 1944, it was an important stronghold of the German defences S. of lake Peipus, and its capture by assault by the Soviet 3rd Baltic army on July 23 eliminated a vital block on the Leningrad-Dvinsk railway.

Psoriasis (Gr. *psora*, scab). Inflammatory infection of the skin. It is characterised by patches covered with white or silvery-grey scales. The cause of this common affection is unknown, but hereditary influences often play a part. The disease is usually first manifested in childhood or adolescence. The lesion begins as a small, round papule, which soon becomes white as the scales form. Ultimately these develop into patches which may be several inches across. After attaining a certain size they often disappear spontaneously, fading first in the centre. The parts most frequently affected are the tips of the elbows and the fronts of the knees, and after these the scalp. Recurrence of the condition after it has disappeared is very common. In the early stages, arsenic and salicin administered internally have proved useful. For local treatment, hot baths, containing a teaspoonful of bicarbonate of soda to the gallon, are helpful. Chrysarobin is a helpful local application. *Pron.* so-ria-sis.

Psychasthenia. Disorder of the mind due to abnormal psychological processes. It is characterised by obsessions, the patient feeling compelled to perform useless and illogical acts in order to prevent some calamity happening, though he recognizes the absurdity of his conduct. Spasmodic movements of the muscles are another symptom. Some authorities use the term in a wider sense to include

neurotic disorders which appear to be mainly constitutional or inherited. *See* Mental Disorder; Neurasthenia; Neurosis. *Pron.* si-kas-theenya.

Psychē (Gr., soul). In classical mythology, a maiden so beautiful that she aroused the envy of Aphrodite, who sent Cupid to inspire her with love for the meanest of men. Cupid, however, fell in love with her beauty himself, but left her owing to the machinations of her jealous sisters. Psychē then set out to look for Cupid, and after long wandering was united to her lover and became immortal. The story of Psychē is beautifully told by Apuleius (*q.v.*). It is an allegorical representation of the human soul, which eventually finds complete happiness by purification through trouble and sorrow. *Pron.* Psi-kee. *See* Cupid.

Psychiatry (Gr. *psychē*, life, soul; *iátrōs*, physician). Medical treatment of the mind, particularly of mental disorder or weakness. It is concerned with describing the different forms of mental disturbance and classifying them in clinical pictures according to their symptoms, though, strictly speaking, it is not concerned with the origin, mechanism, or interrelation of the symptoms. Only when the disorder can be correlated with some demonstrable change in the brain, or can be identified as the secondary effect of organic disease, does psychiatry, within the exact sense of the word, play any primary part. It formulates a psychology of consciousness, concentrates on the anatomical, chemical, and physiological aspects of mental disease, and does nothing with the symptoms but define them as signs of a special kind of degeneration, or as due to constitutional inferiority or hereditary disposition. However, psychiatrists have in practice learnt to observe their patients in the light of psycho-analytic theory. *See* Mental Disorder; Psycho-Analysis. *Consult* Text-book of Psychiatry, D. K. Henderson and R. D. Gillespie, 1944.

Psychical Research. Term denoting the scientific study of the more obscure and unexplained activities of the human spirit (Gr. *psychē*), or of spirit in general. It became current about 1882, when the society for psychical research was founded by Henry Sidgwick, F. W. H. Myers, E. Gurney, and others for the serious study of thought transference, apparitions and haunted houses, hypnotism, trances, clairvoyance, and spiritual-

istic phenomena. Men of science, with few exceptions, dismissed all these things as belonging entirely to the realms of superstition and fraud. The founders of the society, while recognizing the part played by trickery, malobservation, and defective recording of facts, thought that there was sufficient evidence for the genuineness of some phenomena to justify investigation.

Time has already justified the society in respect of part, at least, of its programme. Hypnotism, once left to the quacks and showmen, has been definitely annexed by science, and is recognized as a legitimate therapeutic agency. Automatic writing, in which the hand of the scribe writes, without his will, matter of which he may have no conscious knowledge, has been proved to be a genuine phenomenon, and, taken with the facts of hypnotism, has largely suggested the idea of the unconscious self, which plays so important a part in modern psychological study.

Most workers in this field agree that genuine telepathy—*i.e.* the influence of mind on mind apart from the recognized channels of communication—actually takes place. Recent experiments have also provided evidence for clairvoyance—*i.e.* direct supernormal apprehension of facts without the intervention of another mind—and precognition.

The careful inquiries of the society leave little, if any, room for doubt that many persons in a perfectly normal state of mind and health, but perhaps endowed with special sensibility, have from time to time seen visions or apparitions of friends or strangers, sometimes living, sometimes dead. The records contain many apparently well-substantiated cases in which the phantasm has occurred at or near the time of death of the person seen, or when he was in critical danger, and a certain number in which the actual details of the event were presented. And it is difficult to brush away the evidence that in some instances apparitions "haunt" definite places. The establishment of the facts is one thing, their interpretation another, and an extremely difficult one. Various explanations may reasonably be given for various types of occurrence: for some, normal subconscious activity; for others, the supernormal faculties of living persons, *e.g.* telepathy; but there are other phenomena for which some explanation outside the living individual has been postulated, such as communication from the

dead or a "cosmic reservoir," in which, so to speak, all human experiences are stored, and from which they may be drawn again in favourable circumstances and by certain individuals.

Interest in psychical phenomena naturally centres upon the question how far they yield trustworthy evidence of survival after death. Apart from the study of alleged phantasms of the dead, inquiry into this most obscure subject has taken two main directions. The first is the study of the utterances of "trance-mediums," which often purport to give communications from the dead to their living friends. The difficulty here is to exclude the possibility that the medium, even without intended fraud, may make use of conscious or unconscious knowledge, of indications given unwittingly by the visitors, or of telepathic communications from living persons. The second direction is the study of cross-correspondences between automatic writings. In some instances automatic writers, unknown to one another and of unimpeachable honesty, have produced scripts which were unintelligible until one was supplemented by the other; and it has been supposed that in such cases a disembodied intelligence has deliberately given his message in part to each writer, in order to demonstrate his continued existence.

Abnormal psychical phenomena of bewildering variety have been reported, both in the presence of recognized mediums, and in so-called "Poltergeist" cases of violent movements and breakages of furniture, crockery, etc. Both types of occurrence call for investigation by experts in detecting trickery, the ordinary observer being easily deceived. The experts are not agreed as to whether trickery explains everything. In "Poltergeist" cases the rôle of medium is frequently taken by a mentally and physically subnormal adolescent, who may be unconscious of the tricks he (or she) is playing. See *Dream*; *Haunted House*; *Poltergeist*; *Spiritualism*.

Psycho-Analysis (Gr. *psychê*, soul; *ana-*, again; *lûo*, loose). Name given by Freud to his method of investigating the unconscious. The term has come to cover in a general sense the whole body of Freud's teaching. The method is based upon the theory that continual mental conflicts are going on in all minds below the threshold of consciousness, their object being to isolate and keep away from observation ideas, feelings, wishes, which are abhorrent to conscience. As a rule this attempt is only partially successful, and the repressed material filters through under various disguises in dreams, symbolic acts, etc., or manifests itself in neurotic symptoms. For cure it is necessary (1) to make the patient's ego able to tolerate the knowledge of the repressed material, (2) to bring it back into consciousness, and (3) so to modify and rationalise the super-ego (whose original harshness has led to the repression) that the patient will not suffer more anxiety than he can bear when each conflict is brought into the open.

The process of analysis is based upon the facts that repressed material is always striving to return to consciousness, and that the repressing force of the super-ego is lessened in sleep and other quiescent states of the mind. The patient is therefore asked to recline upon a couch in a soothing atmosphere, and is then required to associate freely to some idea which makes a suitable starting point, e.g. a dream or the stage reached at the end of the previous analytic session. The flow of associations will sooner or later lead back to some repressed conflict which is at the moment near the surface and active. When the analyst judges that the right moment has come, he will offer as much of an explanation as he believes that the patient can accept.

This treatment leads not only to the revealing of the buried memories which are the source of the conflict, but also to a release of the feelings which were repressed with them. These are then vented upon the analyst, who is made, so to speak, to play the part of all the people who were concerned in the drama which precipitated that particular conflict. This projection of emotion is known as the transference, and the analyst for his part must at this stage be able to bear having great quantities of

hatred, scorn, neurotic love, etc., hurled at him without reacting except as a doctor and a scientist. When each of these feelings has been explained to the patient, the normal relation of confidence between doctor and patient must be restored before the work can proceed afresh.

Since one repression leads to another, and both serious mental disease and strongly anti-social traits of character are the result of accumulations of stresses which started in early childhood, conflict after conflict will have to be uncovered and resolved. Cure is, of course, effected only when the patient has achieved self-dependence. See *Ego*; *Repression*; *Super-Ego*; *Unconscious*.

Psychology (Gr. *psychê*, soul; *logos*, a discourse). Biological science having for its object the study of mind. For those who do not believe that mind exists and regard all "mental" phenomena as activities of the brain and nervous system, psychology is simply a branch of physiology. The fundamental nature of the relation between body and mind is left by both sciences to philosophers, psychologists acting on the working assumption that both bodies and minds exist and can be separately dealt with and described, and that they are in a continual state of interaction. On the one hand all knowledge of the external world reaches the mind through the senses; poisons which affect the brain disturb the mind, etc. On the other bodily reactions to stimuli can be governed by thought, and strong emotions, etc., control much bodily functioning. Medical discoveries, such as the use of shock therapy for depression and leucotomy for manic behaviour, serve to show, if this be necessary, how close is the tie between body and mind.

Psychology in relation to animals deals with observation of their behaviour and attempts to estimate the degree of their intelligence and the acuteness of their perceptions. The chief points of difference between human beings and animals, apart from

speech, are the possession by the former of reason and conscience. Reason is found in a rudimentary state in chimpanzees, and both mechanisms exist in domesticated dogs; but their rôle in the life of man is immeasurably greater.

The nature and function of the human mind have always been matters for speculation, and until the 19th century it was assumed that psychology was a branch of philosophy. Philosophers felt free to advance theories of the mind and to support them by data drawn almost exclusively from observation of their own mental processes. Since the minds of philosophers differ in many respects from those of men in general, the knowledge obtained in this way was not only full of subjective errors and of a peculiar and forbidding aridity, but was as a rule almost useless for application to the problems of ordinary life.

Until the last quarter of the 19th century few people doubted that the mind consisted of elements which were, or had been, present to consciousness. It was recognized that memories not in use at any particular moment must, so to speak, have "somewhere to go to," and something analogous to a mental storage department was therefore postulated to contain these memories. But nothing was known of this region until the publication of the findings of the psychiatrist Sigmund Freud. Freud posited not only a "pre-conscious" wherein lie memories, beliefs, purposes which can be recalled when needed, but also an "unconscious," inaccessible by ordinary methods of observation, but with a strong life of its own which continually affects the conduct of the individual. Freud's system is still rejected by many psychologists; but its existence has revolutionised the study of the mind, both normal and abnormal, and the treatment of mental disease.

Anything that mankind is doing or has ever done may provide a subject for psychological investigation. Different workers are attracted by different fields, and the range of objects is so large that many of them are unrelated. Attempts are often made, for instance, to classify human beings into different types. The best known are those of Jung (*q.v.*), who divided them into introverts and extraverts, and Kretschmer, who thought of them as pykniaks and schizoids. A more useful division is into types indicating the mental disorders that charac-

terise their extreme instances—obsessional, hysterical, etc.

Other topics which have attracted workers are the methods by which children put together the data provided by their senses and build up a more or less accurate picture of the world around them; the psychology of study; the nature of musical appreciation. The general change from assumption to observation has been especially important in connexion with education, where the starting point becomes how children do behave instead of an assumption as to how they ought to behave.

Psychological methods have been strikingly applied in the sphere of group and social psychology; in both the U.K. and the U.S.A. psychology is used to elucidate industrial problems; and it has been employed in the selection and training of candidates for particular posts in the civil service, the fighting services, industry, etc.

McDougall, 28th ed., 1946; Work of Psychologists and Psychiatrists in the Services, H.M.S.O., 1947; Normal and Abnormal Psychology, J. E. Nicole, 1948.

Psychoneurosis. Mental disorder, the result of a chain of abnormal psychological processes. Anxiety states and obsessions come under this classification. See Hysteria; Neurasthenia; Neurosis.

Psychophysics (Gr. *psychê*, soul, mind; *physis*, physics). Term invented by the German philosopher Fechner, and defined by him as a theory of the exact relations between mind and body, and, generally speaking, the relations between the psychical and physical worlds. According to Wundt, it consists in the investigation of the relations that can be shown empirically to exist between the psychical and physical aspects of vital processes. The object is to discover these relations; beyond that its interest ceases. Psychology examines these relations from the point of view of the mind; physiology, from the point of view of the body.

Psychosis. Disorder of the mind, not due to recognizable psychological processes as are the neuroses and psychoneuroses.

The term is in practice equivalent to mental disorder (*q.v.*).

Psychotherapy (Gr. *psychê*, soul; *therapeia*, treatment). Treatment of mental disorders by influencing the mind. Used generally for the treatment of hysteria, neurasthenia, and kindred affections, it embraces treatment by suggestion, hypnotism, psychoanalysis, and re-education where function has been impaired in the absence of organic disease.

Psychrometer. (Gr. *psychros*, cold; *metron*, measure). Wet and dry bulb thermometer. It consists of two thermometers, one with a bulb exposed to the air, and the other with the bulb covered with muslin kept wet with water. The first gives the direct air temperature; the second a lower temperature due to the evaporation of the water. The drier the atmosphere the more rapid the evaporation, and the greater the difference of temperatures recorded by the two thermometers, so enabling the amount of moisture in the atmosphere to be calculated. The depression of the wet bulb also depends upon the rate of flow of the air over the bulbs. In the Assmann psychrometer a known and constant rate of ventilation is obtained by using a mechanically driven fan.

Ptah. Egyptian deity. The local god of Memphis in the 1st dynasty, he was the divine artificer, creating all things out of the Nile mud. Assimilated to other gods—Osiris, Apis, Sokar—he is represented with a mummified body, wearing a skull-cap. In later times, as a bandy-legged dwarf, he resembled the Greek Hephaestus. See Egypt.

Ptarmigan (Gaelic *tarmachan*). Species of grouse (*Lagopus mutus*), found in the mountainous districts

Ptarmigan. Hen bird of this species of grouse
W. S. Berridge, F.Z.S.

of N. Europe. In the summer the plumage is brownish grey marked with black lines and dark spots, and in winter it is white with the exception of a small scarlet comb, a black line on each side of the head, and black outer tail feathers.

It is only the British bird that thus changes its plumage for protective purposes. It is 14 ins. long, and the legs and feet are thickly feathered. In Great Britain it is restricted to the highest parts of the Scottish highlands and to some of the western islands. Both in summer and winter it so closely resembles its surroundings that it is difficult to detect until it takes flight. In the nesting season the hen sits so close that she may be approached without difficulty, and when the young are about, the hen will endeavour to draw off an intruder by running near him with a trailing wing as if wounded. The ptarmigans seen in the markets are mainly willow grouse imported from Scandinavia. See Bird; Grouse.

Pteridophyta (Gr. *ptēris*, fern; *phyton*, plant). Botanical group which includes the ordinary ferns, the water ferns (Marsileaceae), the club mosses (Lycopodiaceae and Selaginellaceae), and the horsetails (Equisetaceae). Anatomically the pteridophyta are more complex than the mosses; the specialisation of tissues for distinct functions has reached a higher stage of efficiency. In the same way as the mosses they exhibit a regular alternation of generations, but with a difference. The fern-plant produces spores and is the asexual generation; from the spore is produced a small green body, not as a rule exceeding a quarter of an inch in length, known as the prothallus, and this bears the male and female organs. From the fertilised egg the new fern-plant arises. It is therefore the fern-prothallus which corresponds to the moss-plant. In some pteridophytes, e.g. *Selaginella*, two kinds of spore are produced, larger (megaspores) and smaller (microspores); each spore on germination forms a prothallus. The prothallus developed in the megaspores bears female organs, while the microspore furnishes the male gametes. See Fern.

Pteris (Gr., fern). Genus of ferns of the family Polypodiaceae. Natives of all regions, they have usually creeping rootstocks. The leaves or fronds are of varied form, but usually divided into strap-shaped lobes. Bracken (*Pteridium aquilinum*) used to be included in this genus. The distinguishing feature is the massing of the spore-capsules in a continuous line around the margin of the frond or its divisions. Many species are in cultivation as ornamental plants.

Pterobranchia (Gr., wing-gilled). Small group of minute organisms dredged from the depths

Pterobranchia. Cephalodiscus dodecalophus, from the Straits of Magellan. A. Colony. B. Highly magnified individual specimen, indicated by a in A

of the ocean. They were formerly supposed to be polyzoa, but are now regarded as hemichorda (q.v.).

Pterodactyl (Gr. *pteron*, wing; *daktylos*, finger). Name given to the flying lizard, the fossil remains of which are found in rocks of Mesozoic age. Varying in size from only a foot in the spread of their wings up to some 20 ft., these reptiles were remarkable for their bird-like habits. The wings, however, resembled more those of the present-day bat, being a membrane attached to the body and stationed between the long, jointed fingers of the fore limbs.

The hind legs of the pterodactyls bore a strong resemblance to those of reptiles, but the heads of many were more bird-like, possessing jaws covered with a horny beak. In some members the jaws were provided with strong conical teeth. The bones were hollow, in this respect resembling birds, the skulls pointed, the eyes large, and in some of the earlier

Pterodactyl. Skeleton of *P. spectabilis*, a short-tailed flying reptile. By courtesy of the trustees of the British Museum

forms the tail was very long and slender. The majority were incapable of long-sustained flight. Remains of the reptile have been found in England, Europe, and N. America. See Lizard.

Pteropoda (Gr. *pteron*, wing; *pous*, foot). Group of marine molluscs. They were formerly ranked as a separate order, but are now included in the Gastropoda (q.v.). The foot has been modified into a pair of wing-like processes, by the aid of which the animal swims. Hence

they are popularly called sea butterflies. Some of them bear small, transparent, glassy shells, and some species form the chief food of the baleen whales. The majority are tropical. See Mollusca.

Pteropoda. Shell-bearing Cavolinia tridentata

Pterosauria (Gr. *pteron*, wing; *sauros*, lizard). Name given to extinct flying reptiles that are known also as ornithosauria and pterodactyls. See Pterodactyl.

Ptolemaic System. Theory expounded by the ancient Egyptian Ptolemy to account for the movements of heavenly bodies. He supposed that the moon, sun, and stars revolved in circles about the earth. Beyond the earth, and beyond the fire and water which it supported, was the ether. The zones of the heavens were in and beyond the ether, each zone a transparent spherical shell. Each shell or sphere had its own heavenly body which, revolving with it, moved round the earth.

The innermost sphere was that of the moon, and the others in order were those of Mercury, Venus, the sun, Mars, and Jupiter, with Saturn and the fixed stars sharing the eighth outer sphere. Afterwards a ninth sphere was added to explain the slow movement of the precession of the equinoxes, and beyond that a tenth sphere to account for day and night. The tenth sphere or *primum mobile* therefore revolved from E. to W. in 24 hours and carried along with it all the inner spheres. The apparent progression and regression of planets were accounted for on the supposition that each moved in a circle on its own sphere, while the latter moved round the earth. This theory dominated astronomical thought till the time of Copernicus (q.v.). See Astronomy; Deferent; Epicycle.

Ptolemais OR **ACE**. Ancient city of Phoenicia. Lying S. of Tyre, it is now known as Acre (*q.v.*)

Ptolemy OR **CLAUDIUS PROLEMAEUS** (*f.l.* A.D. 127–51). Egyptian astronomer and geographer. The dates of his birth and death are unknown, all that is certain being that he conducted his observations in Alexandria during the reigns of Hadrian and Antoninus Pius.

Ptolemy was one of the most eminent scientific men of the ancient world. He not only co-ordinated the scientific knowledge of his time but added to it results of his own which have stood to the present day. His doctrines were incorporated in his great work in 13 volumes, called by the Arabs the *Almagest* (*q.v.*).

In what must be regarded as one of the greatest works of the ancients, Ptolemy treats of the positions and motions of the earth, moon, sun, and stars, and makes and proves the statement that the earth is a sphere. His work contains theorems and problems in trigonometry and geometry which are of fundamental importance, the length of the year, a catalogue of stars of the N. hemisphere, motions of the planets, etc.

As a geographer, Ptolemy was as celebrated as he was as an astronomer and mathematician. His *Geographikḗ Syntaxis* dominated its own particular sphere as his *Almagest* did astronomy, and Ptolemy's concept of the world held till the 15th century. It was the first attempt to place geography on a scientific basis. He laid down the latitude and longitude of places and constructed maps of the known inhabited world on a mathematical basis far in advance of his time. See *Astronomy*; *Map*; *Ptolemaic System*. Consult also *Works*, ed. J. L. Heiberg, 1895–1907; *Geographia*, ed. C. F. A. Nobbe, 1842–45; *The Geography of Ptolemy Elucidated*, T. G. Rylands, 1893; *Planetary Systems*, J. L. Dreyer, 1906; *Introduction to the History of Science*, G. Sartori, 1927–31.

Ptolemy I Soter (367–283 B.C.). King of Egypt. He was one of the favourite generals of Alexander the Great, at whose death in 323 he became satrap of Egypt, and in 305 assumed the kingly title, thus inaugurating the Ptolemaic dynasty, which lasted until 30 B.C. After his death he was called Ptolemy Lagi. The aid sent in 304 to Rhodes, when

besieged by Demetrius Poliorcetes, earned for him the name Soter (Gr., saviour). Soter founded Ptolemais in Upper Egypt, as a rival to Thebes, undertook many overseas adventures, and twice occupied Jerusalem. He fostered the commercial and intellectual interests of his capital at Alexandria, built the Serapeum, and planned the famous library and museum, where under his auspices Euclid taught mathematics. In 285 he abdicated, and died two years later.

Ptolemy II Philadelphus (308–246 B.C.). King of Egypt. Born in Cos, a younger son of Berenice, he succeeded on his father Soter's abdication in 285. Establishing sea-command in the Mediterranean, he annexed Coele-Syria and Phoenicia, and fostered trade with Somaliland. He opened a canal from the Nile to the Red Sea, and founded in his mother's honour the port of Berenice. He maintained diplomatic relations with the Indian emperor Asoka, completed the lighthouse on the Pharos islet at Alexandria, and built the great pylon at Philae.

His first wife, Arsinoë I, daughter of Lysimachus of Thrace, was banished in favour of his own sister, Lysimachus' widow, Arsinoë II. He wedded her, and, at her death in 270, deified her as Philadelphus (Gr., loving a brother or sister), a title afterwards attached to himself also. In her honour he reclaimed land in the Fayum, calling it the Arsinoite nome.

Ptolemy III Euergetes (281–221 B.C.). King of Egypt. Elder son of Arsinoë I, he succeeded his father Philadelphus in 246, and by marrying Berenice, daughter of Ptolemy Soter's stepson Magas, added Cyrenaica to Egypt. He overran the Seleucian kingdom to Babylon and Susa, bringing back many Egyptian deities carried away by Cambyses. Hence he and his consort were deified with the title Euergetae (Gr., benefactors), and the decree of Canopus (*q.v.*) was promulgated in their honour.

During his reign Ptolemaic sea-power reached its acme. The splendid Edfu temple and a pylon at Karnak (*q.v.*) were founded by him. See *Eratosthenes*.

Ptolemy V Epiphanes (209–181 B.C.). King of Egypt. Succeeding his father Ptolemy IV Philopator in 205, under guardians, his minority was marked by the invasion of Egypt's overseas possessions by Antiochus the Great and Philip V of Macedon.

Ptolemy V Epiphanes, King of Egypt
From a coin

The intervention of Rome confirmed to the Seleucid king Coele-Syria and Phoenicia. Epiphanes (Gr., illustrious) was declared of age in 197. He wedded a daughter of Antiochus, Cleopatra I, who brought as a dowry the revenues of Coele-Syria and Palestine. The financial measures associated with a projected Syrian campaign led to his death by poisoning. See *Rosetta Stone*.

Ptolemy VI Philometor (186–145 B.C.). King of Egypt. Son of Cleopatra I, he succeeded his father Epiphanes in 181, under his mother's regency until her death about 173. The invasion of Egypt by Antiochus IV Epiphanes, and the capture of Philometor at Memphis, are referred to in Dan. 11. His younger brother, nicknamed Physcon (Gr., obese), was proclaimed king in 170, and for the rest of the reign there was intermittent rivalry between them, each being supported in turn by Rome. Shortly after being proclaimed king of Syria, Philometor fell in battle near Antioch.

Ptolemy X Soter II (d. 80 B.C.). King of Egypt. Son of Cleopatra III, he succeeded his father Physcon at his death in 116. He was formerly ranked as Ptolemy VIII, but as two other Ptolemies, Eupator and Neos Philopator—who were perhaps both sons of Philometor—reigned between Epiphanes and

Ptolemy VI Philometor, King of Egypt
From a bronze bust

Ptolemy III Euergetes, King of Egypt
From a coin

Ptolemy X Soter II, King of Egypt
From a bronze bust

Ptolemy I Soter, King of Egypt
From a coin

Physcon, *Lathyrus*, or **Soter II**, now usually ranks as **X**. His mother was co-regent until in 110 he exercised sole authority, but three years after was banished in favour of his younger brother, **Ptolemy XI**, or **Alexander I**. He in his turn was deposed in 88, and *Lathyrus*, recalled from Cyprus, reigned a second time until his death.

Ptolemy XIII Auletes (95-51 B.C.). King of Egypt. On the assassination of **Ptolemy XII** (**Alexander II**) in 80 the legitimate line ended. The throne was offered to a natural son of *Lathyrus*, nicknamed **Auletes** (Gr., flute-player), from his proficiency with that instrument. He married **Cleopatra V**, and on her death about 69 fled to Rome, his daughter **Berenice IV** being put in his stead. Rome reduced *Cyrenaica* to a Roman province and confiscated Cyprus, but acknowledged **Auletes** as legitimate sovereign of Egypt, on payment of a tribute of 6,000 talents. **Auletes** greatly embellished *Philae*.

Ptolemy XIV Philopator (61-47 B.C.). King of Egypt. On the death of **Auletes** in 51 his eldest son, **Philopator**, and his daughter, **Cleopatra**, ascended the throne jointly, under the guardianship of the Roman senate. In their fourth year the queen was banished, and raised an army in Syria, but without avail. After his defeat at *Pharsalia* **Pompey** sought refuge in Egypt, but was slain at **Ptolemy's** instigation. On **Julius Caesar's** arrival at *Alexandria* **Cleopatra's** cause was espoused by him. In 47 **Ptolemy** was drowned after a battle on the Nile, and his sister was reinstated, with their brother, **Ptolemy XV**, as co-regent. See **Cleopatra**.

Ptomaine (Gr. *ptōma*, corpse). Alkaloidal substances formed in the process of putrefaction of nitrogenous organic tissues. They have been regarded as responsible for the symptoms in cases of poisoning by meat, but many, if not all, such cases occur because the meat has become infected with disease-producing micro-organisms. The bacteria chiefly associated with this form of poisoning are of the dysentery group. Further symptoms are due partly to the development of germs in the intestine. Treatment consists in clearing the gut, controlling shock, and keeping the heart at work.

Ptoxis (Gr. *ptōxis* from *ptōtein*, to fall). Inability to raise the upper eyelid. It may be congenital, or due to injury or disease, producing paralysis of the nerve which supplies the eyelid, locomotor ataxia being the most common. See **Eye**.

Ptyalin (Gr. *ptyalon*, saliva). Enzyme in the saliva. Secreted by the salivary glands, it acts on starch, splitting it into the simple substances, dextrin and maltose, which can be absorbed in the intestinal tract.

Puberty (Lat. *puber*, mature). Age at which the reproductive organs become functionally active. In boys, in temperate regions, changes characteristic of puberty generally appear between the 14th and 16th years, when the secretion of the testes is poured into the blood. The rate of growth is increased, the frame and general build begin to approach those of the man, hair appears in the pubic region, the tones of the voice become deeper, and for a time some slight want of control over the pitch of the voice gives rise to the occasional squeakiness known as "breaking" of the voice. Pugnacity and desire for adventure are psychological attributes. In girls, puberty generally occurs between the ages of 13 and 15, when the ovarian secretion passes into the bloodstream. The figure fills out, the breasts become enlarged and rounded, and the menstrual function is established, while modesty and shyness are psychological concomitants. The hotter the country, the earlier puberty tends to occur.

Publican (Lat. *publicanus*). In ancient Rome, a contractor for public business, but more especially for the collection of taxes. The tax-farmer paid the state a certain sum and found his remuneration in what excess revenue he could collect, a vicious system, which inevitably caused injustice and oppression. In practice, owing to the heavy financial responsibility involved, publicans formed themselves into syndicates to carry out any particular contract. The farming of taxes was for long a coveted privilege of the equestrian order at Rome, which was chiefly composed of capitalists and men of business. The actual work of collecting the taxes was done by slaves, freedmen, and other people of humble rank. See **Equites**; **Licensing Laws**.

Public Assistance. Name given by the Local Government Board Act, 1929, to what was formerly called poor relief and from 1948 was termed national assistance.

Since the 16th century the relief of the poor had been primarily the responsibility of the parish. The overseer of the parish was empowered to levy a payment from every resident for that purpose. There was thus main-

tained a local interest in suppressing vagrancy and idleness, and a stigma came to attach to receiving poor relief. The poor law tended to be administered harshly and at times viciously, particularly in workhouses. In 1834 an Act established poor law unions, provided for the election of boards of guardians for each, and established a Local Government board to supervise their administration. The Local Government Board Act, 1929, transferred to the ministry of Health the functions of the Local Government board and to the county authorities the functions of the boards of guardians. Each county council then had to appoint a public assistance committee and local sub-committees for each poor law area of the county.

The National Assistance Act of 1948 transferred responsibility for the relief of the poor from the county to the state, acting through the national assistance board, which is responsible for unemployment assistance, uninsured old age pensions, blind persons' assistance, etc. The Act marked the end of the old poor law system, instituted by an Act of 1601. See **Poor Law**; **Social Security**.

Public Authorities Protection Act. Passed by the British parliament in 1893. It required all legal proceedings against public authorities for acts, neglects, or defaults in their public duties to be begun within six months of the act or default. The time was extended in civil proceedings to one year by the Limitations Act, 1939. With public bodies established since the Second Great War the practice is to provide for special periods of limitation of proceedings; e.g. the period is three years for proceedings against the coal board or the corporations set up by the New Towns Act, 1946.

Public Company. Company in which the shares are held by the public and are readily transferable. To form a registered company certain documents have to be filed with the registrar of companies. The most important of these is the memorandum of association. For a public company this has to be signed by at least seven persons. The memorandum must state (a) the proposed name of the company, with "Limited" as the last word (if the liability of the members is to be limited); (b) the part of the United Kingdom in which the registered office of the

company is to be situate; (c) the objects of the company. The "subscription clause" requests that the seven signatories may be formed into a company in pursuance of the memorandum, and states the number of shares for which each undertakes to subscribe. If the company is limited by shares, the memorandum must also state that the liability of the members is limited, and the amount of the share capital with which the company is to be registered and its subdivision into shares. If the company is limited by guarantee, the memorandum must also state the amount which each member undertakes to contribute should the company be wound up. Many professional organizations, sports clubs, etc., are companies limited by guarantee. The objects clause of the memorandum strictly defines the scope of the activity of the company, and can be altered only with difficulty; consequently it must be drafted with great care. For this reason the formalities of registration, which are simple, are generally entrusted to a solicitor or a company registration agent.

Consulting the Files

Each registered company has a file in the Companies Registration Office, Bush House, London, W.C.2. On payment of a nominal fee any member of the public can consult the file of any registered company. The file contains a copy of the memorandum of association, the articles of association, the prospectus or statement in lieu of prospectus, the annual return (containing a summary of share capital and shares, a list of shareholders, particulars of directors and the secretary, particulars of mortgages and other registered charges, the directors' report, the balance-sheet and the auditors' report). The Companies Act requires public companies to file periodically various documents, so that members of the public who may be interested can refer to the file for precise information. In 1946 there were 216,000 registered companies in the U.K.; of these, 13,000 were public companies and 203,000 private companies. The public companies had a total paid up capital of £4,078 millions—an average of about £300,000; the private companies had a total paid up capital of £1,923 millions—an average of about £9,000.

Public Enemy No. 1. Term officially used in the U.S.A. to describe a criminal, offending against

federal as distinct from state laws, who is regarded as the most dangerous man of his time. It was first applied in 1932 to describe John Dillinger (*q.v.*) and after his death, 1934, to Al Capone (*q.v.*).

Public Health. Term for the collective physical health of the community, and the steps taken by the community to maintain this. The general hygiene which it connotes is directed towards the elimination or amelioration of unfavourable conditions affecting the health of the public at large, and thus to the increase of health and the prolongation of life. Its instruments are the machinery of education and the powers and provisions of organized authority for safeguarding the health interests of the community, where ignorance, indifference, or avarice runs counter to them. The various public health provisions that are made for the common good, necessary and valuable though they are, cannot in themselves secure a high level of public health, for this is in great measure dependent on the hygienic concern and habits of the people in the intimate circumstances of their living. Popular education and training in such matters are essential.

Public health, however, does not relate solely to physical well-being; it involves also morals and economic conditions. Thus all measures that are calculated to raise the standard of social well-being, physically and morally, fall within the realm of public health—the ultimate aim being to secure in the greatest possible number the healthy mind in the healthy body. The aim of preventive medicine is to make human knowledge of all preventable disease as complete as possible, and to apply this knowledge to the best advantage. It seeks to prevent or remove all those circumstances which cause or favour the appearance and propagation of disease; and to increase the individual power of resistance.

Disease is not an eliminator of the unfit only; it destroys indiscriminately. Preventive medicine, therefore, is, if anything, in more urgent need of continuing development than is curative medicine. The effects on public health of general medical services working fully on hygienic and preventive lines, which became a possibility with the introduction of the national health service in July, 1948, are almost incalculable; for it is the general practitioner

who, with his first-hand knowledge of the needs of the individual, is at grips with the essential problems of preventive medicine.

Hygiene, or the art of preserving health, has been taught and practised since before the time of Hippocrates, a great teacher of the subject so far as empiricism could advance it; but it did not acquire a scientific basis until the knowledge of the laws of life (physiology) began to be studied, in the light of which the causes of disease could be discovered and prevented. Sydenham's observations upon the national history of infectious disease (1661-76) disclosed facts which stimulated the study of epidemiology long before the agents directly responsible for infection were known.

The doctrine that infection spreads by minute parasitic organisms of a specific nature was first philosophically maintained by Fracastoro in the 16th century; but Pasteur's discoveries (1856-64) made possible an immense step forward in care of public health. The period 1760-1800 saw the beginning of public health effort in Great Britain, though public concern led only in 1847 to the appointment of the first public health official, Dr. Duncan of Liverpool.

Community and the Individual

In the earlier days of organized public health endeavour, the central and local health authorities concerned themselves with the abatement of grossly insanitary conditions and with efforts to prevent the spread of certain specific diseases, regarded as more particularly affecting the health of the community. With a broadening outlook an increasing regard came to be paid to the individual. This was first manifested in the growing provisions for the care and treatment of the sick; and the provision of a healthy environment for the well.

Provisions for guarding the health of the individual include care of the expectant and nursing mother and her infant, medical inspection of school children, allotment of important foodstuffs in time of shortage to special sections of the community, as well as the services provided under the National Health Service Act, 1946. Extension of public health provisions has been the result of a growing recognition of the relationship between health, industrial efficiency, and poverty; and public health work engages

personnel who minister to the sick, protect from disabilities and incapacities, and regulate personal and industrial hygiene.

The marked reduction in infant mortality in many countries during the 20th century was a result of combating parental ignorance through the provision out of public funds of infant and antenatal clinics, child welfare centres, and related activities. Legislation has been introduced in the U.K. and elsewhere relating to child-birth, infancy, and childhood, the school child, those industrially employed in factories and workshops, housing, national health insurance, and communicable disease. Measures have been put in operation against tuberculosis and venereal disease, two of the greatest enemies of public health. With increasing knowledge of the causal agents of infection, provisions for the prevention and cure of communicable disease have become more effective. Especially is this true in reference to the bacteriological diagnosis of cases of disease which cannot be diagnosed with certainty by clinical methods, to the discovery of preventive inoculations to confer temporary immunity from attack, and of curative inoculations to reduce mortality. The use of ever-improving methods of diagnosis and the prompt notification of communicable disease, the isolation or quarantine of sufferers, and the necessary disinfection have increased the control of most forms of communicable disease.

In England and Wales the Local Government board was the central controlling department in most matters of public health until 1919, when the ministry of Health (*q.v.*) was established. Public health administrative authorities embrace county councils, county borough councils, borough councils, urban and rural district councils; and the public health service of local authorities includes a legal and clerical staff, an engineering and surveying staff, and a sanitary staff under the direction of the M.O.H. See Death Rate; Disease; Health Centre; Infant Mortality; Preventive Medicine.

Public Health and Hygiene. ROYAL INSTITUTE OF. Body formed in 1937 by amalgamation of the Royal Institute of Public Health (founded 1886) and the Institute of Hygiene. Its function is to promote the interests of those working upon public health at home and overseas. It is recognized as a public educational

institution, its lectures and instruction in bacteriology, chemistry, biochemistry, sanitary law, industrial diseases, and vital statistics at the laboratories in Queen Square, London, W.C.1, being accepted as preparing for degrees and diplomas in public health of universities and medical corporations of the U.K. The address of the institute is 28, Portland Place, W.1, and it has an official journal.

Public House. Licensed house where alcoholic liquors are provided for retail sale and consumption within specified hours. See Inn; Licensing Laws.

Public House Trust. This organization, founded by temperance interests for the acquisition of hotels, public houses, etc., is now known as Trust Houses Ltd. See Trust House.

Public Opinion. Term to denote the predominant view of a community on a particular subject. Measuring public opinion on contemporary questions has become a social science, and questionnaires to establish it are conducted by such organizations as the Gallup Poll (*q.v.*) and Mass Observation (*q.v.*). It is generally held that public opinion is reflected in a nation's legislature, but this is not always so; sometimes public opinion is ahead of the legislature, sometimes the legislature loses touch. An instance of the former was the U.K. parliament's opposition to electoral reforms demanded by public opinion in 1831-32; of the latter, public disagreement with the inclusion by the house of commons 1948 of a clause in the Criminal Law Amendment Bill proposing the suppression of the death penalty for murder.

Public Policy. Comprehensive legal term for the overwhelming interest of the country as a whole. In English law, a contract which is immoral, or in unreasonable restraint of trade, or of a fraudulent or criminal character, is said to be against public policy, and is unenforceable. The courts will not lightly hold a contract to be void on this ground. The chief classes of contracts attacked by the doctrine are contracts not to trade, or not to work, and for this reason all trade unions, whether of masters or men, cannot enforce at law the contracts entered into between them and their members. See Trade Union.

Public Record Office. For an account of this institution, see Record Office.

Public Relations Officer. Employee of a business firm or govt.

service whose duty is to foster good relations between the organization and the general public. He is usually expected to keep in direct touch with public opinion, so far as it may affect his firm or department, through organized inquiry; to act as representative on public committees of all kinds; to answer inquiries; to arrange lectures, exhibitions, etc. Usually, too, he acts as, or is responsible for the activities of, a press officer. See Press Officer.

Public School. The exact meaning of this term in the U.K. has changed from time to time, and it is still used loosely to denote (as in the U.S.A.) a school that is not privately owned and controlled. The latest official definition is in the terms of reference of the Fleming Committee, appointed in 1942 "to consider means whereby the association between the public schools (by which term is meant schools which are in membership of the governing bodies association or the headmasters' conference) and the general educational system of the country could be developed and extended..." Public schools so defined comprised 89 "independent" schools and 99 aided either by grants from the ministry of Education or by the local education authorities. The Education Act of 1944 allowed local authorities to provide education of the public school type where this seemed to suit parents and pupils.

The Public Schools Act of 1868 dealt with only seven schools—Eton, Winchester, Westminster, Charterhouse, Harrow, Rugby, Shrewsbury. The headmasters' conference was established by Thring, headmaster of Uppingham, as a protest against the exclusion of these seven from the Endowed Schools Act of 1869. Membership of this conference came to be one of the criteria of status as a public school. An association of governing bodies of public schools was founded in 1940; in 1942 came a similar association in respect of girls' schools. The associations act only in an advisory and consultative capacity.

The term public school therefore came to include a great diversity of institutions. Some are wholly boarding schools; some wholly or mainly day schools; a few independent ones are primarily day schools. Out of 99 direct-grant, aided, or maintained schools, 15 have more boarders than day boys, and 42 are wholly day schools.

The schools have markedly different histories. Canford, Stowe, and Bryanston were established after the First Great War. Others belong to the 19th century. The majority have had a continuous existence, with fluctuating fortune, during several centuries; Lincoln school dating back to 1090, Carlisle grammar school to 1170. Some developed from medieval grammar schools set up by individual endowment or by the Church to prepare the sons of landowners and merchants for university, Church, or law. Others, like Winchester college, were established as "perpetual colleges" where "poor and needy scholars" might live as a community and study beside the sons of "nobles and influential persons." Several public boarding schools for girls came into being during the last quarter of the 19th century. Consult Public Schools and the General Educational System, H.M.S.O., 1944.

Public Service Vehicle. In English law, vehicle carrying passengers for hire. This definition excludes a tram, trolley bus, or contract carriage for fewer than eight passengers; it includes motor coaches and buses. Public service vehicles may be express carriages (conveying passengers at separate fares, none less than 1s.); stage carriages (taking passengers at separate fares, some or all less than 1s.); or contract carriages (with passengers paying a lump sum for use of the vehicle). Taxicabs are not contract carriages, but if separate fares are charged they may become express or stage carriages. Public service vehicles are regulated in each area by traffic commissioners, and owners must annually license them. Stage and express carriages may run only on routes covered by a road service licence. Drivers and conductors of public service vehicles need special licences valid for three years, and their hours of duty are limited. All these vehicles are controlled by the Road Traffic Acts of 1930 and amending Acts.

Public Trustee. English official appointed by virtue of the Official Trustee Act, 1906, which became operative Jan. 1, 1908. He is a corporation sole whose business it is to act as executor and trustee of the estate of anyone in England who appoints him. The Act does not extend to Scotland. He can be appointed alone, or with a co-trustee or trustees, and the great advantage of so appointing him lies in the certainty that the funds

of the trust will not be frittered away, nor embezzled, nor lost in speculation, as sometimes happens with a private trustee. Investment of funds in the charge of the public trustee is limited to certain types of non-speculative security. He charges small fees, generally by way of percentage on receipts, for his services.

Public Works Administration. One of the agencies of F. D. Roosevelt's New Deal in the U.S.A. It was created under authority given him by the National Industrial Recovery Act of 1933. Its object was to expand federal and non-federal public construction, increase employment, stimulate private industry, and promote economic recovery. Harold Ickes, secretary of the interior, was appointed head of the P.W.A. and thus became responsible for the expenditure of a special congressional appropriation of \$3,300,000,000—the largest fund so far created by any nation for a peace-time purpose. In his *Back to Work*, Ickes gave an account of what the P.W.A. did in road-making, irrigation, providing cheap electric power, modernising transport, and improving public health. In 1939 the P.W.A. was absorbed in the Federal Works Agency.

Publishing. The business of multiplying literary works and distributing them to retail sellers. Printer, publisher, and bookseller were in the early days of printed books combined in one person, but the three branches have, with few exceptions, drifted widely apart. In this division the description printer stands not only for the actual printer, but for the mechanical producer of the book, which includes paper-maker, binder, and the makers of all the materials that are required for books. The printer in this fuller sense of the word is usually employed by the publisher, who is in direct relation with the author, or his agent, while the bookseller is the distributor to the public of the manufactured article produced by the printer out of the author's work for the publisher.

The publisher's functions embrace the selection of manuscripts suitable for publication, for which purpose he employs readers to supplement and correct his own judgement, and the commissioning of books on special subjects to suit the requirements of his market. The format of a book, the characters it is printed in, the thickness of the paper, its opaqueness or transparency, the proper distribu-

tion of black on white, the legibility of type, proper margins, and suitable bindings, are all considerations to which the publisher must give close attention.

Most publishing firms have special lines to which they confine themselves; only a few publish books of a certain standard in almost any field of literature. The publications of general publishers often range over history, biography, belles lettres, fiction, and poetry. Publishers of specialities often confine themselves to one such field, e.g. law, medicine, fine arts, sport, army and navy, maps.

Methods of Distribution

When a publisher has fulfilled his functions of selection and manufacture, the business of distribution begins. This is done in different ways; by travellers who visit the booksellers with samples, by creating a demand through advertisements in the public press, by means of reviews which the public expect for their guidance in the periodicals they read, and here and there by means of canvassers who sell books on the instalment plan.

Bigger sales can be secured for the general run of literature by the local efforts of booksellers who can directly reach every likely reader of a new publication, while a fashionable novelty will probably gain particular impetus through newspaper advertising, which for serious and professional literature is extravagant and uncertain. Continental publishers, however, have the burden of printing large editions in order to fill the demand for books on sale or return, which often results in heavy returns of dead stock. Expensive books and art publications are often sold by subscription, as are books printed in limited editions.

More original and often more lucrative than the issuing of submitted MSS. are publications designed by publishers themselves, the writing of which is confided to authors selected for the task. Principal among these are collective works, such as encyclopedias, which often require the employment of hundreds of collaborators, and much careful planning and organization, and also individual works planned to satisfy special interests. In this way publishers may stimulate study and render invaluable service to education. The Dictionary of National Biography; the encyclopedia publications of The Amalgamated Press, Ltd.; and the Home University and similar

libraries are instances of such enterprise. See *Bookselling*; *Illustration*; *Printing*, etc. Consult *The Truth About Publishing*, Sir S. Unwin, rev. edn., 1946.

Puccini, GIACOMO (1858-1924). Italian composer. Born at Lucca, June 22, 1858, he studied locally, and in 1877 produced a cantata, *Juno*. He worked at Milan conservatoire, 1880-83, and in 1885 his one-act opera, *Le Villi*, was produced at La Scala. His first great success was with *Manon Lescaut*, staged at Turin, 1893, and its triumph was outdone by that of *La Bohème*, founded on H. Murger's novel, 1896. His other works, the best of which are in the repertory of most great opera houses, are *La Tosca*, 1900; *Madame Butterfly*, 1904; *The Girl of the Golden West*, 1910; *La Rondine*, 1917; and *Il Tabarro*, *Suor Angelica*, and *Gianni Schicchi*, one-act operas, 1918. Puccini took the place left by Verdi as leader of the Italian operatic tradition. His most popular work is *La Bohème*, but *Manon Lescaut*, *Madame Butterfly*, and *La Tosca* closely rival it in popularity. He died Nov. 29, 1924. Turandot, which he had not finished when he died, was completed by Alfano, and produced in Turin in 1926. His letters, ed. G. Adami, appeared in Eng. trans. in 1931.

Giacomo Puccini, Italian composer

Puck or **ROBIN GOODFELLOW**. Mischievous, friendly fairy of English folklore. Puck, or a word of similar sound—Irish *puca*, Welsh *pucca*, Swedish *pojke*, Old Norse *puki*, Low German *pook*—is associated with a merry, familiar house spirit in the folklore of many peoples, and there is a curious parallel among the Red Indians of North America, for among the Algonquins *Puckwudjines* signified the little vanishing people. Puck is an important character in Shakespeare's *A Midsummer Night's Dream*, taking part as the servant of Oberon, in both the "human" plots as well as in the fairy scenes.

Puck. A disk of vulcanised rubber 1 in. thick and 3 ins. in diameter used instead of a ball in ice hockey.

Puck of Pook's Hill. Volume of stories by Rudyard Kipling, a blend of English legend and history, interspersed with verse, published in 1906. From Pook's

Hill two children are conducted by Puck through successive episodes from the days of the mythical Wayland's forge to Elizabethan times. A companion volume of stories, *Rewards and Fairies*, 1910, continued the adventures.

Pudding Lane. A London thoroughfare. It is a narrow way running S. out of Eastcheap to Lower Thames Street. The Great Fire of 1666 is said to have originated in a house in this lane. See *Great Fire*; *Pye Corner*.

Pudding Stone. Popular synonym for conglomerate (*q.v.*), a term used in geology for a rock consisting of rounded, water-worn pebbles set in a finer matrix. Hertfordshire puddingstone is the name given to a special variety of flint conglomerate.

Puddling. Name given to a process for converting cast iron into malleable or wrought iron. Invented by Henry Cort (*q.v.*) in 1784, the process consists in the removal of the carbon and silica—down to very minute proportions—and also the manganese and phosphorus and to some extent the sulphur, which cast iron always contains as impurities. The process oxidises these impurities, the carbon being converted into gas which escapes, and the silica and other elements into slags called "cinder," which are skimmed off the surface of the molten mass at the proper stage.

Puddling is carried out in a special form of reverberatory furnace, having a tall chimney to ensure a good draught. Pig iron is melted on the bed or hearth of the furnace, and when quite molten, the furnace door is opened, and the surface of the melted metal thus exposed to the air. Iron oxide is at once formed, and is worked into the mass by the puddler by means of a "rabble," an iron tool with a long handle. Additional oxide may be introduced if required in the form of magnetite or haematite, or "blue billy," a burnt iron ore. As more oxide is worked in, the mass begins to get pasty, and the puddler begins to form it into balls weighing from 60 lb. to 80 lb., which he withdraws from the furnace as he completes them. See *Casting*; *Iron*; *Metalurgy*; *Steel*; *Wrought Iron*.

Pudsey. Mun. bor. of W. Riding of Yorks, England. It is situated 3 m. E. of Bradford and 4 m. W. of Leeds, having rly. connexion with both cities. The boundaries of both are contiguous with its own. The industries include the manufacture of woollens and worsteds, iron and

brass founding, and the making of machinery. The bor. has three parish churches, S. Wilfred's, Calverley (originally 12th century, but since extensively rebuilt), S. John's, Farsley (1841), S. Lawrence's, Pudsey (built in 1821 to replace a 16th-century chapel of ease). There are also a town hall, mechanics' institute, public baths, and parks. The bor., which was incorporated in 1899, and enlarged in 1937 by the urban dists. of Farsley and Calverley, includes Fulneck, where a party of Moravians settled in 1745. It gives its name to a bor. constituency. Pudsey was the birthplace of three famous cricketers, Tunncliffe, Sutcliffe, and Hutton. Market day, Sat. Pop. est. 30,000.

Pudnkottai. Town and former state of India. The state, now merged in Madras, was surrounded by the dists. of Tanjore, Trichinopoly, and Ramnad. The rulership was given to a Tondeman chief as a reward for assistance against the French and Haidar Ali in the 18th century. The raja was assisted by an executive council composed of a diwan and two counselors. The town, centrally situated, is the only urban area of any size in the former state. Pop. 26,101.

Puebla. Inland state of Mexico. It occupies one of the highest parts of Mexico, the centre being part of the Anahuac plateau, and lies between the states of Vera Cruz on the E. and Hidalgo, Tlaxcala, Mexico, and Morelos on the W. It is drained by the Atoyac, Salado, and other streams. The soil of the river valleys is fertile, and rice, sugar, coffee, cotton, etc., are cultivated. Cattle are reared, and minerals found, but not exploited to any extent. Cotton thread, calicoes and printed goods are manufactured in considerable quantities at the capital, Puebla, and at Atlitico. The area is 13,124 sq. m. Pop. 1,294,620. *Prom.* Pway-blah.

Puebla. Third largest city of Mexico. The capital of the state of Puebla, it stands on the Atoyac river, 65 m. S.E. of Mexico City, at an alt. of 7,200 ft. In the locality are several lofty mountains, among them Orizaba and Popocatepetl. One of the oldest and finest cities of the republic, Puebla has a handsome cathedral, little inferior to that in Mexico City, a state government building, the palace of justice, a state college, an episcopal palace, the Palafoxiana library, and an academy of fine arts. The industries include ironfounding, distilling, flour-milling,

and the manufacture of cotton and woollen goods, tobacco, bricks, glass, and boots and shoes. The town is an important rly. junction having connexions with Mexico city, the port of Vera Cruz, and Oaxaca and other towns of the S. The road to Mexico city is first-class, as is that to Oaxaca. Founded in 1530, Puebla was occupied by the Americans in 1847, besieged by the French in 1862, and captured by them in 1863. It figured in the revolutionary troubles of 1914-15. Pop. 137,930.

Pueblo. City of Colorado, U.S.A. The second largest city of the state, and the co. seat of Pueblo co., it stands on Arkansas river, 122 m. S.S.E. of Denver, and is served by the Atchison, Topeka, and Santa Fe, and other rlys. The city possesses a state mineral palace, containing gigantic bronze statues of King Coal and Queen Silver. An important distributing centre, Pueblo is celebrated for its iron and steel industries, and has large smelters, foundries, and boiler works, great stockyards, and furniture and firebrick factories. The Climax mine produces 85 p.c. of the world's molybdenum. Pueblo is the market for the cattle, alfalfa, and sugar-beets produced in the great irrigated dist. which extends 250 m. along the Arkansas, and of which it is the centre. In the neighbourhood are deposits of coal and other minerals, and large oil-fields. Pueblo was founded in 1859, and became a city in 1873. Heavy loss of life and great damage to property were caused by floods in June, 1921. Pop. 52,162.

Pueblo Indians (Span., village). Term denoting various N. American Indian tribes in Arizona and New Mexico. For the former see Hopi; the latter number approx. 10,000. A pueblo usually comprises a many-chambered stone or adobe edifice of six or seven storeys, the roofs forming receding terraces. The cliff-dwelling and the Mexican *casa grande* represent early types of the pueblo culture, developed

Puebla, Mexico. Façade of the cathedral, showing the west doors and towers. See page 6752

under the economic pressure of a deficient water supply. Monogamy prevails. The women build the houses, and make the best N. American Indian pottery; the men cultivate crops and are the best N. American Indian weavers.

Their elaborate ceremonies, in underground halls (kivas), are mainly rain making rites. See American Indians; Zuni.

Pueblo Nuevo del Terrible. Industrial town of Spain, in the prov. of Cordova, 50 m. N.W. of the city of Cordova. It is the centre of an important mining region, with foundries of lead, zinc, and other metals. Pop. 17,500.

Puelche. South American Indian tribe in Central Argentina. An offshoot of the Chilean Araucanians, they intermingled with the Pampas Indians and the Patagonians, and produced various hybrid strains to which their name is loosely applied. Mostly wild, nomad horsemen, they migrated beyond the Rio Negro.

Puente del Inca (Sp., Inca bridge). Tourist centre of Argentina, about 70 m. W. of Mendoza. It is on the route of the Andean pass of Uspallata (q.v.), which is traversed by the Transandine rly. to Valparaiso. Here are a natural rock bridge and hot springs close to the great statue of Christ on the Argentine-Chilean border.

Puente Genil. Town of Spain, in the prov. of Cordova. It stands on the river Genil, 48 m. by rly. S. of Cordova, and is a junction for the rly. to Jaén. The name is derived from a bridge (Sp. *puente*) over the Genil, uniting the old, higher town with the lower. It manufactures olive oil, flour, and linen goods. Pop. 19,400.

Puerperal Fever (Lat. *puer*, child; *parere*, to bear). Form of blood poisoning due to infection by micro-organisms during or shortly after the process of childbirth. This disease was at one time very common, and was responsible for a high mortality among mothers. The use of anti-septic methods, entailing scrupulous cleanliness on the part of doctor and midwife, and thorough sterilisation of all instruments and appliances used, has reduced the incidence of the affection to a very low figure; and penicillin and the sulpha drugs have been used with good effect.

Puerperal Insanity. Name given to mental derangement associated with pregnancy or parturition. The conditions which most frequently predispose towards puerperal insanity are hereditary influences, seduction, shame, shock, and exhaustion following disease, frequent pregnancies, or prolonged lactation. The liability to insanity is greater in the first pregnancy than in succeeding ones. Four divisions are generally recognized: insanity of pregnancy, insanity of labour, insanity of the puerperium, and insanity of lactation.

Insanity of pregnancy first manifests itself about the third month, and most frequently takes the form of melancholia. Sometimes it is associated with a firm belief that the confinement will be fatal. Delusions and hallucinations may appear, and the woman may show a strong aversion to her husband. There is considerable risk of suicide in this condition.

In regard to the second division, insanity of labour, violent delirium occasionally occurs during the process of labour if the pains are severe, particularly if the woman is alone and without assistance. Recovery, as a rule, occurs rapidly after the child is born.

Insanity of the puerperium is insanity developing within the first two months after delivery. The form may be either mania or melancholia. Soon after delivery there may be acute delirium, generally passing off in a few days or weeks. Premonitory symptoms are insomnia and irritability. Hostility may be displayed towards the husband, nurse, or child. Delusions and hallucinations may be present. Suicide or injury to the child may be attempted.

The term insanity of lactation is applied when the symptoms begin from two to eighteen months after delivery. Melancholia is the most

Pueblo Indians. Left, an old hunter from New Mexico. Right, a chief from Rio Grande

frequent type, sometimes interrupted by periods of excitement. See Mental Disorder.

Puerto Cabello. Main street of the Venezuelan town

Puerperium. Period following the birth of an infant during which the mother is recovering from the effects of labour. It may be regarded as extending in normal cases over five or six weeks. During this period the uterus or womb undergoes involution, *i.e.* gradual reduction in size, and the secretion of milk in the breasts becomes established. The puerperium is a physiological state, and although the woman requires special attention and care during this time, it should not be regarded as identical with illness. The pulse after delivery is usually slower than normal, and the temperature may for a few days be raised to 100° while the flow of milk is being established. Slight disturbance may cause the temperature to rise readily to 101° or 102°, but if the rise persists for any length of time, it may be a sign of untoward developments necessitating careful examination.

The mother should keep more or less in bed until from the tenth to the fourteenth day after delivery, and thereafter should daily accustom herself to gradually increasing physical effort. See Obstetrics.

Puerto Barrios. Seaport of Guatemala, Central America. It stands on Amatique Bay, an inlet of the Caribbean Sea, and has a sheltered harbour which handles three-quarters of the country's imports. It is the terminus of the rly. which connects with the ruined city of Guatemala la Nueva, and thence to the Pacific. Pop. 26,000.

Puerto Cabello. Venezuelan seaport, in Carabobo state. It stands on the Golfo Triste, about 30 m. by rly. N. of Carabobo, and 80 m. W. of Carácas. The town is well provided with wharves and warehouses, and has a custom house, municipal buildings, etc.

It is the second greatest export centre of the country. The chief exports are coffee, cocoa, sugar, cinchona, dye-woods, rubber, cattle, and animal products. There are saw-mills, cotton mills, and cigarette factories. In 1743 it resisted the attack of a British squadron, and in 1823 the last battle in the war of independence was fought here. The fortifications were destroyed

during the Anglo-German blockade of 1902-03. Population est. 25,000.

Puerto Cortés, formerly CABALLOS. Seaport of Honduras, Central America. It stands on the Gulf of Honduras, 9 m. N.N.E. of Omoa, and is the second port of the republic. It is the terminus of the rly. to the interior and La Brea on the Pacific. The harbour, the best on the N. coast, is spacious, sheltered, and deep, and the exports include cattle, hides, bananas, coffee, cedar and mahogany, vanilla, rubber, and gold. A large trade in cattle is carried on with Mexico. Pop. est. 7,000.

Puerto de Santa Maria, EL. Seaport of Spain, in the prov. of Cadiz (known throughout Andalusia as El Puerto). It stands on the river Guadalete, at its entrance to the Bay of Cadiz, 8 m. N.E. of Cadiz, on the rly. to Seville. It has a Moorish citadel, a 13th century Gothic church, a Jesuit college, and a celebrated bull-ring. Founded by the Romans, ruined by the Arab invasion, and rebuilt in 1264 by Alphonso X of Castile, it was a rich and populous town until the beginning of the 19th century. Its main industry now is the wine trade. Sherry is exported in large quantities, and large stone warehouses, or bodegas, for the storage of the wine have been erected. Salt is also exported. Manufactures include liqueurs, brandy, soap, starch, and glass. Population 19,800.

Puerto Deseado. Seaport of Argentina. On the E. coast of Patagonia, it lies 40 m. S. of Cape Blanco and at the mouth of the Deseado river. It is the terminus of a short rly. to C. Las Heras. In 1520 it was visited by Magellan.

Puertollano. Town of Spain, in the prov. of Ciudad Real, at an altitude of 2,400 ft. It is on the

Madrid-Badajoz rly., 30 m. S.W. of the city of Ciudad Real. Puertollano owes its prosperity to important coalfields in the vicinity, worked since 1873. Pop. 23,000.

Puerto Madryn. Seaport of Argentina, in the terr. of Chubut. It stands on the Nuevo Gulf, and is the coast terminus of the rly. to Trelew, a Welsh settlement, and Gaiman.

Puerto Montt. Seaport town of Chile, capital of the prov. of Chilhoe. It stands on the Reloncavi Bay, at the head of Ancud Gulf, 60 m. direct E.N.E. of Ancud, and is connected by rly. with Valdivia, 125 m. to the N.N.W. Amid enchanting scenery, it is the base for excursions to the Chilean lakes. It has an excellent harbour, and exports timber, wheat, and leather. Pop. approx. 45,000.

Puerto Plata. Seaport town of Santo Domingo, W. Indies. It stands on the N. coast, with a sheltered harbour, and is a cable station connected with St. Thomas, Leeward Isles. It has connexion by rly. with the interior, and by steamship with the U.S.A. and Europe. Of considerable commercial importance, it exports tobacco, cocoa, coffee, bananas, dyewoods, cotton, etc. Pop. 11,777.

Puerto Principe. Former name of a province and city of Cuba now called Camaguey (*q.v.*).

Puerto Real (Port Royal). Seaport of Spain, in the prov. of Cadiz. It stands on the Bay of Cadiz, 6 m. E. of Cadiz, on the Seville-Cadiz rly. The Portus Gadetanus of Roman days, it was rebuilt 1483-88, by Ferdinand and Isabella, and is now chiefly a sea-bathing resort. It has a 16th century church and a fine town hall. The chief exports are wine, oil, and salt. Shipbuilding and repairing are engaged in. Pop. 10,400.

Puerto Rico. Island in the W. Indies, formerly called Porto Rico, and a possession of the U.S.A. The easternmost and smallest of the Greater Antilles, it lies 75 m. E. of Haiti, and measures 100 m. by 38 m. It is crossed from E. to W. by mountain ranges, on either side of which rich alluvial lands stretch down to the sea. The rivers, which flow generally N. and S. from the centre of the island, are numerous, among the principal of them being the Loiza, Arecibo, Plata, and Bayamon.

Puerto Rico arms

The elevated parts of the island are covered with fine forests of palms, sandal-wood, cedar, willow, and various fruit trees. The sugar industry produces over 700,000 metric tons annually. Much rum is made and tobacco is raised, and a high-grade coffee is shipped abroad. Pineapples and coconuts are also important exports and others are cigars, molasses, hats, fibres, and hand embroidery. Exports of fruit are increasing rapidly. Gold and other minerals exist, but are little exploited, and manufactures are undeveloped. Rly. transport facilities are almost confined to the coastal rlys., which nearly encircle the island. The capital is San Juan; other large towns being Ponce and Mayaguez. Discovered by Columbus in 1493, the island was settled by Juan Ponce de León in 1510. It remained a Spanish possession down to 1898, when it was ceded to the U.S.A. by the treaty of Paris, Dec. 10, 1898. Two years later civil government was established. An earthquake, Oct., 1918, killed over 100 persons, rendered thousands homeless, and caused damage estimated at \$800,000. Air services connect the island with the U.S.A., Central and

Juan Pueyrredón, Argentine soldier

virtually brought the Argentine nation to a sense of its strength. After the founding of the United Provinces of the River Plate, 1816, Pueyrredón was proclaimed dictator, and wisely guided the young republic until 1825, living in retirement during the disturbed times that followed.

Pufendorf, SAMUEL VON (1632-94). German jurist. Born at Chernitz, Jan. 8, 1632, he was educated at Leipzig and Jena. In 1661 he made a name by his Latin work on the Elements of Universal Jurisprudence, for which he was chosen

vice-royalty of Buenos Aires, he rose to the rank of general, distinguishing himself especially in the fighting against the British during 1806-07, which

of Sweden, 1677, and in 1688 to the elector of Brandenburg. He died in Berlin, Oct. 26, 1694. Pufendorf's greatest work is his *De Jure Naturae et Gentium*, 1672, and he is also known by some historical writings and owing to his disputes with Leibniz.

Puff Adder (*Crotho arietans*). Venomous serpent, found in Africa. It is repulsive in appearance, having a very large, flattened head and thick and triangular body, 4 to 5 ft.

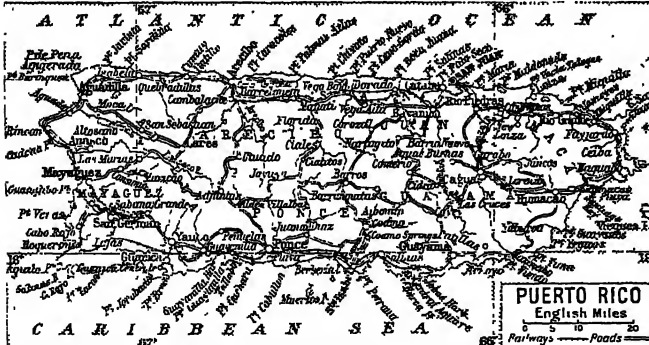

Puff Adder. Venomous African snake. Left, distended jaws showing the poison fangs

long, usually mottled with various shades of brown on the back and sides and yellowish-white beneath. When angry they draw in their breath and inflate their bodies, whence their popular name. Their venom is very virulent, and their habit of lying half-concealed in the sand and not attempting to go away when approached makes them very dangerous to unsuspecting travellers.

Puff-ball (*Lycoperdon*). Genus of fungi of the family Lycoperdaceae. The spore-bearing portion of the fungus is enclosed in a continuous wall of two layers, of which, by expansion of the inner, the outer layer breaks up into spines or warts. When the spores are ripe the inner wall opens at the apex to release them. Two common and graceful forms, covered with short spines or pointed warts, are *L. gemmatum* and *L. pyriforme*, which are edible whilst the flesh is still white. The allied giant puff-ball (*Calvatia gigantea*) also affords food before the flesh turns brown. See Fungus.

Puffin (*Fratercula arctica*). Sea bird belonging to the auk family. The plumage is black on the crown, back and wings, and white elsewhere. The bird is remarkable for its very large, adze-shaped beak, which is striped with brilliant red and orange. The decorations of the bill are shed in winter. It is found mainly on the N. shores of Great Britain, the N. temperate zone, and the Arctic, nesting in holes in the ground and crannies in the rocks, and often taking

Puerto Rico. Map of the island in the West Indies, ceded to the U.S.A. in 1898

South America, and the West Indies. The prevailing language is Spanish, but English is also spoken. Area, 3,423 sq. m. Pop. 1,869,255, about two-thirds being whites. Consult Puerto Rico and its People, T. White, 1938.

Puerto Varas. Town of Chile, in the prov. of Valdivia. Situated 120 m. S. of Valdivia, it is a centre for visiting the "Switzerland" of Chile, where there are many famous beauty spots. It stands on Lake Llanquihue and is connected by rly. with Santiago. Pop. 45,000.

Pueyrredón, JUAN MARTIN DE (1777-1850). Argentine soldier and statesman. Born in Argentina one year after the creation of the

professor at Heidelberg. In 1670 he went to Lund as professor, became historiographer to the king

Puffin. Sea-bird with large brilliant-coloured beak

possession of rabbit burrows. In St. Kilda puffins are so numerous that the ground is in places honey-combed with their holes. They feed upon small fish, and can store quite a number in the large beak when collecting food for their young. In winter most of the birds migrate to the Mediterranean. See Auk; Lundy.

Puffing Billy. Name of the oldest railway locomotive in existence. Built in 1813 by Jonathan

Puffing Billy. The oldest railway engine in existence

Foster under William Hedley's patent, it was used for hauling coal trucks at Wylam colliery, Northumberland. It was the first railway engine to trust to its own weight for adherence to the track; for Trevithick's rack engine of 1804 had toothed wheels engaging with a rail. Puffing Billy is now in the Science Museum, London. See Locomotive illus. p. 5223.

Puffin Island. Islet of N. Wales. Known also as Priestholm, and by the Welsh as Ynys Seiriol (Seiriol's Island), it is off the N.E. coast of Anglesey, opposite Penmon lighthouse, and is about $\frac{1}{2}$ m. in length. Seiriol, a religious recluse of the 6th century, had a cell here. The island is famous as the resort of puffins.

Pugachev. Town of R.S.F.S.R., in the region of Saratov. Formerly known as Nikolaevsk, it is on the Irghits, and is situated 100 m. S.W. of Samara. The centre of an agricultural area, it does trade in corn and cattle. Pop. est. 13,000.

Pug Dog. Small dog of the mastiff group. It somewhat suggests a diminutive bulldog, from which it has probably been derived by a long process of degeneration. It is believed to be of Dutch origin, and was introduced into Great Britain

Pug Dog. Specimen of the toy breed

in the time of William of Orange, being known as the Dutch pug. Its skull is broad, with a very

short muzzle, the tail curls and lies close to the body, and the hair is very short and usually fawn-coloured or black. One of its essential points is a black mole on each cheek, with a tuft of hairs growing from it. The pug is probably the most indolent of all dogs and loves to be pampered, for which reason it has a great tendency to put on fat. See Dog, colour plate.

Puget, PIERRE (1622-94). French sculptor, architect, and painter. Born at Château Follet, near Marseilles, Oct. 31, 1622, he studied in Italy. He painted several pictures for his native place, but is better known by his sculpture, for which he was employed on public works by Fouquet and Colbert. His Milo of Crotona and Perseus and Andromeda were erected in the park at Versailles, and there is a Puget room in the Louvre. He died at Marseilles, Dec. 2, 1694.

Puget Sound. Irregular inlet in the N.W. of Washington, U.S.A. An arm of the Pacific Ocean, with which it communicates by Juan de Fuca Strait, it has many branches and extends for a long distance into the interior of the state. Its length is 125 m. and breadth 5 to 25 m., and it is navigable throughout. On its shores are the ports of Tacoma, at its head, Seattle, and Port Townsend.

Puggaree (Hind. *pagri*, turban). Long, light scarf formerly worn round the helmet as part of the British soldier's clothing in hot climates.

Pugilism (Lat. *pugil*, boxer; from *pugnus*, fist). Term formerly used for the now obsolete bare-knuckle fighting, sometimes applied to modern boxing (*q.v.*).

Pugin, AUGUSTUS WELBY NORTHMORE (1812-52). British architect. Born in London, March 1, 1812, he was educated at Christ's Hospital. He was employed on stage scenery and other ventures, but soon turned to architecture, and having embraced Roman Catholicism, designed many churches for that communion, including the cathedral of St. George, Southwark. When the new houses of parliament were projected, he was called upon by Barry to provide the whole of the detail drawings.

Pugin lived at Salisbury and then at Ramsgate, building in the latter town a house and a church of his own. He had a profound belief in the close connexion between Gothic architecture and Christianity, and published his critical Contrasts; or a Parallel between

the Architecture of the 15th and 19th centuries, 1836, and The True Principles of Christian Architecture, 1841. In the last year of his life he became insane through overwork, and he died at Ramsgate, Sept. 14, 1852. See Killarney. Consult Lord Shrewsbury, Pugin, and the Catholic Revival, D. Gwynn, 1946.

Pugliese Aqueduct. Engineering work in Italy. One of the largest of its kind in the world, it was completed in 1917. To carry water from the Apennines to the S., its main line goes for 133 m. from Caposele to Villa Castelli in Apulia; there it is divided. One short branch goes to Foggia, and the other to Bari, Lecce, and Taranto. Altogether the work distributes water to 536 towns and about 2,000,000 people. In the main line there are 97 tunnels, three of them more than 9 m. long.

Puisne Judge. Official of various courts of law in the English high court. On the common law side all judges except the chief justice are called *puisne* judges. The term is used in America, India, and the British dominions where the courts are constituted of a chief justice and other, inferior, judges. It is derived from old French *puisé*, younger and so inferior, from Lat. *post natus*, born after. Pron. like puny.

Pukapuka, or DANGER Is. One of the Cook Islands. It trades in citrus fruits, bananas, copra, etc., mainly with New Zealand. Pop. 660.

Pulacayo. Town of Bolivia, in the department of Potosi. It is celebrated for the Huanchaca silver mines, among the largest in America. The rly. runs to Uyuni, attaining an alt. of 13,700 ft. and giving a fine view of Andean peaks and volcanoes. Pop. 4,000.

Pulaski, CASIMIR (1748-79). Polish soldier. Born at Wincary, Podolia, March 4, 1748, he fought for Polish freedom against Russia and became commander-in-chief. The attempt to prevent a partition of Poland having failed, he migrated to America, and took part in the War of Independence with Kosciuszko and Lafayette, fighting with especial distinction at Brandywine and Germantown, and raising a corps known as the Pulaski legion. Wounded at the siege of Savannah, Oct. 9, 1779, he died two days later.

A. W. N. Pugin, British architect

Pulborough. Market town of Sussex, England. It stands on the Arun, 11 m. by rly. S.W. of Horsham. The large church, partly E.E., contains some old brasses. Corn and cattle markets are held. An old pack-horse bridge is preserved. Pop. 2,000.

Pulci, LUIGI (c. 1432-87). Italian poet. He was born at Florence, and enjoyed the patronage of Lorenzo de' Medici, on whose behalf he more than once acted as confidential ambassador. Pulci's chief work is *Il Morgante Maggior* (The Giant Morgante), 1481, a chivalrous romance, the central figure of which is rather Orlando than the giant whom he subdued. This is the first great modern example of burlesque poetry. Byron translated the first canto. *Consult* The Renaissance in Italy, J. A. Symonds, new ed. 1897-99.

Pulex. Genus of insects including the cosmopolitan human flea, *Pulex irritans*. The adults suck blood with their piercing mouthparts. They are often found on the badger and fox in addition to man. The larvae are active, vermiform creatures about 4 mm. long when mature; they do not suck blood, but live in cracks of floors, under carpets, feeding on particles of organic matter among the dust and dirt. The punctures made by *Pulex* are irritating to most people, although some appear to be immune. Application of dilute ammonia often allays the irritation.

Pulikat. A town of Madras state, India, in the Chingleput dist. It is situated at the S. end of Pulikat Lake, a shallow coastal lagoon of brackish water connected to the Buckingham Canal. It was formerly the chief settlement of the Dutch on the Coromandel coast. It is on the coast rly. N. from Madras. Another spelling is Palghat, not to be confounded with the town of that name in the Malabar dist. Pop. 9,500.

Pulitzer, JOSEPH (1847-1911). American journalist. Of Jewish descent on his father's side, he was born at Budapest, April 10, 1847. Going to the U.S.A. in 1864, he served in the 1st New York cavalry during the Civil War. In 1876-77 he was correspondent of the New York Sun in Washington and Europe, and in 1878 he bought the St. Louis Dispatch, which he amalgamated with the Evening Post as the Post-Dispatch. He acquired in 1883 and greatly developed the New York World. He founded and endowed the school of journalism at Columbia university. In later years he

suffered from loss of sight, but retained undiminished his interest in journalism until his death on Oct. 29, 1911. The prizes for which his will provided are mentioned separately below. *Consult* Life and Letters, D. C. Seitz, 1926.

Pulitzer Prizes. Foundation established in the U.S.A. in 1918 under the will of the above Joseph Pulitzer. Twelve prizes of \$500

are each awarded annually as follows for the best work accomplished by Americans in various fields during the previous year. One is given to the newspaper that has rendered the most disinterested and meritorious public service. Others go to individuals for the most distinguished reporting, Washington or foreign correspondence, editorial writing, cartoons, and news photography. The remaining prizes recognize the most meritorious novel; play representing the educational power of the stage; book on the history of the U.S.A.; biography teaching patriotism and unselfish service; and volume of verse. There is a similar prize for the best musical composition. Awards are made by the trustees of Columbia university on the recommendation of the advisory board of its school of journalism. *See* Literary Prizes.

Pulkova. Village of N.W. Russia. It is situated on a mountain ridge 10 m. S. of Leningrad. Here was the famous observatory built by the tsar Nicholas I in 1839 and totally destroyed by German bombs in 1941. In the construction of Russian maps the meridian of Pulkova (30° 19' 40" E. of Greenwich) was formerly used.

Pullet. Name applied usually to a hen chicken in its first year. The Royal Agricultural Show committee, however, restrict its use to birds hatched in the year of the show held in June. *See* Ancona Fowl; Fowl; Poultry.

Pulley. Wheel with a flat, convex, or grooved rim, mounted on a shaft or pin upon which it is free to revolve or which is free to revolve with it. A grooved pulley

is for use with ropes or chains, the groove serving as a guide to prevent the rope from slipping off. Pulleys with wide, flat, or convex rims are used in conjunction with flat belt driving; a convex rim serves to keep the belt central on the pulley.

Fig. 1 represents a pulley secured by its block or frame to a beam, with a cord passing over it

on the ends of which weights W and W^1 are hung. As the distances d and d' are equal, by the law of the lever it follows that W and W^1 must be equal in order to balance each other. The same condition applies if the pulley be omitted and the cord passed over a fixed pin, but in practice a pulley serves to lessen friction—the larger the pulley the less the friction.

If, as in Fig. 2, one end of a cord be secured to a beam and passed round the movable pulley A and the fixed pulley B , W will require only half its weight applied at P to balance it, for W is virtually suspended by two cords, and half its weight is borne directly by the beam, whilst the pull of the other half $W/2$ passes over the pulley B . By increasing the number of movable pulleys the effort of P to balance W is decreased by one-half for every pulley; thus in Fig. 3, P and W are in equilibrium when $P = W/(2 \times 2 \times 2) = W/8$. Combinations of pulleys are known as systems. Fig. 4 indicates the second system, in which the same cord passes round all the pulleys, and in this case W is equally distributed between the four cords 1, 2, 3, and 4, from which it follows that $P = W/4$. The practical application of this system is seen in blocks and tackle. The first system is illustrated by Fig. 3, in which there is a separate

cord for each movable pulley, one end of which is secured to a beam. In the third system, shown in Fig. 5, the ends of the separate cords are all attached to the weight, the cord 2 sustains twice the weight of No. 1, the cord 3 twice that of No. 2, and the cord 4 twice that of No. 3, and $W =$ the total pull of the 4 cords, or to express it as a formula, $W = P + 2P + 2^2P + 2^3P = 15P$, whilst the reaction of the beam is given by $W + P = 16P$.

Pullman. District of Chicago, U.S.A. It was founded in 1881 by G. M. Pullman as a proprietary utopia for his employees. Charges of undemocratic town management culminated in an extensive strike in 1894. Thereupon the court ruled that the Pullman company was exceeding its charter in leasing houses to its workers, and Pullman was incorporated in the city of Chicago. Another Pullman is a city of Washington, seat of the state college for science and agriculture, 80 m. S. of Spokane.

Pullman, GEORGE MORTIMER (1831-97). American inventor. Born in Chautauqua co., N.Y., he began business first as a cabinet-maker and then as a building contractor. In 1863 he built the first Pullman sleeping-car. He carried out further improvements in railway carriages, and in 1887 invented the corridor train and introduced dining-cars. He made a large fortune, and founded the

George M. Pullman,
American inventor

model town of Pullman (*v.s.*), afterwards incorporated with Chicago. See Railways.

Pulp. Word used in a number of senses: (1) Material of which paper is made when ground up and mixed with water. (2) The soft part of any fruit, *e.g.* the pulp of an orange. (3) In mining, the pulverised ore mixed with water. (4) In dentistry, the soft sensitive tissue filling the central cavity of teeth. See Dentistry; Paper.

Pulpit (Lat. *pulpitum*, scaffold, stage, or desk). In ecclesiastical architecture, an enclosed stage or platform, raised above the level of the ground and congregation, from which the preacher delivers his sermon. Some have canopies or sounding-boards. The traditional place for the pulpit is on one side of the nave, often being built against one of the

pillars dividing the nave from the north aisle; the handsomest examples, however, in point of design and carving, are independent structures. The marble pulpits of Siena cathedral and the

Pullman Cars. Exterior and interior of a modern British Pullman car, the forerunner of which was invented and built by George Pullman in 1863

Baptistery at Pisa, both sculptured by Pisano, are masterpieces. Wooden examples of the Low Countries include many splendid specimens of carving. Pulpits for preaching were occasionally erected in the open, *e.g.* the famous pulpit by Donatello attached to the wall of the cathedral at Prato. Detached open-air platforms were used in England in the 16th and 17th centuries. See Mahomedan Art; Preaching.

Pulque. Alcoholic beverage made by the natives of Mexico and Central America from the fermented juice of cacti or agaves. A favourite drink with the natives, to Europeans it has a sour, unpleasant taste.

Pulpit. 1. Hexagonal pulpit by Niccolò Pisano, 1260, Baptistery, Pisa. 2. Carved wooden pulpit, in mosque of Ala-ed-din Konieh. 3. Modern marble, St. Albans Cathedral, Herts

Pulse (Lat. *puls*, meal, pot-
tage). Collective term for peas
and beans and other leguminous
plants and seeds.

Pulse (Lat. *pulsus*, beating).
Expansion and contraction of an
artery, caused by variations in the
volume of blood propelled into the
circulation at each beat of the
heart. The pulse can be felt with
the finger in any artery lying just
beneath the skin, but is most con-
veniently examined in the radial
artery a little above the wrist.

The pulse varies in rate, strength,
regularity, and tension, and the
character of each of these attri-
butes furnishes information valu-
able in the diagnosis of certain
conditions, constitutional or in-
fectious, and of various affections
of the heart or arteries. At birth
the pulse rate is between 130 and
140 beats a minute, and this
gradually decreases during child-
hood, the rate in healthy adults
being from 70 to 80. In old
age the rate is usually from 65
to 70. The average pulse rate in
women is a little higher than that
in men of the same age. The rate
is increased by muscular effort,
fever, anaemia, and some other
diseases, and is slower than normal
in certain physical and nervous
disorders. A very common cause of
irregularity in the pulse is ex-
cessive smoking. *See* Anatomy;
Artery; Blood.

Pulse Modulation. Method of
radio transmission. Radio tele-
phony is accomplished by the
modulation of a carrier wave. In
ordinary broadcasting and in the
trans-Atlantic telephone service,
the carrier is a series of continuous
waves; modulation consists in
causing the transmitted sound
waves to effect alterations, cor-
responding to their frequency,
intensity, and duration in either
the amplitude (amplitude modula-
tion) or the frequency (frequency
modulation) of the continuous-
wave carrier. During the Second
Great War a new technique was
developed. In this the carrier
consists of brief, recurrent bursts
of radiation called pulses. Be-
tween pulses the transmitter is
quiescent; for the duration of
each pulse it transmits at full
power. A pulse transmission may
be modulated by the sound waves
in different ways.

In the diagram (a) is indicated
how pulse amplitude modulation
"spells out" the message by a
variation of the energy conveyed
by individual pulses. Pulse fre-
quency modulation is illustrated
at (b) and pulse width modulation

(or pulse duration modulation) at
(c). There are other possible
methods of pulse modulation. A
practical application is illustrated
at (d). A British army wireless
equipment developed during the
war could send eight separate

Pulse Modulation. Diagram showing
various methods of pulse modulation.
See text

messages simultaneously on the
same wavelength. The ampli-
tude-modulated pulses numbered
1 after each synchronising pulse
conveyed the first message; those
numbered 2, the second message;
and so on. The receiver was so
arranged that each section of it
responded only to those pulses
which occurred a definite fraction
of a second after each synchronis-
ing signal. Each message was thus
automatically sorted out from
the others.

Pulse transmission may be
applied to ordinary broadcasting.
It can be carried
out only on the
very short waves
(very high fre-
quencies); but
such wavelengths
have come in-
creasingly into
use. It has be-
come possible to
broadcast 8 or 10
different pro-
grammes simulta-
neously from one
pulse-modulated
transmitter. The
listener can then
take his choice
without altering
the tuning, by
merely pressing a
numbered button
in the receiver.

Pultusk. Town of Poland. It
stands on the Narew, in the co.,
and 35 m. N., of Warsaw. Its
trade and industries are unim-
portant. The ancient castle was
formerly a residence of the bishop
of Plock. Pultusk was the scene
of the victory of Charles XII of
Sweden over the Saxons in 1703,
and of the French over the Rus-
sians, Dec. 26, 1806. Population
(estimated) 20,000.

Pulverised Fuel. Fuel used
in industrial processes. Boilers
using it require a pulverising plant
to reduce the solid fuel to a fine
powder. Nozzles are provided,
through which the powdered fuel
is blown, mixed with air, having
a high degree of turbulence.
Partial combustion occurs, re-
sulting in an intensely luminous
flame, radiating heat to banks of
tubes enclosing the combustion
space, and is completed by a
secondary air supply. Preheating
the air supply by means of the
waste gases reduces the amount
of air required. Fuels with a high
ash content are not satisfactory,
since there is a deposit of fine
dust or fused ash on the water-
cooled surfaces which impairs
their efficiency. The disposal of
the dust also presents a difficult
problem. Pulverising plant may
consist of a bin and feeder system,
in which a single pulveriser is
used for a number of boilers, or
a separate pulveriser for each
boiler, usually of the ball and
roller type, with direct feed to the
boiler. Preliminary heating is
usually necessary in order to
reduce the amount of moisture.
See Combustion; Fuel.

Puma (*Felis concolor*). Large
carnivorous mammal of the cat
family, widely distributed through

Puma. Male and female of *Felis concolor*, a large
American member of the cat tribe
Gambier Bolton, F.Z.S.

N. and S. America. It is easily recognized by its size, the body being nearly four feet long, and its uniform and unspotted tawny colour. Young animals are profusely spotted with black and have ringed tails, but they assume the colour of their parents when about six months old. There are several local varieties.

In N. America the puma is commonly known as the mountain lion or the panther, while in S. America it is called the lion or cougar. Native Indians call it "the friend of the Christian," on account of its harmlessness to man and its tendency to accompany him—apparently out of curiosity. But it is a dangerous foe to horses, cattle, deer, and dogs, and does great damage in the neighbourhood of farms and cattle ranches. In the forest regions it preys chiefly on monkeys and rodents. It usually spends the day in sleep, and roams

by night in search of prey, which it kills by leaping on their backs and breaking their necks. A puma has been known to clear nearly 40 ft. in a horizontal leap and 20 ft. in a vertical one. It makes its lair in cavities in the rocks, and usually produces from two to four cubs in a litter. In captivity it is usually gentle and easily tamed.

Pumice or Pumice Stone. An effusive igneous rock possessing a spongy texture. Grey in colour, it has been formed by the expansion of occluded gases when the molten rock reaches the surface. Pumice stone is characteristic of lavas of rhyolitic composition, and is extensively used as a polishing, smoothing, and cleaning stone. Ground to a powder and mixed with soaps, it forms a constituent of many metal polishes.

The finest pumice stone is obtained from the Lipari Islands. See Rhyolite.

PUMP AND PUMPING MACHINERY

John G. Day, A.M.I.Mech.E.

The scientific basis of pumping and the principal types of pumps in common use are here described. Further relevant information appears under Air-Pump; Compressed Air; Hydraulics; Vacuum; Water Supply, etc.

A pump may be defined as a machine for moving and elevating liquids. Fig. 1 illustrates graphically some of the principal terms used in pumping. Total static head is the vertical height through which the liquid has to be raised, total pump head is the total static

head plus friction loss and velocity head. Friction loss is the loss of energy due to friction set up between the water and the inside surface of the pipe. It varies approx. as the square of the velocity of water in the pipe, with the roughness of the surface of the

pipe, and with its length. Other factors which increase friction losses are sudden changes in direction, due to sharp bends, sudden changes in diam., and obstructions created in pipes by certain types of valve. Energy thus has to be imparted by the pump to overcome friction; this additional head is frequently expressed as friction head. Velocity head represents the head in ft. due to the velocity of water in the pipe; it is usually extremely small and can be neglected in calculations.

The total delivery head against which a pump will work depends solely on the power exerted by the pump, but the suction lift is limited by the pressure of the atmosphere. This latter pressure will support a column of water approx. 34 ft. high and it therefore follows that theoretically the maximum height to which water can be lifted by creating a perfect vacuum in the suction pipe is 34 ft. When due allowance is made for friction loss, velocity head, etc., and the practical impossibility of forming a perfect vacuum, a maximum suction lift of about 25 ft. is usually taken, and it is advisable to reduce this still further if possible. This applies to cold water only. For liquids other than water, suction lift is affected by the specific gravity and viscosity of the liquid. For pumping hot liquids, and in particular hot water, as in boiler feeding where the feed water temp. is high, the vapour given off by the liquid counteracts the atmospheric pressure on the surface of the liquid. It may even be necessary for the hot liquid to flow by gravity to the pump, that is, to have a positive head on the suction.

The chief classes of pump, according to their working principles, are:

(a) *Reciprocating Pumps.* These may be subdivided into (i) lift or suction pumps; (ii) lift-and-force pumps. The principle of the lift pump is illustrated in Fig. 2, which shows a simple hand pump, the most common form of lift pump. When the bucket B is raised a partial vacuum is formed below the bucket, causing the water to rise through the suction pipe, lifting foot valve A, and entering the barrel. During the down stroke the water is trapped by the closing of A and is forced through the valve in B, and eventually up through the delivery. The column of water below B is prevented from falling by atmospheric pressure acting on the level of water on the outside of the suction pipe. On the next up stroke of the bucket the water above B is carried upwards, and simultaneously more

Pump. Fig. 2. Diagram illustrating the principle of the lift pump. See text

Pump. Fig. 1. Illustrating some of the principal terms used in pumping

water is drawn into the barrel through A. This type of pump is single acting and discharges water on the up stroke of the bucket only. Theoretically, the quantity of water delivered during each up stroke is the volume displaced by the bucket, but in practice it is slightly less owing to a certain amount of "slip" past the valves and bucket. The ratio of the actual to the theoretical quantity is called the volumetric efficiency of the pump; in a good pump it is about 95 p.c.

Fig. 3 shows a single acting lift-and-force pump. The delivery valve B is in a separate chamber and not attached to the plunger. The plunger draws in water during the up stroke and forces it out through B during the down stroke. The delivery head against which

Pump. Fig. 3. Section of single acting lift-and-force pump. See text

the pump will work is limited only by the power exerted on the plunger during the down stroke, and by the strength of the pump casing to withstand the internal pressure due to the liquid. The solid plunger working through a watertight gland frequently replaces the bucket, particularly in pumps working under very high pressure, e.g. pumps for hydraulic presses.

Fig. 4 shows a double acting pump which delivers on both the in and the out stroke of the piston. There are thus two suction valves A1 and A2, and two delivery valves B1 and B2, A1 working simultaneously with B2, and A2 with B1. The delivery side of the pump is fitted with an air chamber, the function of this being to relieve the pump and pipes of sudden shocks, by virtue of the compressibility of the air in the upper part of the chamber. The air chamber also produces a more even flow in the delivery pipe and its use is absolutely imperative in the case of high pressure pumps.

The design of valve fitted to a reciprocating pump depends on the type of pump and the liquid

Pump. Fig. 4. Section of double acting pump. See text

being dealt with. The hinged flap valve is common in smaller pumps. Metal wing guided valves, conical and mushroom valves, and valves with rubber sealing disks are in wide use. For viscous liquids, ball valves may be preferable. Whatever the design of valve an ample area is necessary to allow the liquid to pass without raising the valve far from its seat. Wear increases rapidly with the lift of the valve, and a slow-closing valve results in loss of volumetric efficiency.

The reciprocating pump can be arranged for drive by steam engine, petrol and oil engine, and electric motor. To give a more even flow and turning moment and for other practical considerations, multi-barrel pumps are frequently used, common types being duplex (quad-ruple acting) bucket pumps and triplex single acting ram pumps. Fig. 5 illustrates a general purpose electrically driven duplex pump.

Pump. Fig. 5. A general purpose electrically driven duplex pump

The motor is situated on top of the crank case and the drive to the pump is taken through compound gearing, the whole of the motion work being totally enclosed in the crank case and automatically lubricated. This type of pump is used in mines, as is the horizontal triplex single acting pump. Some of the famous early steam engines of Newcomen and Watt were in actual fact steam driven reciprocating pumps, the engine driving the pump through a beam arrangement. Driving a pump thus formed one of the first practical uses of steam power. There are many fine installations of large vertical triplex ram pumps driven by triple expansion steam engines in water-works. In gas works, and where process steam is available, the direct acting steam driven simplex and duplex double acting pump is used for pumping tar, ammoniacal liquor, etc. The pumps used in conjunction with Pluto (q.v.) in 1944 were of the horizontal triplex ram type and could pump against pressures of 600 lb. per sq. in. Fig. 6 illustrates one of these pumps, which were petrol engine driven.

Special designs of reciprocating pumps are made for dealing with pitch at high temps., concrete, sewage, molasses, volatile substances, etc. In the Diesel engine

Pump. Fig. 6. Horizontal triplex ram type

the fuel is supplied and regulated accurately by a small plunger pump driven from the engine. As the time allowed for the injection of this exceedingly small quantity of oil is less than $\frac{1}{1000}$ sec., the efficiency of the engine depends upon the proper design and timing of these pumps. The pumps frequently have to deliver against pressures of 10,000 lb. per sq. in.

(b) *Centrifugal Pumps.* This type of pump has no valves or buckets, the main parts being an impeller

rotating in a volute casing. Fig. 7 shows a section of a typical centrifugal pump. The impeller A is mounted on a shaft B, and is open at the centre and divided into a number of compartments by vanes. These vanes are curved backwards from the direction of rotation. The centrifugal force produced by the rapid rotation of

Pump. Fig. 7. Section of a typical centrifugal pump. See text

the impeller forces the liquid out from the eye of the impeller to its periphery, thus creating a vacuum at the eye. This in turn induces the water to flow up the suction pipe and into the pump. On leaving the vanes the water enters the volute casing, which is so shaped that its area increases towards the delivery. The kinetic energy thus imparted to the water by the impeller is converted into pressure energy as the velocity is reduced till it reaches the delivery pipe. When the pressure becomes more than sufficient to balance the delivery head, flow takes place up the delivery pipe. The design illustrated is made in a standard range for quantities up to 3,500 galls. per min. and heads up to 200 ft., the figures referring to a rotational speed of 1,450 r.p.m. Efficiencies of over 85 p.c. are common. Many centrifugal pumps being designed to run at a rotational speed of 2,900 r.p.m., this type of pump is very suitable for direct drive from electric motor, oil or petrol engine, or steam turbine.

A very popular design of centrifugal pump for small installations is the self-contained motor pump (Fig. 8). Here the impeller is

mounted on an extension to the motor shaft, and the volute casing is bolted to the motor frame.

Pump. Fig. 8. A popular design of a centrifugal pump

Fig. 9 illustrates a very large pump, a motor car being shown in the delivery connexion to give some idea of the size. Three of these 102 in. pumps were supplied to the Middle Level Drainage Commissioners and installed at St. Germans, Norfolk, the capacity

Pump. Fig. 9. A very large pump with a capacity of 1,000 tons of water per min.

of each pump being 1,000 tons of water per min.

For very high heads, multi-stage pumps are used. These have several impellers mounted on a common shaft, and the liquid passes from one to the other through specially shaped passages, gaining pressure at every stage. The number of stages is rarely more than ten, and designs for heads up to 2,000 ft. are fairly common. Typical applications are boiler feeding, colliery drainage, water supply, hydraulic service. The multi-stage pump is made vertically for use in boreholes, the motor being fixed at the top. In the submersible borehole pump the transmission shaft is eliminated entirely, the motor driving the pump being made submersible and built as a unit with the pump, the complete unit suspended by a rising main from the well head, and cables led from the motor to the starter at ground level.

Special uses of the centrifugal pump, which has a very wide range of application, include dewatering and impounding of docks, sewage installations, dredging, dewatering of mines, marine work, waterworks, boiler feeding, hot oil pumping in refineries, irrigation, hydraulic pressure services. Fire-fighting units use a centrifugal pump driven by petrol or oil.

(c) *Rotary Pumps.* These are of the positive displacement type, usually without valves, and are compact. Constructed in many different designs, they are used chiefly for dealing with liquids, e.g. spirits, oils, beer, wines, petroleum products, thin tar, lard, which have a lubricative action and are free from grit, etc. Other uses are for circulating cooling water in internal combustion engine jackets, lubrication systems, operating hydraulic and machine tools, and for presses, cranes, and variable speed gears.

Fig. 10 shows a simple gear pump, probably the most common type. It consists of two toothed wheels mounted on parallel shafts and revolving in

Pump. Fig. 10. Common type of a simple gear pump

a surrounding casing bored to accommodate the rotors, and having inlet and outlet connexions cast integral. The spindle of one of the gear wheels is extended to form the driving shaft. Another type (Fig. 11) has rotors bored to fit loosely on eccentrics turned on the driving shaft, with a strip A held in position by a spring to separate suction

Pump. Fig. 11. A type of rotary pump. See text

from delivery. Other types have radial pistons operated by an eccentric on the rotating shaft, and are sometimes equipped with automatic stroke control.

(d) *Pumps Operated by Gas or Vapour.* Pumping liquids by means of compressed air, as in

the air lift, is a comparatively simple method and consists of forcing air into the open end of a rising main deeply submerged in the liquid (see Fig. 12). The air impregnates the liquid and reduces its density, with the result that the weight of a column of liquid and air inside the rising main is less than the weight of an equal column surrounding the rising main. The air escapes as large bubbles which form a succession of elastic pistons and push plugs of liquid upwards in front of them, the total volume of liquid in the delivery pipe at any instant being less than would be required to fill to the liquid level. The efficiency falls as the ratio of AB to BC increases, since a larger quantity

it forces the water in that chamber through the delivery valve and into the delivery pipe. When the

Pump. Fig. 13. Section of Pulsometer steam pump. See text

level of water in this chamber has fallen to a certain point, steam escapes in the delivery pipe and condensation begins. This condensation moves the ball over, closing the chamber, and the partial vacuum thus formed causes water to be drawn through the suction valve and into this chamber. Whilst this is going on, steam is entering the other chamber and expelling water from it until the condensation level is reached, when it starts to draw in more water. The Pulsometer steam pump is the modern counterpart of Savery's water-raising engine, the Miner's Friend, first patented in 1698, and works on exactly the same principle.

The hydraulic ram is an extremely simple and cheap device for raising water to a considerable height for domestic and industrial purposes and utilises the momentum of a volume of moving water to deliver part of that water to a greater height than its original head.

Pump. Fig. 14. Pump working on hydraulic ram principle. See text

Water falls through the drive pipe A (Fig. 14), the supply being taken from e.g. a stream, into a ram chamber wherein is a waste valve V1.

A delivery valve V2 is kept closed while V1 is open by the

greater pressure of water in the delivery pipe. When the velocity of water escaping through V1 reaches a certain figure, V1 is suddenly forced against its seating and the trapped water opens V2 and flows up the delivery pipe until its momentum is destroyed, when V2 closes and V1 opens, and the cycle starts again. The hydraulic ram will work with a fall of a very few ft. and will work for very long periods with little or no attention.

In addition, there are mechanical lifters, such as chains or buckets, which dip into the liquid. The pumps described are designed to deal with liquids, but many of them differ only in detail from pumps used for air or gases.

J. G. Day

PUMPS IN THE PETROLEUM INDUSTRY. These are used for two purposes: (1) moving oil through pipe lines, emptying and filling tanks, etc., and (2) lifting oil in the well. Those used for (1) are usually types of centrifugal and reciprocating pumps, size and design depending on their duty, and are driven by steam, internal combustion engine, or electric power. Most oil well pumps are either gas lift—similar to air lift but using natural gas in place of air—or simple plunger pumps operated from the surface by rods. Gas lift is advantageous in deep wells, and where mechanical pumping is difficult, but it is unsatisfactory where production is less than 100 barrels per day. The rod-operated plunger pump is screwed to the bottom of a pipe suspended in the well. It uses simple steel ball valves, and a steel plunger or piston is moved in the body of the pump by rods which protrude through a stuffing box on the pipe at the top of the well. Oscillation of rods is generally by a pivoted beam (walking beam) driven by a gas engine or electric motor. Sometimes, by means of pull rods and cranks, several wells are pumped by one engine. Pumps vary from 2 to 4 ins. in diam. and from 5 to 20 ft. in length, the stroke varies from 18 ins. to 10 ft. and speed is from 12 to 40 strokes per min. An electrically driven centrifugal pump which operates submerged at the bottom of the well is also made. The smallest size works inside a 6½-in. pipe.

Pumpnickel. German bread made of coarse, unbolted rye. It is very heavy and of doughy consistency, with a hard outer crust, and is somewhat acid in taste. Sometimes

Pump. Fig. 12. Arrangement of air-lift pump working by compressed air. See text

of air is required to aerate a given quantity of the liquid.

The Humphrey gas pump, in which an elastic fluid is used to expel the water, is actually a four stroke internal combustion engine of which the pump barrel is the cylinder, and a column of water continually added to at the suction end, and subtracted from at the delivery end, is the piston. A set of five of these pumps was installed at the Chingford reservoir of the Metropolitan Water Board, each pump capable of delivering 40 million galls. per day against a head of 30 ft.

In the Pulsometer steam pump (Fig. 13) the water is forced up by the direct action of steam. The pump consists of two bottle shaped chambers meeting at the top where steam enters one or the other, depending upon the position of a ball valve which is so arranged that it can close either of the chambers. Each chamber has a suction valve and a delivery valve. When steam enters one chamber

a glazing flavoured with caraway seeds is given to this bread, which was largely made in Westphalia.

Pumpkin (*Cucurbita pepo*). Trailing and climbing annual herb of the family Cucurbitaceae. Its

Pumpkin. Fruit, and stalk with male flower, leaf, and tendril; inset, female flower

native country is unknown. As a cultivated plant it was introduced to England from the Levant about 1570. The bristly, succulent stems bear five-lobed leaves and strong spiral tendrils by means of which it climbs bushes. The large yellow flowers are unisexual, though both male and female grow on the same plant. The females are distinguishable at sight from the presence of the ovary below the calyx. This develops into the enormous fruit or gourd pumpkin, sometimes weighing over 20 lb. The vegetable marrow and the squash are cultivated varieties of this species. Though not so popular as the marrow, the pumpkin can be cooked in a variety of ways, the best known of which is pumpkin pie. It is easily grown from seeds sown in spring in a gentle heat, and the young plants are set out of doors when there is no danger of night frosts. They succeed in most soils, but do best above a heap of well-covered manure; they require an abundance of water when fruiting. See Gourd; Vegetable Marrow.

Pump Room. Room in the buildings attached to a mineral spring, where the waters are drunk by persons undergoing a cure. The most famous place of the kind in England is the pump room at Bath, which, under the autocratic rule of Richard Nash, was made the capital of the province of pleasure for the fashionable world from about 1706 until his death in 1761. Tunbridge Wells and Scarborough were rather repaired to for relief, though in the time of Charles II the former was a frequent resort of the court. Aix-les-Bains, Baden, and Homburg are Continental

spas famous for their pump rooms. See Nash, Richard; Spa.

Pun. Play upon the similarity of sound in words of different significance. The word is supposed to derive from the A.S. *punian*, to pound or bruise, and thence to indicate a pounding of words into a new sense. At its best the pun is rare wit, sharpening and clinching the thought to which it owes its being. When a French Revolutionary, being carried to the scaffold, regretted that he had not finished writing a play, Danton said, "Tu feras assez de vers"—you will make enough verses (or worms).

Apart from the happy conversational puns of scores of quick-witted people, the greatest examples in English are those of Thomas Hood. When he had been ill crossing the Channel, Hood declared that a "sick transit" had destroyed the "glory o' Monday." In his writing, including poetry, the pun achieved an acknowledged position as a literary form, often with moving effect. Other users of the pun as an aid more especially to conversational wit were Lamb—who Hazlitt said always made the best pun of the evening—Sydney Smith, Douglas Jerrold, and O. W. Holmes. With the mere word torturing which passed for punning in the burlesques and pantomimes of the later 19th century the pun fell into discredit. Consult Addison's essay in *The Spectator* (No. 61) for the history of the pun, and Birch's letter in *The Guardian* (No. 36) for its apology.

Pump Room. Exterior of the Royal Pump Room, Harrogate, and below, interior of the world-famous Pump Room, Bath

Puna. High Andean plateaux stretching from Colombia to Chile. Being bounded by the higher rims of the Andean chains they resemble vast troughs. Their great elevation gives them a cold, bleak climate which, together with the little precipitation, restricts the natural vegetation to poor tuft grass and other low plants. On the lower punas, however, the conditions resemble those of the world's poorer grasslands, and pastoral occupations can be pursued. The name is also given to the cold, dry wind on these plateaux. See Andes.

Punakha. Chief town of the independent state of Bhutan, India. It is situated on the E. edge of the Himalayas on the Sankosh, a small tributary of the Brahmaputra, and has a fortress of great natural strength.

Punan. Indigenous tribes of Indonesian stock in Sarawak and central Borneo. Estimated at 100,000, round-headed, pale-yellow, muscular, they are inoffensive jungle nomads, wear bark waistcloths, occupy rude leaf shelters, and subsist on wild sago, fruits, and game hunted with blow-gun and poisoned darts.

Punch. Alcoholic beverage made of spirits and fruit juice, spice, sugar, and hot water. The name and the drink were originally Indian, *panch* being Hindi for five—the five essential ingredients including arrack and tea. According to the spirit used, punch is called rum, brandy, or whisky punch. Wine or even ale is sometimes added. Milk punch is made of milk and rum, generally bottled, and drunk cold.

Punch. Steel tool for forming holes in thin metal or for marking a point on metal, usually for starting a drill. Punches may be used with a hammer or mechanically operated. In fine precision work an automatic centre punch is employed, the blow being applied by a spring mechanism inside the handle. Typical manual examples are pin punches for driving out dowel pins and nail punches for sinking nailheads below the surface of the wood. A bell-centre punch, which slides inside a bell-shaped base-block, marks the centre of the end of a shaft for work on the lathe; a dinking punch cuts washers from leather; a rivet punch, which has a hollow cupped head, finishes off rivet heads. Power-operated punches can run holes through several inches of steelplate.

Punch OR THE LONDON CHARI-VARI. British illustrated weekly journal. Devoted to social and

political satire, humour, and literary and dramatic criticism, its first issue was published June 17,

Punch. Replica of the first issue of Doyle's cover, Jan. 6, 1849
By courtesy of the proprietors of "Punch"

1841. Ebenezer Landells, Henry Mayhew, Mark Lemon, and Stirling Coyne were chiefly concerned with its production, and for a short time the three last named were joint editors. Then Mark Lemon became chief editor, remaining so until his death in 1870. Succeeding editors have been Shirley Brooks, 1870; Tom Taylor, 1874; Sir F. C. Burnand, 1880; Sir Owen Seaman, 1906; E. V. Knox, 1932; C. K. Bird (Fougasse), 1949.

Punch became in 1842 the property of Bradbury & Evans, a firm known since 1872 as Bradbury, Agnew & Co. The original cover was the work of A. S. Henning; second by Hablot K. Browne (Phiz), Jan., 1842; third by W. Harvey, July, 1842; fourth by Sir John Gilbert, Jan., 1843; fifth by Kenny Meadows; sixth by Richard Doyle, Jan., 1844; and the seventh and present cover, by Richard Doyle, Jan., 1849. The original price of 3d. was maintained until 1917, when the extra cost of materials due to the First Great War forced it up to 6d. The Punch Almanack, a special Christmas number, first issued 1842, was later supplemented by an annual summer number.

Punch has been banned more than once in Russia, Germany, and France; but on the whole, while pricking bubbles, it has reflected week by week the best and most representative feeling of the nation, as well as its follies and foibles, and many a good cause has found in it a helpful friend. Reprints in various forms, e.g. Pictures from Punch, 4 vols., 1906;

the Punch Library of Humour, ed. by J. A. Hammerton, 25 vols., 1907, Mr. Punch's History of Modern England, by C. L. Graves, 4 vols., 1921-22; and the New Punch Library, ed. Sir John Hammerton, 20 vols., 1933, bear witness to its permanent appeal. British art and letters are equally well represented in its pages, and scholarship has given an edge to its wholesome fun. Numbers of its cartoons, like Leech's General Février turned Traitor, 1855; Tenniel's Dropping the Pilot (Bismarck), 1889; and Partridge's King Albert (Unconquerable), 1914, have become historic. Much of its verse, as Hood's Song of the Shirt, 1843, and Tom Taylor's Abraham Lincoln, 1865, are permanent additions to English literature; and numbers of its jokes, as Advice to persons about to marry—Don't! or the frugal Scot's Bang went Saxpence 1, or the curate's egg that was excellent in parts, have passed into proverbs.

Among the many brilliant writers and artists who have sat round

Punch and Judy. The famous old puppet play, still a popular entertainment with children. Right, Judy attempts to rescue their baby from the violence of Punch

the staff table at the weekly dinners, in addition to those named already, are the à Becketts, F. Anstey (Guthrie), Alfred "Crowquill," Harry Furniss, Douglas Jerrold, R. C. Lehmann, Percival Leigh, Charles Keene, E. V. Lucas, Henry Lucy (who, as Toby, M.P., contributed Essence of Parliament for over 30 years), George du Maurier, Phil May, A. A. Milne, L. Raven-Hill, E. T. Reed,

Frank Reynolds, Linley Sambourne, Ernest Shepard, Claude Shepperson, W. M. Thackeray, and F. H. Townsend. See Charivari; Keene, C.; Omnibus; consult also The History of Punch, M. H. Spielmann, 1895.

Punch and Judy. Name of an English puppet play, performed in the open by itinerant entertainers. The performer is concealed in a portable frame covered with cloth, the upper part of which is open in front, forming a small covered stage. The puppets are moved from below by the hands of the performer, who utters the dialogue in a nasal falsetto, varied to suit the characters. There have been various forms of the play, but the hero, Punch, is always a violent, pugnacious, but droll and high-spirited rascal, hunch-backed, hook-nosed, and gaily dressed, who

with the help of a stout cudgel overcomes all his enemies in succession. In one version, Punch, having murdered his child and his wife, Judy, flies from an officer of the law, escapes from the Spanish Inquisition, and repels various antagonists, including Disease, Death, and the Devil. Punch is commonly accompanied by a small live dog, Toby.

Punch, originally called Punchinello, appears to have been introduced to England from France at the Restoration, but did not gain great popularity until the reign of William III, when the show may have been modified by the influence of Dutch puppet plays. Addison devotes an article in The Spectator (No. 14) to the play. Judy is a familiar form of the once common name Judith, and Toby, as a dog's name, is due to the dog of Tobias in the Book of Tobit. See Marionettes; Punchinello; Puppets. Consult Punch and Judy, J. P. Collier, illus. G. Cruikshank, 5th ed. 1870.

PuncHESTOWN. Racecourse in co. Kildare, Eire. In the parish of Rathmore, it is 2 m. from Naas and 24 m. S.W. of Dublin, with a rly. station. It is noted for its steeplechases, especially the meeting of the Kildare Hunt in April.

Punchinello. Older form of the name Punch in the Punch and Judy show. It is adapted, probably,

Punchinello, as he appeared on the old Italian stage

through the influence of the old word *punch*, short and fat, from Fr. *Polichinelle* or Ital. *Policinella*, more commonly *Pulcinella*. This character appears in the Italian Commedia dell'Arte (*q.v.*) about the beginning of the 17th century, and originated in the neighbourhood of Naples. Traditionally represented with a black mask and a hooked nose, he is a boastful country clown, the hero of ridiculous and rascally exploits, and not devoid of wit. *Pulcinella* apparently means little chicken, though the origin of the name has been much debated. The character was soon transferred from the theatre to the puppet show, and in this form was adopted by the French, who made him dwarfish and lurch-backed, and the mouth-piece of much rillery and satire. The English Punchinello, whose rôle was long much less restricted than that of the conventionalised Punch, resembles his French original in his unflinching impudence and hilarity.

Punctuation (Lat. *punctum*, point). Method of dividing written words by a system of conventional marks, called points or stops, into sentences and clauses. It is done for the quicker apprehension of their meaning by the eye, and the avoidance of misunderstanding of their purport, and as a guide to intonation in reading aloud. Aldus and Paulus Manutius (*q.v.*), the 16th century printer-publishers of Venice, were the first to introduce systematised punctuation into printed books, and the advantages of the device speedily conquered the world. In non-inflectional languages, such as English, where position chiefly determines the relation of words, long sentences would be almost unintelligible without some such assistance.

Four principal marks are in use: the full point, or period (.), marking the end of a sentence; the colon (:), marking a shorter pause, properly placed where the sense is continued independently of

grammatical construction, and best employed only to introduce a formal statement; the semi-colon (;), denoting a still shorter pause and separating the conjunct members of a sentence; and the comma (,) marking the shortest division of a sentence and indicating the shortest pause in reading aloud. In addition, the notes of interrogation (?) and of exclamation (!) indicate a question and admiration or surprise respectively. Quotation marks (" ") often called "inverted commas," mark the beginning and end of a quotation or passage of dialogue in narrative; and the dash (—) is used to suggest hesitation, or to introduce a word or thought supplementary to something said just previously.

Pedants have raised punctuation to the dignity of a mystery. Theoretical rules for its application are of little use. Common-sense, reinforced by the ear, is the best guide for the writer; while printers generally follow rules laid down in their respective establishments. See Colon; Comma, etc.

Pundit OR **PANDIT** (Hindi, learned man). Designation of teachers, especially of Sanskrit and Hindu scholars. The term is also applied to skilled native topographical surveyors, some of the earliest having been schoolmasters. In the old supreme court of India the Hindu adviser of the British judges was called the pundit.

Pungue. River in Mozambique, E. Africa, rising in the Inyanga range in Mashonaland, Rhodesia, and falling into the Indian Ocean at Beira. It is navigable for about 100 m. by small steamers. It was first explored by Sir L. S. Jameson and Frank Johnson.

Punic Wars. Series of wars fought between the Romans and the Carthaginians, or Poeni, for the mastery of the western Mediterranean. In the first Punic War (264–241 B.C.) the cockpit of the struggle was Sicily, the largest portion of which was in the hands of the Carthaginians. The Romans, who were not a seafaring people and had no fleet, were at a serious disadvantage against Carthage.

By 260, however, the Romans had built themselves a fleet, and by the use of boarding bridges gained under Duilius a great victory at Mylae, on the N.E. coast of Sicily. In the fighting in Sicily, the Romans had the advantage of the co-operation of Hiero of Syracuse, while the greatest asset of the Carthaginians was the skilful generalship of Hamilcar Barca, who with a comparatively small force held the Roman armies at bay over a long period. In 256 the

Romans attempted to create a diversion by sending an expedition to Africa under Regulus (*q.v.*).

At first successful, the army of Regulus was eventually completely defeated in 255, and the struggle again centred in Sicily. The Romans captured Panormus in 254, and defeated the Carthaginians in battle near that town in 251, but the war dragged on, and it was not until 242 that success finally passed to the Romans by another great naval victory near the Aegates Insulae off the W. coast of Sicily. The defeated Carthaginians were unable to continue to send supplies to their stronghold of Lilybaeum, which had been besieged by the Romans for ten years. With the fall of Lilybaeum, the Carthaginians were forced to give up Sicily, and the two belligerents were glad to make peace.

In the Second Punic War (218–201 B.C.) the scene of the first fighting was Spain, where the Carthaginians, endeavouring to carve out a new dominion for themselves to compensate for the loss of Sicily, came into conflict with the Romans, who had also been extending their dominion in the same quarter. In 218 B.C. Hannibal conceived the idea of carrying the war into Italy. Leading an army across the Pyrenees, and across the still more formidable barrier of the Alps, he descended into the valley of the Po, and after victories at Lake Trasimenus, 217, and Cannae, 216, seemed to have Rome at his mercy. The Greek cities of S. Italy joined him, and Syracuse changed sides. The central Italian states, however, stood firm for Rome.

A skilful general was found in Quintus Fabius Maximus, surnamed Cunctator (Delayer) on account of his non-forward policy. Fabius resisted all temptation to risk a pitched battle, contenting himself with harassing Hannibal on every possible occasion, in the belief that he would thus wear down his strength. These tactics were successful, and the Romans secured a breathing space in which to recover their strength. In 207 the decisive battle of the war, reckoned as one of the decisive battles of the world, was fought.

Hasdrubal, brother of Hannibal, who had had charge of the Carthaginian forces in Spain, outwitted Scipio, the Roman general opposed to him there, and made his way to Italy, with reinforcements. Before he could effect a junction with his brother, however, he was defeated and slain at the battle of the Metaurus. Henceforward Hannibal was doomed. In 206 Scipio decided to carry the war into the enemy's

country, and landed in Africa with an army in 204. Hannibal was recalled in the following year, but at the battle of Zama in 202 his army was completely defeated by that of Scipio. By the terms of the peace concluded shortly afterwards the Carthaginians were compelled to pay an indemnity of £2,350,000 over a period of 50 years, to reduce their navy to ten ships, and to give up Spain.

Carthage was thus reduced to a shadow of her former self. Her commercial prosperity, however, began gradually to return, and this aroused the jealousy of Rome, where there was always a strong party which believed that the only safe policy was the complete destruction of Carthage. The "Délenda est Carthago" (Carthage must be destroyed) of the elder Cato has passed into a proverb. In 149 occasion was found to pick a quarrel with Carthage, and the third Punic War (149-146 B.C.) began. After a vain endeavour to placate Rome, the Carthaginians took up arms, prepared for desperate resistance. No success at first attended the Roman arms, until the arrival in Africa of P. Cornelius Scipio, a descendant by adoption of the conqueror of Hannibal. Scipio brought about the fall of Carthage in 146. The city was razed to the ground, and the territory of Carthage became the Roman province of Africa. See Carthage; Hannibal; Rome; consult Rome and Carthage, R. B. Smith, 3rd ed. 1883; The Second Punic War, T. Arnold, 1886; History of Rome, T. Mommsen, Eng. trans. rev. ed. 1901.

Punishment (Lat. *punire*, to punish). Infliction of pain or suffering for a misdeed. From early historical times some form of definite punishment of wrongdoers by the state has been recognized. The early forms were based upon the principle of retaliation, i.e. the infliction of corresponding pain or suffering upon those who had caused them. This theory of punishment remained in wide practice until the middle of the 19th century when theories of reformation and prevention made headway, until at present the emphasis is all on these aspects of punishment.

Barbarous practices like breaking on the wheel, burning at the stake, hanging and quartering, also aimed at making the punishment so terrible as to act as a deterrent to others, but in this they wholly failed, and it is still a matter of controversy whether such punishments as death, flogging, etc., are deter-

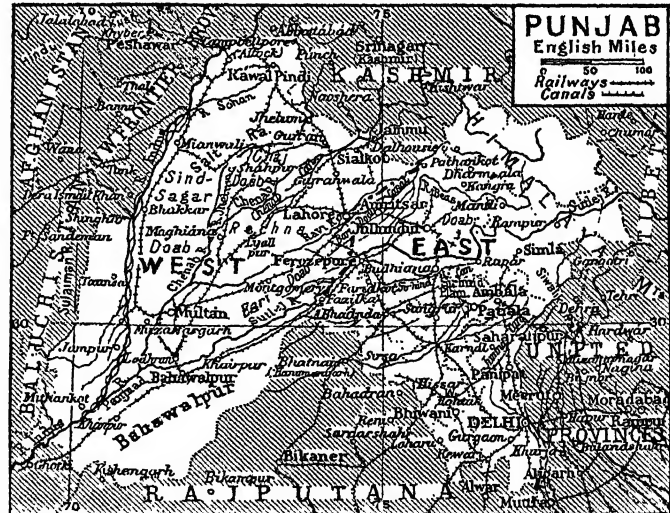

rent in their operation or not. In the army and navy punishments have been even more severe, with the object of preserving discipline, than in the civilian code. Keelhauling (*q.v.*), flogging with the cat-o'-nine tails, and hanging were common up till the 18th century, in the British navy; in 1749, out of 36 articles of naval punishment, no fewer than ten awarded the death penalty without any alternative, and twelve others had death as an alternative. The articles failed through their very severity, and have been mitigated by a number of Acts, as have those of army punishments. See Borstal System; Capital Punishment; Prison.

Punjab, OR PANJAB. Name of an area of the Indian sub-continent. It means land of the five rivers (Jhelum, Beas, Ravi, Chenab, and Sutlej—the confluence of which, the Panjnad, as a left bank affluent, joins the Indus near Alipur). The Punjab was a prov. of British India during 1849-1947. It was annexed by Great Britain after the second Sikh war. It lies N.W. of the United provs., N. of Rajputana and Sind, and E. of the N.W. Frontier prov., which was detached from it in 1901. Delhi

99,089 sq. m., of which 11,000 sq. m. are highlands. The Punjab states cover 37,000 sq. m., of which 12,000 sq. m. are highlands. Included in the highlands are part of the N.W. end of the Himalayas, the foothills of which in the Punjab are known as the Siwaliks. N. of the salt range between the Indus and the Jhelum is a tableland from 1,000 to 2,000 ft. high, much cut up by streams.

The plains cover an area almost as large as the British Isles. They comprise five doabs or riverain tracts, namely, Jullundur between Sutlej and Beas, Bari between Beas and Ravi, Rechna between Ravi and Chenab, Chaj between Chenab and Jhelum, and Sind-Sagar between Jhelum and Indus; the Sirhind plain between the Sutlej and the Jumna on the high land between the Indus and the Ganges river systems; and Bahawalpur between Rajputana and the Indus-Panjnad-Sutlej.

Lahore, formerly the capital of the British prov., became, after partition, the capital of the W. Punjab; Ambala the capital of the E. Punjab. A mass migration of Hindus from W. to E., Muslims from E. to W., and involving in all

Punjab. Map of this former province of British India, showing the partition boundary between Pakistan and India

prov. was detached in 1911. In 1947 the Punjab was divided into W. Punjab, Pakistan, and E. Punjab (later Punjab), India, the boundary passing roughly from the N.E. of Bahawalpur along the Sutlej and then crossing E. of Kasur and Lahore to the Ravi up to the boundary of Kashmir. The whole Punjab has an area of

10 million people, took place shortly after partition and was accompanied by disorders producing great loss of life in the autumn of 1947. On the basis of the 1941 census, the area and estimated pop. of W. Punjab are 62,261 sq. m., 16 million; of (E.) Punjab 36,828 sq. m., 12½ million. Towns with pops. of over 100,000 are Rawalpindi

and Multan (W. Punjab); Amritsar, Ludhiana, and Jullundur (Punjab, India).

Owing to clear skies the climate tends to extremes of heat in the early summer and frost and cold in the winter. During May, a mean daily temp. above 110° F. is recorded at Jacobabad, reputed to be the hottest place in India. The monsoons bring heavy rains in the late summer, and there is a second rainy period in the winter. The Punjab differs from the rest of India in the cold weather rains and the aridity of the plains. The latter caused the British govt. to construct the finest system of irrigation canals in the world; the chief of these perennial canals are called Jhelum, Bari Doab, Chenab, Sirhind, and Western Jumna. Some 15 million acres of land in British Punjab were watered by irrigation in 1945-46.

The arid plains of the S.W. and the highland princely states of the N.E. are scantily peopled; between these two the density of pop. decreases with distance from the Himalayas, except in Rohtak and Gurgaon in the S.E. Nearly 60 p.c. of the people depend on tillage and 20 p.c. on the primitive handicrafts of the weaver, potter, leather-worker, carpenter, and blacksmith. The people include agricultural Jats (20 p.c.), efficient and hard-working cultivators and excellent soldiers; agricultural Rajputs (7 p.c.), generally poor cultivators; Brahmans, Arains, and Kamboh. The chief vernaculars are Lahndi on the W., Panjabi in the centre, and W. Hindi in the S.E. Less than six p.c. are able to read and write, but there are govt. high schools for boys, middle schools, and primary schools.

The first rly. was opened in 1862; the trunk line connects Lahore with Delhi and Karachi and runs N.W. to Peshawar beyond the Indus; most of the connecting lines cross the plains S.W. or S.E. of the trunk line. Total length of rlys. in 1946 was about 4,300 m.; of metalled roads, 4,643 m.

Wheat and barley are the chief crops, wheat covering a quarter of the tilled area. They are winter rain crops, reaped in March and April. Millets, pulses, sugar-cane, cotton, and rice are also grown. Much of the wheat is exported, via Karachi. Oil is extracted in the Attock district.

The history of the Punjab and adjacent areas is of considerable interest, in view of the fact that the mountainous ramparts of the Himalayas, Hindu Kush, and

Suleiman mts. tend to restrict human migration. Alexander the Great invaded the Punjab from the W., and reached the Beas (Hyphasis) before he turned back, in 326 B.C. Greek rule ceased when he died, three years later. Asoka, 273-231 B.C., had a long and peaceful reign; for the next twelve centuries the country was dominated by foreign invaders, or split up into numerous petty states. The raids of Turkish soldiers of fortune from the W., notably Mahmud of Ghazni (d. 1030), during the 10th and 11th centuries, resulted in the overthrow of Buddhism. From 1206, for three centuries, Turkish and Afghan sultans ruled from Delhi a kingdom of varying dimensions; during this period the Monguls came, first in 1221, under Jenghiz Khan, and later from 1240 to 1303, at irregular intervals, to ravage the land. Tamerlane, in 1398-99, led his mass-oring Turks to Delhi, and sacked the royal city.

From 1556 until 1707 the Punjab was strongly ruled by Mogul emperors, beginning with Akbar and ending with Aurungzebe; Lahore became their great city. Between 1738 and 1762 Nadir Shah eight times, and Ahmad Shah six times, invaded the Punjab from Persia; the Sikhs rose then to power, and Ranjit Singh, 1799-1839, suppressed all rivals. In 1809 Ranjit Singh pledged himself by treaty with the British to make no conquests S. and E. of the Sutlej. The successors of the great maharaja failed to uphold the pledge, and were defeated in the first and second Sikh wars, and the Punjab was annexed by Britain in 1849. Much unrest was manifest in 1919-20, serious rioting taking place at Amritsar (q.v.) and other places. See India; Indus; Nautch Girl; Pakistan; consult The Punjab, North-West Frontier Province, and Kashmir, J. McC. Douie, 1916; Wealth and Welfare of the Punjab, H. Calvert, 2nd ed., 1936; Chiefs and Families of Note in the Punjab, Griffin and Massey, 1940.

Punjab University. Former educational institution at Lahore.

Created as an examining body in 1882, it derived from Lahore university college, established in 1869 to promote the diffusion of European science as far as possible through the medium of the vernacular languages of the Punjab, and to afford every encouragement to the study of the English language. From 1919 it included also teaching depts., eleven in number in 1946. There were also several affiliated institutions. University faculties included arts, Oriental languages, science, medicine, agriculture, commerce, engineering, law, and dentistry. After partition, 1947, the university was divided into the universities of East Punjab (India) and West Punjab (Pakistan).

Punkah, the Indian fan suspended from the ceiling and worked from outside the house

Punkah (Hindustani). Name for a large fan used in India. It is fixed to the ceiling, and worked by a servant. The word originally meant a fan of palmyra leaf.

Puno. Department and city of S.E. Peru, on the borders of Bolivia. The dept. has an area of 26,133 sq. m., and contains most of Lake Titicaca, though otherwise largely mountainous. It was formerly celebrated for the wealth of its silver mines; now mining and stockraising are the chief occupations. The climate is cool. Pop. 548,371. Puno, the capital, stands on the W. shore of Lake Titicaca, at an alt. of 12,560 ft., 110 m. direct N.E. of Arequipa, with which it is connected by rly. Alpaca wool is exported. In the vicinity are gold, silver, and copper mines. Pop. 15,880.

Punshon, WILLIAM MORLEY (1824-81). British Methodist preacher. Born at Doncaster, May 29, 1824, he preached at Hull, 1840, and became a Wesleyan minister at Whitehaven, 1845. A stirring preacher, he successfully

Punting. 1. Position for taking stroke in racing punt. 2. Putting in the pole. 3. Beginning of stroke. 4. Middle, and, 5, finish of stroke. 6. Recovering the pole

held charges at Carlisle, Sheffield, and Newcastle-upon-Tyne, before proceeding to Canada in 1868. President of the Wesleyan Conference, 1874, he died April 14, 1881. A selection of his sermons and addresses appeared in 1882.

Punt. Flat-bottomed boat, propelled by means of a pole. In the rules and regulations governing punt races it is defined as a flat-bottomed craft without stem, keel, or sternpost, and the width at each end must be at least one-half of the width at the widest part. Subject to these conditions a punt may be any width or length.

The original punt was a heavily built contrivance, used by Thames fishermen, and had a well for holding water towards the stern, in which the small fish used for bait were kept alive. From this has been evolved the pleasure punt, and the long racing boat often only 16 ins. wide.

The art of punting requires considerable practice and caution on the part of the novice. There are two styles of using the pole: the running method, and the more general one of pricking. In the former a few steps forward are taken each time the pole is pushed against the bed of the river; in the

latter, a more or less stationary position is maintained. The pole should be put in the water well in

Punt Gun, used for duck shooting

front of the operator, and care is required in gathering it for the next stroke.

Punt or Puoni. Ancient name of a region southward of Egypt. Perhaps the biblical Put (Gen. 10), it is especially identifiable with the Somali coast.

Punta Arenas, Seaport town (also called Puntarenas) of Costa Rica, capital of the dept. of Punta Arenas. It stands on the E. coast of the sheltered Gulf of Nicoya, and is the Pacific terminus of the transcontinental rly. from Limón. It trades in coffee and rubber. Pop. 26,375.

Punt Gun. Gun used in a punt for wild-duck shooting. The gun is sometimes made to turn on a swivel or a pivot attached to the barrel; or a gun with a stock is supported on a crutch. The

muzzle-loading type are the cheaper, but breech-loaders are handier, and generally preferred. They are both single and double barrelled.

Pupa (Lat., baby or doll). Resting stage in the life-history of all insects that undergo complete

metamorphosis. During this stage the larva becomes transformed into the perfect insect. No food is

Pupa of (above) Cabbage white Beauty butterfly; and (right) Death's Head moth

taken, but in some insects the pupa is free and active when the adult is due to emerge, and in others it is quite immobile. In moths and many other insects the pupa is enclosed in an earthen cell or in a cocoon. In most butterflies the pupa is naked and is commonly known as a chrysalis. See Insect.

Pupienus Maximus, MARCUS CLODIUS. Roman emperor, A.D. 238. When the tyrant emperor Maximinus had been declared a public enemy by the senate, Pupienus was called to the throne, together with Balbinus (*q.v.*) as joint ruler. Pupienus took the field against Maximinus, whose army surrendered to him, Maximinus himself being killed by his own soldiers. Balbinus and Pupienus, however, could not agree; their authority was defied, and they were both murdered in a revolt of the praetorian guard.
